Chapter 9 Financial Analysis

9.1 Presuppositions of the Financial Analysis

9.1.1 Scope of the Financial Analysis

1. The viability of the project can be analyzed based on the revenues and expenses related to the project. In this short-term development plan, there are four routes and eight terminals. The project is analyzed independently by route to judge the financial viability of each route.

2. Financial conditions of the project vary according to the manner in which funds are raised. Figure A9.1.1 presents a framework to calculate financial conditions according to the respective roles of the port management body, shipping management body and the government.

3. In this analysis, port management bodies manage and operate only terminals. Terminal facilities are constructed by government subsidies and foreign funds. The project cost includes construction costs of port facilities, operating costs of ports, reinvestment costs and so on. Revenues from port operations are calculated based on the respective tariffs

4. On other hand, it is assumed that shipping management bodies manage and operate the ferry service while the procurement of ships is executed with soft foreign loans or government grants. Procurement of the ships will be done by the government, which in turn will give them to shipping management bodies. The project cost includes procurement costs of ships under the case of loans, operation costs of shipping and so on. Revenues from shipping operations are calculated based on the respective tariffs.

5. A separate financial analysis of each port management body and each shipping body will be conducted. For port management bodies, the financial analysis will be conducted on both terminals of the four routes: Surabaya - Banjarmasin, Selayar - Labuhan Bajo, Manokwari - Biak, and Wahai - Babang. And the financial condition of the shipping management body is also analyzed by each route.

9.1.2 Financial Conditions of Port Management Bodies

(1) Project life

6. Considering the conditions of the long-term loans and the service life of the port facilities, the project life for the financial analysis is determined as 34 years from the beginning of the project including four years for detailed design and construction of the port facilities and 30 years of operation.

(2) Base year

7. In principle, all costs and revenues are indicated in prices of 1998, even though the price survey was conducted in 1997 before the economic crisis. But in present times, it is impossible to forecast the price variance exactly in Indonesia. Therefore neither price inflation nor increases in nominal wages are considered during the project life.

(3) Number of passengers, vehicles and cargo volume

8. The traffic volume (passengers, vehicles and cargo volume) on each route is forecast as shown in Table A8.3.1 (1), (2).

(4) Revenues

9. The terminal charges now applied to PT. ASDP ferry boats are very low when compared with the equivalent charges to the national shipping line PT. PELNI under the control of DGSC. The terminal charges for the ferry boats under the Project must be raised at least to the same level now applied to PT. PELNI. This is based upon a concept that the competitive condition for both shipping lines should be equalized; at the same time, the revenue should be maximized under present circumstances in order to reduce the amount of the subsidy. The charges are determined as follows:

Port dues : Rp.40/GRT
Berth dues: Rp.32/GRT

10. Terminal charges now applied to passengers, vehicles and other cargoes are kept at a very low level. Although this tariff is very low, this is the direct charge to the users and it is difficult to raise drastically without proper adjustment with other public charges. And a slight increase would only have a marginal effect on revenue level.

11. As with existing ferry terminals and vessels, one-hundred per-cent Government subsidy is necessary for loan repayment including interest for both terminals and vessels as well as the depreciation or reinvestment because these expenses cannot be covered by the revenues. Normal administration costs including personnel expenses and others except maintenance shall be covered by the revenue. However, all or a part of the maintenance cost must also be subsidized by the government in most cases.

(5) Fund raising

12. Necessary funds for the implementation of the project will be raised as follows:

1) Foreign funds

13. Seventy-five per cent of the construction cost or total foreign currency cost for the construction, whichever is higher, is subject to the soft foreign loan. Conditions of the loan for this project are assumed to be as follows:

Loan period:	30 years, including a grace period of 10 years
Interest rate:	2.2% per annum (soft loans from foreign government)
Repayment:	fixed amount repayment of principal

2) Domestic (government) funds

14. The construction cost except the above foreign funds will be supplied by government funds. The government funds are assumed to be in the form of a grant.

15. In addition to the above funds necessary for the initial construction, the government is assumed to supply necessary funds continuously for reinvestment, repayment and interest on soft loans and operating expenses during the project life. This situation is the same as that of other port operation offices at present.

(6) Expenditures

1) Investments

16. The initial construction costs of the project are estimated in Chapter 4 of Part 3 (the short-term development plan). Required construction costs for investments are shown in Table A9.1.2 and A9.1.3.

