5.1 Database Components

5.2 Dam Inventory Data

5.2.1 How to Retrieve

Click the 'Dam Inventory Retrieval' button.

- 1) Click the Check Box.
- 2) Enter the Text Box such as follows if you would like to retrieve the name of scheme of 'ANGAT'.
[e.g] ANGAT, A', AN'T, 'GAT, etc.

Click the 'Retrieve' button.

- 1) Click the Check Box.
- 2) Click the right edge of Combo Box, and then either select one of Combo Box or enter such as "Con" if you would like to retrieve all of Concrete Double Arch, Concrete Gravity, Concrete Weir.

Click the 'Browse' button.

Dam-Reservoir Scheme Search Results

The results of your search are shown below. To view more information about a station, please click on the ID in the table below.

Dam-Reservoir Type Scheme Search Results

NATIONAL WATER RESOURCES BOARD
INVENTORY OF PLANNED DAM RESERVOIR TYPE SCHEME

Name of Scheme: ANGAT
Agency: NPC

1. Location River System

Water Resources Region	3	River System	PAMPANGA
Province	BULACAN	Stream	ANGAT
Municipality	MASILA	Municipality	10,000
Latitude	N 14° 54' 55"	Longitude	E 121° 10' 06"

2. Purpose/Purpose of Scheme

Purpose of Development: Irrigation Power Flood Control Municipal and Industrial Water
 Present Status (Date of Commission): in 1967

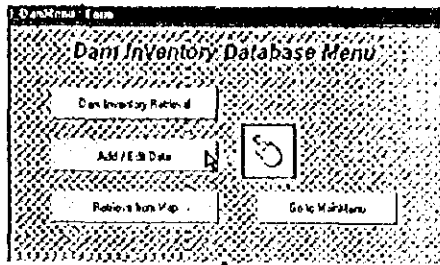

3. Hydrological Information

Catchment Area (km ²)	500	Mean Discharge (m ³ /sec)	37200
Discharge Rate (m ³ /sec)		Mean Average Height (m)	
Specific Discharge (m ³ /km ² /hr)	10.40	Design Flood of Dam (m ³ /sec)	58000

4. Reservoir Information

Full Supply Level (ELm)	212	Gross Storage Volume (10 ⁶ m ³)	100000
Minimum Operating Level (ELm)	190	Active Storage Volume (10 ⁶ m ³)	80000

5.2.2 How to Add / Edit

Click the 'Add / Edit Data' button.

Add / Edit for Dam-Reservoir Type Scheme

NATIONAL WATER RESOURCES BOARD INVENTORY OF PLANNED DAM RESERVOIR TYPE SCHEME

Name of Scheme: SUNGAI ALAM
 Agency: NEC

1. Location River System

Water Resources Region		River System	APRA
Province	ABRI	Stream	SINONGAY
Map	BONTOL	Map Scale	<input type="radio"/> 1:250,000 <input type="radio"/> 1:500,000
Latitude	N 17° 45' 00"	Longitude	E 110° 32' 00"

2. Purpose Present Status

Purpose of the alignment: Irrigation Power Flood Control Municipal and Industrial Water

Present Status (Study Level): FS JSS

3. Hydrological Information

Catchment Area (km ²)	3720	Main Discharge (m ³ /sec)	24300
Evaporation Rate (mm/year)		Basin Average Rainfall (mm/year)	
Specific Discharge (mm/250 km ²)	7.10	Design Flood of Dam (m ³ /sec)	64000

4. Reservoir Information

Full Supply Level (EL m)	332	Gross Storage Volume (10 ⁶ m ³)	12100
Minimum Operational Level (EL m)	270	Dead Storage Volume (10 ⁶ m ³)	3000

1) Add New Data

- 1) When you click the 'Add New' button, you can add new data.
- 2) Enter the data into each field.
- 3) After encoded, click the 'Return to DamMenu' button.

2) Edit the Data

Record: 11 4 52 of 64

Add / Edit for Dam-Reservoir Type Scheme Return to Dam Menu

NATIONAL WATER RESOURCES BOARD **INVENTORY OF RESERVOIR**

Name of Scheme: 161725
 Agency: MEA

1. Location / River System

Water Resource Region	2	River System	CHALAN
Province	EGAFIA	Stream	MAZAT
Map	SCLAND	Map Date	<input checked="" type="radio"/> 1978/200 <input type="radio"/> 1982/200

Purpose of Development	<input checked="" type="radio"/> Irrigation <input type="radio"/> Power <input type="radio"/> Flood Control <input type="radio"/> Municipal and Industrial Water
Project Status (Step Level)	Commission <input type="radio"/> In 1982

3. Hydrological Information

Catchment Area (km ²)	4,113.0	Mean Discharge (m ³ /s)	217.000
Evaporation Rate (mm/year)	8.10	Seven Average Rainfall (mm/year)	
Specific Discharge (m ³ /km ² /100 km ²)	3.00	Design Flood of Dam (m ³ /s)	

4. Reservoir Information

Full Supply Level (FLM)	199	Design Storage Volume (10 ⁶ m ³)	1,230.00
Storage Coefficient (SC)	74.8	Min. Reservoir Volume (10 ⁶ m ³)	785.000

Record: 11 4 52 of 64

- 1) Click the 'Move' button, and then select a record for which you would like to edit.
- 2) After edited, click the 'Return to Dam Menu' button for update table of database.

5.3 Output Sample

1) Dam Inventory Data

 NATIONAL WATER RESOURCES BOARD	INVENTORY OF PLANNED DAM- RESERVOIR TYPE SCHEME
---	--

Name of Scheme : ANGATAgency : NPC

1. Location/River System

- Water Resources Region	3	- River System	PAMPANGA
- Province	BULACAN	- Stream	ANGAT
- Map	MANILA	- Map Size	1/250,000 : 1/50,000
- Latitude	N 14° 34' 55"	- Longitude	E 121° 10' 06"

2. Purpose/Present Status

- Purpose of Development	<input checked="" type="checkbox"/> Irrigation <input checked="" type="checkbox"/> Power <input checked="" type="checkbox"/> Flood Control <input checked="" type="checkbox"/> Municipal and Industrial Water
- Present Status (Study Level)	Commission in 1967

3. Hydrological Information

- Catchment Area (km ²)	368.0	- Mean Discharge (m ³ /sec)	59.200
- Denudation Rate (mm/year)		- Basin Average Rainfall (mm/year)	
- Specific Discharge (m ³ /sec/100 km ²)	10.40	- Design Flood of Dam (m ³ /sec)	5,800.00

4. Reservoir Information

- Full Supply Level (EL.m)	217	- Gross Storage Volume (10 ⁶ m ³)	1,075.00
- Minimum Operating Level (EL.m)	180.0	- Active Storage Volume (10 ⁶ m ³)	850.000
- Surge Level (EL.m)	219.0	- Flood Control Space (10 ⁶ m ³)	
- Drawdown Depth (m)	37	- Dead Storage Volume (10 ⁶ m ³)	225.00
- Geology			

5. Main Dam Information

- Dam Type	Rockfill	- Dam Height (m)	131.0
- Crest Elevation (EL.m)	223.5	- Crest Length (m)	368
- Bottom Elevation (EL.m)	92.5	- Embankment Volume (10 ⁶ m ³)	

6. Construction Cost (at the Price Level of)

- Total Project Construction Cost (10 ⁶ US\$)	
- Dam Cost (10 ⁶ US\$)	
- Power Facilities Cost (10 ⁶ US\$)	
- Water Supply Facilities Cost (10 ⁶ US\$)	

7. Main Features of Hydropower

- Installed Capacity (MW)	218.0	- Rated Net Head (m)	135
- Length of Waterway (m)		- Firm Peak Power (MW)	150.0
- Diameter of Waterway (m)		- Annual Total Energy (GWh)	393.0
- Tailwater Level (EL m)		- Firm Energy (GWh)	280.0
- Plant Maximum Discharge (m ³ /sec)		- Secondary Energy (GWh)	118.0
- Firm Discharge (m ³ /sec)			

8. Main Features of Irrigation

- Total Irrigation Area Covered by Water Supply from the Reservoir (ha)	
- Period of Irrigation Water Being Supplied	From month _____ to month _____
- Annual Mean Discharge Supplied (m ³ /sec)	
- Monthly Maximum Discharge (m ³ /sec)	

9. Main Features of Municipal Water Supply

- Main Area Served by the Municipal Water Supply System	
- Mean Discharge Used for Municipal Water Supply (m ³ /sec)	

10. Other Description on the Dam-Reservoir Scheme

8.1 Methodology of Probability Calculation

All projects are planned for the future, and the planner is uncertain as to the precise conditions to which the works will be subjected. Since the exact sequence of streamflow for future years can not be predicted, something must be said about the probable variations in flow so that the plan can be completed on the basis of a calculated risk. This section describes the methods for estimating the probability of hydrologic events.

8.1.1 Recurrence Interval

The recurrence interval is defined as the average interval in years between the occurrence of a flood of specified magnitude and an equal or larger flood. The m th largest flood in a data series has been equaled or exceeded m times in the period of record, n years and an estimate of its recurrence interval T as given by the Hazen formula is

$$T = \frac{2n}{2m-1} \quad (8.1)$$

Several other formulas have been suggested for the calculation of recurrence interval or return period. The disagreement between the various formulas is limited to the larger floods, where m is small. If m equals 5 or more, the calculated values of T by all methods are almost identical. Equation (8.1) can be used to define plotting position, which provide a good estimate of flood flows with return periods of less than 20 years.

If an event has a true recurrence interval of T years, then the probability P that it will be equaled or exceeded in any one year is

$$P = \frac{1}{T} \quad (8.2)$$

Since the only possibilities are that the event will or will not occur in any year, the probability that it will not occur in a given year is $1 - P$.

