8.4 Initial Environmental Examination (IEE)

8.4.1 Study Flow and Environmental Items of IEE Study

(1) Study Flow of IEE

In order to evaluate whether Environmental Impact Assessment (EIA) is necessary for a proposed project of a master plan, generally, initial environmental examination (IEE) study is required. Through IEE study, scope of the EIA is determined for the identified projects. However, if the project is evaluated not necessary for EIA, then countermeasures for mitigating impacts of the project which requires environmental consideration are examined from the point of view of environment impact.

In this Master Plan study, IEE for the major proposed projects was started with basic data collection on environmental situations in the Study Area through literature reviews and field surveys. These data and facts were analyzed for identifying present environmental issues of each proposed project as for some environmental items. The environmental items were selected as explained in the following section by holding meetings with ALMA and MARENA before execution of IEE study.

These results analyzed were used for examining possible environmental impacts, which would be caused by implementation of each proposed project, from the viewpoint of environmental impacts, and for judging finally whether EIA would be required for each project.

(2) Environmental Items

Environmental fields to be evaluated have very wide range including social aspects, natural aspects and pollution. The environmental items for IEE were selected to analyze and summarize the environmental aspects and issues, in consideration of the purpose of IEE and the characteristics of Managua as shown in Table 8.4.1.

Table 8.4.1 Environmental Items

| | 1. Social Environment | 2 | . Natural Environment | | 3. Pollution |
|-----|--------------------------------|-----|----------------------------|-----|--------------------------|
| 1.1 | Resettlement | 2.1 | Topography and Geology | 3.1 | Air Pollution |
| 1.2 | Economic Activities | 2.2 | Soil Erosion | 3.2 | Water Pollution (surface |
| 1.3 | Traffic and Public Facilities | 2.3 | Ground Water | | & ground) |
| 1.4 | Spilt of Community | 2.4 | Hydrological Situation | 3.3 | Soil Contamination |
| 1.5 | Cultural Heritage & Properties | 2.5 | Coastal Zone | 3.4 | Noise and Vibration |
| 1.6 | Water Rights and Rights of | 2.6 | Fauna and Flora (Protected | 3.5 | Ground Subsidence |
| | Common (Property of the land) | | and Fragile Areas) | 3.6 | Offensive Odors |
| 1.7 | Public Health Condition | 2.7 | Meteorology | | - |
| 1.8 | Waste | 2.8 | Landscape | | - |
| 1.9 | Disaster (Risks) | | | | |

In the meetings with ALMA and MARENA for discussing the items, the following three points were agreed to be included and considered in the environmental items.

- A land property shall be considered in item 1.6 if some impact is predicted.
- Protected and fragile areas shall be considered in item of 2.6.
- Both surface and ground water shall be considered in item 3.2.

8.4.2 Summary of Environmental Issues and Examinations

(1) Social Environment

1) Resettlement

By the execution of each project, resettlement of existing housing and buildings is predicted at some locations of proposed road widening, new roads and new public bus terminals.

Spontaneous and Progressive Settlements

There are many "spontaneous" and "progressive" settlements to be relocated in Managua, as shown in Figure 8.4.1. "Spontaneous" is a settlement of urban squatters and "progressive" is another settlement which became legal settlement from spontaneous settlement by planning orders and urbanization program implemented. Relocation of these settlements is one of the social issues to be solved by urban development.

Especially, several spontaneous settlements have occupied illegally some sections of Managua Ring-road Project (1994) since the earthquake of 1972. Some portions of Travesía (Class 1 six-lane road) is proposed to be constructed as a part of the ring-road project. Total length of the ring-road project is approximately 16.8km. As of May 1994, 19 spontaneous settlement areas having 2,089 houses exist on a section of 4.07 km in the ring road project area. It is said, however, that total number of these settlements at present is estimated as more than two or three times of 1994.

It is predicted that some spontaneous and progressive settlements existing in areas of the proposed projects have to be relocated for the implementation of each project. Therefore, detailed study on such settlements will be required to look for measures to solve the issue.

• Road Sections to be Widened

As one of the results of roads and road traffic analysis, the current right-of-way (ROW) of the road network can be addressed as follows:

- Most of existing four-lane roads can be widened to six-lane road using the existing ROW
- Most of existing two-lane roads have a ROW of less than 18 m.
- There are some roads that can be widened from two lanes to four lanes or more using existing ROW.

Accordingly, existing housings along two-lane roads having a ROW of less than 18m will have a possibility to be resettled by the execution of these roads widening. Detailed study is required for the resettlement on such a road.

New Road Construction Sections

New road construction sections have a relation with the proposed land use plan as follows:

Progressive Urbanization and Spontaneous Settlements, to be Renewed Spontaneous Settlements, to be relocated 2 Lanes 4 Lanes 6 Lanes **T**

Figure 8.4.1 New Road Construction Project vs Spontaneous and Progressive Settlements

- New road constructed by 2003
 Most of "new road by 2003" will be constructed in/near the urban core and axis, and district center according to proposed land use plan of Managua for 2003.
- New road constructed by 2008
 Most of "new road by 2008" will be constructed in the residential area near the
 urban core and axis, and district center according to proposed land use plan of
 Managua for 2008.
- New road constructed by 2018
 Most of "new road by 2018" will be constructed in outskirts of the residential area and others according to proposed land use plan of Managua for 2018.

Some existing housings in areas of the proposed new roads will have a possibility to be resettled by execution of these road constructions. Therefore, detailed study is required for the resettlement on such an area with consideration of above noted characteristics.

- Public Bus Terminals
- Improvement of existing markets (Short and Medium-Term)

Among three terminals which are proposed to be constructed in parallel to the redevelopment and expansion of the existing markets, adjacent huge areas of *Mercado Oriental* are occupied by a lot of small stalls. Most of the stalls are illegal occupation and not authorized. There is a total area of 182,463 m², however, only 36,493 m² belong to ALMA. Many of these small stalls are occupying not only in the blocks but also both sides of many roads in the areas. Therefore, removals of these stalls will be required depending on the design and plan of the redevelopment, expansion and construction before the implementation.

Both Mercado San Judas and Mercado Virgen de Candelaria are relatively small markets located in a residential area. Accordingly, resettlements of some housings in these surroundings are predicted in accordance with the design and plan of the redevelopment, expansion and construction.

