# Chapter 7

# **Transportation Demand Forecast**

#### **Chapter 7** Transportation Demand Forecast

#### 7.1 Objective of the Analysis and Simulation Cases

The objective of the simulation is to quantitatively test the concepts and principles of the transportation system development, such as the foundation of the "Urban Transportation Management Policies and Strategies" mentioned in Chapter 6, the recommendation of the "Long Term Development Plan" mentioned in Chapter 8, several traffic management schemes to be discussed in the "Traffic Control and Management System" mentioned in Chapter 9. Furthermore, based on the projected transportation demand coupled with the corresponding costs, transportation policies and strategies are examined economically and financially in "Economic Analysis" in Chapter 12 and "Financial Analysis on Public Transport Projects" in Chapter 13. Future traffic demand is also the primary input into the environmental air pollution analysis in Chapter 14, thus providing the vital link between the impact of transport policies on the environment.

Several combinations of infrastructure development and transportation demand management schemes are taken into consideration for evaluating the impacts of the various policies and strategies on transportation system development.

Future transportation demand has been predicted for 30 cases as listed in Table 7.1.1. They include simulation runs with and without improved public transportation system (trunk bus system and/or LRT system), highway network development and traffic restraint scheme(area pricing).

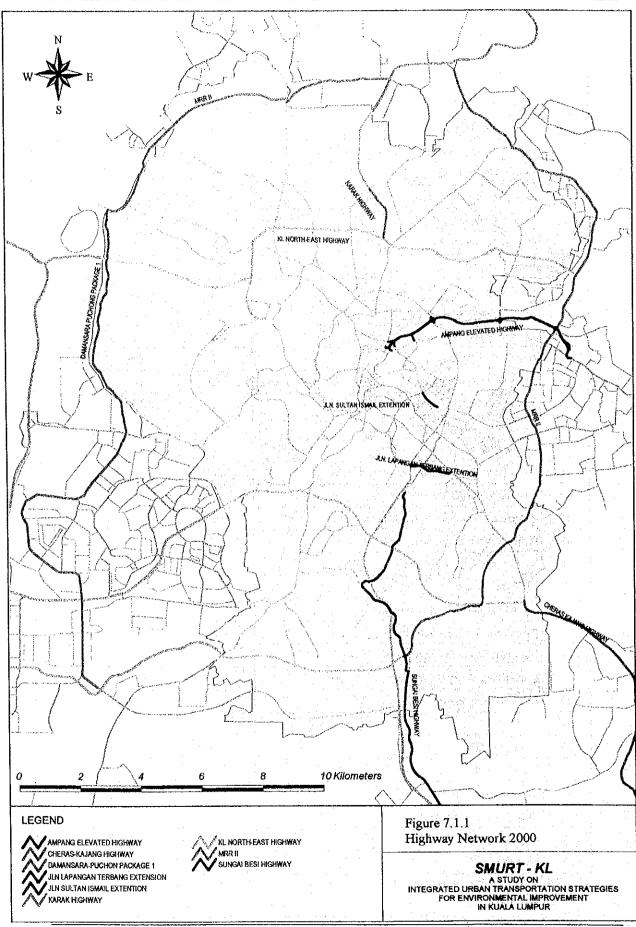

Components of the highway network to be added onto the existing highway network for demand projection years 2000, 2010, and 2020 are listed in Table 7.1.2 and the highway network is shown in Figures 7.1.1 through 7.1.3. The composition of the public transport network is summarised in Table 7.1.3 and the public transport networks for simulation cases are illustrated in Figures 7.1.4 through 7.1.8.

## 7.2 Future Trip Production 2000 - 2020

Trip production in the Kuala Lumpur Metropolitan Area will gradually increase at an average annual growth rate of 2.73 percent in the period from 1997 to 2020, while population in the metropolitan area will increase at 1.2 percent per annum, and job opportunity at 2.0 percent per annum. The higher growth rate of the person trip demand compared to population and job opportunity could be attributed to an increase in real household income because members of higher income households make more trips than their lower income counterparts. Since the job opportunity increases more rapidly than the population, NHBB (non-home-based business) trips and NHBO (non-home-based others) trips will increase above the average growth rate of the total person trip production. In contrast, HBS (home-based school) trips will increase more slowly due to the change in age structure.