8.1.2 Gumbel Method

Gumbel suggested that the distribution of extreme values was appropriate for flood analysis since the annual flood could be assumed to be the largest of a sample of 365 possible values each year. Based on the argument that the distribution of floods is unlimited, i.e., that there is no physical limit to the maximum flood, Gumbel proposed that the probability P of the occurrence of a value equal to or greater than any X be expressed as

$$P = 1 - e^{-e^{-b}} \quad (8.3)$$

$$b = -\ln \left[-\ln \left(1 - \frac{1}{T} \right) \right] \quad (8.4)$$

where e is the base of Natural logarithms and b is given by

$$X = \bar{X} + \sigma(0.7797 b - 0.45) \quad (8.5)$$

where \bar{X} is the arithmetic average of all values of X , and σ is the standard deviation of the series computed from

$$\sigma = \left[\frac{\sum (X - \bar{X})^2}{n - 1} \right]^{1/2} \quad (8.6)$$

where n is the number of years of record. The probability P is related to the recurrence interval T .

8.1.3 Log Pearson Type III Distribution

In 1967, the U.S. Water Resources Council adopted the log Pearson Type III distribution (of which the lognormal is a special case) as a standard for use by federal agencies. The purpose was to achieve *standardization of procedures*. The recommended procedure is to convert the series to logarithms and compute the mean, standard deviation, and skew coefficient G , which is

$$G = \frac{n \sum (\log X - \overline{\log X})^3}{(n - 1)(n - 2)(\sigma_{\log X})^3} \quad (8.7)$$

The values of X for various periods are computed from

$$\log X = \overline{\log X} + K \sigma_{\log X} \quad (8.8)$$

where K is selected from the following table for the computed value of G and the desired return period. Lognormal probability paper should be used for graphical display of the curves. A straight line will result only if $G = 0$.

K value of Log Pearson Type III Distribution

Skew coefficient G	Return Period, yr

8.2 How to Use

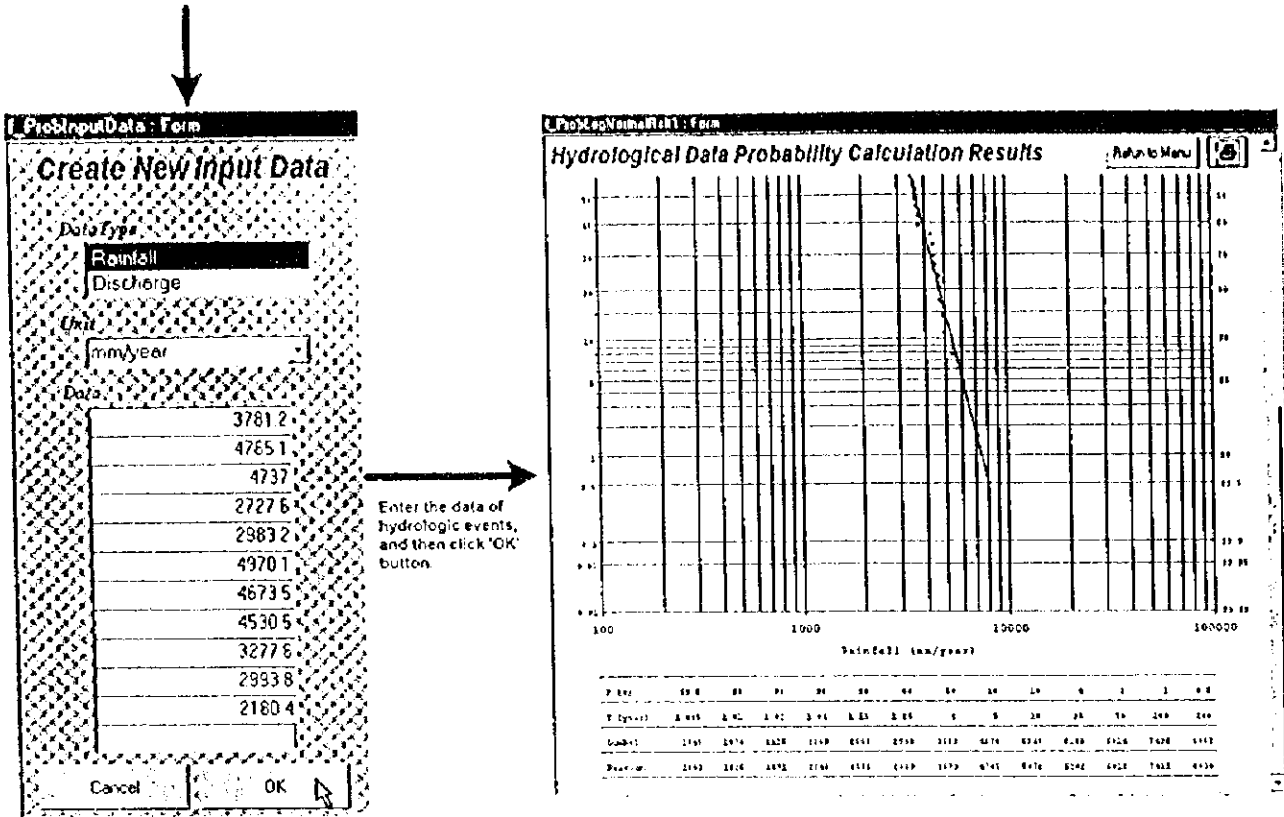

You can estimate easily the probability of hydrologic events by using this tool. Gumbel method and Log Pearson Type III distribution explained at the previous section are available, and this tool can also print out the lognormal probability paper with plotting position by Hazen formula.

Input data of hydrologic events is recorded directly on Microsoft ACCESS, and is possible to read from external files such as Microsoft EXCEL.

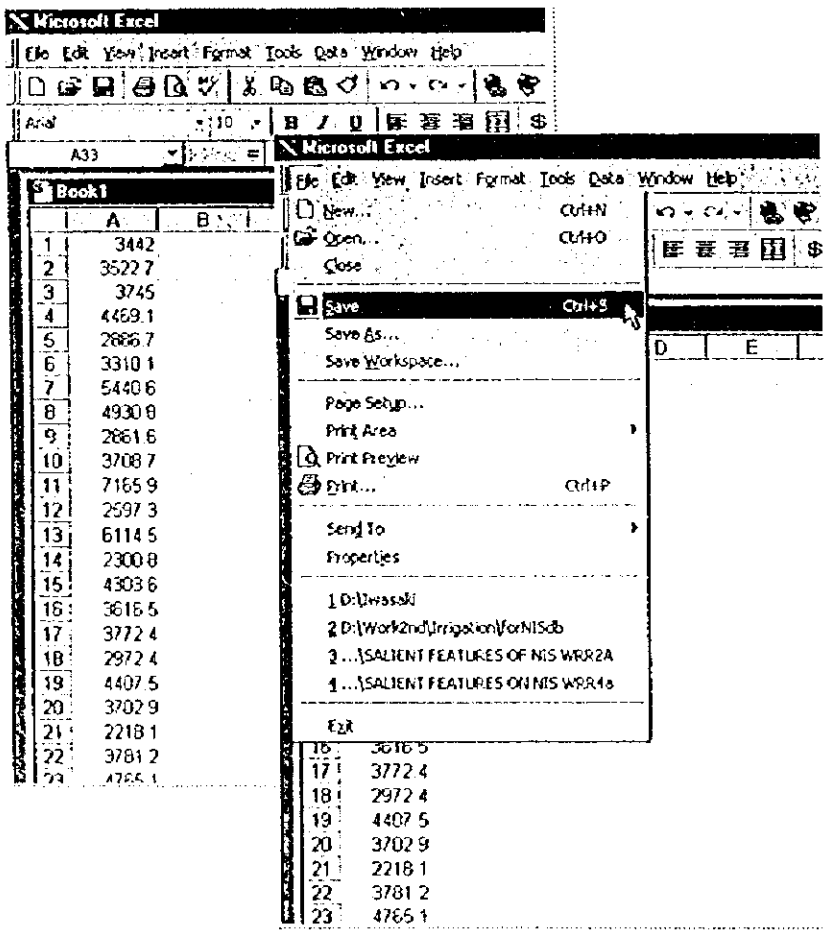

This section will explain the handling by using annual rainfall data of Baguio city for the example.