New construction sites (Long-Term)

Among three sites of new bus terminals proposed, *Villa Flor* is located in a residential area with three blocks. However, there is no existing bus terminal in the area and suitable space for it at present. Therefore, resettlements of some housings in the area are be predicted depending on the design and plan of the construction.

As for Sabanagrande and Satélite Asososca (Eduardo Contreras), they are developing areas in the outskirts of Managua. Present condition of roads in both areas is quite bad. Almost all roads are not paved well.

Around Satélite Asososca (Eduardo Contreras) area, there is private land space which is considered as a bus terminal. Several buses park in the space and a bus cooperative is situated in the space for coordinating operations of buses.

In Sabanagrande, there is no bus terminal at present. Only two buses are available in the settlement. The final stopping place for bus turning is called as "bus terminal" by the peoples of Sabanagrande.

Accordingly, social benefits and conveniences will increase for these two settlements by the execution of the project. It is evaluated as a result of field reconnaissance that enough spaces to construct a bus terminal exist in the fringe areas of these settlements at present. Therefore, bus terminals in these two settlements should be planned and constructed to increase positive impacts in accordance with the future urbanization and development plan.

2) Economic Activities

Approximately 80% of industries such as Textile Industry, Food Industry, Chemical-Textile Industry, Chemical-Petroleum Industry, Metal-Mechanical Industry and Chemical-Pharmaceutical Industry, and about 83% of the industrial employment of the nation are concentrated in Managua. Most of these large industries are located along Pista Pedro Joaquin Chamoro and Carretera Norte Via Panamericana. North part of the City is characterized by these large industrial activities. It is supposed that improvement of the roads and traffic conditions by the implementation of the proposed projects would give benefits and conveniences to these industrial activities.

On the contrary to this situation in the north, the east, the west, and the south of the City are less developed. However, changes of economic structures and land use values including agricultural productions, commercial activities and job opportunities are envisioned in the areas around new road construction and widening sections in the long-term. These changes may have impact of both positive and negative on the economic structures depending on the situations in these areas. Therefore, new road and widening sections in these areas shall be planned and designed to mitigate possible negative impacts with consideration of future developments and land use plans.

In addition to the above, some changes in the economic activities of/around Mercado Oriental, Mercado San Judas and Mercado Virgen de Candelaria are anticipated by the construction of new bus terminals. Accordingly, these construction plans shall be elaborated carefully to eliminate the negative impacts on these activities in cooperation and concert with the redevelopment and expansion plans of the markets.

3) Traffic and Public Facilities

In order to keep airplane operations safe, there exist two zones where constructions are restricted in the south-west of Managua International Airport as follows:

- Zone 1: A height is restricted to be less than 100 m high from the ground.
- Zone 2: A gradient is restricted to be less than 5 % degree slope.

In the proposed projects, no construction of more than 100 m high is planned. However, some locations of proposed new road will be in the zone 2. Zone 2 includes the following areas:

- South-west side of the airport
- Between 4,000 m and 6,100 m from the landing strip
- South-east side of Mercado San Miguel (I. Montenegro)

Therefore, new road construction in zone 2 shall be planned and designed in accordance with the restriction.

4) Split of Community

Road sections to be widened of the proposed road network are designed naturally along the existing roads. Therefore, the existing communities along these roads will not be split. However, little information of community structures in some fringe areas in the east, west, and south of the City, especially "blank" areas on the Land Use Map, is available at present. Accordingly, it is unknown whether there would be some possible impacts on communities located in the area of new road construction.

5) Cultural Heritages and Properties

Many facilities and properties in Managua were destroyed and damaged by two major earthquakes in March 1931 and in December of 1972. Most part of the City center was rebuilt after the earthquake of 1931. However, since the earthquake in 1972, the area has been left without remarkable construction development due to the Government decision.

Some of cultural heritages exist in the Managua including *Plaza de la Revolución*, *Palacio Nacional*, *Ruinas de la Catedra* (heavily damaged by the 1972 earthquake), *Palace of Arts*, *Montoya and Cacique Diriangen Monuments*, *Ruben Dario Teather* and so on. Almost of these heritages are located in the center of the City and along the existing roads.

Several archeological sites had been investigated in Managua. A total of 10 archeological sites were found so far. Eight locations among them are scattered along the southern shore of Managua Lake (Lago de Managua), namely between the lake and Pedro Joaquin Chamorro. Other two of UNI (Predios) and Vill Tiscapa are located around Tiscapa Lake, and remaining one San Cristobal is located on the south side of Caretera Norte at the east of the Managua International Airport. In Nicaragua, Decree No.1142 (December 1982) "Ley de Proteccion al Patrimonio, Cultural de la Nacion" protects archeological sites of the country.

Therefore, the proposed widening section around the *Tiscapa* Lake, and proposed new road sections around eight sites along Managua Lake and *San Cristobal* shall be carefully designed to avoid negative impacts on these archeological sites.

6) Water Rights and Rights of Common

There is no river in the Study Area. Therefore, no impacts on water rights are expected by the execution of the proposed project.

7) Public Health Condition

Some sanitation issues such as generation of solid waste and wastewater shall be considered in the construction of proposed bus terminals at 6 locations. Especially, three terminals will be planned to be constructed in parallel to the redevelopment and expansion of the existing markets. Therefore, adequate management to control these issues shall be taken in accordance with the following Decrees:

- Decree No.33-95 Regulations on the Evacuation and Polluted Waters of Domestic, Industrial and Agricultural Water
- Decree No.432 of April 17, 1989 Rules and Regulations of Sanitary Inspection
- Decree No.394 of October 12, 1988, Sanitary Regulations

8) Waste

Generation of surplus soil, construction and demolition waste, debris and logs are anticipated during the construction stage of the proposed project. Proper solid waste management will be required during the construction stage.

9) Disaster (Risks)

• Earthquake

Earthquake is a serious issue in this region and has negative impacts on social and natural environment, and to the urban development. As a matter of the fact, Managua was hit and destroyed by two major earthquakes in March 1931 and December 1972.

There are many seismic faults and inferred faults which mainly cross in a direction from north-east to south-west in the City. The positions of 12 major seismic faults have been identified according to existing data and literatures. This situation is critical for the proposed projects, therefore, particular geological survey and study is required at the detailed design stage of each proposed project. Some preventive measures shall be considered, especially for construction of fly-over and public bus terminals.