17. The depreciable facilities and equipment will be renewed based on their service lives (See Table A9.1.4).

18. The funds required for reinvestment will be financed by the government.

2) Maintenance costs

19. Annual maintenance costs (including repairs) are calculated as 1% of initial depreciable assets excluding the maintenance free assets.

3) Personnel and administration costs

20. Annual personnel costs are estimated based on the present number of workers.

21. Annual administration costs are assumed as 50% of the annual personnel costs. This ratio is based on the actual situation of ferry port financial conditions.

4) Depreciation expenses

22. Annual depreciation expenses of port facilities and equipment are calculated by the straight-line method based on their service lives.

9.1.3 Financial Conditions of Shipping Management Bodies

(1) Project life

23. Considering the conditions of the long-term loans and the service life of the boats, the project life for the financial analysis is determined as 26 years from the beginning of the project including one year for the boat purchase and 25 years of operation (the same as the service life of a new boat).

(2) Base year and number of passengers, vehicles and cargo volume

24. Financial conditions for the base year and the number (of passengers, vehicle and cargo volume) are the same as port management bodies of paragraph 7 and 8.

(3) Revenues

25. The boarding tariff rates of passengers, vehicles and cargo are assumed based upon the present tariff rates (route distances of over 50 miles, ferry boat sizes of over 500 GRT).

(4) Fund raising

26. For the procurement of ships, two alternative fund raising cases are considered.

1) Case of long-term loans

27. The funds for the boat purchase are assumed to be raised by the long-term loans locally.

Loan period:	20 years (no grace period)
Interest rate:	9.0% per annum (local loans)
Repayment:	fixed amount repayment of principal

2) Case of governmental grant

28. The ships are procured by the government and supplied to the operator free of charge. Shipping management body is not burdened with repayment of loan or interest.

(5) Expenditures

1) Procurement of ships in the case of long-term loans

29. In the event that long-term loans are used for financing, the procurement cost of ships must be determined. Current prices of new 1,000GRT and 5,000GRT ferry boats are confirmed. The service life of new boats is generally defined as 25 years.

30. An alternative case is to procure used ferry boats, which come at a 60% price reduction but have a remaining service life of only 15 years. When the service life of the ferry boat expires during the project life, it is assumed that the replacement cost of the used boat is borne by the shipping management body.

2) Shipping operation expenses

31. The shipping operation expenses including personnel, administration, maintenance (docking and repairs), insurance and so on are assumed based on the present PT. ASDP operation.

9.2 Evaluation

9.2.1 Evaluation of Financial Soundness of Port Management Bodies

32. At the present stage, the Indonesian government does not consider ferry terminal facilities managed by MOC to be profitable. Therefore, the method of evaluation is intended to show the operating income shortage or the required subsidies for this project.

33. As with existing ferry terminals and vessels, one-hundred percent Government subsidy is necessary for loan repayment including interest for both terminals and vessels as well as the depreciation or reinvestment because these expenses cannot be covered by the revenues. Normal administration costs including personnel expenses and others except maintenance shall be covered by the revenue. However, all or a part of the maintenance cost must also be subsidized by the government in most cases.

34. The port management body cannot cover operating costs (personnel, administration and maintenance costs) by only its own operating revenues,. As maintenance costs occupy the largest share of operating costs, the percentage of the maintenance costs which cannot be covered by operating revenues is calculated. The results of these calculations are shown in Table 9.2.1 to 9.2.4.

35. Furthermore, the results of calculations of the government subsidies to the repayments and interests for the initial investments and reinvestments are shown in Table A9.2.1 to A9.2.4.

36. Financial statements, which conbine unified the aforementioned subsidies for operating costs and for investment relations as well as depreciation of fixed assets are shown in Table A9.2.5 to A9.2.8.

37. The percentage of maintenance costs which cannot be covered by operating revenues is calculated as follows.

1) Surabaya - Banjarmasin route:

The port management body cannot cover approximately 80% of the maintenance costs by the operating revenues.

2) Selayar - Labuhan Bajo and Manokwari - Biak routes:

The port management body cannot cover approximately 100% of the maintenance costs by the operating revenues.

3) Wahai - Babang route:

The port management body cannot cover approximately 110% of maintenance costs by the operating revenues.