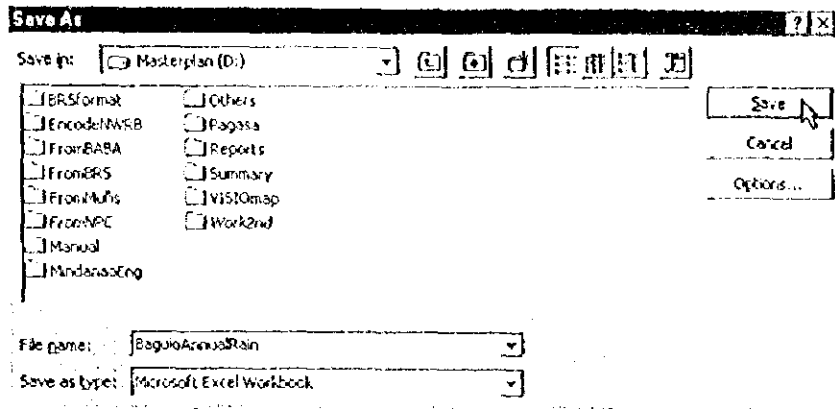

8.2.1 Using Input Form of Microsoft ACCESS

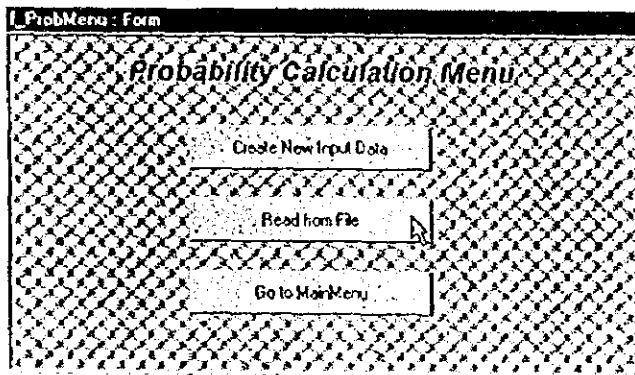

8.2.2 Using Data Read from File

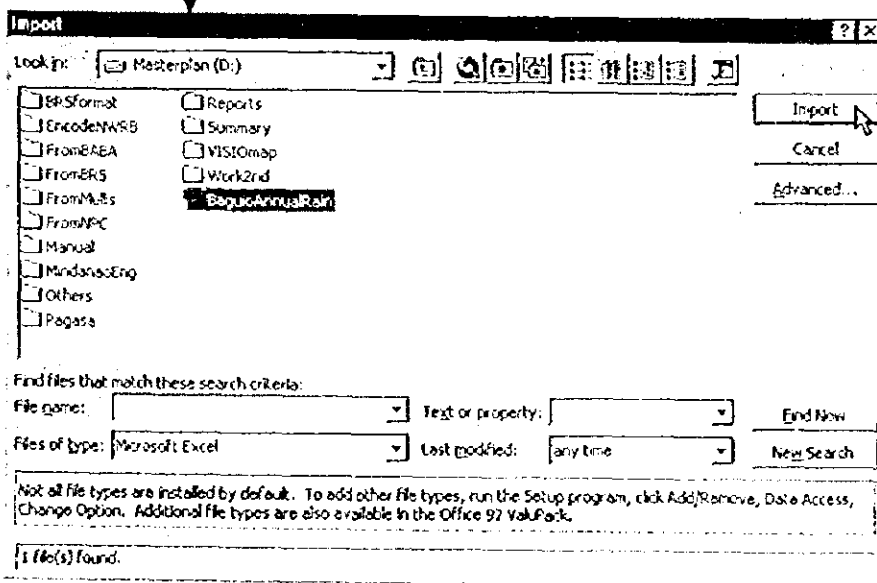

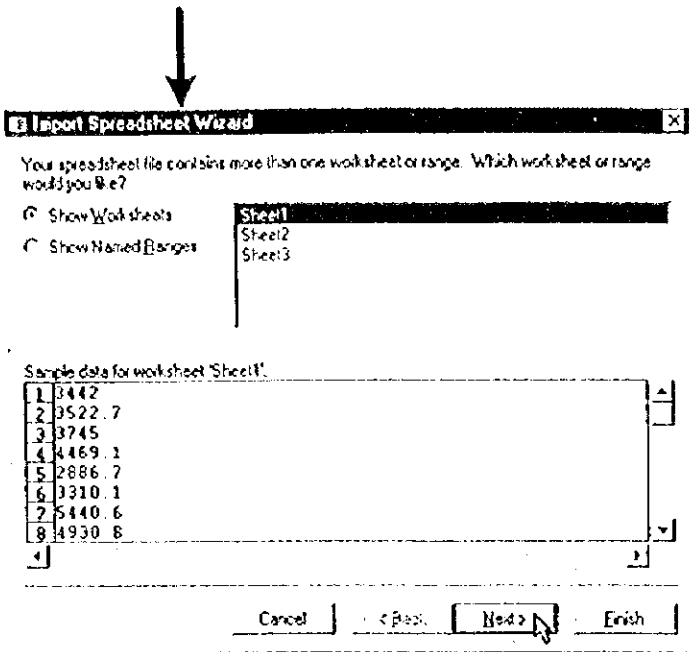

Enter the file name, and then click 'Save' button.
 In this section, 'File name' is 'BaguioAnnualRain', and 'Save as type' is 'Microsoft Excel Workbook'.

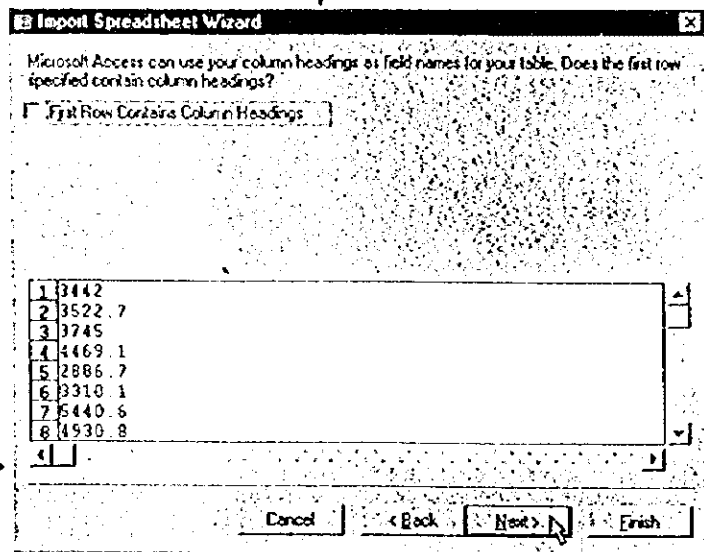

On Microsoft ACCESS, click the 'Read from File' button.

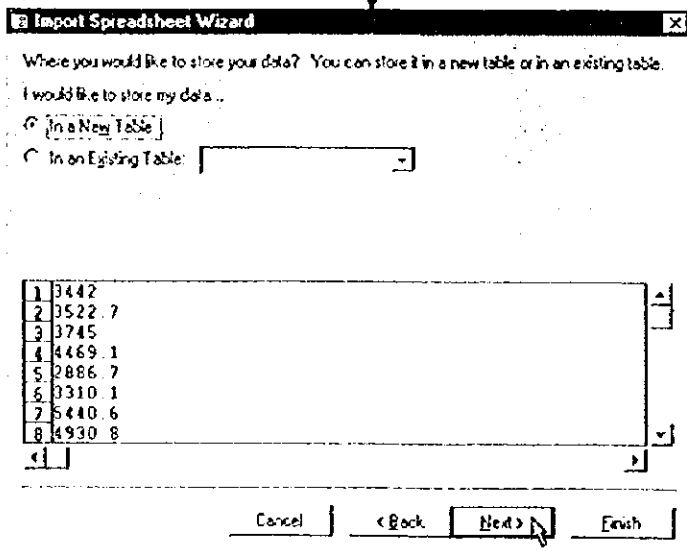

On the Import dialog, select created file, and then click the 'Import' button.

Click the Option button of 'Show Worksheets', and select the work sheet which you would like to import, and then click 'Next >' button.

Click 'Next >' button.

Click the Option button of 'In a New Table', and then click 'Next >' button.

Import Spreadsheet Wizard

Microsoft Access recommends that you define a primary key for your new table. A primary key is used to uniquely identify each record in your table. It allows you to retrieve data more quickly.

Let Access add Primary Key.
 Choose my own Primary Key: _____
 No Primary Key.

	Data
1	3442
2	3522.7
3	3745
4	4469.1
5	2886.7
6	3310.1
7	5440.6
8	4930.8

Cancel < Back Next > Finish

Click the Option button of 'No Primary Key', and then click 'Next >' button.

Import Spreadsheet Wizard

You can specify information about each of the fields you are importing. Select fields in the area below. You can then modify field information in the 'Field Options' area.

Field Options

Field Name: Data Data Type: Double

Indexed: No Do not import field (Skip)

	Data
1	3442
2	3522.7
3	3745
4	4469.1
5	2886.7
6	3310.1
7	5440.6
8	4930.8

Cancel < Back Next > Finish

Enter as "Data" at the Text Box of 'Field Name', and then click 'Next >' button.

Import Spreadsheet Wizard

This's all the information the wizard needs to import your data.

Import to Table: [L_ProbData]

I would like a wizard to analyze my table after importing the data.
 Display Help after the wizard is finished.

Cancel < Back Next > Finish

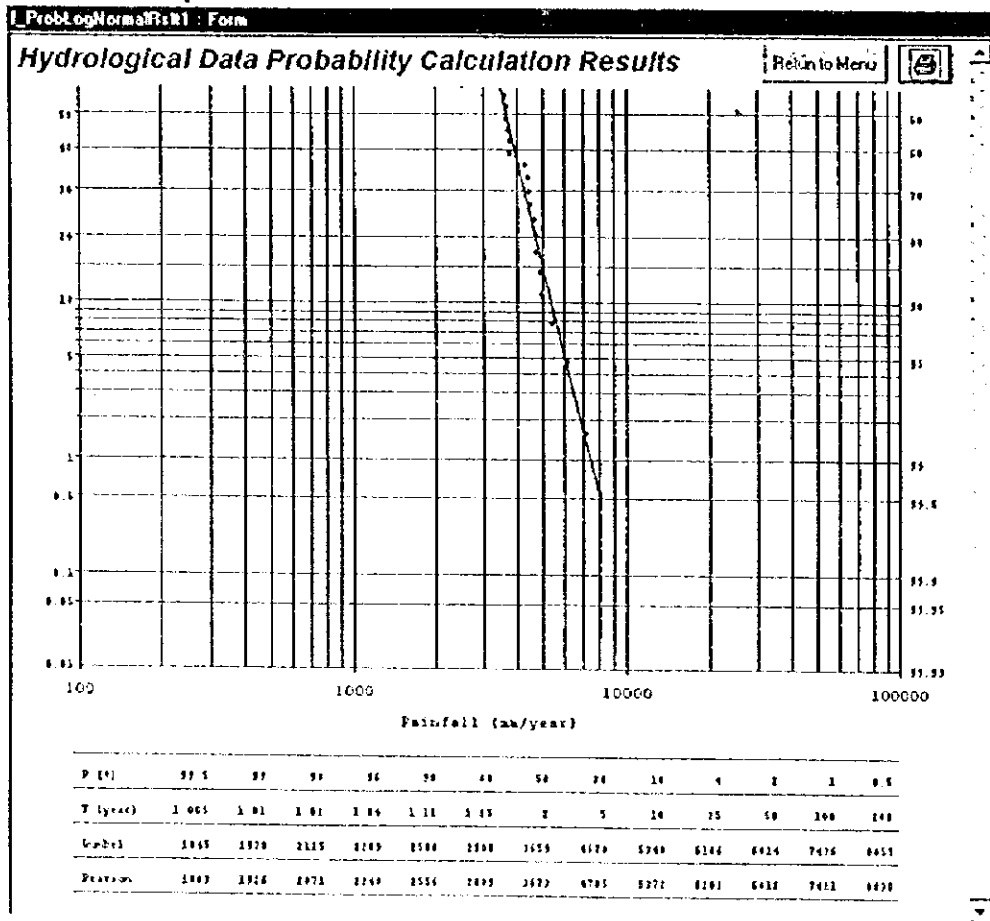

Enter as "L_ProbData" at the Text Box of 'Import to Table', and then click 'Finish' button.

Click 'OK' button.

Choose the data type at List Box of 'Data Type', and then click the right edge of Combo Box of 'Unit', select one. Then click 'OK' button.