Road Flood

High precipitation is recorded in the rainy season from May to November in Managua. Particularly, after a heavy rainfall, which is frequently observed in the season, some roads in the City are flooded and submerged. These conditions would cause not only traffic congestion, disorders and accidents but also economic damages. Followings are the critical sections of the road flooding and submerging of the City.

- Intersection de Ferrenteria Lang 150 mts arriba (Inundación y Sedimentación)
- Dupla Norte: Frente al Taller Los Martinez
- De Montoya 4c. al Lago
- Semáforos de Linda Vista 1 c. arriba
- Costado de San Antonio

Some rainwater drainage systems along the road, which are connected mainly to the nearest storm-water drainage ditches called as *Cauce*, are constructed in the City. It is supposed that, however, the reasons for the floods and submerging on roads are clogs in pipes of the systems by some solid wastes and other substances, and/or overflows from the drainage systems caused by huge amount of the rainfall at one stroke, and so on.

Therefore, further study will be needed on actual conditions of the rainfall patterns, critical area of the floods and submerging and the rain drainage systems in Managua including position of its networks, acceptance capacities and, operation and management systems.

Improvement of existing rainwater drainage systems and construction of new systems shall be considered at the detailed design stage. Public notice and environmental education shall be considered to prevent illegal solid waste dumping into the drainage ditches and road side gutters.

Flooding Area

According to existing data, areas of flooding are found around Ciudad Sandino (west part of Managua), circumference of Laguna de Acahulinca and east of the Managua International Airport. Especially, some of the proposed projects will be located around flooding areas of Ciudad Sandino and in east of the Managua International Airport. Therefore, a study on the flooding and surrounding areas, and a topographical and geological survey is required for collecting basic data including extent of the critical areas, history of flooding and present situation. Provided that the flooding disasters in these areas have been observed frequently, the projects should be designed to avoid these areas.

(2) Natural Environment

1) Topography and Geology

The configuration of Managua extends with gently slope from South to North. The altitude of the City is from approximately 42m at south shore of the lake up to approximately 220m nearby *Sierras* (mountains) and the mean altitude is approximately 82.97m above sea level.

Land configurations around Asososca Lake and Nejapa Lake located in the west part of the City are relatively complicated with hills, lakes and valleys. It is said that the geology around these lakes consists of a fragile soil of some igneous rocks. As a matter of fact, the existing road section of Carretera Nueva A Leon between Asososca Lake and Motastepe hill has been moved from previous position due to landslides. Therefore, a study on the geology around these surroundings would be needed before the proposed construction of road widening and new road around the area.

2) Soil Erosion

No large scale excavation is proposed by the proposed projects. Therefore, no impact on the soil is predicted by project implementation. However, If excavation and slope cut is required during construction of new road and road widening around *Asososca* Lake and *Nejapa* Lake, due to the relatively complicated configurations of topography and geology, some consideration to avoid soil erosion would be needed during the construction stage.

Removal of existing vegetation is anticipated for the construction of new roads and widenings. Accordingly, in such a case, necessary measurements will be required to avoid exposure of the surface soil during and after construction including forestation.

3) Ground Water

On the east side of Managua, there is an aquifer mantle bed. However, the depth of the water level is approximately 22 m - 23 m from the surface of the earth. Also, there are a lot of water wells for domestic use in Managua. Ground water levels of some wells in the City are shown in the following Table.

Table 8.4.2 Ground Water Level of Wells in Managua

| Well | Position in Managua | Depth (m) |
|-------------------|---------------------|-----------|
| C. Sandino | North West | 64 |
| Eduardo Contreras | North West | 95 |
| Nejapa | South West | 116 |
| Centroamerica | South | 110 |
| Sabanagrande | East | 43 |
| Mercado Oriental | North | 38 |

Source: ENACAL (INAA)

No large scale excavation is proposed by the execution of each project. Therefore, no impact on the groundwater is expected by the project implementation.

4) Hydrological Situation

There is no river in Managua. However, some rainwater drainage ditches called as *Cauce* are located in the City. Due consideration to minimize the damage on these ditches and rainwater reserve ponds by construction of each project is required at the detailed design stage.

5) Coastal Zone

There is no sea coastal zone in the Managua. The City, however, spreads along the southern shore of Managua Lake with the length of approximately 23.5 km.

The project area does not include or face the coastal line of the Lake. Therefore, no impact is predicted on the line by the execution of each proposed project.

6) Fauna and Flora

• Fauna and Flora

Some endangered fauna is identified in Managua such as Garrobos (Ctenosaura similis similis), Iguanas (Iguana iguana rhinolopha), Chichiltotes (Icterus gularis), Sinsonte (dromococeyx phsianellus) and Piches (Dendrocygna autumnalis). However, detailed information regarding the habitats, ecology and distributions of these species is not available at present. And there is no specific protected area of Fauna and Flora in Managua. Taking the result of discussions with MARENA, ALMA and Nicaraguan environmental experts into consideration, it is supposed that there is no serious impact on the Fauna and Flora in Managua by the execution of each project.

Protected and Fragile Areas

Several crater lakes (Laguna) of old volcano exist in and around Managua. Most of the crater lakes and surrounding areas have been protected against development by Presidential Decrees. Motastepe hill having a 359.5 m height above sea level which is located at north-west side of the Nejapa Lake is also a natural reserve.

Therefore, a study on the fauna and flora will be needed before implementation of each project.

| Table 8.4.3 | Protected Crater Lake Areas |
|--------------------|--|
| Area (km²) | Remarks |
| 6.00 | Chiltepe Natural Reserve (Decree No.1320) |
| 8.00 | Chiltepe Natural Reserve (Decree No.1320) |
| 0.06 | Chiltepe Natural Reserve (Decree No.1320) |
| 0.69 | Tiscapa, Asososca, Nejapa Natural Reserves (Decree No.42-91) |
| 0.19 | Tiscapa, Asososca, Nejapa Natural Reserves (Decree No.42-91) |
| 0.13 | Tiscapa, Asososca, Nejapa Natural Reserves (Decree No.42-91) |
| | Area (km²) 6.00 8.00 0.06 0.69 0.19 |

7) Meteorology

No large-scale excavation and land reclamation which lead to a significant change of existing topography and geology widely, and no construction like high-rise buildings are proposed in the Master Plan. Therefore no impact is predicted on meteorological situation by the execution of each project.