9.2.2 Evaluation of Financial Soundness of Shipping Management Bodies

38. The financial soundness of shipping management body is appraised by the following four cases:

Case 1: The procurement of new ferry boats with long-term loans
Case 2: The procurement of new ferry boats by government grant
Case 3: The procurement of used ferry boats with long-term loans
Case 4: The procurement of used ferry boats by government grant

39. Based on the above, the profit and loss statements for each route are shown from Table A 9.2.9 to A9.2.24.

40. Financial soundness of the shipping management body is evaluated as follows:

Cases 1 and 3: Financial soundness cannot be ensured on any of the four routes.
Cases 2 and 4: All four routes are viable.

41. The financial soundness assessment for each route is summarized in Table 9.2.5.

Table 9.2.5 The Assessment of the Financial Soundness to Each Route

Route	Case 1	Case 2	Case 3	Case 4
	New Boat	New Boat	Used Boat	Used Boat
	Loans	Grants	Loans	Grants
Surabaya-Banjarmasin	×	○	×	◎
Selayar-Labuhan Bajo	×	○	×	○
Manokwari-Biak	×	○	×	○
Wahai-Babang	×	○	×	○

Assessment
◎ : Very Viable
○ : Viable
△ : Repeat to Deficit and Profit
× : Not Ensure

9.3 *Sensitivity Analysis*

9.3.1 Sensitivity Analysis for Port Management Bodies

42. Sensitivity Analysis is conducted to examine the impact of unexpected future changes. For example, during the recent economic crisis in Indonesia, the rupiah has depreciated more than 1/5 against the US dollar in the last six months. Although the Indonesian market seems now to have recovered stability, it is very difficult to forecast the price variance exactly. Therefore the following two cases are envisaged:

a) Required subsidy to cover operating costs when revenue decreases by 50%.
b) Required subsidy to cover initial investments and reinvestments when construction cost increases by 40%.

43. The results of calculations of the above a) are shown in Table 9.3.1 to 9.3.4.

44. The results of calculations of the above b) are shown in Table A9.3.1 to A9.3.4.

45 In this case, the percentage of maintenance costs which cannot be covered by operating revenues is calculated as follows.

1) Surabaya - Banjarmasin route:
   The port management body cannot cover approximately 100% of the maintenance costs by the operating revenues.
2) Other three routes:
   The port management body cannot cover approximately 130% to 140% of maintenance costs by the operating revenues.

9.3.2 Sensitivity Analysis for Shipping Management Bodies

46. It is also very difficult to set up the sensitivity analysis for the shipping operation. Due to the great degree of uncertainty in terms of price variance, for the sensitivity analysis of shipping management bodies, procurement costs of ferry boat are assumed to increase by 80%. The same four cases described in the paragraph 38 are employed here as well.

47. Based on the above, the profit and loss statements for each route are shown from Table A 9.3.5 to A9.3.20.

48. Financial soundness based on the sensitivity analysis is evaluated as follows:

Cases 1 and 3: Financial soundness cannot be ensured on any of the four routes.
Cases 2 and 4: Surabaya-Banjarmasin route is viable but the other three routes are not.

49. The financial soundness assessment for each route is summarized in Table 9.3.5.

Table 9.3.5 The Assessment of the Financial Soundness to Each Route on Sensitivity Analysis

Route	Case 1 New Boat Loans	Case 2 New Boat Grants	Case 3 Used Boat Loans	Case 4 Used Boat Grants
Surabaya-Banjarmasin	×	○	×	○
Selayar-Labuhan Bajo	×	△	×	△
Manokwari-Biak	×	△	×	△
Wahai-Babang	×	×	×	△

Assessment
◎ : Very Viable
○ : Viable
△ : Repeat to Deficit and Profit
× : Not Ensure

9.4 Conclusions

(1) Port management body

50. The port management body cannot cover approximately 80% of the maintenance costs by the operating revenues in Surabaya - Banjarmasin route, approximately 100% of the maintenance costs by the operating revenues in Selayar-labuhan Bajo and Manokwari - Biak routes. In Wahai - Babang route, the port management body cannot cover approximately 110% of maintenance costs by the operating revenues.

51. At present, the terminal charges of port management bodies are at a comparatively low level according to the government policy. To eliminate the gap between the present tariff for ferry boats and PT. PELNI and improve the financial conditions in this short-term development plan, government should set the port tariffs at the same level as applied to PT. PELNI and each terminal should try to cover operating costs using operating revenues.

