(3) Design Waste Volume

1) Unit Generation Rate and Bulk Density

Results of the field survey on unit generation rate for solid waste in Yatta (municipality/village no. 117) and Bait Fajar (municipality/village no. 50) are indicated in Table 2.3.9 (see Appendix for detailed data). Yatta is a medium sized city of 30,000, while Bait Fajar is a small city with population less than several thousand.

Table 2.3.9 Results of Unit Generation Rate Survey

	Yatta city	Bait Fajar city	Average
Unit generation rate (kg/capita/day)	0.74	0.43	0.58
Bulk density (ton/ m')	0.34	0.24	0.29

Naturally, the unit generation rate will vary depending on factors of community size, population, level of economic activity, etc. Survey results for Ramallah, one of the major cities in the West Bank, indicate a unit generation rate of 0.85 kg/capita/day which substantiates the appropriateness of the above survey findings.

With consideration to the range of municipality/village size, population, level of economic activity, etc. for the Project area, the average value (0.58 kg/capita/day) for the computational results in the case of Yatta and Bait Fajar is the unit generation rate generally applied under the Project for collection equipment design. In the case of relatively large municipalities/villages (medium sized cities with populations over 15,000 as of 1997) as well as those which exhibit significant commercial activity, the computed value (0.74 kg/capita/day) for Yatta is applied. These municipalities/villages are as indicated in Table 2.3.10.

Table 2.3.10 Municipalities/villages Subject to Application of a Unit Generation Rate of 0.74kg/capita/day

Municipality/village name 1997 population Justification Group no. ~ municipality /village no. 1-1 Baka Al-Shreqeah 3,695 Robust commercial activity Robust commercial activity 1,868 1-2 Nazlet Essa 2,900 9-23 Sabastea Tourist area 44-103 Beir Nabala 4,510 Robust commercial activity Large population; robust commercial 45-104 Al-Ram 25,164 activity 53-116 Al-Dahreyah 20,560 Large population 54-117 30,870 Large population Yatta 55-118 Doura 15,476 Large population; robust commercial activity 64-129 Area hub; robust commercial activity Toubas 1,756 1,719 Robust commercial activity 78-154 Al-Jalameh

On the other hand, the disposal sites under the Project are regional sites servicing population centers ranging from large municipalities/villages to those of small size with populations of only several hundred. Given the facts that the unit generation rate for the Ramallah city area (a large municipality/village) is 0.85 kg/capita/day, that the results of team survey for Yatta (using for medium-size municipality/village and for those with significant commercial activity) indicates a unit generation rate of 0.74 kg/person/day, and that for other small municipalities/villages rate is applied 0.58 kg/person/day for estimation of solid waste amount, therefore, the average value of 0.7 kg/capita/day is applied in calculating the waste volume at the regional disposal sites.

Based on the above, unit generation rates adopted for the Project are as indicated in Table 2.3.11.

Table 2.3.11 Unit Generation Rates for Solid Waste Applied under the Project

	Unit generation rate (kg/capita/day)	Remarks
Collection equipment design - 1	0.58	Applied to target municipalities/villages except for the 10 indicated in Table 2.3.10
Collection equipment design - 2	0.74	Applied to the 10 municipalities/villages indicated in Table 2.3.10
Disposal equipment design	0.70	Applied to calculation of waste amount received at the target disposal sites

With regard to bulk density, the average value of Yatta and Bait Fajar, 0.29 tons/ m' will be applied to equipment design under the Project.

2) Waste Volume Forecast

Generated waste volume in 2004 for the Project area is estimated at 490 tons/day as shown in Table 2.3.12, based on the previously discussed population forecast and the above unit generation rates. Computation results for waste volume at the target regional disposal sites are shown in Table 2.3.13.

Table 2.3.13 Waste Amount to be received at Target Disposal Sites in 2004

Disposal site	Design target population (service population) (persons)	Unit generation rate (kg/capita/day)	Waste amount (tons/day)
Jenin	277,563	0.7	194.3
Toubas	49,086	0.7	34.4
Tulkarem	57,500	0.7	40.3
Jericho	43,750	0.7	30.6
Ramallah	365,145	0.7	255.6
Total	793,044		555.2

2-3-2-2 Collection Equipment Plan

(1) Design Waste Volume

As discussed earlier, 160 municipalities/villages are targeted under the Project, comprising 68 groups. The waste collection equipment plan encompasses the necessary equipment required to respond to the waste volume on a group-wise basis. Generated waste volume in the Project target year of 2004 is indicated in Table 2.3.12; and as discussed in the section on design approach, the design waste volume is the same as the generated waste. The total waste volume of municipalities/villages targeted in the Project is 490.3 tons per day.

(2) Concept for Existing Equipment

At present, the commonly utilized tractors have low transport capability, resulting in the open dumping of waste at sites on the periphery of the target municipalities/villages. It is thus necessary that these be replaced with vehicles capable of negotiating the medium to long distances to the regional disposal sites. Also, the 5 m container system used in a portion of the cities in the area is effective where generated waste volume is large; however, there are few places where this system would be appropriate for each target municipalities/villages. Furthermore, this equipment is old. Given these factors, a shift will be made under the Project to the compactor truck - container system being pursued by the PA as a standard for the area. Among the existing compactor trucks on hand, it will be necessary to replace those which have been in use beyond the normal vehicle utility life of 8 years. Accordingly, only existing vehicles fabricated after 1992 will be considered as effectively usable under the Project. Also, only existing containers which are 1360 mm width and comparable to the standard used by the PA will be subject to incorporation into the Project.

Table 2.3.14 indicates existing equipment to be utilized under the Project.

Table 2.3.14 Existing Equipment to be Utilized under the Project

Equipment	Gгоир по.	Municipality/village	Nos. on hand	Remarks
I. Compactor trucks:	45	104 Al-Ram	1	12 m', 1995
II. Containers:				
	23	49 Tekoa	80	1.1 m
	42	98 Bait Doquo	19	1.1 m
	44	103 Bier Nabala	60	1.1 m ²
	45	104 Al-Ram	75	1.1 m ²
	48	109 Al-Jeeb	45	1.1 m
	55	118 Doura	100	1.1 m
	64	129 Toubas	40	1.1 m

(3) Vehicle Types Studied

The PA is pursuing the establishment of a waste collection system adopting the 12 m compactor truck in tandem with the 1.1 m container as the standard system. However, in consideration of the fact the many of the target municipalities/villages have small populations which can be effectively serviced by a single collection vehicle, and that roads are sometimes narrow to the point where waste collection by a small vehicle would be more appropriate, the three types of compactor truck indicated in Table 2.3.15 were subject to study. The small type dump truck was eliminated from consideration since its transport and waste loading efficiencies are less than that of the small compactor truck, as well as the fact that the PA side strongly desires the compactor truck.

Table 2.3.15 Appropriateness of Studied Vehicle Types

Vehicle type studied	Advantages	Disadvantages
Large compactor truck 12 m (used with 1.1 m container)	Transport efficiency is high. Loading from 1.1 m container is possible.	Roads in the Project area are often narrow, placing a constraint on use.
Medium compactor truck 8 m' (used with 1.1 m' container)	Appropriate to waste collection conditions in the Project area. Loading from 1.1 m container is possible.	Although transport efficiency is superior to the small compactor truck, it is inferior in terms of suitability throughout the entire area.
Small compactor truck 5 m ² (used with 0.6 m ² container)	Most suitable to waste collection conditions throughout the Project area.	Low transport efficiency in the case of long distances. Only loading from 0.6 m ² container possible.

Currently, many municipalities/villages use tractors for waste collection, capable of operating on narrow roads. In order to provide service on a par with the present, it is better that collection be performed by small vehicles. Use of large vehicles would preclude the ability to cover all roads presently serviced by tractors. However, the fact that appropriateness of equipment to the collection area is not the sole criterion must also be considered. Also it is noted that many of the municipalities/villages will require hauling of collected waste for long distances over rugged terrain. Since the target municipalities/villages are small, in many cases roads in these areas are narrow, and many municipalities/villages need distant transportation the approach under the Project will be to establish a waste collection system utilizing medium and/or small collection vehicles. Because the use of large vehicles in municipalities/villages of a size warranting waste collection by only a single vehicle would limit the roads along which waste collection could be performed, adoption of the large type vehicle will be reserved specifically for those cases were long distance hauling is required.

(4) Calculation of Collection Capacity

a) Load Volume per Single Trip

As discussed earlier, the unit volume weight of collected waste is 0.29 tons/ m². Unit volume weight after compaction by the compactor truck is determined at 0.6 tons/ m² (compaction rate 1:2), with loading rate set at 90%. Vehicle transport volume per single trip is as follows:

Large (12 m') compactor truck: $12 \text{ m'} \times 0.6 \times 0.9 = 6.5 \text{ tons/trip}$ Medium (8 m') compactor truck: $8 \text{ m'} \times 0.6 \times 0.9 = 4.3 \text{ tons/trip}$ Small (5 m') compactor truck: $5 \text{ m'} \times 0.6 \times 0.9 = 2.7 \text{ tons/trip}$

b) Container Capacity

Assuming appropriate container placement and loading rate to be set at 80% taking into consideration generated waste volume fluctuation by day and season, container capacity is determined as follows:

1.1 m' container (net: 0.9 m'): $0.9 \text{ m'} \times 0.29 \text{ tons/m'} \times 0.8 = 0.21 \text{ tons/unit}$ 0.6 m' container (net: 0.5 m'): $0.5 \text{ m'} \times 0.29 \text{ tons/m'} \times 0.8 = 0.12 \text{ tons/unit}$

Proper distribution of containers considering waste amount to be generated is important to use container efficiently.

c) Cycle Time per Trip

The cycle time per single collection vehicle is calculated as follows. Respective times are determined on the basis of time and motion study results.