8) Landscape

There is no specific views to be interfered by the execution of the proposed projects. However, at the design stage, some attention shall be paid on the design and layout of pedestrian bridges and fly-overs in the Public Transportation Corridor, public transportation facilities and bicycle and pedestrian path to make harmony with the surrounding environment.

(3) Pollution

1) Air Pollution

It is evaluated that air quality in Managua is not critical at present, according to field survey results and existing data. As a matter of course, increase of total number of vehicles in the City will make easily the air quality situation worse, particularly if existing inadequate vehicle maintenance remains unchanged.

In order to control quality and quantity of vehicle exhaust gas, in general, overall measures including establishment of national standard, car inspection system, monitoring system of spread of gases and so on are required. And also, it is required to decrease vehicle trips and increase average travel speed through a comprehensive urban transpiration projects and management.

As for national standards for air pollution and vehicle exhaust gas emission, they are not available in Nicaragua at present. However, a committee organized by MARENA, MTI and the Custom Office of Nicaragua has decided to check the exhaust gas of every vehicle from January 1999, and to control vehicle gas emissions from 2002. These movements by the Government will contribute to reduce air pollution caused by vehicle traffic.

MTI conducts periodically mechanical inspection for city buses. However, this system is limited only for mechanical check.

2) Water Pollution

On the east side of Managua, there is an aquifer mantle bed. The depth of the water level is approximately 22 m - 23 m from the surface of the carth. And there is no river in Managua. Accordingly, no impact is expected on both surface and groundwater by the execution of the proposed projects. As discussed earlier, however, proper management of the surplus soil, construction and demolition waste and so on is also required to prevent contamination of the water of Asososca, Nejapa and Tiscapa Lake caused by the wastes during the construction stage.

3) Soil Contamination

During implementation of the proposed projects, construction materials such as asphalt emulsion may possibly be dispersed on the earth along the construction sites. Therefore, suitable construction management is required to control the disperse.

After implementation of the proposed projects, vehicle exhaust gases will be dispersed on the roadside soil by the traffic. However, this situation would be not so serious as heavy metal contamination because that lead-containing gasoline has been prohibited to use in Nicaragua.

4) Noise and Vibration

Road noise levels of more than 60 dB(A) were observed during the field survey in Managua. It is one of the environmental issues in the City. Most of the sound sources at survey locations were:

- Gasoline and diesel engines
- Exhaust system without any muffler device or out-of-order
- Horn of such a vehicle as old and reconditioned cars, buses, trucks and motorcycles
- Interlocking paved road

Even though traffic situation is improved by the completion of proposed new road network plan, the situation of noise level would not be improved at all without any control of these sound sources.

Therefore, introduction of obligatory systems for equipping muffler devices and muted horn as a national standard to all vehicles will be a principal measure for mitigating road noise situation.

Interlocking paved road itself has a potential for generating noise and vibration by vehicle traffic. Most of the roads in Managua are paved either by asphalt or interlocking. Accordingly, conversion of interlocking to asphalt pavement may be required as one of the countermeasures for mitigating noise and vibration in critical areas.

5) Ground Subsidence

No large scale excavation which will affect the groundwater and geographical situation is proposed. Therefore, no ground subsidence is anticipated by the implementation of the proposed projects.

However, if excavation and cutting is required during construction of new road and road widening around *Asososca* Lake and *Nejapa* Lake, due to the relatively complicated configurations of these areas, consideration to avoid an affect on groundwater stream and ground subsidence should be given in the construction.

6) Offensive Odors

Specific offensive odors will not be produced by the implementation of the proposed projects except exhaust gas from vehicle. In order to control odors from exhaust system, vehicle engine maintenance is essential. Therefore, introduction of vehicle inspection system is awaited.

8.4.3 Results of Initial Environmental Examination

(1) Summary of IEE Results

Based on the examinations and discussions in the previous section, the initial environmental examination (IEE) was carried for the following projects:

- Road Network: Widening and new construction sections in the Short, Medium and Long-Term.
- Public Transportation Corridor: Short, Medium and Long-Term
- Public Transportation Terminals: Every proposed public transportation terminal

(2) Results of IEE

Each environmental item was rated according to the four categories shown in Table 8.4.4.

Table 8.4.4 Examination Category

| Category | Examination and Evaluation | Remarks |
|----------|-----------------------------|--------------------------------|
| Ā | Serious impact is expected | |
| В | Some impact is expected | |
| С | Extent of impact is unknown | Further study will be required |
| D | No impact is expected | |

The results of Initial Environmental Examination (IEE) can be summarized as presented in Table 8.4.5. The environmental items which were evaluated as categories "A", "B" and "C" are considered to require further studies on environmental impacts and the mitigation measures.

8.4.4 Overall Evaluation

(1) Environmental Items Required for EIA

Based on the results of IEE, the environmental items shown below are considered to be affected by the execution of each proposed project. Particularly, resettlement will be the most critical issue in the execution of projects of road and public transportation terminal from the point of view of environmental impact.

In Nicaragua, however, no specific technical guidelines for environmental impact assessment (EIA) is existing, in spite that the national EIA system has been set up by MARENA as shown in the next section. EIA will be needed on the following aspects:

Resettlement

The prediction for resettlement shall be done using a detailed map of distribution of the housing in the target area. A mapping survey by project will be required in order to identify the population, their economic conditions and related information. The situation of the resettlement site shall be studied to identify whether the site is suitable as an alternative land for living.

Regarding a compensation on properties affected by a road project, according to ALMA, there are two systems as follows:

- Partially affected: A compensation is given to the affected portion of land and building based on an appraisal made by Ministry of Finance.
- Totally affected: The Municipality gives alternative land if available, otherwise, pays a compensation according to appraisal value.

However, a compensation system for resettlement and relocation of the spontaneous settlements and illegal stalls around markets have not been established yet at present. Therefore, specific program to resettle and relocate the affected people shall be prepared to mitigate negative impacts before the execution of each project.

Economic Activities

Market structures, distribution of the illegal stalls around the markets, local economy and industry and future plans including regional economic development shall be studied in order to identify the actual condition of each existing market proposed to be redeveloped with public bus terminals.