8.3 Output Sample

Maintenance

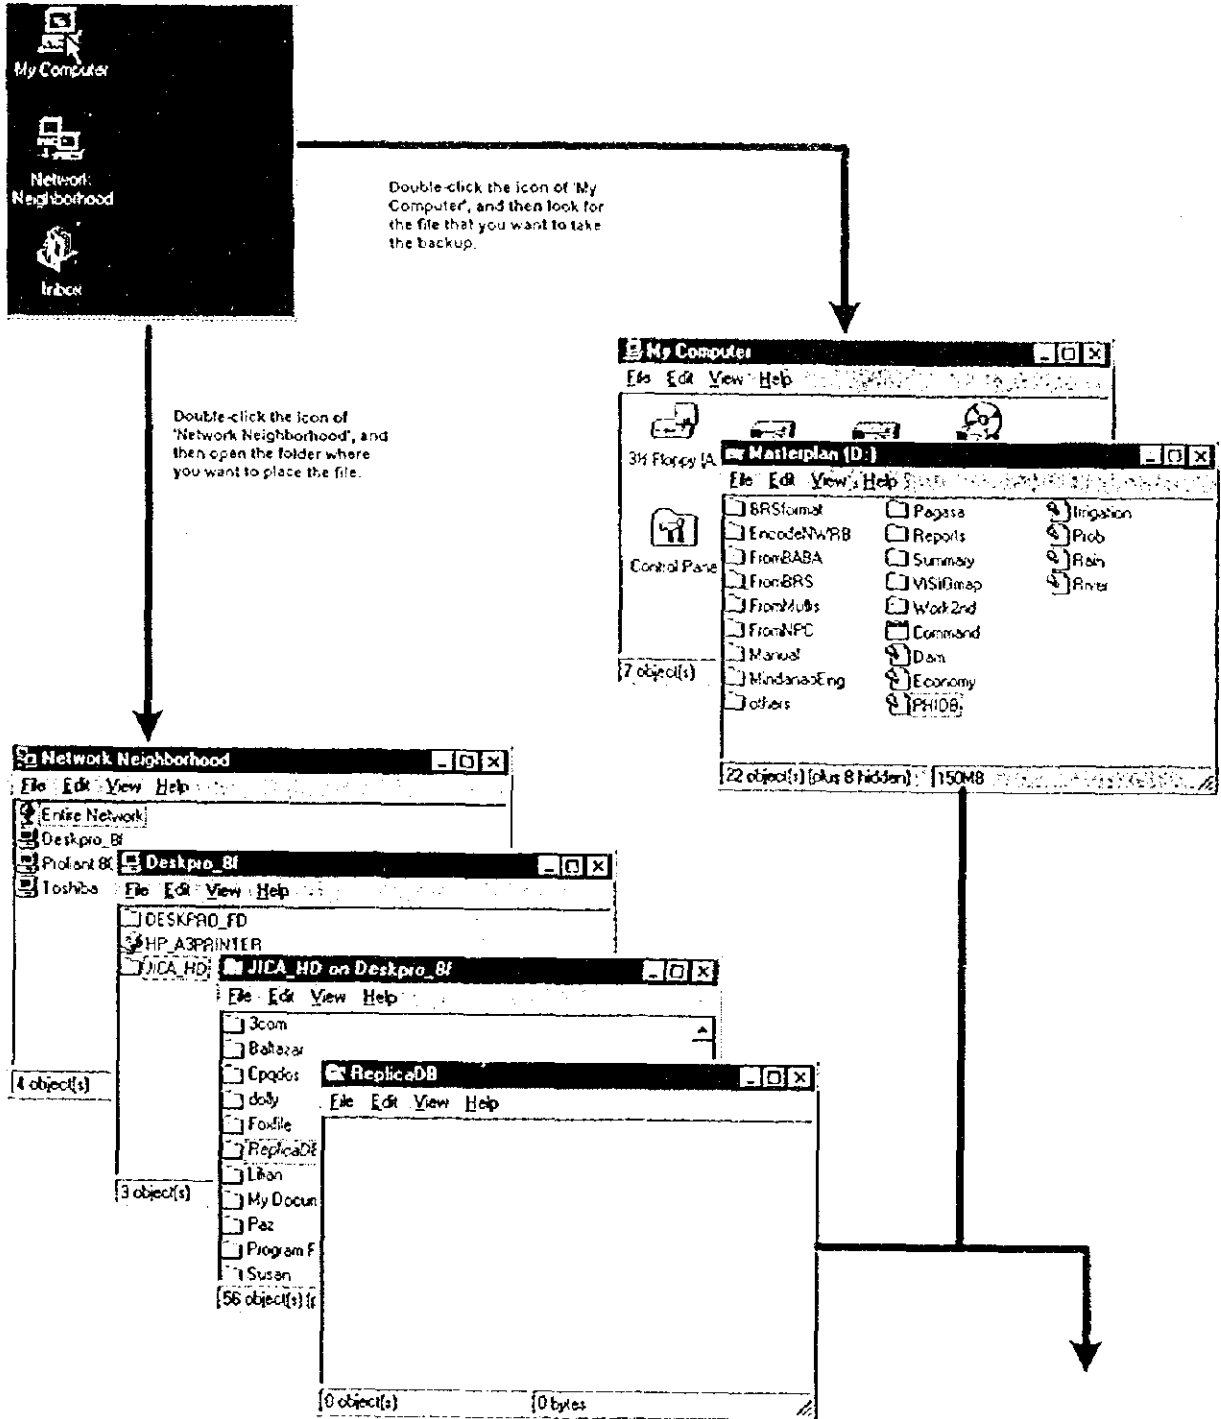

CONTENTS

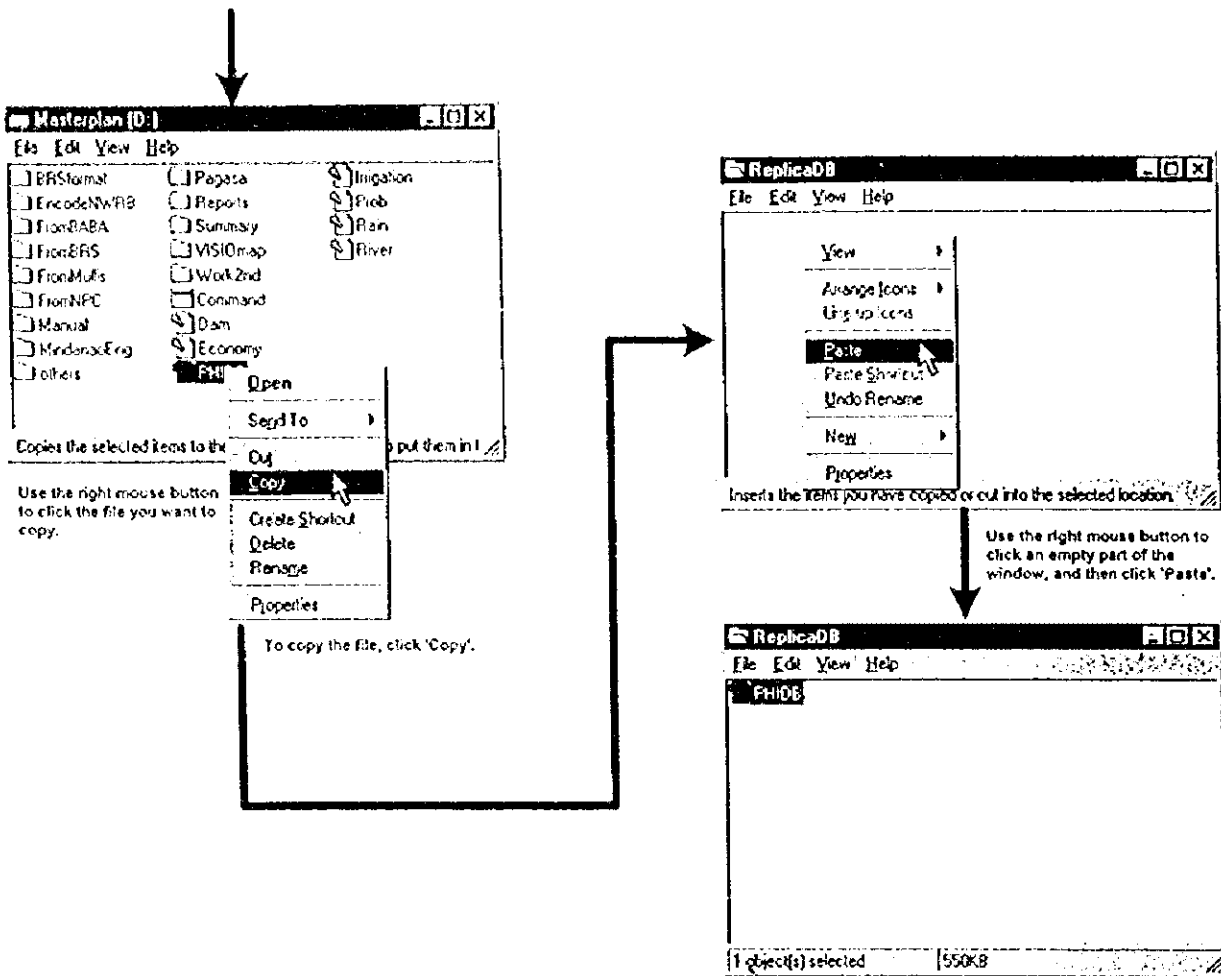

9.1 Back Up the Information	108
9.1.1 Back Up to the Hard Disk of Network Computer	108
9.1.2 Back Up to the Floppy Disk	109
9.2 Compact Database	112
9.3 Repair Database	113