52. The operating cost including maintenance cost cannot be covered even if the terminal charge for ferry boat is raised to the same level applied by PT. PELNI. It would be necessary to raise drastically the present terminal tariffs of passengers, vehicles, cargoes and so on. In the case of Surabaya - Banjarmasin route where a high demand forecast is expected, the charge would have to be raised three times the present level for the port management body to cover all operating costs including maintenance costs by itself.

53. However, as eastern Indonesian routes are selected due to the importance of middle and short distance routes as a life line for citizens and the necessity of urgent ferry route development considering the Indonesian Government's eastern region development plan, it is acceptable for the routes to be subsidized by the government. All or a part of the maintenance cost must also be subsidized by the government or be covered by raising the tariff.

(2) Shipping management body

54. The project can be regarded as financially viable if government grant is used to procure the ferry boats. But it is difficult for three routes except Surabaya - Banjarmasin route to be financially viable if price variance such as in the recent economic crisis occurs again.

CONCLUSIONS AND RECOMMENDATIONS

Conclusions and Recommendations

Conclusions

- Long-term Ferry Development Plan -

(Relation between Present Economic Situation and Study)

1. In March 1997 when this Study began, the Indonesian economy was growing smoothly and the Second Twenty-five Years Development Plan estimated GRDP in 2019 at 2,036 billion Rupiah (1993 constant price). However, the problem of economic situation surfaced after currency crisis in December 1997 left the Indonesian economy in a state of confusion. It is very difficult to assess precisely the possible influence of the recent economic situation on this Study.

(Traffic Demand in Future)

2. The forecast (target year of 2019) was based on the Origin Destination data composed of twenty-seven provinces. The 1990 OD was modified so that the total volume of OD would be the same as the 1988 data.

3. Passenger volume was forecasted using the formula (Fratar Method) obtained from the relation between passenger and GRDP/capita excluding oil and gas. Cargo volume was forecasted using the formula obtained from the relation between cargo and GRDP including oil and gas.

4. The total passenger volume in Indonesia is forecasted as 409.8 million. This value is equal to 5.84 times the passenger volume in 1995 (70.23 million). On the other hand, the total cargo volume in Indonesia in 2019 is estimated at 1.094 billion tons. This value is equal to 6.94 times the cargo volume in 1995 (158 million tons).

(Future Nationwide Ferry Service Network)

5. The nationwide ferry service network in the target year should be developed according to the following requirements; 1) Distance of ferry routes is within 550NM (1,000km) or sailing time of 20 hours, 2) Passenger demands are more than 300,000 a year, 3) Both ports connected by the ferry route are not linked by road and 4) Ferry routes in Maluku and Irian Jaya should be given high priority. The following routes are selected as the nationwide ferry service routes network in 2019.

DKI (Jakarta) - West Kalimantan

East Java - South, Central and East Kalimantan

East Java - South Sulawesi
NTT & NTB - South Sulawesi
South Sulawesi - Maluku (through Southeast Sulawesi)
Maluku - Irian Jaya

6. In addition to the routes proposed as mentioned above, the following routes are also proposed from the viewpoint of completing the nationwide ferry service network after 2019.

Riau and Jambi - West Kalimantan
East Kalimantan - Central Sulawesi
East Timor - Maluku

(Selection of Ferry Routes for the Long-term Development Plan)

7. Under the condition that there be eight(8), nine(9) or ten(10) routes in the long-term development plan, the long distance routes and the middle and short distance routes are evaluated separately.

8. Concerning the long distance ferry routes, the four routes whose ferry passenger demands exceeded three hundred thousand (300,000) in 2019 and the Ambon - Sorong route whose ferry passenger demand was the largest in Maluku and Irian Jaya are proposed.

a) Surabaya - Banjarmasin
b) Jakarta - Pontianak
c) Surabaya – Ujung Pandang
d) Kendari - Ambon
e) Ambon - Sorong

9. With regard to the middle and short distance routes, the routes whose passenger demands are more than one hundred and fifty thousand (150,000) in 2019 are proposed, that is, one in Nusa Tenggara and the remaining three in Maluku and Irian Jaya.

a) Selayar - Labuhan Bajo
b) Manokwari - Biak
c) Wahai - Babang
d) Patani - Sorong

(Ferry Terminal Development Plan at Each Site)

10. The main items of evaluation for the terminal site selection are oceanographic and topographic conditions, accessibility from/to main city and road and land use

condition. The ferry development plan at the selected site is proposed according to the field survey based on the basic premises.