Cm = loading time (L) + moving time (M) + travel time (T₁) + unloading time (U) + travel time (T₂)

Where:

Cm : cycle time per trip

L+M: loading time and moving time (3 min. / container unit)

 T_1, T_2 : travel time (V = 30 km/hour) U: unloading time (U = 10 min)

The 12 m' compactor must load 30~35 numbers of 1.1 m' container in a single trip. In the case of the 8 m' compactor, the required number of 1.1 m' container to be loaded in a single trip is 20~25. The 5 m' compactor will load around 25 numbers of 0.6 m' container in a single trip. Accordingly, loading and moving times are as follows:

12 m² compactor truck: 105 min. 8 m² compactor truck: 75 min. 5 m² compactor truck: 75 min. Hauling distance measured off maps from each municipality/village group to the regional disposal site, and calculation of cycle time per trip using the above formula are given in Table 2.3.16.

d) Vehicle Collection Capacity

Applying the cycle times calculated in the previous section, possible number of trips and collection/transport capacity per day for each type of vehicle are computed as follows.

Also as discussed earlier, operational rate with respect to total days in a year is 79%. Actual work time per day is 7 hours.

Possible trips per day:

7 hours × 60 minutes/Cm

Collection capacity per day:

load volume per trip × no. of possible trips per

day × operational rate (79%)

Based on the above conditions, standard collection capacity per vehicle is as indicated in Table 2.3.17.

(5) Selection of Collection Vehicles

With consideration to the fact that almost all of the target municipalities/villages and its common service groups are small in the waste volume they produce, and for the most groups can be serviced by a single collection vehicle, the collection equipment for the Project is selected according to the criteria below. A flow chart for the selection procedure is given in Figure 2.3.2.

a. Municipalities/villages with Large Waste Volume

Al-Ram (group no. 45), Al-Dahreyah (group no. 53) and Yatta (group no. 54) generate large volume of waste, and will require three or more units of medium sized compactor truck (8m³). In order to negotiate narrow roads as well as prevent the number of collection vehicles from being excessive, a combination of medium (8m³) and large (12m³) vehicles will be adopted in the case of these municipalities. The necessary numbers of vehicles for the three municipalities are indicated in Table 2.3-18. Al-Ram already has one unit of 12 m² compactor truck on hand, and the number of 12 m² compactor truck to be procured under the Project will accordingly be the figure in the table minus one.

Table 2.3.18 Vehicle Selection for Municipalities/Villages Requiring 3 or More Medium Compactor Trucks (8m²)

Group		micipality/ Village	Dis- tance	Waste volume	Cap	acity	Ve	hicle	Total capacity	Existing
no.		•	1		8 m	12 m	8 m	12 m	Ī	vehicle

53	116	Al- Dahreyah	28	22.43	7.3	9.5	2	1	24.1	:
54	117	Yatta	10	33.67	10.2	13.9	2	<u> </u>	34.3	

b. Municipalities/villages with 1.1 m' Containers On Hand

In the case of municipalities/villages with 1.1 m containers on hand, 8 m³ or 12 m³ compactor trucks will be adopted to effectively use this existing equipment. Municipalities/villages already in possession of 1.1 m² container equipment are the 6 indicated in Table 2.3.19. Given waste volume and capacity of compactor truck, Doura will require 2 units of 8 m³ compactor truck. Also, Toubas will be supplied with a single 12 m³ compactor truck as this will be sufficient to service the municipality. The remaining 4 municipalities will be provided with a single 8 m³ compactor truck each.

64	129	Toubas	5	12.82	10.2	2		111

c. Other Municipalities/villages with No Container on Hand, and Less than 15 km Hauling Distance

Among the municipalities/villages without container on hand, there are 16 groups where distance to the regional disposal site is under 15 km (excepting the previously discussed Yatta). Since these municipalities/villages do not require long distance hauling of waste, the small compactor truck (5 m³) suited to narrow roads in the communities would be appropriate. Of the said 16 groups, 13 can be serviced by a single small compactor truck (5 m³). Groups which cannot be so serviced are the three indicated in Table 2.3-20. Group no.46/47 (Al-Sawahreh Al-Sharqeah, etc), group no. 50 (Bani Noaim) and group no. 60 (Tammoun, etc) will be supplied with 1 unit of medium compactor truck (8 m³) as shown in Table 2.3.20.

Table 2.3.20 Vehicle Selection for Municipalities/villages with Distance to Disposal Site Less than 15 km, and which Require Two or

 d. Municipalities/villages with No Container on Hand, and 15 km or More Hauling Distance

Among the municipalities/villages without container on hand, there are 43 groups where distance to the regional disposal site is 15 km or more (excepting the previously discussed Al Dahreyah). As these require a type of vehicle that can negotiate narrow roads as well as featuring good transport efficiency, the medium-size compactor truck (8 m³) is mainly appropriate. Of the said 43 groups, 39 groups can be serviced by a single unit of medium-size compactor truck. A further 23 groups within this total can be serviced by one unit of small compactor truck (5 m³) due to small waste volume, and thus will be provided with the small compactor truck (5 m³) under the

(6) Results of Waste Collection Vehicle Selection

In line with the above selection criteria, the results of waste collection vehicle selection for each municipality/village are as indicated in Table 2.3.22.

38 5.55 22 ឧ 7 9.19 4.43 22 S 90 20 12.83 8.37 (23 3.16 24 \$0.0 2,7 5.84 29 3.80 6.62 11.52 3.03 7.22 6.37 5.01 490.26 5.50 4.41 Municipality & Villago Volume 65 130 Qurawet Bani Hassan 68, 136 Jalboun 69 137 Der Ghazaleh 133 Kofur Al-Deek 75 146 AJ-Woghaver 148 Om Al-Tout 61. 125 Bardala 63 126 Ean Al-Baida 149 Al-Macalleh 158 Ajjoh 159 Al-Zaweah 135 Kefel Hares 138 Arabbounea 147 Jalkammis 140 Al-Jdaydeh 74 143 Kofur Rase 78 154 Al-Jalameh 57 120 Tarkoumeah 131 Al Zaweah 144 Fahmeh 66 132 Der Balout 145 Al-Rameb 156 Al-Dahea 134 Dier Estia 59 122 Bait Awla 60 123 Tammoun 79 157 Anzeh Total 70, 139 Serees 73 142 Yashad 124 ALFarah 128 Taynseer 72 141 Arrabeh 152 Zbouba 155 Arabeh 62 127 Aqueba 64 129 Toubas 76 150 Etenek 151 Ancen 77 153 Jaban 58 121 Sureif Municipality & Village Water Deal Venicle Typolomy Municipality & Village Volume and American Professional Municipality & Village Volume American Professional Municipality & Village Volume American Professional Municipality & Village Volume American Professional Municipality & Village Volume American Professional Municipality & Village Volume American Professional Municipality & Village Volume American Professional Municipality & Village Volume American Professional Municipality & Village Volume American Professional Municipality & Village Volume American Professional Municipality & Village Volume American Professional Municipality & Village Volume American Professional Municipality & Village Volume American Professional Municipality & Village Volume American Professional Municipality & Village Volume American Professional Municipality & Village Volume Profe Results of Collection Vehicle Selection 16.88 18 11.05 18 27.45 28 12.66 17 22.43 28 33.67 10 0 ۶ 3.56 35 4.92 28 5:63 38 4,85 24 8 36 23 5.90 6.02 | 36 87 6.53 30 12,13 36 84 Banizaid Al-Gharbial 3.72 8 4.28 809 5.67 8,6 95 Al-Mazzua Al-Keblea 105 Al-Savahreh Al-Sharqesh 88 Bait Aour Al-Foka 102 Al-Nabi Samweel 96 Aby Shkhaidem 106 Al-Shaikh Saed 93 Kofur Neamah 53 116 Al-Dabreyah 100 Bait Souriek 50 112 Bani Noaim 103 Beir Nabala 107 AJ-Zuayem 80 Der Oudees 92 Der Bazeea 98 Bait Doque 113 Al-Samoua 115 Al-Sheulch 111 Al-Kpaba 10% Bait Anan 45 104 Al-Ram 109 Al-Jeeb 99 Bait Ejza 101 Bair Fxa 89 AJ-Tahta 110 Katard 86 Alleban 81 Oubeats 82 Bodrus 83 Shoqba 85 Ranties 87 Aboud 91 Bateen 94 Kober 97 Anata 52 114 Sacer 117 Yana 55 118 Dours 56 119 Ezuna 90 Safa 42 S 38 39 4 48 \$ 2 9 90 3.91 17 7 ৪ 3 -ဗ္က 3.12 18 6.84 35 6.50 4 2.65 3 7 89 197 30.0 Table 2.3.22 162 Khalet Al-Hadadh 43.46 Braidash/Hindaza 42 Jouret Al-Shamma 70 Exbet Al-Tabech 54 Baquet Al-Hatab 72 Al-Nabeo Eleas 68 Kofur Qudoom 41 Om Salmouneh 160 Wade Al-Neas 59 Kofur Thuluth 161 March Maslah 52 Nahaleen 53 Kefur Laquet 63 Ras Al-Tierch 25 51 Wadi Fokeen 20 40 Marsh Rabah 64 Al-Kheumch 65 Ezbet Jaloud 66 Al-Ashquer 76 Bart Lageab 43 Waid Rahal 67 AJ-Mdawer 44 Bait Tarner 61 Al-Fondok 29, 62 Ras Atoub 34 78 Naleen 79 Al-Media 77 Bait Sira 24 50 Bait Fajar 57 Emmateen 60 Journafout 69 Habla 74 Falames 71 Asaleb 58 Parata 75 Seer 49 Tekoa 55 Hajoh 73 Jayos 26 eq ន 8 zi R 32 ដ Volumance & Committee × 3.57 22 4 6.69 6.07 28 23 я 7.27 5.63 2,0 ş 3,98 8.56 7.28 3.87 6.70 8 3.52 3.93 Municipality & Village 17,48 ALWalayeb/Bain Al-Jownia 1 Baka Al-Shrqeah 35 Al-Shawswreh 3 Der Al-Ghosoun 4 Al-Jarousheah 21 Bait Emmreen 28 Marge Ghazal 11 Kofur Abbous 10 Kofur Jamenal 16 Der Al-Hamb 31 Pain Al-Dulce 9 Kofur Zebaad 29 Margo Najeh 30 Al-Zobaidat 33 Al-Obaydyn 36 Ras Al-Wad 2 Nazlet Essa 20 39 Al-Masara 17 Bait Dajan 18 Azmout 22 Nusf Ibail 34 Dar Salah 25 Bezareah 27 Al-Jiffish 32 Al-Ouja 23 Sabastes 24 Borga 1,12 26 Fasayol 14 Safareen 15 Roujeeb 20 Yaseed 13 Faroun 37 Hosan 33 Batier 12 Shofeh 19 Salim 7 Atecl 6 Eiler S Sida 8 Zita 2 _ 22 장임