9.1 Back Up the Information

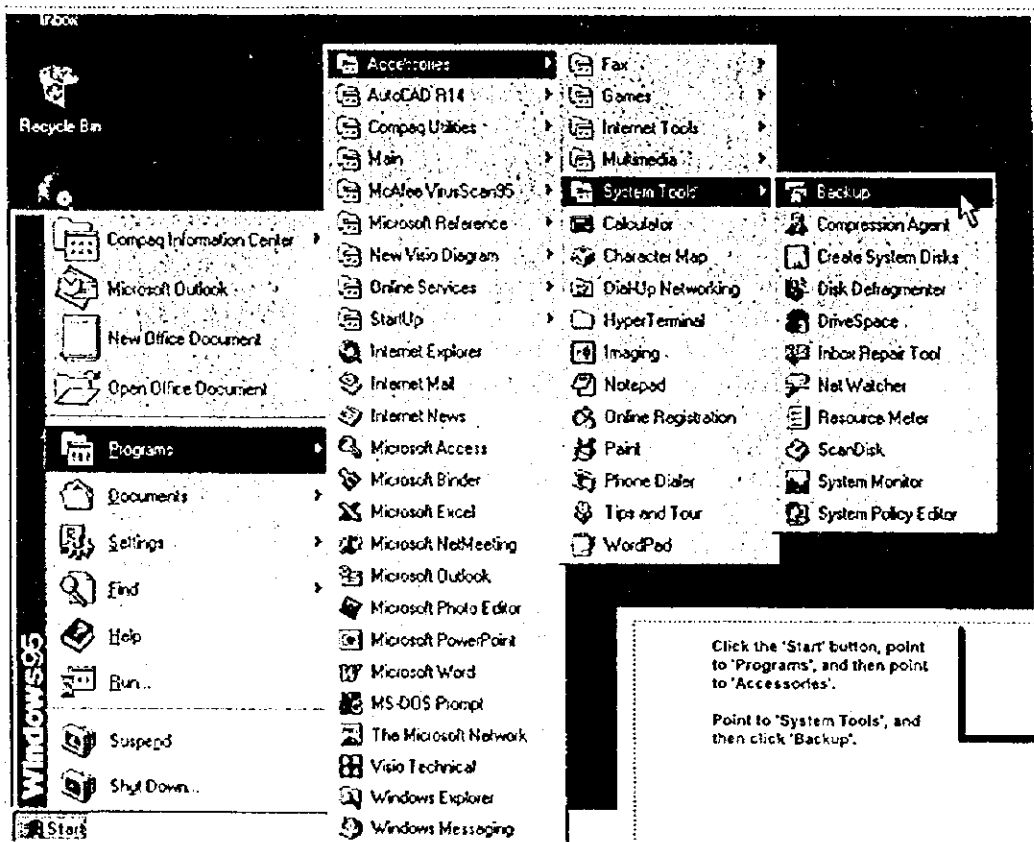

You may lose the files if your hard disk fails or you accidentally overwrite or delete data. Backing up your files safeguards them against these loss. You should take a backup to the other media regularly by the following procedure.