Air Pollution

Total quantity of emission pollutant from vehicle exhausts shall be predicted for evaluating future air pollution. As one of the prediction methods, there is a model developed by the Public Works Research Institute, Ministry of Construction, Japan.

In this model, an "emission factor" and "traffic volume" of each vehicle type shall be prepared as parameters for the prediction. The emission factor per vehicle is obtained generally through a literature survey or assumed through related data and a field survey. Total emission pollutant produced by vehicle is given as a product of the emission factor of every vehicle type and traffic volume predicted for the target year.

Noise

Several prediction models of road noise level have been proposed and developed to evaluate impacts from noise generated by vehicle traffic. The models usually calculate a sound pressure level (SPL) (dB(A)) using some parameters of average power level (PWL) of noise per vehicle (L_w) (dB(A)), traffic volume (vehicle/h), velocity (km/h), and so on. Therefore, these parameters shall be obtained in the prediction.

(2) Other Environmental Items

The projects classified as category "C" require further studies on the following items:

- Traffic and Public Facilities
- Split of Community
- Cultural Property
- Disaster (risks)

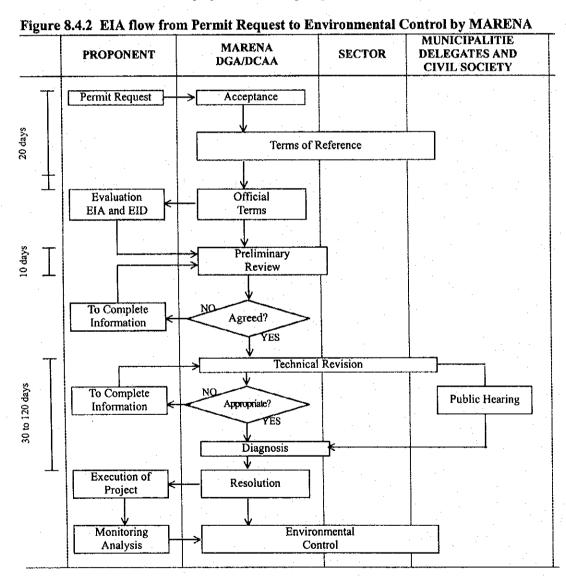

- Topography and Geology
- Soil Erosion
- Fauna, Flora and Protected Area
- Landscape

8.4.5 EIA system in Nicaragua

"Regulations to the Permission on the Environmental Impact Assessment (EIA: Evaluación de Impacto Ambiental)" has been established by Presidential Decree No. 45-94 in October 1994, and the procedural system of EIA was created at the same time by the Ministry of Environment and Natural Resources (MARENA). The regulation of EIA and its procedures can be summarized as follows:

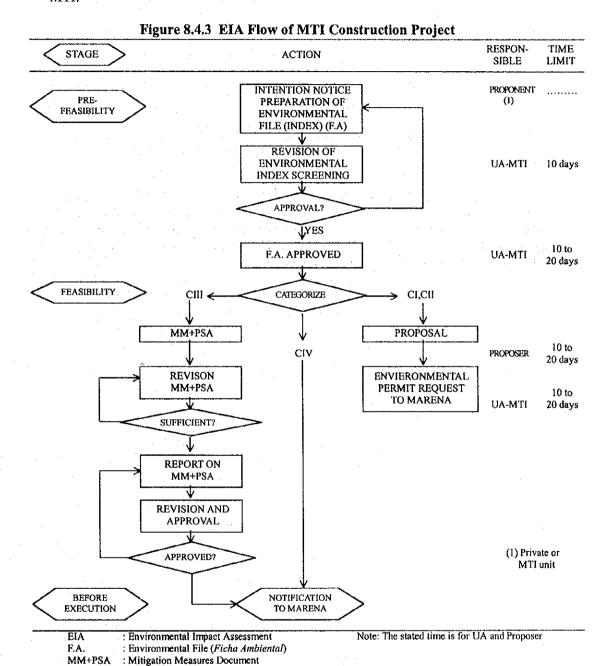

(1) Procedural Flow of EIA

The Division of Control of Environmental Activities and Economies (DCAA) of Directorate General of Environment (DGA: Direction General del Ambiente) of MARENA is responsible for the EIA system. Figure 8.4.2 is the procedural flow chart of EIA. In this chart, SECTOR stands for an Ad Hoc committee consisting of delegates from such entities as Ministries, organizations, authorities and private sectors involved in the project. The proponent submits the application form for issuing the permit to MARENA. The SECTOR discusses and/or evaluates the project at each step required in the flow.

(2) EIA for Construction Project by MTI

Regarding construction projects by the Ministry of Transportation and Infrastructure (MTI), the Ministry has its own internal EIA system. Figure 8.4.3 is the procedural flow of the internal EIA process for a construction project including road development by MTI

PSA : Environmental Follow -up Plan

Source: Ministry of Construction and Transportation (MTI)

: Mitigation Measures

MM

In the MTI's EIA process, every MTI construction project is screened and categorized in accordance with the project classification defined as Category A, Category B, Category C and Category D based on the EIA system of the World Bank (WB) as shown in Table 8.5.6.