(7) Quantity of Containers

The necessary quantity of containers is calculated on the basis of frequency of collection from each container, design waste volume, and capacity per container. In particular, this required quantity varies greatly depending on the frequency of collection from the containers (in the case of collection every other day, twice the number of containers become necessary compared with collection everyday). Under the Project, the approach will be to procure the minimum necessary quantity which corresponds to the required quantity for everyday collection. On the basis of this strategy, the necessary quantity of containers is computed considering the operational rate (79%) for waste collection vehicles.

Required quantity of containers = design waste volume / container capacity / operation rate of collection vehicle (79%)

As discussed in section (4) under calculation of collection capacity, the 1.1 m container is to be utilized with the 12 m and 8 m compactor trucks, and the 0.6 m container with the 5 m compactor truck. Container capacities of respective type are as follows,

1.1 m² container: 0.21 ton/unit 0.6 m² container: 0.12 ton/unit

The municipalities/villages shown in Table 2.3.23 already possess 1.1 m³ containers. In order to effectively use these, the quantity to be purchased under the Project corresponds to the computed quantity minus the number of this equipment on hand.

Table 2.3.23 Number of Containers for Municipalities/villages with Existing Containers (1.1 m) on Hand

Group No.	Mun	icipality/village No.	Waste volume t/day	Computed quantity	No. on hand	No. to be procured

Procurement quantities	7	30	38	1,545	1,892				

2-3-2-3 Disposal Site Equipment Plan

(1) Project Disposal Sites

As discussed previously, the target disposal sites for equipment procurement under the Project are the following four:

- i) Jenin disposal site
- ii) Toubas disposal site
- iii) Tulkarem
- iv) Jericho disposal site
- v) Ramallah disposal site

Also as indicated earlier, the service populations in the Project year (2004) for the target disposal sites are as shown in Table 2.3.26.

Table 2.3.26 Service Populations for the Target Disposal Sites

Disposal site	Service population (persons)
Jenin	277,563
Toubas Tulkarem	49,086
Tulkarem	57,500
Jericho	43,750
Ramallah	365,145
Total	793,044

(2) Design Waste Volume

As discussed previously, design waste volume is the waste intake volume in the year (2004). Disposal site equipment design is accordingly carried out based on this design waste volume. The said design waste volumes are calculated from the earlier discussed waste intake volumes, and are as indicated in Table 2.3.27.

Table 2.3.27 Design Waste Volume for the Target Disposal Sites

Disposal site	Service population (persons)	Waste intake volume (tons/day)
Jenin	277,563	194.3
Toubas	49,086	34.4
Tulkareem	57,500	40.3
Jericho	43,750	30.6
Ramallah	365,145	255.6
Total	793,044	555.2

(3) Work Quantity

In order to implement sanitary landfill disposal of waste at the disposal sites, necessary works can be classified into four types, i.e. (i) spreading and compaction of waste, (ii) spreading and compaction of covering soil, (iii) excavation and loading of covering soil and (iv) transport of covering soil. Work quantities per day as computed from the design waste volume are as indicated in Table 2.3.28.

Table 2,3,28 Work Quantities at the Project Disposal Sites

Disposal site	Spreading/ compaction of waste (m'/day) ①	Spreading/ compaction of covering soil (m'/day) ②	Covering soil excavation (m²/day) ®	Covering soil transport (m'/day)
Jenin	555.1	63.1	47.2	75.5
Toubas	98.3	10.9	8.4	13.4
Tulkarem	115.1	12.7	9.8	15.7
Jericho	87.4	9.7	7.5	12.0
Ramallah	730.3	80.7	62.1	99.4
Total	1,586.2	175.3	135.0	216.0

Note:

- (1) Waste amount converted to volume before compaction (waste density: 0.35 t/m)
- 2 Soil volume prior to compacting: Compaction ratio of waste after compaction: 0.5, Covering soil thickness after compaction: 17% of waste layer thickness after compaction (waste layer: 2 m; covering soil: 35 cm), volume change rate: 1.3.
- (3) Excavated volume (volume change rate: 1.3)
- (4) Loose soil (volume change rate: 1.6)

(4) Equipment Plan

Landfill disposal work at the sites with scale corresponding to those under the Project requires combined work by the equipment indicated below.

i) Bulldozer:

spreading/compacting of waste and covering soil

ii) Backhoe:

excavation/loading of covering soil

iii) Dump truck:

transport of covering soil

Bulldozers are to be equipped with trash racks to improve spread and compaction efficiency.

However, procurement of a full set of the above equipment will not be necessary in the case of the Toubas, Tulkarem and Jericho disposal sites, as the design waste volume is small. Instead, a single unit of versatile track loader will be supplied to each site for carrying out the required multiple tasks.

As a result, necessary equipment at each disposal site is computed as follows based on the design work quantities.

(a) Jenin Disposal Site

(a)-1 Spreading/compacting equipment for waste and covering soil

The 165 ps class (20 ton) and 110 ps class (13 ton) bulldozer capacities were comparatively studied.

Respective spreading and compacting capacities are computed as indicated below, and shown in Table 2.3.29.

Calculation of Bulldozer Work Capacity

Bulldozer spread and compacting capacity is computed according to the following formula:

$$Q = (60 \cdot q \cdot f1 \cdot E) / Cm$$

where:

Q : work quantity per 1 hour of operation (m³/h)

q: spread volume per one time (m³)

fl: soil conversion coefficient (equivalent to 1 for the purpose here of

computing loose volume work quantity).

E: Work efficiency per 1 hour of operation (0.7)

Cm: cycle time (min.)

 $q = 0.6 \cdot l \cdot h^2$

where:

1 : blade width (approx. 3 m for 110 ps class; approx. 3.3 m for 165 ps

class)

h: blade height (In the case of soil spreading: approx. 0.9 m for 110 ps class; approx. 1.3 m for 165 ps class. In the case of waste spreading: approx. 1.3 m for 110 ps class; approx. 1.9 m for 165 ps class.)

 $Cm = L/V_1 + L/V_2 + Tg$

where:

L : average spread distance (a general 30 m is applied here)

V₁: forward velocity (here, 50 m/min. is applied) V₂: backward velocity (here, 50 m/min. is applied)

Tg : gear change time (here, 0.3 min. is applied)

Table 2 3 20 Rulldozer Work Capacity

	I UOLE 2.3.27 Dullu	otel mork cupuc	· <i>y</i>
Туре	Work category	Capacity (m³/h)	Remarks
110 ps class	Soil spreading/compacting	40.8	
-	Waste spreading/compacting	85.2	w/ trash rack
165 ps class	Soil spreading/compacting	93.7	
•	Waste spreading/compacting	200.1	w/ trash rack

On the basis of the above work capacity and previously discussed work quantities, the net operating times per day are around 10.1 hours and 4.3 hours for the 110 ps class

and 165 ps class bulldozers, respectively. Considering standby time for waste delivery, soil transport, etc., the work time in the case of the 110 ps class bulldozer becomes excessively long, precluding effective work execution. Accordingly, one unit of 165 ps class bulldozer will be deployed to the site under the Project.