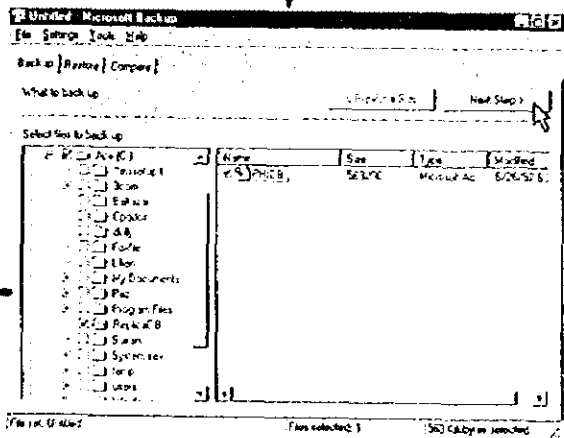

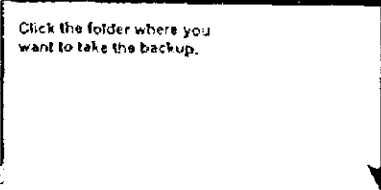

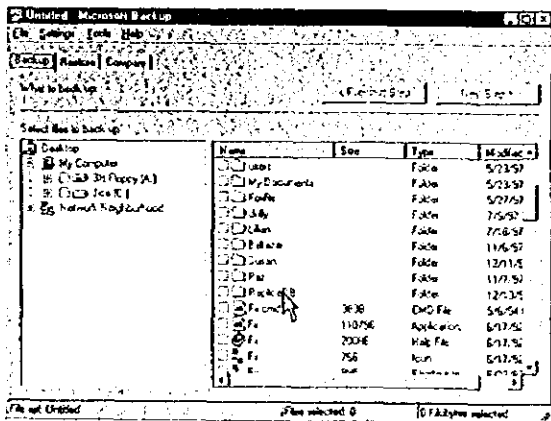

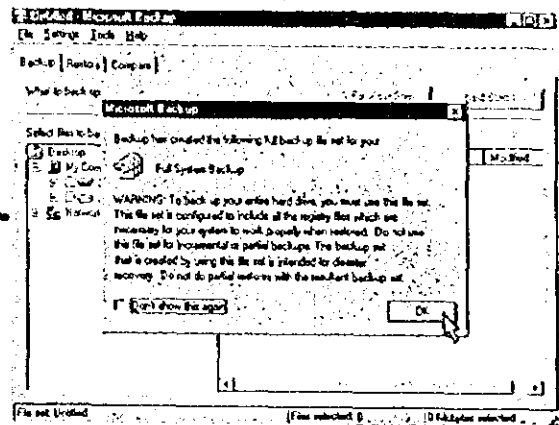

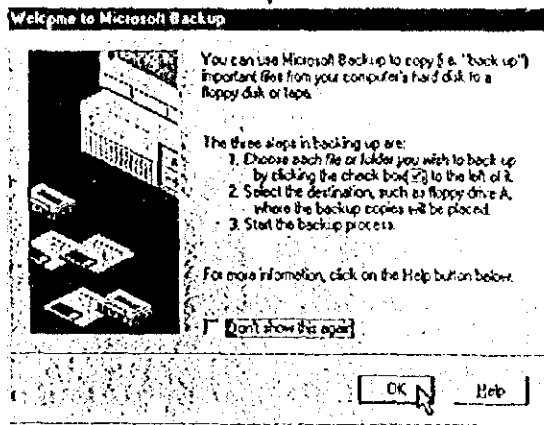

9.1.1 Back Up to the Hard Disk of Network Computer

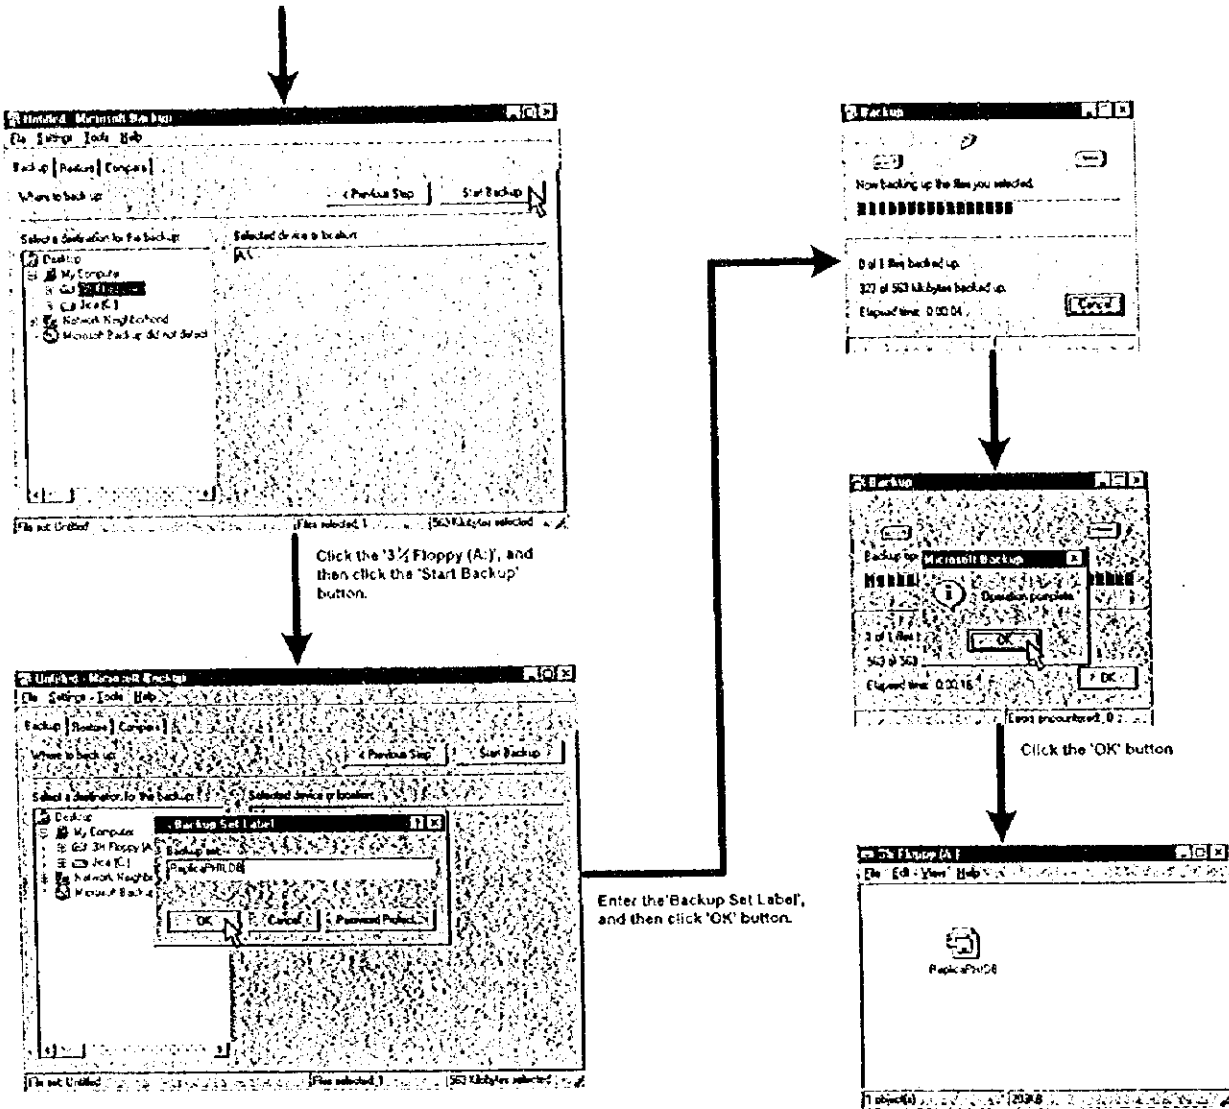

9.1.2 Back Up to the Floppy Disk

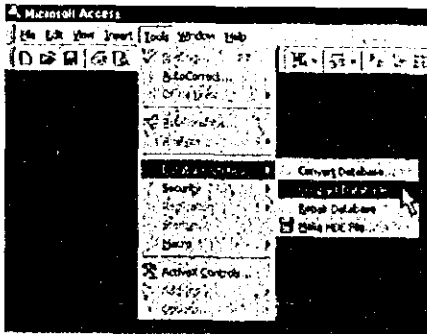

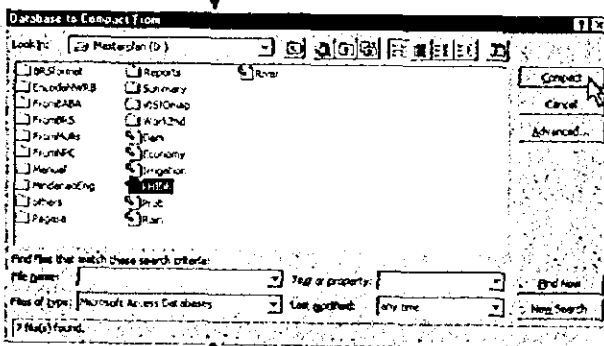

9.2 Compact Database

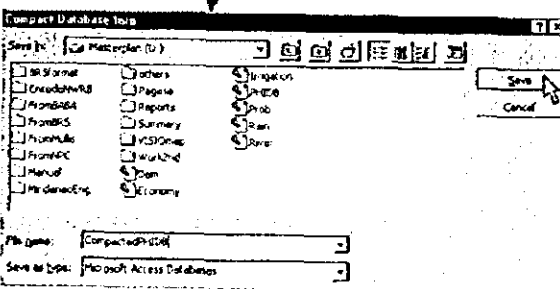

You may find that the file size of database changes in the near future. The file size of database becomes big by repeating the operation of the addition, the renewal and the deletion in the database. This is to be generated the blank portion in the database by these operation. The increase of the file size becomes the burden to the hard disk. Compacting database has the effect to make small the file size by rearranging useless space. You should compact the database regularly by the following procedure.

On the menu of Microsoft Access, Click the 'Tools', point to 'Database Utilities'. Then click the 'Compact Database'.

Select the file that you want to compact, and then click the 'Compact' button.

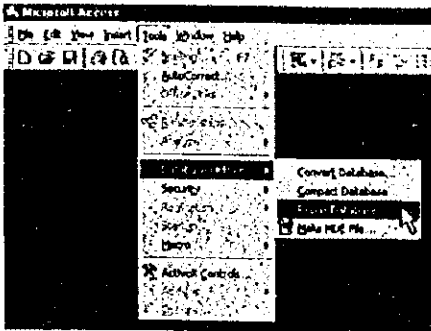

Enter the file name you want to save, and then click the 'Save' button.

In the comparison between 'PHILDB' and 'CompactedPHILDB', the file size of data-base decreases from 690 KB to 468 KB.

9.3 Repair Database

You may face the situation that the file can not open or the database can not operate normally. In most cases, the database was damaged by some reasons. If the damaging is slight, you can repair the database file in the way of the following example. However, you can not repair the database without backup file if your hard disk fails or delete the file.

On the menu of Microsoft Access, Click the 'Tools', point to 'Database Utilities'. Then click the 'Repair Database'.

Select the file that you want to repair, and then click the 'Repair' button.

Attachment LA to Part-L: EXPLANATION NOTE ON PROJECT CYCLE MANAGEMENT
Attachment LB to Part-L: GUIDE FOR MODERATOR

Part - I. WORKSHOP USING PROJECT CYCLE MANAGEMENT(PCM)

I.1 Objectives of Workshop Using PCM

The Project Cycle Management (PCM) was applied to the Study on water resources development and management in the Philippines in the second field investigation stage as well as third field investigation stage. It was expected that the workshops, which are the highlight of the PCM, would facilitate the JICA Study Team to formulate the master plan that is acceptable to and is able to be implemented by the agencies concerned of the Philippines. The PCM is a newly developed method to formulate, implement and maintain plans in the mutually understood and agreed manner among the participants from the various parties. The benefit and loss to those parties that are incurred by the plans may naturally vary, and sometime their relation becomes opposite. The main objectives of holding the PCM workshop are summarized as follows:

- i) To scrutinize the problems related to the project,
- ii) To collect various opinions and verify the master plan proposed through project dialogue, and
- iii) To identify and establish the strategic approaches to solve problems from the various aspects.

Hence, the PCM is usually applied for the people benefited, local residents and implementing agencies of the projects. The concerned agencies with the water resources development master plan are, however, widely diversified in functions and positions thereof. NIA, for instance, is a user of water through diverting a part of river water. Meanwhile, DENR is responsible for preservation of the river environment, which may be affected by the water diversion. Accordingly, mutual understanding among the agencies concerned is fundamental to formulate an effective Master Plan. In this respect, the PCM was introduced to the group of agencies that form the Steering Committee of the Study in the stage of a master plan study.

L.2 Activities and Selection of Participants

L.2.1 Preparatory Works

In cooperation with the National Water Resources Board (NWRB), the JICA Study Team conducted the one-day Workshop by using the Project Cycle Management (PCM) method for the Master Plan Study on Water Resources management in the Philippines on January 15 and June 26, 1998. Since the method is a quite new approach for having project dialogue among relevant agencies including NWRB, JICA, the Study Team, the following preparatory works for the PCM workshop were conducted during the assignment period of the PCM Expert for the period from December 21 1997 to January 16, 1998 in the second stage field investigation.

As the nature of the PCM method, it facilitates communication and cooperation among all parties involved in the project. Although in the method the constant procedure and uniform understanding of the term are used, its application to the study can be flexibly adjusted and planned in compliance with the magnitude and complication of the problems involved in the study.

The selection of participants for the workshop is the important process of the PCM procedure. Basically, it is advisable that the participants of the workshop comprise the representatives of beneficiaries, the community directory affected by the project, relevant governmental agencies, experts, and funding agencies. Since the workshop is held on in the stage of the master plan study concerned with many agencies, the forty-five (45) participants were invited from the 14 governmental agencies as shown in Table L-1.

L.2.2 Guidance on PCM Method

Prior to holding the workshop, the guidance of PCM method attended by the representative from relevant offices was conducted on January 8, 1998, as listed in Table L-2. In the guidance, the procedures and mechanisms of the PCM method were explained to the attendants by using flip chart on PCM method and the explanatory note on the Project Cycle Management as well as brief case study. The explanatory note is shown in the Attachment LA to this Part-L: EXPLANATORY NOTE ON PROJECT CYCLE MANAGEMENT.

L.2.3 Orientation for Moderator

In response to the request from NWRB, the orientation for the selected moderators was conducted on January 14, 1998. The material for the orientation, " the Guide for Moderator" was prepared, in which the detailed steps were explained, and instructions to steer the workshop were given. In addition, the prevailing subjects were illustrated to the eligible moderator, and specific tasks and role were allocated to three personnel who were selected as the moderator for the workshop. The Guide for Moderator is presented in the Attachment LB to this Part - L.

I.2.4 Workshop Using PCM Method

The Workshop using Project Cycle Management (PCM) for the Master Plan Study on Water Resources Management in the Republic of the Philippines was conducted on January 15, 1998 at the BSWM Convention Hall, Visayas Ave. in Quezon City. The one-day workshop was organized jointly by the NWRB and the JICA Study Team. The workshop was conducted pursuant to the program shown in Table L-3.

Since the PCM workshop was conducted by being attended by 45 participants, the participants were divided into three groups, allocating the issues relating to the water resources management, water supply and the irrigation demand as shown in Table L-4. These groups were chaired by Mr. Melchor O. Baltazar (Deputy Executive Director of NWRB at that time), Mr. Toshio Katayama (Deputy Team Leader of the JICA Study Team)/Mr. Lope R. Villenas (Chief Water Resources Development Officer of NWRB) and Mr. Emerson Coloma (Irrigation Expert of the JICA Study Team). The participants are listed in Table L-5.

I.3 Performance of Workshop

I.3.1 Participation Analysis

Before starting the group works, the overall discussion on participation analysis and problem analysis was conducted to determine on what projects the participants belong to and what problem they have. Table L-6 shows the results of the overall participation analysis. The outputs of the overall participation analysis indicate that there are many agencies which have the issues on water right as shown in Table L-7. Each group performed further detailed participation analysis. As a consequence, each group identified the target group as shown below:

Group	Target Group
Water resources management group	Water related organizations
Water supply group	MWSS
Irrigation water demand group	Farmers in the country

In the detail participation analysis, the target group that may be solved under the project is identified, though wide views arise through project dialogue. In addition, the specific issues of the target group such as differing needs, demands and absorptive capacities were extracted in the course of the group work as shown in Table L-8. The participation analysis of each group is shown in Table L-9.

I.3.2 Problem Analysis

The first step of this method is to identify a core problem, which is the starting point of the analysis. Each work group identifies the core problem as follows:

Group	Core Problem
Water resources management group	Weak institutional framework
Water supply group	People experience inadequate and unportable water supply
Irrigation water demand group	Farmer cannot get enough irrigation water.

The outputs in this stage are shown in Table L-10.

I.3.3 Problem Analysis, Objectives Analysis and Selection of Approach

The approaches identified through the workshop are as follows:

Group	Approach
Water resources management group	Institutional Strength Approach
Water supply group	Water Resources Approach
Irrigation water demand group	Water Management Improvement Approach

Though more time was required to find out the measures to obtain the final outcome, the approaches were identified from the objective trees as shown in Table L-11. The "Matrix for Selection of Approach" is shown in Table L-12.

L3.4 Project Design Matrix

Based on the results of the successive analysis such as problem analysis, objectives analysis and alternative analysis, the PDM was prepared by each group independently as shown in Table L-13. Finally, three PDMs were integrated into one PDM through workshop held at the third field survey as shown in Table L-14. As summarized in the integrated PDM, the project purpose identified by the participants of the workshop is that not only the safe and adequate drinking water for Metro Manila residents but also irrigation water for farmers in the basin are provided systematically. In order to achieve the project purpose, the following outputs were identified through project dialogue among the participants.