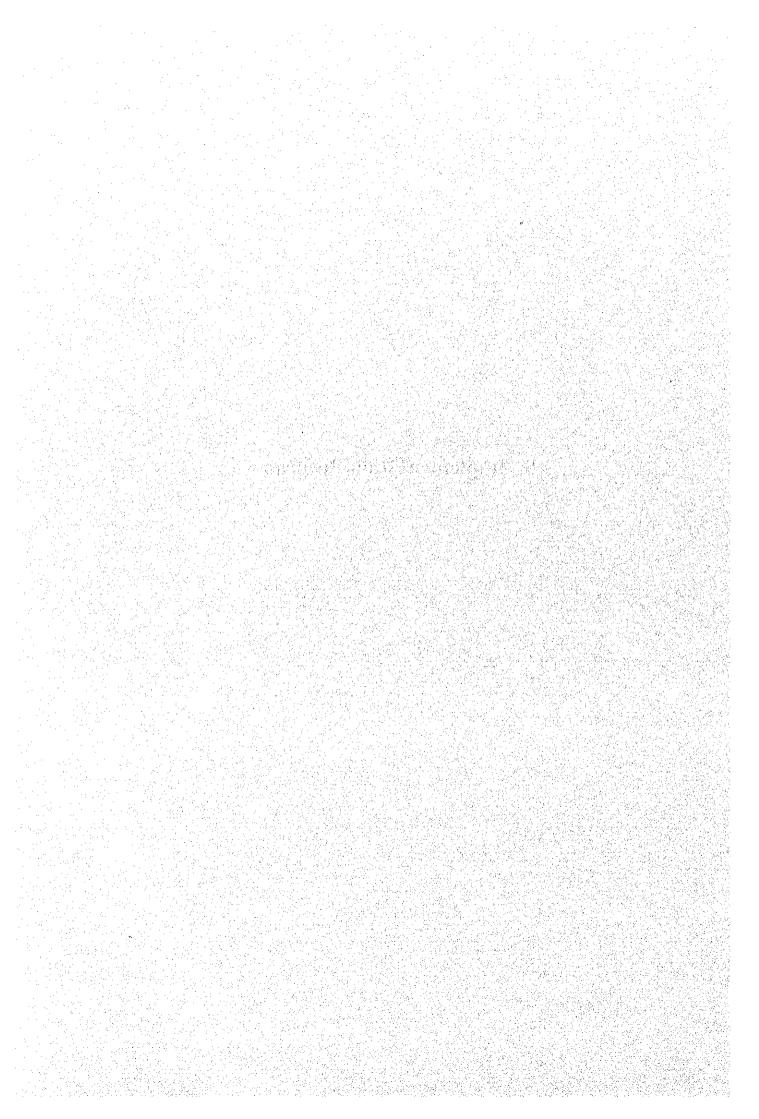

Table 8.4.6 Project Category for EIA process of MTI

| WB Categories | MTI Categories | Projects |
|---------------|----------------|--|
| Category A | CI | Environmental assessment (EA) is normally required, as the project may have diverse and significant environmental impacts. |
| Category B | CII | More limited environmental analysis is appropriate, as the project may have specific environmental impacts. |
| Category C | CIII | Environmental analysis is normally unnecessary, as the project is unlikely to have significant environmental impacts. |
| Category D | CIV | Environmental projects for which separate EAs are not required, as environment is a major focus of project preparation. |

Source: "Environmental Assessment Sourcebook, Volume I, Polices, Procedures, and Cross-Sectoral Issues, World Bank Technical Paper Number 139", 1991, Environmental Department, World Bank (Table arranged by JICA Study Team)

In any case of the categories CI, CII, CIII and CIV, the result of MTI EIA process is submitted to MARENA EIA process. The EIA results by MTI might be used on behalf of the formal appreciation form for the Environmental Permit of MARENA and the MTI delegate would be involved in the "SECTOR" of MARENA EIA process as one of the member for discussing and evaluating the MTI project.

(4) Summary

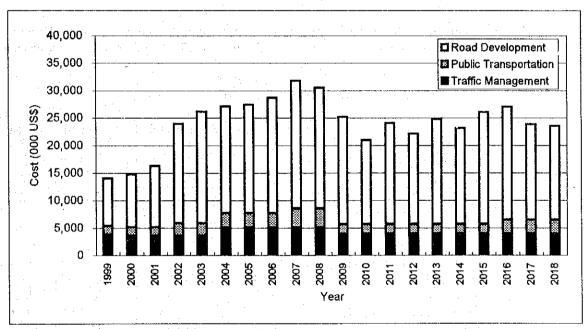

• The total cost of the Master Plan accounts for US\$481 million, as shown in Table 9.1.5. The allocation is US\$95 million in the Short-Term, US\$145 million in the Medium-Term and US\$241 million in the Long-Term. Required average annual investment is the highest in the Medium-Term. Figure 9.1.2 presents the annual investment requirement of the Master Plan.

9.2 Fund Source

(1) Self-Financing Projects

- As was examined by financial evaluation (see Section 8.3), there are some financially viable projects. They are:
 - 1. Travesía (Road Project Package No. 2).
 - 2. Public Transportation Corridor Carretera Norte and Pista Juan Pablo II/Pista Sabana Grande (Public Transportation Project Package No. 1 and No. 2).
 - 3. Public Bus Terminals (Public Transportation Project Package No. 7 ~ No. 12).
 - 4. Public Transportation Priority Areas (Traffic Management Project Package No. 13).
- For the above-listed projects, allocation of public fund is not necessarily needed due to the following reasons:
 - The private sector can be invited for the construction and operation of the project.
 - If the public sector implements the project by itself, commercial loans can be mobilized due to high financial viability.
 - If external grant can be tapped for the implementation of the project due to the high economic feasibility, the revenue can be used for the implementation of other transportation projects.
- Table 9.2.1 shows the investment requirements of the Master Plan considering the self-financing projects. The total investment of US\$481 million has been reduced to US\$395 million by about 18%.

Table 9.2.1
Investment Requirements of Master Plan

(US\$ million)

| | Short Term | Medium Term | Long Term | Total |
|--------------------------------|------------|-------------|-----------|-------|
| Road Projects | 67.7 | 105.4 | 181.6 | 354.8 |
| Self-Financing Projects | <u> </u> | 16.4 | 31.7 | 48.2 |
| Sub-Total | 67.7 | 89.0 | 149.9 | 306.6 |
| Public Transportation Projects | 9.2 | 14.7 | 20.1 | 44.1 |
| Self-Financing Projects | 7.2 | 12.7 | 16.1 | 36.1 |
| Sub-Total | 2.0 | 2.0 | 4.0 | 8.0 |
| Traffic Management Projects | 18.2 | 25.4 | 38.9 | 82.5 |
| Self-Financing Project | 0.2 | 1.4 | 0.6 | 2.2 |
| Sub-Total | 18.0 | 24.0 | 38.3 | 80.3 |
| All Projects | 95.2 | 145.5 | 240.6 | 481.4 |
| Self-Financing Projects | 7.4 | 30.5 | 48.5 | 86.4 |
| Total | 87.8 | 115.0 | 192.2 | 394.9 |

(2) Possible Fund Source

- Table 9.2.2 presents the summary of possible fund sources (refer to Chapter 6). However, the magnitude has a very wide range due to the following reasons:
 - 1. Aid from foreign countries is not reliable depending largely on the economic, social and political situation of both recipient and donor countries.
 - Increase of tax needs social consensus and amendments of related laws and regulations. Although the Petroleum Consumption Tax is likely to be raised soon, the municipal Road User Tax and the national Import Tax for cars will require a lengthy discussion to be amended.