Table 2.3.30 Bulldozer Work Time (Jenin)

	I WOLL BUSING	25311111020	77 0111 2111	10 0111117	
Туре	Work category	Work quantity (m³/day)	Capacity (m³/h)	Operational efficiency	Work time (h/day)
110 ps	Soil spreading/compacting	61.3	40.8	79%	1.9
class	Waste spreading/compacting	555.1	85.2	79%	8.2
	Total				10.1
165 ps	Soil spreading/compacting	61,3	93.7	79%	0.8
class	Waste spreading/compacting	555.1	200.1	79%	3.5
	Total				4.3

(a)-2 Excavating/loading equipment for covering soil

It is planned to supply a single unit of versatile 0.8 m³ class backhoe (net capacity 0.7 m³) for excavating and loading covering soil. Also, it will be necessary to provide a breaker attachment given the fact that ground at the site consists of a hard limestone layer.

Excavation and loading capacity for the 0.8 m³ class backhoe is computed at 13.8 m³/h according to the formula below. Also, the appropriate 1,000 kg class breaker attachment for the 0.8 m³ class backhoe has a work capacity of 25 m³/h. Accordingly, the work time per day is around 6.7 hours (as indicated in Table 2.3.31) based on the previously discussed work quantities, and this equipment is thus considered sufficient to accomplish the required daily work load.

Calculation of Backhoe Work Capacity

Backhoe excavation and loading capacity is computed according to the following formula:

 $Q = (3600 \cdot q \cdot K \cdot f1 \cdot E) / Cs$

where:

Q: raw excavation volume per 1 hour of operation (m³/h) q: bucket level-scoop capacity (here, 0.7 m³ is applied)

K: bucket coefficient (here, 0.65 is applied)

f1 : soil volume conversion coefficient (here 0.6 is applied)

E: work efficiency per 1 hour of operation (0.45 is applied as loading works must also be performed)

Cs: cycle time (32 seconds is applied taking into consideration required 180

degree rotation)

Table 2.3.31 Backhoe Work Time (Jenin)

	A 15010 AIDIDA	221011111			
Туре	Work category	Work quantity (m³/day)	Capacity (m³/h)	Operational efficiency	Work time (h/day)
0.8 m ³	Excavating/loading	47.2	13.8	79%	4.3
class	Breaker work	47.2	25.0	79%	2.4
	Total				6.7

(a)-3 Transport equipment for covering soil

Dump truck equipment will be necessary to transport excavated covering soil within the disposal site. Since transport quantity will be small, a single dump truck will be deployed at the site. The volume of soil which can be transported within the site by a single dump truck is computed as follows, and shown in Table 2.3.32.

Calculation of Dump Truck Work Capacity

Dump truck soil transport capacity is computed according to the following formula:

 $Q = (60 \cdot C \cdot f1 \cdot Et) / Cmt$

where:

Q: transport quantity per 1 hour of operation (m/h)

C: load volume per one time (loose soil) (8 ton class: 5 m; 15 ton class:

9.3 m)

fl: soil conversion coefficient (equivalent to 1 for the purpose here of

computing loose volume work quantity).

Et : work efficiency per 1 hour of operation (0.9)

Cmt : cycle time (min.)

 $Cmt = (Cms \cdot n) / (60 \cdot Es) + T$

where:

Cms: cycle time for loading equipment (here, 32 sec. for the backhoe is

applied)

n : no. of cycles by loading equipment per single dump truck load

Es: loading work efficiency (here, the general 0.9 is applied)

T: required time for one round-trip by dump truck (here, 6 min. is applied)

 $n = C/(q \cdot K)$

where:

K

e bucket capacity of loading equipment (here, 0.7 m' for the backhoe is

applied)

bucket coefficient of loading equipment (here, 0.65 m' for the backhoe is

applied)

Table 2.3.32

Dump Truck Work Capacity

Туре	Maximum load (I/vehicle)	Transport capacity (m³/vehicle)	Transport capacity (m³/h)
8 ton class	8	5.0	21.58
15 ton class	15	9.3	27.73

Dump truck work time is computed as shown in Table 2.3.33, based on the required soil transport volume per day of 75.5 m indicated in Table 2.3.28.

Table 2.3.33

Dump Truck Work Time (Jenin)

Туре	transport quantity (m³/day)	Transport capacity (m³/h)	Operational efficiency	Work time (h/day)
8 ton class	75.5	21.58	79%	4.4
15 ton class	75.5	27.73	79%	3.4

The 8 ton class dump truck is sufficient for the envisioned soil transport works. Accordingly, one unit of 8 ton dump truck will be deployed at the site under the Project.

(b) Toubas Disposal Site

The following study was carried out assuming the need to supply the 120 ps class (1.8 m²) track-loader in order to effectively carry out the required spreading/compaction of waste and covering soil using a single unit of equipment.

Work capacity for the 120 ps class track-loader is computed as indicated below, and shown in Table 2.3.34. This equipment is capable of small quantity soil scooping (not the large scale excavation as in the case of the backhoe considering soil condition of the site), and short distance transport of excavated soil collected in the bucket.

Calculation of Track-loader Work Capacity

(1) Track-loader spread and compacting capacity

$$Q = (60 \cdot q \cdot fl \cdot E) / Cm$$

where:

Q : work quantity per 1 hour of operation (m³/h)

q : spread volume per one time (her, 1.8m' is applied)

f1 : soil conversion coefficient (equivalent to 1 for the purpose here of computing

loose volume work quantity).

E: Work efficiency per 1 hour of operation (0.7)

Cm: cycle time (min.)

 $Cm = L/V_1 + L/V_2 + Tg$

where:

L: average spread distance (the general 30 m is applied here)

V₁: forward velocity (here, 50 m/min. is applied)
V₂: backward velocity (here, 50 m/min. is applied)
Te : gear change time (here, 0.3 min. is applied)

18 . Bem change time (note) on some a off a

(2) Track-loader scooping capacity

$Q = (3600 \cdot q \cdot K \cdot fl \cdot E) / Cs$

where:

Q: raw scooping volume per 1 hour of operation (m³/h)

q: level-scoop capacity of bucket (here, 0.34 m³ is applied corresponding to scooping depth of 15 cm and bucket height of 15 cm)

K: bucket coefficient (here, 0.4 is applied)

fi : soil volume conversion coefficient (ratio of raw excavated volume to loose soil, here, 0.6 is applied)

E: work efficiency per 1 hour of operation (here, 0.6 is applied)

Cs: cycle time (sec.)

 $C_s = m \cdot L + T$

where:

m : maneuverability coefficient (here, 1.5 is applied since equipment is crawler

type)

L : scooping distance (here, 6 m is applied as the distance required to scoop up

1.8 m of soil)

T: scooping time (here, 40 sec. is applied as the time required to gather one scoop of soil)

(3) Track-loader soil transport capacity:

$O = (3600 \cdot q \cdot K \cdot fl \cdot E) / Cs$

where:

Q: transport volume per 1 hour of operation (m³/h)

q : level-scoop capacity of bucket (here, 1.8 m³ is applied)

K: bucket coefficient (here, 0.4 is applied)

f1 : soil volume conversion coefficient (here, 1 is applied since transport load is

loose soil)

E : work efficiency per 1 hour of operation (here, 0.6 is applied)

Cs : cycle time (sec.)

 $Cs = m \cdot L + T$

where:

m : maneuverability coefficient (here, 1.5 is applied since equipment is crawler type)

type

L: transport distance (here, 50 m is applied)

T: scooping time (here, 40 sec. is applied as the time required to gather one

scoop of soil)

Table 2.3.34		Track-loader	Work Capacity	
Туре	Spreading and compaction of waste (m³/h)	Spreading and compaction of covering soil (m³/h)	Covering soil scooping (m³/h)	Covering soil transport (50 m) (m³/h)
120 ps class	50.4	50.4	3.6	13.5

On the basis of the above work capacity and the previously discussed work quantities, the track-loader work time is calculated as shown in Table 2.3.35. Since this equipment can perform only small quantity scooping, construction wastes will in principal be transported to and used at the site for covering soil. However, a scooping time equivalent to roughly 50% of the necessary covering soil volume is taken into consideration in order to respond to emergencies.

	·
(D 11 0 3 3 5	Track-loader Work Time (Toubas)
Table 2.3.35	Track_indaer Wark (IIIIe I Laubae)
KUUL KIJIJJ	TIMENTOWNED FROM THREE TECHNOLOGY

Туре	Work category	Work quantity (m³/day)	Capacity (m³/h)	Operational efficiency	Work time (h/day)
120 ps	Waste spreading/compacting	98.3	50.4	79%	2.5
class	Soil spreading/compacting	10.9	50.4	79%	0.3
	Soil scooping	4.2	3.6	79%	1.5
	Soil transport (50 m)	13.4	13.5	79%	1.3
	Total		,		5.6

On the basis of the above, it is concluded that deployment of one unit of 120 ps (1.8 m³) class track-loader will be sufficient to effectively carry out the required range of waste and covering soil spreading/compaction, and covering soil scooping/transport required at the site.