Table 7.2.1	Trip Production Growth in Kuala Lumpur Metropolitan Area
-------------	--

		· · ·		(unit : 1	000 person trips)
Trip Purpose	1997	2000	2010	2020	Average Annual Growth Rate 1997-2020

### 7.3 Trip Production and Attraction

Figures 7.3.1 and 7.3.2 show the predicted total trip production and the trip attraction of "Home to Work Place" trips. Due to continuing suburbanisation, trip production will increase more rapidly in the suburban areas as illustrated. On the other hand the primacy of the CBD in the Kuala Lumpur metropolitan area will be strengthened due to the on-going large-scale urban development projects. These urban development projects create an additional 200 ha of office space by the year 2000, of which KL Sentral and KLCC account for 54% (112 ha). These new urban centres will emerged outside the existing CBD, and consequently the trip production and attraction pattern will be changed.

#### 7.4 Future Trip Distribution : 2000 - 2020

(1) All Trip Purpose

Figures 7.4.1 and 7.4.2 show the predicted trip distribution of "all trip purpose" for the years 1997 and 2020.

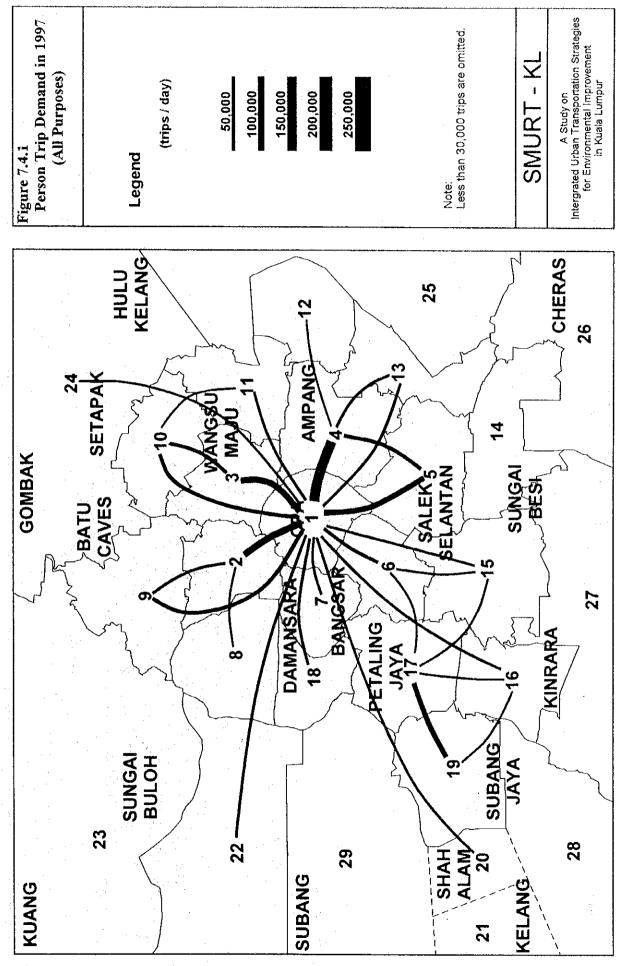

In 1997, the CPA(Central Planning Area) indicates a strong connection with the surrounding areas, in particular, with Ampang, Wangsa Maju, and Kepong areas. This indicates that CPA is a significant urban centre in the Kuala Lumpur metropolitan area. Another centre is found in Petaling Jaya, and it shows a strong connection with Subang Jaya and Puchong areas.