• Thus the budget envelope will be US\$53 to 143 million in the Short-Term, US\$77 to 248 million in the Medium-Term and US\$239 to 750 million in the Long-Term to invest on the transportation sector in Managua.

Table 9.2.2
Possible Fund Sources for Managua's Transportation

(US\$ million)

| | | | (004 | шшы |
|---|--------------|-------------------|---------------|-----------------|
| | Short Term | Medium Term | Long Term | Total |
| Public (Existing Source) | | | | |
| Internal | 36.6 | 48.2 | 147.8 | 232.6 |
| • External (Grant) | (29.7) | (33.0) | (78.8) | (141.5) |
| • External (Loan) | (10.0) | (59.3) | (181.5) | (250.8) |
| Sub-Total | 36.6~76.3 | 48.2 ~ 140.5 | 147.8 ~ 408.1 | 232.6 ~ 624.9 |
| Proposed Tax Increase | | | | |
| • Real Property Tax (ALMA)* | 0.9 | 3.3 | 12.9 | 17.1 |
| • Road User Tax (ALMA) | (2.1) | (4.5) | (15.6) | (22.2) |
| • Petroleum Consumption Tax (Nicaragua)** | 15.7 | 25.0 | 78.0 | 118.7 |
| • Car Import Tax (Nicaragua)** | (47.5) | (75.0) | (235.0) | (357.5) |
| Sub-Total | 16.6 ~ 66.2 | $28.3 \sim 107.8$ | 90.9 ~ 341.5 | 135.8 ~ 515.5 |
| Total | 53.2 ~ 142.5 | $76.5 \sim 248.3$ | 238.7 ~ 749.6 | 368.4 ~ 1,140.4 |

Note: * Proposes timely amendment of cadastral values, not increase of tax rate.

** Assumes 25% allocation to Managua.

(3) Required Financial Arrangements

- In the Short-Term and Medium-Term, the investment requirements of the Master Plan are considerably larger than the lower limit of the budget envelope by US\$35 million and 39 million, respectively. This means that the proposed projects cannot be implemented unless a large amount of foreign aid (grant or loan) and/or new tax revenue are mobilized. There is a way to tap loans from foreign countries having the long-term revenue as a source of its repayment. However, this is also uncertain due to the current guideline set by IMF which is prohibitive for international funding organizations and bilateral sources to arrange new loans for the Government of Nicaragua, though this restriction is expected to be lifted in the near future.
- Therefore, it is strongly recommended for the Government of Nicaragua to secure a revenue enough to fund the proposed projects by increasing the rate of import duty for private cars. In parallel to this action, the arrangement to tap grant aid from external sources should be accelerated for immediate needs of funding.

10. CONCLUSION AND RECOMMENDATIONS

10.1 Conclusion

- 1. Urban transportation system in Managua is entirely road-based. While roads are relatively well provided in terms of right-of way (ROW), the network is configured without explicit functional hierarchy, and existence of missing links and lack of maintenance amplify inefficiency of the network. Construction of new roads is led by low-rise low- density urbanization which occurs inevitably under strong pressure of population increase and in the absence of strict control of the Government. Under these circumstances, Managua will become an energy-consumptive, expensive and environmentally poor auto-based city if road is not developed in compliance with an elaborated land use plan.
- 2. At present, the magnitude and seriousness of traffic problems are not outstanding yet in Managua as are seen in many other large cities in the world. This is not only because of the smaller scale of Managua's economy but because of the relatively high level of infrastructure stock and well disciplined behavior of the citizen. Due, however, to the increasing population and growing economy, traffic congestion will soon be serious. Volume/capacity ratio of roads, which is 0.6 at present, is projected to reach 1.1, over the capacity, by the year 2003. Hence, it is imperative to construct new roads in a well planned manner. If no measure is taken, road network efficiency as well as people's discipline will be eroded causing irreparable damages in the society and economy.

However, the problem of traffic congestion has never been solved in the world merely by constructing the road one after another. It is not only a waste of resources but a profanation to the living environment of the City. Road development must be executed in a balance with other measures of public transportation improvement, traffic management, and demand management. In other words, traffic problem cannot be solved by supply-side measures alone, and demand-side measures should be taken into account.

3. Public transportation is much more efficient than private car in terms of travel cost and road space. Managua should adopt a policy towards the creation of public transportation-based city. However, the current levels of service of public transportation should be upgraded in many areas such as safety, comfort, accessibility and diversity. This is very much critical to curb the future modal shift of people from bus to private car as income increases. Introduction of busways and different types of public transportation services including feeder bus, premium bus (e.g. air conditioned, all-seater, etc.), express bus and collective taxi will contribute to the improvement of Managua's public transportation system coupled with other supportive measures such as rerouting, adjustment of fare structure and development of public bus terminals.

Current public transportation of the City has been operated entirely by the private sector which is not the cases in many other countries. The Government should take advantage of the current situation and refrain from excessive intervention in the future. Therefore, the role of the Government in promoting public transportation-based city is basically to provide with necessary infrastructure for their efficient operation and regulatory framework to encourage entries, competitive operations and new type of services. For this, transit corridors should be defined clearly and public investments be concentrated into these priority areas.

4. At the current level of vehicular traffic, most of traffic congestions and safety problems at some critical sections can be solved or mitigated with low-cost traffic management measures. Usually traffic management measures produce a large

economic benefit compared to its small cost. The role is also important in the future to improve traffic flow, to reduce traffic accidents and to enhance road users' comfort. While conventional traffic management intends to streamline the existing traffic flow, demand management intends to control the demand itself using physical and/or pricing measures. In the context of Managua's situation, the demand management should be looked into from the two important angles. One is to discourage the use of private car and encourage the shift to public transportation, and the other is to generate additional funds for transportation infrastructure development through various user charges and taxes. However, direct pricing measures such as road pricing seem to be immature at present judging from the low time value of the citizen (i.e. distortion of traffic distribution could be unusually large). Presumably in the long-term, these measures should be looked into in relation to clearly determined target roads.