(c) Tulkarem Disposal Site

As in the case of the Toubas disposal site, it will be necessary to supply the 120 ps class (1.8 m) track-loader for Tulkarem disposal site in order to effectively carry out the required spreading/compaction of waste and covering soil using a single unit of equipment.

Applying the same study as for Toubas, the work time for the 120 ps class track-loader based on work capacity and quantities of Tulkarem disposal site is computed as shown in Table 2.3.36.

Table 2.3.36 Track-loader Work Time (Tulkarem)

Туре	Work category	Work quantity (m³/day)	Capacity (m³/h)	Operational efficiency	Work time (h/day)
120 ps	Waste spreading/compacting	115.1	50.4	79%	2.9
class	Soil spreading/compacting	12.7	50.4	79%	0.3
	Soil scooping	4.9	3.6	79%	1.7
	Soil transport (50 m)	15.7	13.5	79%	1.5
	Total				6.4

On the basis of the above, it is concluded that deployment of a single 120 ps (1.8 m³) class track-loader will be sufficient to effectively carry out the required range of waste and covering soil spreading/compaction, and covering soil scooping/transport required at the site.

(d) Jericho Disposal Site

As in the case of the Toubas disposal site, it will be necessary to supply the 120 ps class (1.8 m³) track-loader for Jericho disposal site in order to effectively carry out the required spreading/compaction of waste and covering soil using a single unit of equipment.

Applying the same study as for Toubas, the work time for the 120 ps class track-loader based on work capacity and quantities is computed as shown in Table 2.3.36.

Table 2.3.37 Track-loader Work Time (Jericho)

	A HOLD ALLIE !			(
Туре	Work category	Work quantity (m³/day)	Capacity (m³/h)	Operational efficiency	Work time (h/day)
120 ps	Waste spreading/compacting	87.4	50.4	79%	2.2
class	Soil spreading/compacting	9.7	50.4	79%	0.2
	Soil scooping	3.8	3.6	79%	1.3
	Soil transport (50 m)	12.0	13.5	79%	1.1
	Total				4.8

On the basis of the above, it is concluded that deployment of a single 120 ps (1.8 m³) class track-loader will be sufficient to effectively carry out the required range of waste and covering soil spreading/compaction, and covering soil scooping/transport required at the site.

(e) Ramallah Disposal Site

(e)-1 Spreading/compacting equipment for waste and covering soil

The same study was applied for Ramallah disposal site as in the case of the Jenin disposal site. On the basis of the work capacity and quantities, the net operating times per day are around 13.4 hours and 5.7 hours for the 110 ps class and 165 ps class buildozers, respectively, as shown in Table 2.3.38. Considering standby time for waste delivery, soil transport, etc., the work time in the case of the 110 ps class buildozer becomes excessively long, precluding effective work execution. Accordingly, one unit of 165 ps class buildozer will be deployed to the site under the Project.

Table 2.3.38 Bulldozer Work Time (Ramallah)

Туре	Work category	Work quantity (m³/day)	Capacity (m³/h)	Operational efficiency	Work time (h/day)
110 ps	Soil spreading/compacting	80.7	40.8	79%	2.5
Class	Waste spreading/compacting	730.3	85.2	79%	10.9
	Total	ļ			13.4
165 ps	Soil spreading/compacting	80.7	93.7	79%	1.1
Class	Waste spreading/compacting	730.3	200.1	79%	4.6
	Total				5.7

(e)-2 Excavating/loading equipment for covering soil

The same study was applied as in the case of the Jenin disposal site. On the basis of work capacity and quantities, work time per day is around 8.8 hours as indicated in Table 2.3.39, and this equipment is thus considered to accomplish the required daily work load. Accordingly, one unit of 0.8 m³ class backhoe (with breaker attachment) will be procured for this site under the Project.

Table 2.3.39 Backhoe Work Time (Ramallah)

	7 more =1010;				
Туре	Work category	Work quantity (m³/day)	Capacity (m³/h)	Operational efficiency	Work time (h/day)
0.8 m ³	Excavating/loading	62.1	13.8	79%	5.7
class	Breaker work	62.1	25.0	79%	3.1
	Total				8.8

(e)-3 Transport equipment for covering soil

The same study was applied as in the case of the Jenin disposal site. Dump truck work time is computed as shown in Table 2.3.40, based on the required soil transport volume per day of 99.4 m indicated in Table 2.3.28.

Table 2.3.40 Dump Truck Work Time (Ramallah)

Туре	transport quantity (m³/day)	Transport capacity (m³/h)	Operational efficiency	Work time (h/day)
8 ton class	99.4	21.58	79%	5.8
15 ton class	99.4	27.73	79%	4.5

The 8 ton class dump truck is sufficient for the envisioned soil transport works. Accordingly, one unit of 8 ton dump truck will be deployed at the site under the Project.

(4) Design Equipment Summary

On the basis of the above study, the disposal site equipment indicated in Table 2.3.41 will be supplied under the Project.

Disposal site	165 ps class bulldozer	0.8 m³ class backhoe (w/ breaker)	8 ton class dump truck	120 ps (1.8 m³) class tnick-loader
Jenin	1 unit	lunit	lunit	
Toubas				lunit
Tulkarem	·			Iunit
Jericho	<u></u>			1unit
Ramallah	l unit	lunit	lunit	
Total	2 units	2 units	2 units	3 units

2-3-2-4 Spare Parts Plan

(1) Parts to be Procured

In order to use the equipment efficiently and continuously, it is important to carry out regular replacement of consumable parts and repair/replacement of worn parts based on the guidelines of maintenance manuals for the respective equipment.

Regular replacement parts and spare parts for repair are to be procured on the basis of the following criteria, and in line with specifications and quantities of procured equipment under the Project.

- Vehicle type equipment (waste compactor truck and dump truck)
 parts necessary for approx. 50,000 km of running (approx. 2 years).
- Construction related equipment (bulldozer, backhoe & track-loader)
 parts necessary for approx. 5,000 hours of operation (approx. 2 years)

Regular replacement parts and spare parts for repair are as follows,

- a. Periodical replacement parts oil filter element, air cleaner element, fuel filter element
- b. Spare parts for repair
 engine pistons, liners and bearings,
 clutch & brake system parts,
 frequently replaced electric parts, rubber hoses,
 body hydraulic system parts

Spare parts of generally infrequent repair and those required in the case of accident, etc. are not covered in the above listed parts. Accordingly, it will be noted that the spare parts excluded the above list, be procured by the PA side. After consuming the spare parts procured under the Project, it is necessary to prepare the budget for spare parts by the PA side, which is recommended to be 5 % of the equipment body price per year respectively.

(2) Parts Management

Conventionally, it is desirable that the management of spare parts be carried out by the owner of the related equipment. However, as equipment quantities to be procured for the target municipalities/villages are small (ranging from 1 to several units), it would be difficult to manage parts by each municipality/village. Accordingly, management of spare parts procured under the Project is to be carried out by the central warehouse of spare parts in Ramallah, planned by the Ministry of Local Government, and distributed to the regional workshops including 2 workshops of Jerieho Municipality and Nablus Municipality.

2-3-2-5 Design Equipment Specifications

On the basis of the above study, the equipment indicated in Table 2.3.42 will be procured under the Project. Also, equipment specifications are shown in Table 2.3.43; and preliminary equipment drawings are given in Figure 2.3.3 ~ Figure 2.3.11

Table 2.3.42 Summary of Equipment to be Procured

No.	Equipment	Specifications	Unit	Quantity

Chapter 3 Implementation Plan

3.1 Implementation Plan

3.1.1 Implementation Concept

The Project will be implemented within the framework of Japan's Grant Aid System and will formally commence with the Exchange of the Notes (E/N) between both Japan and the PA upon approval of the Project by the Government of Japan. The PA will then select the Consultant (Japanese firm) to prepare the tender document and to assist the tender process for procurement of equipment. With the completion of the tender documents, the Contractor (a Japanese Firm) which is the successful bidder, will conduct the assigned work and supply the vehicles and equipment. The basic principles and points to note for the implementation of the Project are explained below.

(1) Project Implementing Body

The Responsible Agency of the Project on the PA side will be the Ministry of Planning and International Cooperation and the Ministry of Local Government. Implementing Agency of the Project on the PA side will be the Ministry of Local Government, targeted 160 municipalities/villages comprising 68 joint service group, and 5 major cities (Jenin, Toubas, Tulkarem, Jericho and Ramallah) operating regional disposal sites. It will be necessary for the PA to appoint a key person responsible for the implementation of the Project in order to maintain close communication and consultation with the Japanese Consultant and the Contractor to ensure the Project's successful progress.

This key person must ensure that all the parties concerned of this Project may successfully implement their responsibility by explaining and answering their questions, and provide all possible assistance for the smooth progress of the Project.

(2) Consultant

The Consultant (a Japanese firm) selected by the PA will enter into a design and work supervision agreement with the PA to proceed to the equipment procurement stage of the Project. The consultant will prepare the tender document for the equipment to be procured under Japan's grant aid and will then supervise the procurement process. The Consultant will also conduct the tender process in accordance with the contract between the PA and the Consultant.

