SUPPLEMENT E

Entity Relationship Diagram (ERD)

E.1 Explanation of Entity Relationship Diagram

The Entity Relationship Diagram is a modeling tool used for defining the information needs of business as an entity relationship model. Entity relationship modeling involves:

- The things of importance in an organization (entities)
- The properties of those things (attributes)
- How they are related to one another (relationship)
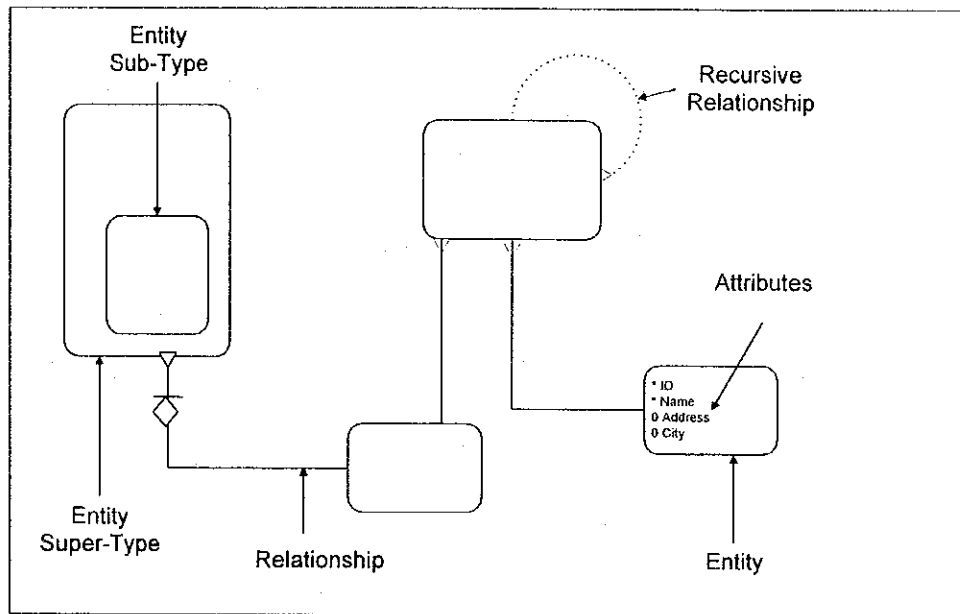

Figure E.1-1: Entity Relationship Diagram

1) Entity

An entity is a thing of significance, whether real or conceptual, about which the business or system being modeled needs to hold information.

Entities can be nested on a diagram to produce super-types and sub-types.
Figure E.1-2: Entity Conventions

2) Attributes

An attribute is any detail that servers to qualify, identify, classify, quantify or express the state of an entity. The types of the attributes that are displayed on an entity are indicated by the symbol displayed to the left of the attribute name.

Diagramming Conventions:

Symbol	Description
#	Unique identifier (UID) A combination of attributes and/or relationships that servers to identify uniquely an occurrence of an entity
*	Mandatory attribute
O	Optional attribute

DEPARTMENT

#*number
 * name
 o address
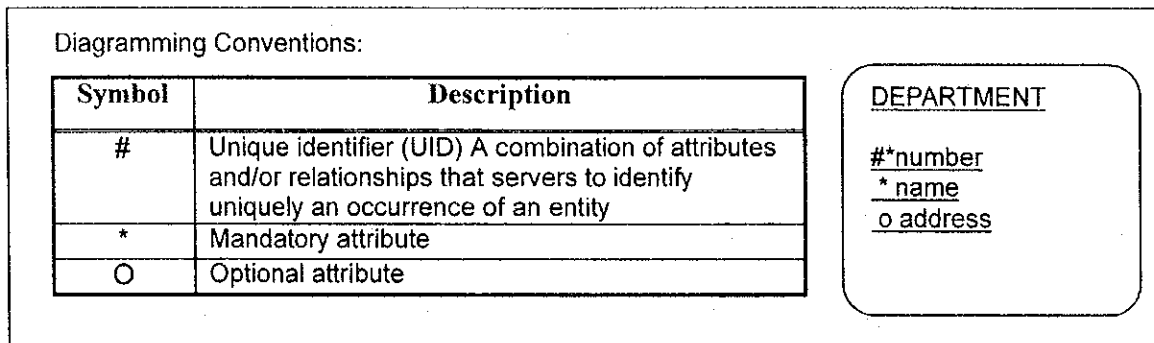

Figure E.1-3: Attributes Conventions

3) Relationship

A relationship is a two-directional, significant association between two entities, or between an entity and itself.