(Ferry Operation)

11. The Study Team set up three model types of ferry boat in the proposed routes, 1,000GRT, 3,000GRT and 5,000GRT according to the traffic demand in 2019. The principle dimensions and characteristics such as length over all, breadth and model speed were determined according to the existing ferry boats.

(Preliminary Design and Cost Estimates)

12. Conditions of design, standard dimensions of ferry boats, tidal level in each terminal site, subsoil conditions and elevation of bearing strata, and dimensions of ferry terminal and onshore facilities are assumed from the conditions applied to the offshore structures in the vicinity of the selected ferry terminal.

13. The basic facilities for ferry terminals such as mooring facilities, loading decks, trestle and causeway are considered in preliminary plans. The construction cost is estimated on the basis of the quantity of construction works for the planned facilities and the basic cost of the works including utilities.

- Feasibility Study -

(Selection of Ferry Routes for the Feasibility Study)

14. Five long distance and four middle and short distance routes are evaluated separately for selecting ferry routes for the short-term development plan. The proposed routes for the short-term development plan are as follows.

Long distance route:	Surabaya - Banjarmasin
Middle and short distance route:	Selayar - Labuhan Bajo
	Manokwari - Biak
	Wahai - Babang

(Natural Conditions)

15. The topographic and hydrographic survey was carried out for each terminal site (except Biak - Mokmer site which was surveyed in the previous study) from January to March 1998. The results of observations verify that maneuverability of vessels at all the terminal sites are not adversely affected by the current. In order to verify the subsoil conditions of proposed terminal sites, one boring for the onshore area and another boring for the offshore facility area were executed at each terminal site.

(Preliminary Design and Cost Estimate)

16. A large volume of reclamation works is required to secure the onshore area of the ferry terminals; Surabaya ferry terminal requires 95,000m^3, 45,000m^3 for Banjarmasin, 55,000m^3 for Selayar(Patunbukan), 25,500m^3 for Wahai, 7,500m^3 for Babang, 36,000m^3 for Biak(Mokmer) and 19,000m^3 for Manokwari.

17. Dredging of 99,200m3 is required for the turning basin and access channel area to obtain the designed depth of -4.5m for the Selayar (Patumbukan) ferry terminal.

18. The mooring facilities of the Surabaya ferry terminal which are constructed some 2,800m away from the coastal line are designed by steel pipe pile foundation to minimize the impacts by currents flows. The access way to connect the onshore facilities and offshore detached platform is designed with rock mound cause way of 800m in length from the land and thereafter 20m span each of pre-stress concrete beam type trestle for the remaining 2,000m. Required dredging volume is estimated at about 230,000m^3.

19. Unit price of each element was determined on the basis of the regional unit prices collected in the field survey in February - March 1998, which reflects to some extent price changes due to the currency crisis.

20. Price of imported products are based on the CIF Jakarta price and adjusted considering import tax and some mobilization fee to the construction site. The basic costs of imported products are converted to Indonesian Rupiah for the estimation of project cost based on the exchange rate of foreign currency as 1US$ = Rp.9,600 = ¥128.

21. The total construction cost for development of the proposed terminal site for the feasibility study is as follows,

(Unit in Million Rupiah)

Route	Construction Cost
Surabaya – Banjarmasin	472,974
Selayar - Labuhan Bajo	44,561
Manokwari – Biak	41,946
Wahai - Babang	45,058

22. The period of survey, engineering study and tender procedure is estimated to be about two years. The construction period of each terminal is estimated to be about two years except for Surabaya - Banjarmasin route which requires a period of two and half

years.

(Environmental Impact Assessment)

23. After conducting the Environmental Impact Assessment, no significant effect on the environmental aspect is expected. Therefore, the implementation of this project includes no difficulty.

(Economic Analysis)

24. The economic benefits are dirided from the implementation of the development of ferry terminals and ferry operation plans including the introduction of the proposed ferry boats. In this economic analysis, reduction of travel time costs, cargo handling costs and saving of transportation costs for the ferry users are treated as the quantified economic benefits.