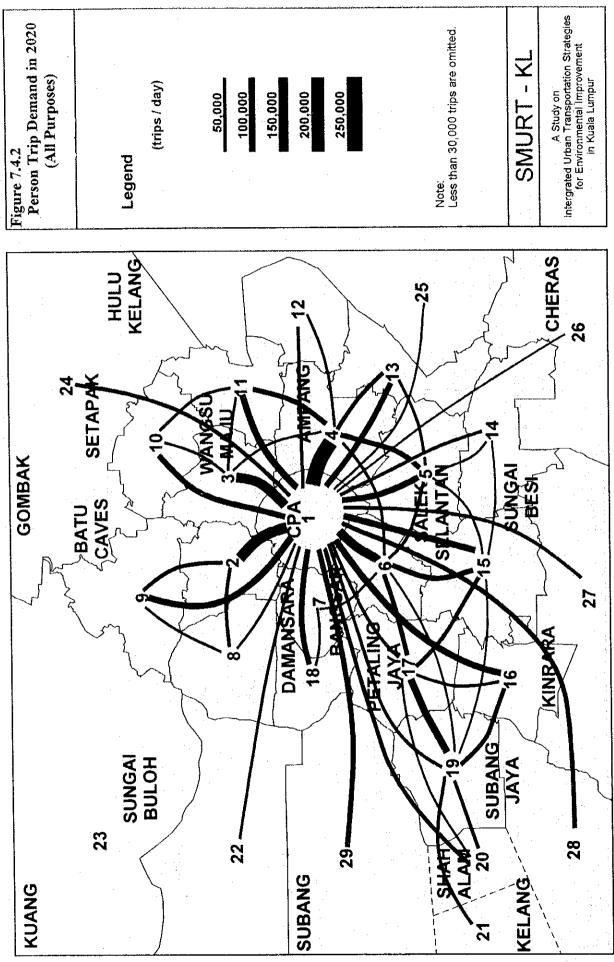

In 2020 the connection between the CPA and the other zones will be strengthened and the trip demand between those zones will increase significantly. In addition, origin destination pairs with more than 30,000 trips will be spread out over the metropolitan area. The increase in trip demand in volume coupled with longer trip lengths will be heavy burden on the transportation network in the future.