(3) Contractor

The Contractor, a Japanese firm, selected by open tender according to the procedure of the Japan's grant aid system, will procure and supply the equipment. Also, the Contractor will provide following training for staffs nominated by the PA to level up their maintenance capability.

- a. Training of mechanics at authorized dealer of manufacturer
- b. Training of operator and mechanics at the time of delivery

As the vehicles and heavy equipment will require the supply of spare parts and the provision of after-service in the case of breakdown following the completion of the Project, the Contractor should pay close attention to the need to establish communication links between the recipient side and the Contractor after the delivery of the equipment..

(4) Necessity of Dispatch of Japanese Engineers

This Project is for procurement of equipment consisting of collection vehicles and disposal site equipment supplied to the implementing agencies of the Project. Therefore, there are no installation work. However, it will be necessary to dispatch an engineer for the training of staffs of implementing agencies at the time of delivery about one month. In this training methods of inspection and maintenance will be lectured and practiced for the collection vehicles and disposal sites equipment.

3.1.2 Implementation Conditions

(1) Conditions of the Procurement in the PA

Conditions of the procurement of vehicles and heavy equipment in the PA are as follows.

- ① There are no manufacturers of vehicles and heavy equipment in the PA.
- ② There are several manufacturer of similar container in the PA
- 3 As the PA adopts same regulations and standards of Israeli for vehicles, collection vehicle and dump truck to be procured shall meet these regulations and standards.
- There are several Agents of vehicles and heavy equipment manufacturers in the PA. They have workshops for maintenance and repair of vehicles and equipment and can provide sufficient after-service.

(2) Points to Note

- 1) The equipment to be procured in the Project is not manufactured in the PA. Therefore it shall be procured from Japan or third countries. Specially, collection vehicles and dump trucks shall meet regulations and standards in Israeli.
- 2) It is desirable to choose vehicles and equipment commonly used in the PA considering proper maintenance and operation, and also training of staffs.
- Procurement of standardized vehicles shall be considered as much as possible, in order to ensure ease of operation and maintenance.

3.1.3 Scope of Works

The division of work between the Japanese side and the PA side is as follows.

- (1) Works by the Japanese Side
 - 1) Procurement of collection vehicles and containers
 - 2) Procurement of disposal site equipment

3) Procurement of spare parts for the above

(2) Items to be borne by the PA Side

- 1) Construction of garages for collection vehicles and disposal site equipment
- 2) Improvement of regional disposal sites
- 3) Construction of Toubas and Tulkarem disposal sites
- 4) Construction of regional workshops and a central warehouse of spare parts

3.1.4 Consultant Supervision

In according with the Japan Grant Aid System, the consultant will organize a project team to conduct the preparation of tender documents and work supervision, taking all the basic design principals into consideration. At the work supervision, the consultant will also dispatch an engineer to advice for follow-up works to be done by the recipient country.

(1) Basic Principal of Consultant Supervision

The consultant will adopt the following principal to fulfill his responsibility to supervise and guide the Contractor in view of the punctual and safe completion of the Project related work within the planned period. The scope of work for the Consultant is shown in Table 3.1-1.

Table 3.1.1 Contents of Consultant Work in the Project (conducted in each phase)

1.	Pre-supply stage	Preparation of tender documents Assistance of tender process Evaluation of tender results Contract work assistance
2.	Supply stage	Supervision of procurement Inspections Report preparation, etc.

1) Schedule Control

- a) The Consultant shall ensure that the Contractor always checks the progress of manufacture and delivery of the equipment against the original plan to ascertain the state of work progress.
- b) The consultant shall control each work item on a monthly basis so that the Contractor adheres to the contracted work schedule.

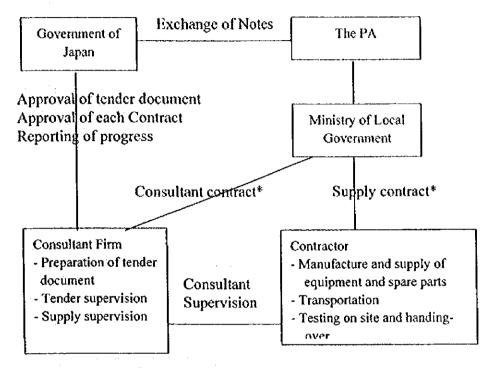

2) Quality Control

- a) The Consultant shall confirm that the specifications and quality of equipment and materials to be procured meet the requirements specified in the detailed design documents.
- b) The Consultant shall witness the quality inspections and various performance tests in connection with the equipment to be procured at the completion of manufacturing

work.

(2) Work Supervision System

The system to supervise the actual procurement process and the involvement of the related organizations are shown in Figure 3.1-1.

*Note: Consultant contract and Supply contract require the official approval of the Government of Japan

Fig.3.1.1 Project Implementation Relationship Chart

3.1.5 Procurement Plan

Since the collection vehicles and disposal equipment to be procured under this Project are not manufactured in the PA, the equipment will be procured from Japan and/or third countries taking into consideration all the required standards, specifications, quality, stable supply, production volume and supply stability, delivery time and ease of operation and maintenance. Spare parts of equipment, these shall also be procured from Japan and third country. Containers will be procured from the PA

3.1.6 Implementation Schedule

In the case that the Project is extended to the implementation stage with grant aid provided by the Government of Japan, the actual procurement will be conducted in two stages following the signing of E/N, i.e., (i) tender process and signing of the supply contract, and (ii) actual procurement.

(1) Tender and Contract

As soon as the E/N has been signed, the Japanese Consultant will conclude a consultant agreement with the PA side and commence to prepare tender documents for the procurement.

The consultant will announce the tender, hold a tender explanation meeting and distribute the tender documents to the prospective bidders on behalf of the PA. Upon receipt of bid prices and application documents, the Consultant will promptly examine them to facilitate the contract between the PA and Japanese contractor. The tender will be witnessed by all applicants and representatives of related organizations. If the contents of the bid with the lowest price are assessed as being appropriate, the bid will be accepted and the bidder will conclude a contract with the PA.

The time required from tender announcement to signing of the procurement contract is expected to be 1.0 month.

(2) Procurement of Equipment

Following signing of the supply contract and its official approval by the Government of Japan, the contractor will commence the procurement work. It is predicted that, considering of the size of this Project, it will take 12 months, if procurement of equipment and works to be done by the PA side are smoothly carried out.

The consultant will conduct detailed arrangements prior to the commencement of the procurement work, and supervise the Contractor in regard to the manufacturing, transportation of equipment and work schedule, etc. The Consultant will also enforce schedule control, as well as quality control, in order to complete the entire work within the period stipulated in the E/N. The Project implementation schedule is shown in Table 3.1-2.

Table 3.1.2 Project Implementation Schedule

3.1.7 Work to be Undertaken by Recipient Country

The items to be undertaken by the PA side are as follows:

- 1) to provide necessary data and information for the Project;
- 2) to construct a garage for the equipment supplied under the Project;
- 3) to improve regional disposal sites (Jenin, Jericho and Ramallah);
- 4) to improve regional disposal sites and preparation of equipment for covering soil (Salfit, Nablus and Hebron);
- 5) to construct Toubas and Tulkarem disposal sites;
- 6) to construct regional workshops (Jenin, Ramallah, Bethlehem and Hebron) and a central warehouse of spare parts (Ramallah);
- 7) to implement proper soil covering using supplied equipment;
- 8) to secure a budget for operation and maintenance following Project implementation;
- 9) to secure personnel to operate and maintain the equipment supplied under the Project;
- 10) to maintain properly and effectively the equipment supplied under the Project;
- 11) to support prompt unloading and customs clearance of the equipment supplied under the Project;
- 12) to tax exemptions and provide necessary conveniences for the equipment supplied and Japanese nationals dispatched under the Project;
- 13) to support customs duty exemptions for the equipment supplied under the Project;
- 14) to bear payment commissions and expenses for opening an account with a Japanese foreign exchange bank; and
- 15) to bear all expenses other than those covered by the Grant, necessary for the execution of the Project.

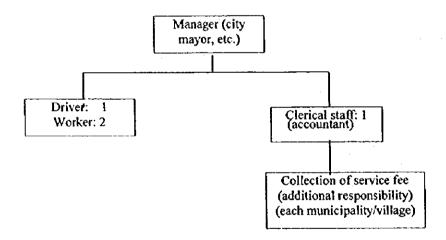

3.2 Operation and Maintenance Plan

3.2.1 Organization for Operational and Maintenance

(1) Solid Waste Collection

Waste collection equipment will be operated by each joint service group. For this purpose, a garage will be constructed at a representative municipality/village within each group, where the said equipment will be kept. Subsequent operation of the waste collection equipment would then be carried out jointly by the group centering on the representative municipality/village. Also, equipment operation and maintenance costs would be borne jointly by the group, with a service charge (including waste collection and disposal cost, and equipment operation and maintenance cost) being collected in each municipality/village corresponding to service population and waste volume. To achieve this, the following operational structure must be established.