25. The following table shows a summary of the economic analysis results (EIRR) for each route.

Route	EIRR	
	Pattern A (Procurement new ferry boats)	Pattern B (Procurement used ferry boats)
Surabaya-Banjarmasin	9.2%	14.3%
Selayar-Labuhan Bajo	11.7%	17.1%
Manokwari-Biak	7.9%	12.1%
Wahai-Babang	3.5%	7.8%

26. In the case of used boats (Pattern B) these results indicate that implementation of the three projects i.e. Surabaya-Banjarmasin, Selayar-Labuhan Bajo and Manokwari-Biak is economically feasible.

27. The economic analysis result of Wahai-Babang route in term of quantified benefits is unfavorable. However, this route will be expected to play an important role as a direct trunk line connecting "Ambon economic influence area" with "Ternate economic influence area" in the future.

28. Also, with the implementation of new ferry service, additional traffic demand generation by increase of punctuality, regularity and comfort in ferry operation, promotion of activation of passenger and commodities movement among regions, promotion of social/cultural communication among regions, promotion of educational

opportunities for people in the region and so on, will be expected. As a result, realization of "promotion of regional economic and industrial activity" and "improvement of regional economic disparity" will be expected. Taking the enormous unquantified effects for the related regions into consideration, we judge that these projects should be implemented to stimulate regional development.

29. Since the Indonesian economic situation is still unstable and the macroscopic economic prospects remain unclear, it is very difficult to assess precisely the possible influences of the recent economic situation on these projects. Therefore, a sensitivity analysis with broader range is carried out.

30. In the low case scenario, the four projects can not be evaluated highly. This is largely due to the decreased traffic demand. However, when the Indonesian economy recovers to the extent that the forecasted traffic demand can be ensured, the implementation of these projects will be feasible.

(Financial Analysis)

31. The port management bodies and the shipping management bodies are treated separately in the financial analysis. The port management body cannot cover operating costs (personnel, administration and maintenance costs) by only its own operating revenues. As maintenance costs occupy the largest share of operating costs, the percentage of the maintenance costs which cannot be covered by operating revenues is calculated.

1) Surabaya - Banjarmasin route: The port management body cannot cover about 80% of the maintenance costs by the operating revenues.
2) Selayar - labuhan rajo and Manokwari - Biak routes: The port management body cannot cover about 100% of the maintenance costs by the operating revenues.
3) Wahai - Babang route: The port management body cannot cover about 110% of maintenance costs by the operating revenues.

32. The financial soundness of shipping management body on any of the four routes can not be ensured if new ferry boats are procured with long-term loans. With used ferry boats by government grant, all four routes are viable.

33. Judging from the above analysis, the project can be regarded as financially viable if government grant is used to procure the ferryboats. But it is difficult for three

routes except Surabaya - Banjarmasin route to be financially viable if price variance such as in the recent economic crisis occurs again.

Recommendations

(Relation between Present Economic Situation and Study)

34. Given the current state of economic confusion, it is unlikely that development of all the four routes should be made immediately from 1999. Considering the possible influence of the recent economic situation, the target year of the short-term development plan would inevitably be delayed for few years. Nevertheless, routes which are expected to generate a relatively larger demand such as Surabaya - Banjarmasin and Selayar - Labuhan Bajo may be developed at earlier time.

(Ferry Terminal Development Plan)

35. In the implementation of the Surabaya terminal, it is necessary for the Indonesian government to coordinate with PELINDO III 's passenger terminal development plan including joint management of the trestle. For the Banjarmasin terminal, the Indonesian government must confirm the future port development plan and consider the land acquisition for the ferry terminal.

(Preliminary Design)

36. At the Surabaya ferry terminal, the access way is constructed by using the 20 m span of the pre-stress concrete beam type for some 2,000m. However, the sub soil conditions under the sea bed around this area are considered undulated and complicated. It is therefore recommended to conduct more detailed soil of the proposed ferry terminal areas to facilitate detailed design of such facilities.

(Environmental Monitoring and Management)

37. To effectiveness of environmental monitoring, it is advisable to have an responsible institution for environmental monitoring and management. This institution will coordinate for the implementation of the environmental monitoring and management.

(Ferry Operation Planning)

38. The specification of all vessels including carrying capacity of ferry boat is confirmed by DGSC. However, the actual loading capacity of boats for ferry service is specified by DGLT. Therefore the ferry boat size and capacity on each route should be precisely determined at the operational stage with the authorization of the competent

authorities according to the actual boats which will be introduced.