Outputs to achieve the Project Purpose on the Integrated PDM

Institutional Aspect	Water Resources Development Aspect	Irrigation Aspect
Master Plan on water supply for Metro Manila is formulated.	Water sources are developed adequately.	Adequate irrigation water is supplied to farmers.
Strong institutional framework is legally established.	Water delivery service is improved to higher level.	Proper irrigation water management is established.
Institutionalized authoritative body (APEX body), WRAP is established	Water quality is maintained well.	Source of water supply is improved.
Water-related institution (NWRB) is strengthened	Over-exploitation of groundwater ceases.	Operation and maintenance of irrigation system is improved.
Hydrological data collection network is established and improved.	Less saline water intrusion into aquifer.	Sediment inflow into reservoir is reduced .

Although the results of the PCM method applied to the master plan stage seems to be not applicable to the specific project, it will provide the strategic ideas to overcome the present issues. Each output tabulated above seems to be an eligible project. Based on the urgency, the importance and the availability of the resources such as budgets and manpower, those outputs will be scheduled and implemented in harmony with the growth

of the national economy.

The PDM finalized at this master plan is subjected to modified corresponding to the new findings and situations to achieve the project purpose set up at this stage.

L4 Monitoring System Using PDM

L4.1 Definition of Monitoring

The term of "monitoring" is common word for checking and/or regulating the performance of not only natural phenomena but also human activities. The word of monitoring is used in various stages and parts in development project to examine a degree of the achievement and/or the performance during the implementation stage of the project or program. In the Project Cycle Management (PCM) method, the term is defined as follows:

The monitoring is to examine the degree of project implementation and to reformulate the project contents as necessary. The project components such as "activities", "outputs" or "project purpose" are examined and checked for the achievement level, grasping the situation of "inputs" and "important assumptions" defined in PDM. The project components representing "activities" and "inputs" may be adjusted and/or modified in compliance with actual situation to achieve project purpose or overall goal.

L4.2 Purpose of Monitoring

The main purposes of the monitoring are to optimize the operation and management of ongoing projects and to ensure the accountability to the funding agencies and stakeholders and decision makers.

The monitoring is the important activity to grasp the level of progress on a regular basis or under some assumptions and to understand the problems preventing the progress of the project. The results of the monitoring results enable the application of appropriate countermeasures to cope with problems, or enable the decision-makers to reformulate or continue the project. The most important purpose of the monitoring is to feed back the results of monitoring activities into the projects so as to steer and optimize the project or program to achieve the project purpose.

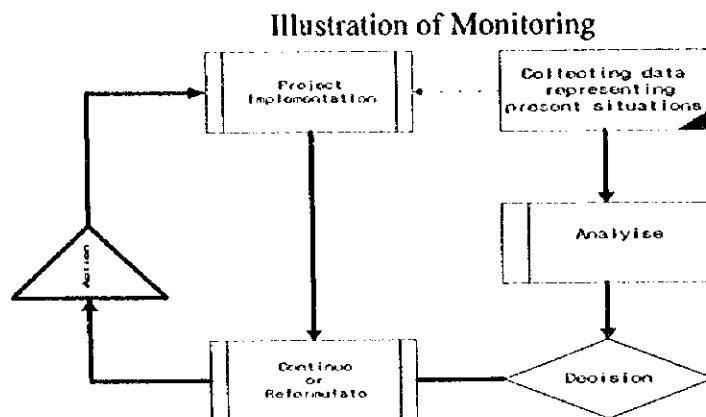

L4.3 Monitoring System

The monitoring requires constant review of the project progress to ensure efficient implementation of the project. The achievement level of "activities", "outputs" and "project purpose" of the PDM are reviewed, influencing factors and movement of important assumptions analyzed, and necessary actions taken to improve the situation. In technical assistance projects, an approval from the higher authority may be necessary for the reformulation of the project activities.

The projects may face unexpected problems during implementation. In such a case, it is necessary to analyze the situation in order to examine the countermeasures and to remove the impedance that is causing the problems. The original plan may be found to be inadequate, inappropriate or already unfeasible in case of changes of the situation.

In that case, partial change of the original plan may be required by readjusting the indicators and adding new activities to improve the project performance.

The systematic monitoring will be required for steering the project or program. The basic monitoring system is illustrated below:

L4.4 Monitoring Mechanism

The following items are subject to the monitoring on the PDM:

- i) Activities
- ii) Outputs
- iii) Project Purpose

If the monitoring indicates that "the project purpose is not achieved as planned", the PDM will be used to investigate its causes. In the matrix, the factors that influence the achievement level of the project purpose are "outputs" and "important assumptions". If the achievement level of "outputs" is lower than planned, it may be caused either by lower achievement of some "activities" or changes in the "important assumptions". Similarly, if there are problems in "activities", the cause might lie in the "inputs" or "preconditions". In some cases, the inappropriate project management may be the cause.

It is necessary to review the situation of the "inputs", "important assumptions" and "preconditions". The first step to establish monitoring system is to create a system to collect, examine and communicate the required information periodically within the project.

The monitoring system must be clarified with respect to the following items:

Items to be clarified	General requirements	Proposal for this project
What to monitor	Indicators of project purpose and outputs, expected results of activities and so on.	Economic growth Population growth Water consumption per capita Water quality
Responsibility	Responsible person, timing, frequency, methods, etc.	NWRB
To whom to report	Higher authority of funding agency	Presidential Task Force JICA
Who makes decisions	Project manager, steering committee	Steering Committee

Since a establishment of monitoring mechanism is a part of institutional building, it is important to design a system that is sustainable after the project completion.

The monitoring results should be shared amongst the project personnel and be reported to the higher authorities. To ensure efficient project implementation, it is important that a regular and smooth flow of information within the project organization be maintained in order to avoid any information gaps.

Whether monitoring results are submitted to the higher authorities as a part of a regular reporting or on an ad hoc monitoring depends on its urgency.

I.5 Observation and Recommendation

The observation and recommendation on the workshop are as follows:

- i) Since the participants were invited from the water-related agencies, the problems arising from the participants are mainly categorized as the views from the implementation agencies. Further discussion with water users groups, leaders and spokespersons, and access to and utilization of MWSS services, and payments for these services will be required for the assurance of the needs of the beneficiaries.
- ii) It will be required to assess the needs of MWSS in relation to other needs such as drainage, solid waste management, other public sanitation measures and public health education. Concerning the analysis on water supply group, both quantity and quality of MWSS services are pointed out, and the measures to attain the core objective are scrutinized carefully.
- iii) It is important to compare the present cost and quality of these services with the cost and quality to be provided under the project based on the results of master plan study.
- iv) Although the MWSS was changed in terms of the management procedure after its privatization, the present situation on the focal issues seems to be still remained in the field in terms of their motivation to change, knowledge and skills that may be required.
- v) It is recommended to prepare a socio-economic profile for each vulnerable group which will quantitatively describe and quantify the impact of the project on the affected group and to identify and assess options for compensating groups which are adversely affected. It is also recommended to conduct dialogues with the communities that may potentially be adversely affected.
- vi) It is recommended to assess existing management information system in terms of its adequacy to enable the executing agency to properly account to the community and other stakeholders for its financial operations and performance.
- vii) It is recommended to allocate the functions to NWRB so as to monitor the conditions in relation to the assumptions adopted in the Master Plan.

Table L-8 DETAILED TARGET GROUP ANALYSIS

	Constraints	Needs
MWSS	Low Water Supply	Develop New Sources
	Water Quality Problems	Improve Water Facilities (Pipes, etc.)
	Concession Agreement	Upgrade Water Facilities
	Water tariff	Service Area Expansion
	High Non-Revenue Voates	Improve Collection
	High investment for long payback period	Reservoir/Dam
	Illegal service connection	Water supply strategy
	No revenue water	Obtain Water Rights
	High Water Leakage rate	Control groundwater abstraction of private wells
	Old water supply facilities	
	Water Rights	
	Shortage facilities	

Table L-9 PARTICIPATION ANALYSIS OF INSTITUTIONAL ASPECTS (Water Resources Management) (1/3)

Detailed Participation analysis

Select the target GRP		Water Res. MGT Global				
Target group		Characteristics	Needs	Constraints		Potentials
Water Users	Industries *	Heavy water user	Efficient water management	Limited use of water	Polluter	Inefficient O and M
	Power NPC	Has different water consumption rates	Adequate infra	Absence of permanent monitoring sites	Drought	Degraded watersheds
	Agriculture NIA *	Non-consumptive user	Proper monitoring	Water use conflicts		Low quality materials
	Domestic Household	Seasonal user	Promotion of advocacy on (Proper) water management efficient	B dishonesty		Lack of qualified contractors
	Private water user	Different levels of income				Monopoly
		Lending agency for WDs				Recreation
						Flood Control
Regulatory Organization	LWA	LWA: regulates water rates of WDs	Regular supply of potable water	Lack of counterpart (labor, right of way) etc.		Promote equitable supply of water
	MWSS	Regulatory for MWSS concessionaires		Ability & willingness to pay	Lack of coordination among line agencies	
	Water resources relate agencies (LGU)	Regulates water rates & water rights	Clear policies & implementing rules/guidelines	Lack of community involvement in project, identification, implementation and monitoring		
	NWRB	Under bureaucratic rules & procedures	Strengthening of capabilities/capacities	Lack of proper monitoring and unresponsive to needs of users		
Pay/Institutional group (DENR)		Technocrats	Agency coordination			
		Provider of technical assistance	Centralized operations			
			System audits			
			Funding			
			Clear regulatory framework			
Water Suppliers Institutions	Water districts	Profit-oriented	Increase awareness of policies, laws, regulations	Bureaucratic red tape	Complacency/tendency	Well defined water resources management policies
		Service oriented	Standardized revenue collection rates/pricing	Availability of reliable hydrological data	Under man/lack manpower	Environmental protector
		Monopoly supplier of irrigation	Balanced ecology/ecosystem		Low income	
	MWSS concessionaires				Poor/absence of data network	
	Private water supply utilities			Lack of Water res. master plan	Overlapping of jurisdiction	International global gateway
	LGU					
	Agriculture			Unclear pricing policies		Revenue provider
	NIA			Inefficient Water supply system		Restore watershed
	Domestic Households					Employment
	LGU					Investments
DENR					Water conservation activities	
					Innovation	