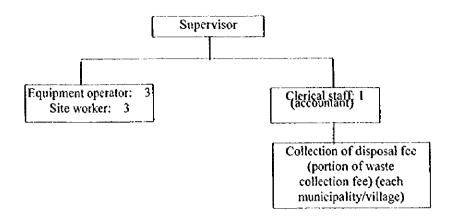

Figure 3.2.1 Waste Collection Organization (groups with a single waste collection vehicle)

(2) Disposal Site

Disposal site equipment will be operated by the major municipality which manages the regional disposal site. Since the municipalities/villages using the regional disposal sites will be charged a disposal charge depending on waste volume, the following operational structure is necessary.

Figure 3.2.2 Disposal Site Organization (Jenin, Ramallah)

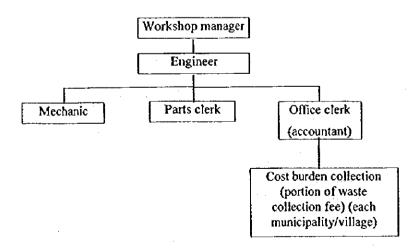

(3) Workshop

Four regional workshops; Jenin, Ramallah, Bethlehem and Hebron, will be jointly managed by the Ministry of Local Government and the relevant major municipalities. The workshops at Nablus and Jericho are operated by the respective municipality. Spare parts will be kept at the central warehouse in Ramallah and supplied to the workshops on an as-needed basis.

Work performed at the workshops will comprise mainly regular inspection/maintenance and minor and medium scale repairs. Overhaul, body work and other major repairs will be subcontracted to the private sector. The necessary organization for operation of the workshops and parts management is as follows:

Figure 3.2.3 Workshop Organization

3.2.2 Maintenance Plan

(1) Basic Strategy

Among the executing agencies, there are currently only 7 municipalities/villages with waste collection vehicles on hand, and only 18 municipalities/villages with agricultural-use tractors on hand. These municipalities/villages subcontract maintenance for this equipment to nearby private repair shops. In almost all cases, other municipalities/villages rent agricultural-use tractors for waste collection, and engage in virtually no vehicle or construction equipment maintenance. As a result, the PA is pursuing a plan to establish regional workshops.

In the case of the equipment to be procured under the Project, it is concluded that effective operation and maintenance is possible through preventive maintenance corresponding to the type of mandatory regular and annual vehicle inspection carried out in Japan. Accordingly, vehicle maintenance would be carried out in the following three stages, centering mainly on the planned regional workshops.

Daily inspection: to be performed by the driver, or at a

nearby private vehicle repair shop

Regular inspection and minor repairs: at the planned regional workshops

Major repairs: subcontracted to the private workshops (manufacturer's agent)

The purpose of regular inspection is not only to constantly maintain vehicles in good operating condition, but also to minimize vehicle damage by identifying causes of potential malfunction as early as possible. From this standpoint, a preventive, regular inspection and maintenance system is to be adopted equipment procured under the Project. At the time of equipment supply as well, inspection and repair manuals will be provided and instruction given in maintenance procedures.

(2) Maintenance Work Content

In the case of vehicle maintenance in Japan, there is a legally mandatory inspection and maintenance framework established by the Ministry of Transportation which specifies the content for monthly, quarterly and annual inspection and maintenance procedures. Under this Project as well, a similar type framework will be the basis for planned maintenance work content given the fact that the equipment supplied is intended for public waste collection service. Since the operational conditions affecting each vehicle will be different, however, inspection and maintenance will be carried out in line with specified running distance rather than stipulated time period.

a. Vehicles

The maintenance work recommended for regular execution with regard to vehicles (compactor trucks, dump truck) is as shown in Table 3.2.1.

Table 3,2.1

Maintenance Work for Vehicles

No.	Item	Running distance	Maintenance content
1.	Minor maintenance	Approx. every 3,000 km	Lubrication, inspection—and adjustment where necessary of power train, hydraulic systems, electrical parts and wheel, axle and suspension system. This preventive maintenance is particularly important.
2.	Medium scale maintenance	Approx. every 12,000 km	Although wear, deformation, cracking, breakage, etc. may not occur in a uniform manner for the various vehicle parts depending on operational conditions, medium scale maintenance is to be carried out approx. every 12,000 km. This would comprise adjustment, repair and part replacement for engine, power transmission system, wheel, axle and suspension system, and all hydraulic systems. Given the nature of the required equipment for this maintenance work, it will be necessary to bring the vehicle to the appropriate repair shop.
			Also, body hydraulic mechanism maintenance, metal surface painting works, etc. would be carried out where necessary.
3.	Major maintenance	Approx. every 36,000 km	Maintenance content is basically the same as that for medium scale maintenance. However, particular attention would be given to brakes, clutch lining and wheel, axle and suspension systems (particularly springs).

b. Construction Machinery

In the case of construction machinery (bulldozer, backhoe, truck-loader, etc.), inspection and maintenance would be carried out for every 50 hours and 250 hours of operation, respectively, in addition to the regular daily equipment check. This inspection and maintenance must be performed in line with the maintenance framework for each specific type of equipment.

Table 3.2.2

Maintenance Work for Construction Machinery

No.	Item	Inspection / maintenance content
1.	Daily inspection / maintenance	Upon completion of operation each day, the equipment operator would inspect, adjust, clean and lubricate the equipment, refuel, and add cooling water.
2.	Weekly inspection / maintenance (approx. every 50 hours of operation)	This would comprise inspection and maintenance which is not possible on a daily basis, oil change, element replacement, equipment lubrication, etc.
3.	Monthly inspection / maintenance (approx. every 250 hours of operation)	This would comprise further detailed inspection, adjustments, parts replacement, etc. not performed at the weekly maintenance level.

Although the utility life of equipment can vary greatly depending on conditions of actual use, both the vehicle and construction equipment supplied under the Project will require replacement every 8 years.

(3) Spare Parts

- a. Spare parts will be prepared in two categories; one is regular replacement parts in accordance with running distance, the other is general repair/replacement of worn parts essential to sustain the equipment utility life and respond to extraordinary breakdown. Items and quantities for these spare parts would need to be constantly on hand in line with the regular maintenance plan as discussed previously.
- b. Under the Project, the regular replacement parts and important spare parts for general repair, as discussed previously, are to be procured, corresponding to 50,000 km running distance (approximately two years worth) for vehicles, and 5,000 hours of operational time (approximately two years worth) for construction equipment.
 - Infrequently used repair parts, and parts only sporadically required in the case of accident, etc. are not included. The PA side will thus assume responsibility for the procurement of these as needed, as well as readying funding for purchase of spare parts to cover the period after exhaustion of the above spare parts component included under the Project (approximately 5% the main equipment price annually).
- c. Spare parts for vehicles will be managed and kept at the central warehouse in Ramallah and will be distributed to the four regional workshops planned at Ramallah, Jenin, Hebron and Bethlehem. In the case of the Nablus and Jericho workshops, the parts will subsequently be supplied from the central warehouse on an as-needed basis. Also, parts for construction machinery will be managed at the central warehouse.

(3) Cost Burden Method

Each municipality/village must bear the cost for maintenance of waste collection equipment, and pay this cost to the respective workshop. To effect this, the workshops and municipalities/villages (groups) must enter into contract to ensure regular maintenance.

3.2.3 Required Personnel for Operation and Maintenance

Required personnel for operation and maintenance is as follows:

(1) Waste Collection

One driver and two workers will be necessary for each unit of waste collection vehicle. Also, one office clerical staff will be required in each group for accountant and service fee collection.

Groups requiring two or more collection vehicles, and corresponding number of necessary personnel are as follows:

Table 3.2.3 Necessary Personnel for Groups Requiring Two or More Collection Vehicles

		Equipme	Equipment quantity (no.)			Necessary staff (person)		
		5 m	8 m	12 m	Driver	Worker	Clerical	
45.	Al Ram		1	2	3	6	3	
53.	At Dahreyah		2	1	3	6	3	
54.	Yatta		2	1	3	6	3	
55.	Doura		2		2	4	2	
56.	Eznna		2		2	4	2	

Note: Equipment quantity for Al Ram includes existing equipment on hand.

(2) Disposal Site

Necessary personnel for the disposal sites is as follows:

Table 3.2.4 Necessary Personnel for Disposal Sites

	Jenin	Ramallah	Toubas	Tulkarem	Jericho
Supervisor	1	1	1	1	1
Clerical	1	1	i	1	1
Site worker	3	3	1	1	1
Equipment operator	3	3	1	1	1
Total	8	8	4	4	4

(3) Workshop

The planned workshops are primarily intended for the maintenance of equipment procured under assistance from Spain, and it will accordingly be necessary to secure staff to respond to the increase in equipment quantities under the Project. The additional personnel required at each workshop in order to maintain the equipment procured by this Project are computed according to the criteria indicated below, and results are as shown in Table 3.2.5.

- a. Work content at the workshops will comprise regular inspection/maintenance and minor and medium scale repairs. Overhaul, body work and other major repair work will be subcontracted to private repair shops.
- b. Regular inspection/maintenance and repair will entail bringing in each unit of equipment two times per month.
- c. Work time required on each unit of equipment brought in will be one day per time.
- d. Operational days per month for each workshop is 25 days.
- e. Number of mechanics for each unit of equipment brought in is 1.5 persons (3 persons per 2 units of equipment).