39. To encourage constant demand for ferry transportation, it is necessary to promote reliable, convenient, comfortable and safe operation. This requires adjusting the schedule during docking maintenance with the estimated demand fluctuation. Also, to operate efficiently with a small number of boats, it is necessary to increase cruising speed, decrease berthing/anchoring time and introduce nighttime operation.

40. Service should be reliable and punctual, with fewer cancellations and less short shipment (left-off). This entails proper frequency, fixed time arrival and departure, easy access to and from the ferry terminals, and so on. In addition, better accommodations including comfortable waiting lounge in passenger terminal and cabin with sufficient number of chairs, concessions on boats, and so on are needed.

41. The stability and strength of ships is the most important element of ship safety. Ship inspection is vital for the safety for ships. The Indonesian government has ratified the international conventions according to the classification of vessels as well as other conventions regarding ship safety. Therefore the inspection of ferry boats at shipyards should be performed in the same manner as other vessels.

42. In addition, life saving facilities, fire prevention and fire fighting equipment should be securely rigged on ferry boats in conformity to the regulations including life jackets and life boats corresponding to the maximum number of passengers.

43. Navigational aids which indicate the location near the entrance of ports (except Surabaya, Banjarmasin and Labhan Bajo) and en route navigational aids should be installed as the need arises.

44. For safe and smooth loading on and off of passengers and vehicles, a movable bridge and an access bridge for passengers to load on and off separately from vehicles at Surabaya and Banjarmasin, a stem/stern ramp type boat for smooth loading on and off without reversing and a lighting system on berth for nighttime operation should be introduced.

45. Concerning the safety ferry operation, it is recommendable to take possible certain steps as soon as possible such as the comprehensive operation supervision, the modernization of facilities concerned and the training of a capable task force including crews to ensure the highest degree of safety and create a promising ferry service.

46. Maintenance of ferry boats should be regularly conducted to keep boats in operational condition, to secure the safety of passengers and vehicles and to prevent damage and trouble. Operators of ferry boats should set up an annual maintenance scheme beforehand to avoid the stoppage of operation in high demand season, especially for the docking maintenance, which ordinarily takes at least one month.

(Ferry Management System)

47. As far as the subsidy system continues, it is recommended that the Government should not only require reports from PT. ASDP but establish a strict investigation system into the financial and accounting system of its branch offices.

48. As for the shipping tariff system in the future, it is recommended that a special tariff be prepared and a season commuter pass be given to people who use a specific route as a lifeline. In the future, shipping tariff, which is determined by the Government at this stage should be freely set up by ferry operating companies according to their own management policy

49. When a ferry network service covers a number of islands in the future, the system may require a computer network on a real-time basis to ensure that up-to-date information is always available.

50. In order for the terminal management to be profitable, efficient placement of staff should be conducted, since the personnel cost at most public terminals forms more than 40% of the annual expense.

51. Aiming at enhancement of profitability, it is necessary to set up a proper tariff of each route and terminal considering operational expense, volume of transportation demand and so on instead of uniform tariff setting. Also, for terminal management, a new system to generate more revenues such as collection of anchoring fee should be introduced.

52. In order to secure efficient management, PT. ASDP should pay attention to its financial soundness as with any other commercial business. It is especially important to let administrative staff obtain a sense of business management as well as to rationalize the staff and organization. This includes elimination of overlapping duties and allocation of multiple tasks to each staff member.

53. The current port and ferry terminal management system are rather complex.

Passenger only ships are being operated as a ferry service which is not different at all from PT. PELNI shipping service. Similar finds of ports and terminals are established and managed by several different bodies such as MOC/KANWIL, PT. ASDP, PT. PELNI, and PELINDO. Considering such a complex situation, it is advisable to review and simplify (or unify) the present administration system and installations in order to develop an effective and financially sound ferry transportation system in Indonesia.

(Financial Analysis)

54. At present, the terminal charges of port management bodies are at a comparatively low level according to the government policy. To eliminate the gap between the present tariff for ferry boats and PT. PELNI and improve the financial conditions in this short-term development plan, government should set the port tariffs at the same level as applied to PT. PELNI and each terminal should try to cover operating costs using operating revenues.