- 5. Safe and comfortable walking is the most fundamental component of urban transportation system. Sidewalk must be improved or constructed in conjunction with road improvement and construction works. Taking advantage of relatively ample road space, widely distributed open space including greenery and lakes in the City, pedestrian and bicycle paths should be provided to improve recreational and environmental conditions of Managua.
- 6. The severe natural conditions of Managua, particularly the possibility of earthquake, should be taken into account in planning land use and road network. Although it is impossible to prevent damages, the City must be ready to control the damage by establishing strong regulatory framework on the land use.
- 7. The proposed projects in the Master Plan will have no significant impact on environment except for possible relocation of housing settlements located in right-of-way of some of the proposed roads and in some sites of the proposed bus terminals. Air pollution, noise and vibration are also critical factors which need to be analyzed in relation to the proposed roads. It should be noted that the proposed projects would contribute positively to the improvement of environment as a whole.
- 8. There is a sheer lack of public funds to finance the implementation of the proposed projects. Particularly in the Short and Medium-Term, the proposed projects cannot be implemented unless foreign aid (grant/loan) and/or new tax revenue is tapped sufficiently.

10.2 Recommendations

Land Use Plan

- Authorize and legalize the proposed land use plan (with density restrictions) after discussions with relevant agencies and amendment, if any (Immediate Action).
- Conduct an in-depth study to compare various possible alternatives in relation to the proposed expansion of Managua International Airport, coupled with land use planning.

Road Development

- Execute the proposed road projects according to the implementation program. All
 the proposed projects are economically feasible.
- Pay due attention in the design of proposed road projects to avoid conflict with the proposed Public Transportation Corridors. Improvement of sidewalk and drainage must be taken into account as well.

- Invite the private sector in constructing the proposed Travesía as a toll road (Medium-Term). This project has been proven financially viable. Prior to the negotiation with the private sector, Government should establish the rules and regulations for implementing privately financed infrastructure projects.
- Conduct routine and periodic road maintenance systematically.

Public Transportation

- Construct Public Transportation Corridors, one on Carretera Norte (Short-Term) and the other on Pista Juan Pablo II/Pista Sabana Grande (Medium-Term). Although these projects are economically and financially feasible, a full-scale feasibility study should be conducted for the former (Immediate Action). Government should take a strong initiative in this project considering the huge economic benefit.
- Employ about 400 security guards to randomly inspect running buses in order to
 prevent in-vehicle crimes. This is an urgent issue to recover people's confidence
 towards the policy goal of public transportation-oriented city (Immediate Action).
 In order to reduce the number of traffic accidents, MTI should strengthen its
 capacity for inspection of bus units and operation.
- Diversify public transportation services by introducing feeder bus (Immediate Action), premium bus (e.g air-conditioned, all-seater, etc.), express bus and collective taxi (Short-Term). For feeder bus, service area should be determined considering the location of urban axes and Public Transportation Corridors.
- Conduct rerouting of bus routes and amendment of fare structure in a timely manner
 in order to rationalize bus operation and to solve the problems inherent to the
 commencement of new services. Bus fare structure should be amended from the
 current flat rate to distance-related system (Immediate Action).
- Construct public bus terminals in conjunction with development or renovation of
 public markets in Mercado Oriental (Short-Term), Mercado San Judas, Mercado
 Virgen de Candelaria (Medium-Term), Villa Flor, Sabana Grande and Ciudad
 Satélite Asososca (Long-Term). These projects seem to be financially viable at a
 relatively low terminal charge and would desirably be operated by COMMEMA.

Traffic Management

- Improve existing traffic signals by adjusting signal phases coupled with minor geometric improvement (Immediate Action).
- Execute intersection improvement projects according to the implementation program. This includes 259 signal installations coupled with coordinated traffic control on 4 sections, 16 grade separations and 5 roundabouts.
- Develop pedestrian crossings with signal installation to improve safety at 3 critical sections (Immediate Action).
- Develop a bicycle road of about 40 kms and a pedestrian path of about 5 km to connect the shoreline of Managua Lake, vista points, major cultural/recreational zones and universities (Long-Term).
- Designate Public Transportation Priority Area around public markets to improve traffic situation by restricting private cars. This should be done in conjunction with the development of public bus terminals.

- Designate On-Road Parking Banned Area in relation to the proposed Public Transportation Corridors for strict enforcement of parking control (Short-Term and Medium-Term).
- Increase the rate of Fuel Consumption Tax (Immediate Action) and Import Duty on cars (Short-Term) to discourage car use and ownership.
- Restrict truck routes by recommending (Short-Term) and designating (Long-Term)
 the truck roads in order to avoid the serious damage on road pavement caused by
 overloaded trucks.

Financing

- Establish an organization to construct and operate the proposed Public Transportation Corridors under strong initiative of the Government (Short-Term).
- Investigate the possibility for COMMEMA to construct and operate the proposed public bus terminals and Public Transportation Priority Areas (Short-Term).
- Take administrative steps to timely re-evaluate the cadastral value of real property to capture the indirect benefit of property owners due to road development (Immediate Action).
- Double the municipal Road User Tax (Rodamiento) for private cars (Short-Term).
- Start negotiation with the national Government regarding the allocation to Managua of the proposed Road Maintenance Fund (Fondo de Mantenimiento Vial) collected from Petroleum Consumption Tax (Immediate Action).
- Negotiate with the national Government regarding the possible increase of Import Duty for cars and its allocation to Managua (Immediate Action). This is important to finance the proposed projects in this Master Plan.
- Accelerate the arrangement to tap grant aid from international funding organizations and bilateral sources (Immediate Action).

Further Studies

- Conduct environmental impact assessment (EIA) for the identified road projects which need relocation of housing settlements.
- Conduct feasibility studies on:
 - Construction of Travesia (Short-Term).
 - Widening of Carretera Sur, Carretera Vieja a León and Carretera Nueva a León (Short-Term).
 - Widening and construction of Pista Portezuelo and Pista Rural de Circunvalación (Short-Term).
 - Widening and construction of Ave. Rubén Darío, Carretera a Masaya and Pista Alterna a Masaya (Short-Term).
 - Widening and Public Transportation Corridor Development of Carretera Norte (Immediate Action).
 - Widening, Construction and Public Transportation Corridor Development of Pista Juan Pablo II and Pista Sabana Grande (Short-Term).
 - Development of Public Bus Terminals and Rationalization of Bus Industry (Short-Term).
 - Intersection Improvement (Short-Term and Medium-Term).