Relationship Syntax

Each Entity 1 { Must be / or / May be } relationship name { one or more / or / one and only one } Entity2
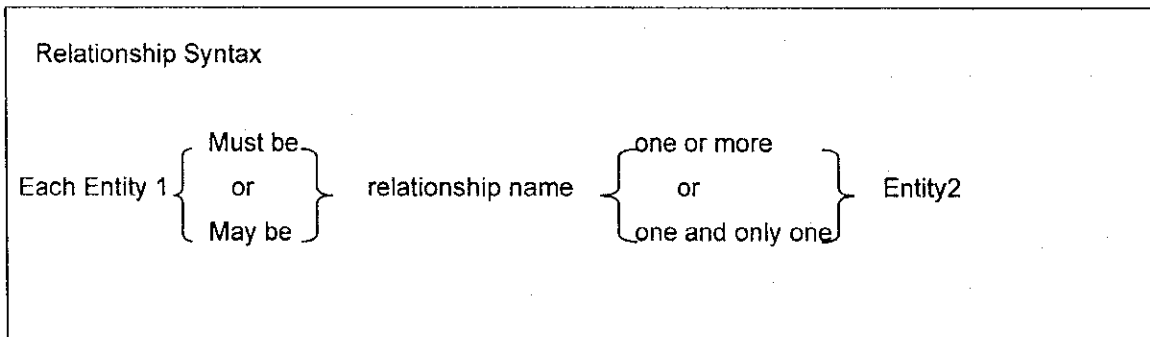

Figure E.1-4: Relationship

Each direction of a relationship has:

• A name

• An optionality, must be or may be

• A degree, one or more or one and only one
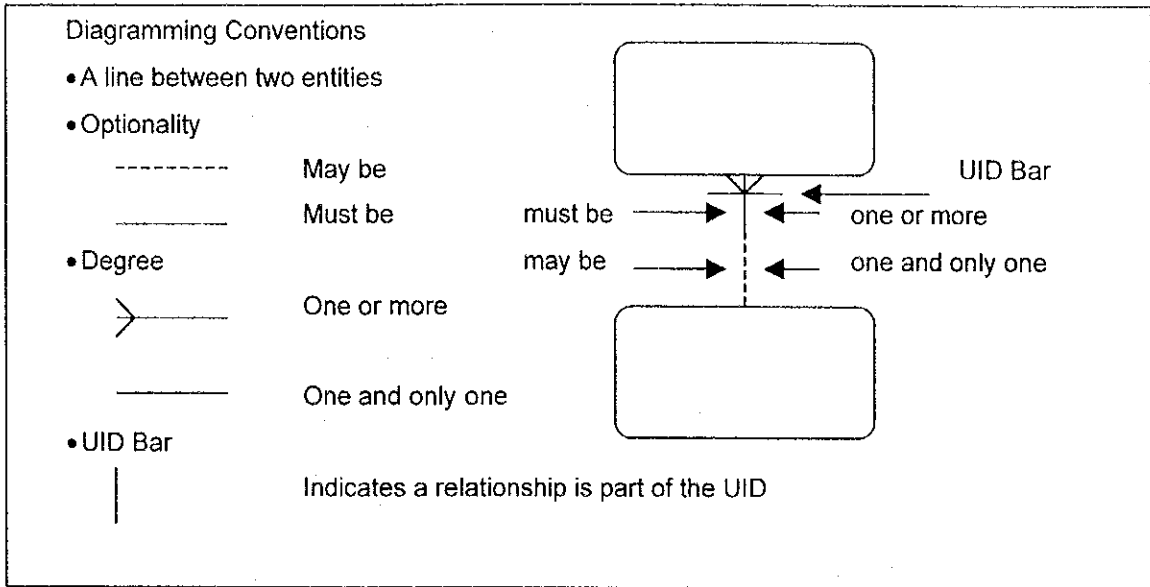

Figure E.1-5: Relationship Conventions

Figure E.1-6: Relationship Example

The relationship between COURSE and INSTRUCTOR is:

- Each COURSE may be taught by one and the only one INSTRUCTOR
- Each INSTRUCTOR must be assigned to one or more COURSEs

4) Physical Model

In physical model, super-types entity and each sub-types entity are generated as one table. Attributes of the table are its own attributes and their super-types attributes.
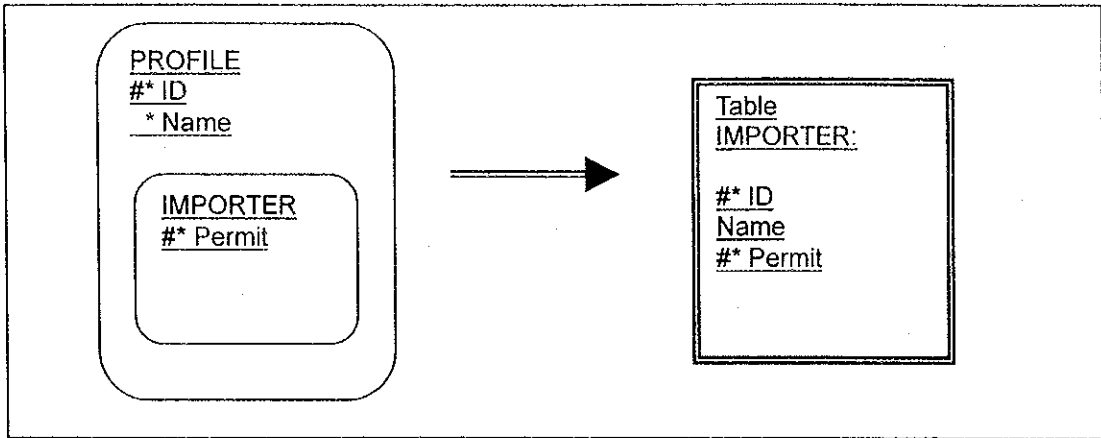

Figure E.1-7: Super-Types and Sub-Types Physical Model

In physical model, there are relationship attributes as attributes of one entity and no effect for another entity.

Figure E.1-8: Relationship Physical Model