55. The operating cost including maintenance cost cannot be covered even if the terminal charge for ferry boat is raised to the same level applied by PT. PELNI. It would be necessary to raise drastically the present terminal tariffs of passengers, vehicles, cargoes and so on. In the case of Surabaya - Banjarmasin route where a high demand forecast is expected, the charge would have to be raised three times the present level for the port management body to cover all operating costs including maintenance costs by itself.

56. However, as eastern Indonesian routes are selected due to the importance of middle and short distance routes as a life line for citizens and the necessity of urgent ferry route development considering the Indonesian Government's eastern region development plan, it is acceptable for the routes to be subsidized by the government. All or a part of the maintenance cost must also be subsidized by the government or be covered by raising the tariff.

APPENDIX

A1.3.1 Evaluation Ranks

1. Long Distant Routes

1) Demand Potential (2004)

	Passenger (1,000,000 Person * NM)	Vehicle (1,000,000 Cars *NM)	Cargo (1,000,000 Ton * NM)
◎ :	100 ～	30 ～	40 ～
○ :	50 ～ 100	20 ～ 30	20 ～ 40
△ :	Less than 50	Less than 20	Less than 20

2) Demand Potential (2019)

	Passenger (1,000,000 Person * NM)	Vehicle (1,000,000 Cars *NM)	Cargo (1,000,000 Ton * NM)
◎ :	400 ～	100 ～	100 ～
○ :	200 ～ 400	50 ～ 100	50 ～ 100
△ :	Less than 200	Less than 50	Less than 50

3) Ratio of Terminal

	Passenger (1,000Rp. / Person)	Vehicle (1,000Rp. / Car)	Cargo (1,000Rp. / Ton)
◎ :	Less than 100	Less than 400	Less than 300
○ :	100 ～ 150	400 ～ 500	300 ～ 400
△ :	150 ～	500 ～	400 ～

4) Ratio of Ferry Boats (2004)

	Passenger (1,000Rp. / Person)	Vehicle (1,000Rp. / Car)	Cargo (1,000Rp. / Ton)
◎ :	Less than 40	Less than 150	Less than 150
○ :	40 ～ 50	150 ～ 200	150 ～ 200
△ :	50 ～	200 ～	200 ～

5) Ratio of Ferry Boats (2019)

	Passenger (1,000Rp. / Person)	Vehicle (1,000Rp. / Car)	Cargo (1,000Rp. / Ton)
◎ :	Less than 40	Less than 150	Less than 100
○ :	40 ～ 50	150 ～ 200	100 ～ 150
△ :	50 ～	200 ～	150 ～

2. Middle and Short Distant Routes

1) Demand Potential (2004)

	Passenger (1,000,000 Person * NM)	Vehicle (1,000,000 Cars *NM)	Cargo (1,000,000 Ton * NM)
◎ :	10 ～	2.5 ～	2.0 ～
○ :	8.0 ～ 10	2.0 ～ 2.5	1.5 ～ 2.0
△ :	Less than 8.0	Less than 2.0	Less than 1.5

2) Demand Potential (2019)

	Passenger (1,000,000 Person * NM)	Vehicle (1,000,000 Cars *NM)	Cargo (1,000,000 Ton * NM)
◎ :	40 ～	9 ～	12 ～
○ :	30 ～ 40	8 ～ 9	10 ～ 12
△ :	Less than 30	Less than 8	Less than 10

3) Ratio of Terminal

	Passenger (1,000Rp. / Person)	Vehicle (1,000Rp. / Car)	Cargo (1,000Rp. / Ton)
◎ :	Less than 100	Less than 400	Less than 300
○ :	100 ～ 150	400 ～ 500	300 ～ 400
△ :	150 ～	500 ～	400 ～

4) Ratio of Ferry Boats (2004)

	Passenger (1,000Rp. / Person)	Vehicle (1,000Rp. / Car)	Cargo (1,000Rp. / Ton)
◎ :	Less than 40	Less than 150	Less than 150
○ :	40 ～ 50	150 ～ 200	150 ～ 200
△ :	50 ～	200 ～	200 ～

5) Ratio of Ferry Boats (2019)

	Passenger (1,000Rp. / Person)	Vehicle (1,000Rp. / Car)	Cargo (1,000Rp. / Ton)
◎ :	Less than 15	Less than 60	Less than 50
○ :	15 ～ 20	60 ～ 70	50 ～ 60
△ :	20 ～	70 ～	60 ～