**Table I-9 PARTICIPATION ANALYSIS OF INSTITUTIONAL ASPECTS
(Water Supply) (2/3)**

Beneficiaries	MWSI	
Affected groups	Deepwell Operators	Metro Manila Residents
Decision Makers	Industrial Commercial Users	DOH
Community Leaders	Manufacturer of Bottle Water	
Potential opponents	Golf Courses	
Implement Agencies		

Detailed Participation Analysis of Megapolice Second

Detailed Participation Analysis	Characteristics of the groups	Needs	Constraints	Potentials
M. Manila residents Low	Low income	Adequate water supply	Inadequate water supply	Capacity to pay
Middle	Middle income	Sufficient income	Inadequate income	Ability to fetch water
High	High income			
	They take a bath more often			
Industries	Profit-oriented	Economic incentives	Government regulations	Generation of income provision of goods/services
		Capital/workforce	Financial/	Business & technical skills
NGO	Active	Funding	Limited funding	Good organization
	Aggressive	Government support		Generates favor

**Table I-9 PARTICIPATION ANALYSIS OF INSTITUTIONAL ASPECTS
(Irrigation Water Demand) (3/3)**

Target Group	Characteristics	Needs	Constraints	Potential
Farmers Nationwide T.G	Hard working	more water for irrigation	Inadequate irrigation water supply	Hardworking
	Average income is low	Adequate irrigation facilities	Inadequate irrigation facilities	Food supply producers
	They own a parcel of land.	Farming equipment	Unirrigated farms	Higher production
		Technical assistance	Peace order situation	
		Information dissemination	Low income	
		Farmer trainings	Change in Development policies	
			Lock of technical know-how	
Irrigators Association	Maintain facilities concerning irrigation	Systematic collection of fees	Collection of fees (Water Charge)	Contributors of taxes
	Cater problems to the LGUs	Able and capable leaders/officials of the association	Poor management of Water supply	
	Collects irrigation service fee	Alternative water source	Inadequate irrigation water supply	source of financial assistance
		Regular meetings/dialogue		
Farmer's Cooperative	Source of financial assistance from a common fund	Systematic collection of loans	Insufficient fund	
			Uncollected loans

Table L-13 PROJECT DESIGN MATRIX (Water Resources Management) (1/3)

Narrative Summary	Verifiable Indicators	Means of verification	Important assumptions
Overall Goal No water crisis	Adequate supply of water coverage by 2025.	Survey record for COSMOS	
Project Purpose Strong Institutional Established framework	No conflict of functions. Adequate framework for integrated water resources management with capable regulatory and institutional system. Master plan report BILL (WRAP) Passed into law Hydrological data network	Feedback study Survey Record	
Outputs 1. Formulation of master plan 2. Presence of institutionalized Authoritative (APEX) body WRAP 3. Strengthened NWRB 4. Establish/Improved hydrological data collection network	Master Plan study conducted in 1999 Bill Passed in 1998 Increasing staff Network completed by 2000	Master Plan Report Report Report	No El Nino occurrence
Activities 1-1 Undertakes master plan study 2-1 Legislative addition 3. Monitoring	INPUTS		Preconditions All proposed recommendations are implemented New administration fully supports existing programmes

Table L-13 PROJECT DESIGN MATRIX (Irrigation Water Demand) (3/3)

Narrative Summary	Verifiable Indicators	Means of verification	Important assumptions
Overall Goal			
Farm production increased	Farmers income will increase by x% by 2025	Production record	No El Nino/El Nina
Increased farmers income			
Project Purpose			
Farmers are provided with irrigation water supply	100% of the area is provided of water by 2025	Production record	No El Nino/El Nina
	180% cropping intensity in the service area by 2025	Project record in NIA	Farmers have enough production inputs
	Yield ha is 7.5 metric tons/ha per cropping before year 2025	Yield record of National sources	Improved farming technology will be maintained
Outputs			
1. Adequate irrigation facilities provided	100 new projects and 50 is carried out rehabilitated projects by 2025	Inventory Reports	Construction money is secured
2. Improved water management	Sufficient water supply is made by 90%	Survey report	
3. Facilities restored			
4 Rehabilitated watershed			
Activities	INPUTS		Reforestation Program
			Preconditions

Table L-14 INTEGRATED PROJECT DESIGN MATRIX (1/2)

Narrative Summary		
Overall Goal		
Agriculture production is increased.		
Project Purpose		
Safe & adequate drinking water for Metro Manila residents and farmers in the basin is provided.		
Outputs		
INSTITUTIONAL ASPECT	Water Resources Development ASPECT	IRRIGATION ASPECT
Master Plan on water supply for M.M. is formulated.	Water sources are developed adequately.	Adequate irrigation water is supplied to farmers.
Water-related institution (NWRB) is strengthened.	Over-exploitation of ground water ceases.	Operation and maintenance of irrigation system is improved.
Strong institutional framework is legally established.	Water delivery service improved to high level.	Proper irrigation water management is established.
Hydrological data collection network is established and improved.	Less saline water intrusion into aquifer.	Sediment inflow into reservoir is reducing.
Institutionalized authoritative (APIEX) body, WRAP is established.	Water quality is maintained well.	Source of water supply is improved.
Activities		
Conduct master plan on the water resources development, including the Agon river basin to Metro Manila.	Establish information system on water delivery & distribution schedule.	Establish conservation plan for integrated water resource management.
Add legislative procedure.	Establish Hydrological gauging station.	Improve low farm efficiency and high conveyance loss.
Send WRAP bill into cabinet.	Monitor compliance, accumulate pertinent water data.	Improve deteriorated canals and related structures, drainage systems and service roads.
Attach the NWRB to the Office of the President.	Detailed geological investigation.	Train O&M field personnel as well as the Ins to raise capability.
Elevate the status of the Executive Director of the NWRB to the member of the Board.	Employ more technical staff.	Establish monitoring system on water resources management program.
Include NWRB in the membership of the ICC Technical Committee, particularly in deliberating on the water supply and water resources.	Carry out training NWRB staff on new technologies.	Train O&M field personnel as well as the Ins to raise capability.
Create a Legal Affairs unit in NWRB to handle litigation and conflict resolution on site and at the national office.	Establish program on management practice.	Train O&M field personnel as well as the Ins to raise capability.
The Director General should have the rank of a Cabinet Secretary.	Establish Field Offices and allocate the corresponding budgetary requirements.	Train O&M field personnel as well as the Ins to raise capability.
	Mobilize the community-based decisions on planning studies for the development and management of the water resources in their respective basins and conduct community based consultations in planning the resource utilization.	Establish monitoring system on water resources management program.
		Improve low farm efficiency and high conveyance loss.
		Improve deteriorated canals and related structures, drainage systems and service roads.
		Train O&M field personnel as well as the Ins to raise capability.
		Establish monitoring system on water resources management program.
		Train workshops experts.
		Improve low farm efficiency and high conveyance loss.
		Improve deteriorated canals and related structures, drainage systems and service roads.
		Train O&M field personnel as well as the Ins to raise capability.
		Establish conservation plan for integrated water resource management.
		Carry out information campaign.
		Carry out reforestation activities.
		Run uncontrolled forest fires.
		4. Implement sufficient preventive maintenance program.
		Stop shifting cultivation, illegal logging, unmanaged grazing.
		Implement effective forest protection schemes.
		Adopt various erosion control measures/practices by the DENR and PG.
		Implement modern treatment process on water pollution.
		Training of staff on new technologies.
		Establish strict implementation of anti-water piracy.
		Issue licenses to parties requiring permits for groundwater.
		Reduce the loss due to illegal pipe connecting and water tapping.

Table L-14 INTEGRATED PROJECT DESIGN MATRIX (2/2)

Verifiable indicators	Means of verification	Important assumptions
By 2025, 100% of service area is covered	STATISTICS by NSO/MWSS/MWSP/MWC	Socio-economic assumptions are not changed.
No Water Crisis occurs.	Monitoring record at MWSS	Consistent Government Support.
Water supply capacity to Manila reserved at year 2000, 05, 10, 15, 20, 25 is as follows: 42,50, 65, 70, 80, 90m ³ /sec.	Project Monitoring Report	Annual population growth is not exceeded by 1.6%.
Service Coverage by MWSS is at 80% in 2025.	Data from NSO/MWSS/MWSP/MWC	Water consumption per capita is estimated by MWSS at 258 lpcd.
Reduction of Water born diseases.	Survey Record	Some large-scale storage type projects for water resources region III are under construction or going to be implemented.
Number of NWRB staff increased by 50% in '99.	Survey Record	No El NINO
Low efficiencies in municipal and irrigation water supply are to be improved and the rate of loss in the municipal water supply shrinks to 20 to 30% in the year 2025.	Progress Annual Report DOH Survey data MWSS Complaint Center	Population in Metro Manila will not increase extraordinary. New administration supports existing policies and expand.
INPUTS		San Roque multi-purpose dam project
Master plan study team	Balog-Halog, Multi-Purpose Dam Project/San Roque Multi-Purpose Dam Project	The proposed BOT projects could complete the tasks on schedule.
Treatment facilities	Bainington Multi-Purpose Dam Project/Bayabas and Masin Dam Project	About 30% of groundwater for the industrial purpose could be reused recycling 3 times for the same purpose until 2025.
Pumps/pipelines/pumping stations	Luban Dam Project	Population owing to groundwater does not expand.
Trained manpower.	Multi-Purpose Dam Project	Construction of the Unmay-Angat Transbasin Project by MWSS is on schedule.
Dam engineer	Anmay-Padre Amayo	MWSS implements the Laguna Lake and Manila Water supply Project III (MWSP III).
	i) Kailwa-Kanon Transbasin Project ii) Kanon-Umlay Transbasin Project iii) Pampanga-Novalejos Water Supply Project iv) Kailwa-Cogeo Water Supply Project	Preconditions
		Local government and resident in reservoir area accept.
		No environmental impacts.
		Foundation of the Luban dam and its reservoir area are not causing the water leakage problem.
		The socio-economic framework follows NED Agrrowth scenarios.
		The unaccounted for water is estimated to be 50% on an average for municipal water supply.
the sectoral annual Gross Domestic Product (GDP) growth rate:	High	Low
Industrial sector	8.70%	5.00%
service sectors	7.20%	5.80%
agricultural sector	4.40%	1.80%