Table 3.2.5 Additional Personnel Required at Each Workshop

	Ramallah	Jenin	Hebron	Bethlehem	Nablus	Jericho	Total
No. of equipment subject to maintenance (units)	18	16	16	8	13	2	76
No. of equipment brought in per month (units/mo.)	36	32	32	16	26	4	152
No. of equipment brought in per day (units/day)	1.4	1.3	1.3	0.6	1.0	0.2	
Necessary personnel:							
Engineer (persons)	1	1	1	0	1	0	4
Mechanic (persons)	3	2	2	3	2	1	11
Parts clerk (persons)	1	1	1	0	1	0	4
Total (persons)	5	4	4	1 .	4	1	19

3.2.4 Operation and Maintenance Cost

(1) Solid Waste Collection

Operating and maintenance cost for each collection vehicle is calculated according to the following conditions.

Condition of cost estimation for solid waste collection

a.	Depreciation	
	Utility life of equipment is determine	ed as follows:
	Waste collection vehicles:	8 years
	Containers:	5 years
b.	Personnel cost	
	Clerical:	NIS 2,000/month/person
	Driver:	NIS 2,000/month/person
İ	Worker.	NIS 1,500/month/person
	Overtime allowance:	20% increase over hourly wage
	(driver and worker)	
c.	Fuel and lubricant cost	
	Diesel unit cost:	NIS 1.5/liter
	Fuel consumption rate:	0.048 liters/HP/hour
İ	Work time:	7 hours per day
	Lubricant cost:	20% of fuel cost
d.	Maintenance cost	
	5% of vehicle purchase cost	
e.	Other costs	
	5% of total cost excluding prin	me cost depreciation

Results of computation according to the above criteria indicates an operation and maintenance cost per vehicle as Table 3.2.6

Table 3.2.6 Operating Cost per Vehicle (in the case of 7 hours of operation per day)

(NIS/month)

			(1415/thona
Vehicle type:	5 m compactor	8 m' compactor	12 m' compactor
Prime cost depreciation	3,422	5,005	6,042
Personnel cost	7,000	7,000	7,000
Maintenance cost	969	1,552	1,917
Fuel/lubricant cost	1,748	2,476	2,915
Other costs	386	451	492
Total O&M cost (excluding prime cost depreciation)	13,524 (10,102)	16,485 (11,480)	18,365 (12,323)

In order to achieve a 100% waste collection rate in 2004, however, overtime work by waste collection personnel will be necessary. The collection cost for each group with consideration to the necessary overtime cost for 100% collection rate, and per household cost (including disposal cost) are indicated in Table 3.2.11.

(2) Disposal Sites

Operating and maintenance cost for disposal sites is computed according to the following conditions:

	Conditions of cost estima	ation for disposal site
a.	Depreciation	
	Utility life of construction equipment at	nd dump trucks is 8 years.
b.	Personnel cost	
	Supervisor:	NIS 2,500/month/person
	Clerical:	NIS 2,000/month/person
	Site worker:	NIS 1,500/month/person
	Equipment operator:	NIS 2,500/month/person
c.	Fuel and lubricant cost	•
	Diesel unit cost:	NIS 1.5/liter
	Fuel consumption rate:	determined separately for each type
	•	of equipment
	Work time:	7 hours per day
	Lubricant cost:	20% of fuel cost
d.	Maintenance cost	
	5% of equipment purchase cost	
e.	Other costs	

Table 3.2.7 Operation and Maintenance Cost of Disposal Site

5% of total cost excluding prime cost depreciation

	Jenin	Ramallah	Toubas	Tulkarem	Jericho
Prime cost depreciation (NIS/month)	18,995	18,995	6,641	6,641	6,641
Personnel cost (NIS/month)	16,500	16,500	8,500	8,500	8,500
Maintenance cost (NIS/month)	7,198	7,198	2,656	2,656	2,656
Fuel & lubricant cost (NIS/month)	12,468	12,468	4,085	4,085	4,085
Other costs (5%) (NIS/month)	1,808	1,808	762	762	762
Total O&M cost (NIS/month)	59,969 (37,974)	59,969 (37,974)	22,644 (16,003)	22,644 (16,003)	22,644 (16,003)
Design waste volume (tons/day)	194.3	255.6	34.4	40.3	30.6
Unit cost per ton (NIS/month/(ton-day)	309 (195)	235 (149)	658 (465)	562 (397)	740 (523)
Population (persons)	277,563	365,154	49,080	43,750	43,750
Per household unit cost (NIS/month/household)	1.5(1.0)	1.1 (0.7)	3.2 (2.3)	2.8 (1.9)	3.6 (2.6)

Note: Figures in parentheses exclude prime cost depreciation.

Along with the waste collection cost, the service fee to cover the above cost must be collected and paid by each municipality/village (in proportion to population and waste volume) to the major municipality which manages the relevant disposal site.

(3) Workshops

Additional cost at each workshop for maintenance of equipment procured in the Project is computed according to the following conditions:

Condition of cost estimation for workshops

a.	Personnel cost	
	Engineer:	NIS 3,000/month/person
	Mechanic:	NIS 2,000/month/person
	Parts clerk:	NIS 2,000/month/person
b.	Parts cost:	NIS 200 each time one unit of equipment is
		brought in
c.	Other costs:	10% of the above costs

Table 3.2.8 Required Additional Operating Cost for Each Workshop

	Ramailah	Jenin	Hebron	Bethlehe m	Nablus	Jericho	Total
Personnel cost	11,000	9,000	9,000	2,000	9,000	2,000	42,000
Parts cost	7,200	6,400	6,400	3,200	6,400	800	30,400
Other costs	1,820	1,540	1,540	520	1,540	280	7,240
Total	20,020	16,940	16,940	5,720	16,940	3,080	79,640

Workshop cost is computed as a part of the waste collection fee under the category of maintenance. The total maintenance cost for the target municipalities/villages is as follows, from which each municipality/village will pay the appropriate cost to the relevant workshop. Also as discussed earlier, it will be necessary for municipalities/villages and workshops to enter into maintenance agreements to ensure full execution of regular equipment inspection and maintenance.

Table 3.2.9 Total Maintenance Cost for the Target Municipalities/villages
(NIS/month)

Vehicle type	No. of units	Unit maintenance cost	Total maintenance cost	Remarks
5 m' compactor truck	38	969	36,822	
8 m' compactor truck	30	1,552	46,560	,
12 m' compactor truck	8*	1,917	15,336	
Total	76*		98,718	

Note: * includes the existing I unit of compactor truck at Al Ram

3.2.5 Cost Burden of Residents in Each Municipality/village

The required cost burden of residents in each municipality/village to cover the above operating cost (excluding prime cost depreciation) for waste collection equipment as well as disposal cost in 2004 is computed according to the following conditions.

Condition of estimation for cost burden by residents

a.	Population, and no. of family mem	bers per household					
	Population: e	stimated population in 2004					
	No. of family members						
	per household: 7	persons					
b.	Disposal cost						
	Jenin, Ramallah:	NIS 2/month/household					
	Toubas:	NIS 3.2/month/household					
	Jericho:	NIS 3.6/month/household					
	Tulkarem Nablus, Salfit:	NIS 2/month/household					
	Qalqileah, Jerusalem, Bethlehen	n: NIS 3/month/household					
	Hebron:	NIS 2/month/household					

The cost burden per household naturally increases with greater waste transport distance. It also increases the smaller the group size in comparison to the transport capacity of collection vehicles. On the other hand, the average ability to bear cost burden is considered at NIS 15/month.

In 2004, roughly half of the target groups under the Project will be able to achieve a 100% waste collection rate with the procured equipment. The remaining half of the municipalities/villages will require overtime work on the part of their personnel to achieve a 100% waste collection rate. Group-wise cost in order to effect a 100% waste collection rate in 2004 (including overtime cost) is as shown in Table 3.2.11, and it will be necessary to collect service charges from residents to cover this cost along with disposal cost.

Since the collectable service fee from residents is considered at NIS 15/month, it will be necessary in the case of the following 5groups to either further combine service with other municipalities/villages nearby, or require a higher cost burden by the residents in the said groups.

Table 3.2.10 Groups with High Cost Burden by Residents (NIS/household)

Municipality/village	Collection cost	Disposal cost	Total
11-15 Al-Jiftlek	12.2	3.6	15.8
21 Bait Tamer	12.2	3.0	15.2
27 Kuf Thuluth	14.0	3.0	17.0
42 Bait Doquo	26.1	3.0	29.1
61,63 Tayaseer	12.3	3.2	15.5

In the case of groups 27 and 61,63 cost burden per household is high; however, there is surplus equipment transport capacity. Nevertheless, since nearby groups are already of suitable size, it is recommended that new municipalities/villages to share service be identified in the adjacent area in order to reduce the cost burden per household. Group 42 as well exhibits surplus collection capacity given its small size. Furthermore, service fees greatly exceed the assumed ability of residents to pay. The PA side will accordingly need to effect appropriate measures to address this situation.

In the case of the 11-15 group, on the other hand, cost burden is high due to greater transport distance. It will thus be necessary to explore means of securing a funding source to cover this higher cost.

Table 3.2.11 Operation and Maintenance Cost of Each Group