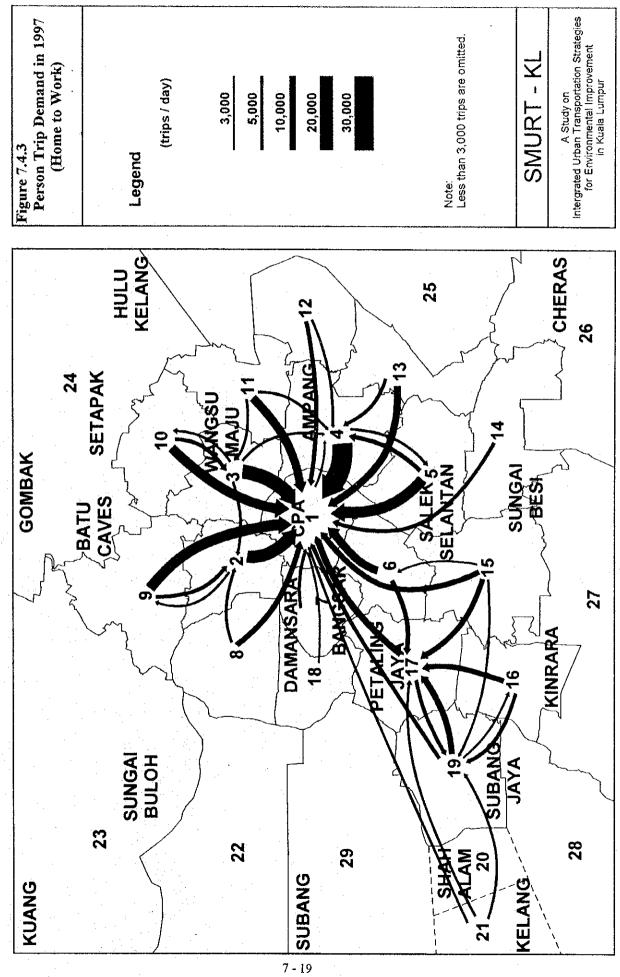

(2) "Home to Work Place" Trips

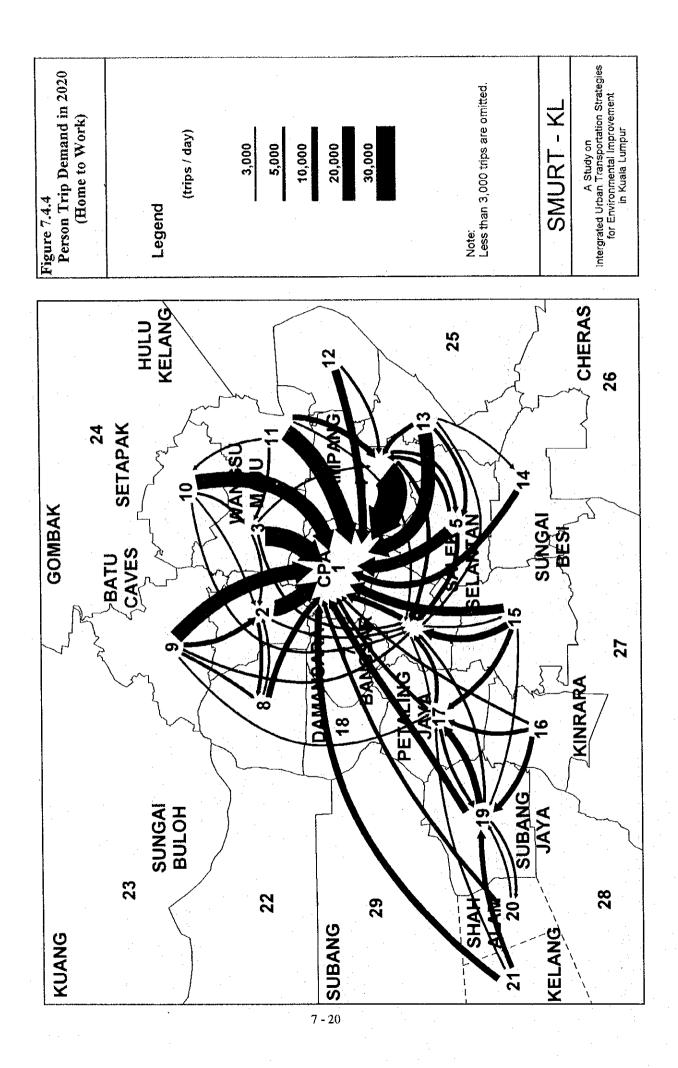

Figure 7.4.3. and 7.4.4 illustrate the predicted "Home to Work Place" trip distribution pattern in the years 1997 and 2020.

In 1997 many employees commute to the CPA from the surrounding suburban areas. Since job opportunity will increase due to large scale urban development in the CPA, trip attraction of "home to work place" purpose in the CPA will increase tremendously. Petaling Jaya and Subang Jaya will also see an increased trip attraction from the surrounding areas. It should be noted that the Zone No 6, which includes KL Sentral, will be a new work place centre and attract many employees from many zones in the metropolitan area.

#### 7.5 Modal Share in 2000 -2020

The share of public mode of transport in the Kuala Lumpur Metropolitan Area is estimated to be 24.0 percent in 2000, 23.6 percent in 2010, and 25.6 percent in 2020 under the BASE cases(as shown in Table 7.5.1), in which both highway and public transportation network development is assumed to be completed according to the schedule listed in Tables 7.1.2 and 7.1.3. The drop in public transport share between 2000 and 2010 is attributable to the excessive expressway development planned in the period. When a traffic restraint scheme, such as the area pricing is applied and the total number of car trips in the CBD is limited at the level of the year 1997, the share of public transport will slightly increase to 24.2 percent in 2000, 25.4 percent in 2010, and 28.9 percent in the metropolitan area as shown in Table 7.5.1 and Figure 7.5.1.

In the CBD, the share of public transport is 19.1 percent in 2000, 19.3 percent in 2010, and 20.7 percent in 2020 (as listed in Table 7.5.2) under the BASE cases, which include the highway development and public transport system development by trunk bus system. If a traffic restraint scheme is introduced in the CBD, the share of public transport in CBD-related trips will increase sharply to 20.3 percent in 2000, 29.3 percent in 2010, and 40.3 percent in 2020.

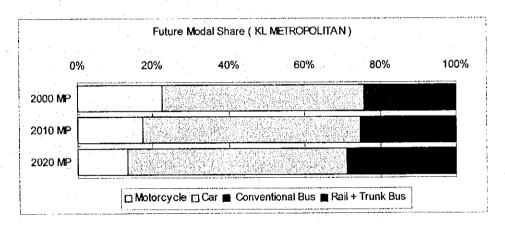

Figure 7.5.1 Modal Share in KL Metropolitan Area

If the rail-based transport system were not provided at all, in other words, only trunk bus system and conventional bus system were available (Without Railway Case), the share of public transport in the Kuala Lumpur metropolitan area is estimated at 20.5 percent in 2000, 20.9% in 2010, and 21.9% in 2020, respectively. With regard to the trips related to the CBD, the share of public transportation is estimated at 16.8 percent in 2000, 24.6 percent in 2010, and 30.1 percent in 2020, respectively.

Table 7.5.2 Predicted Modal Share in CBD

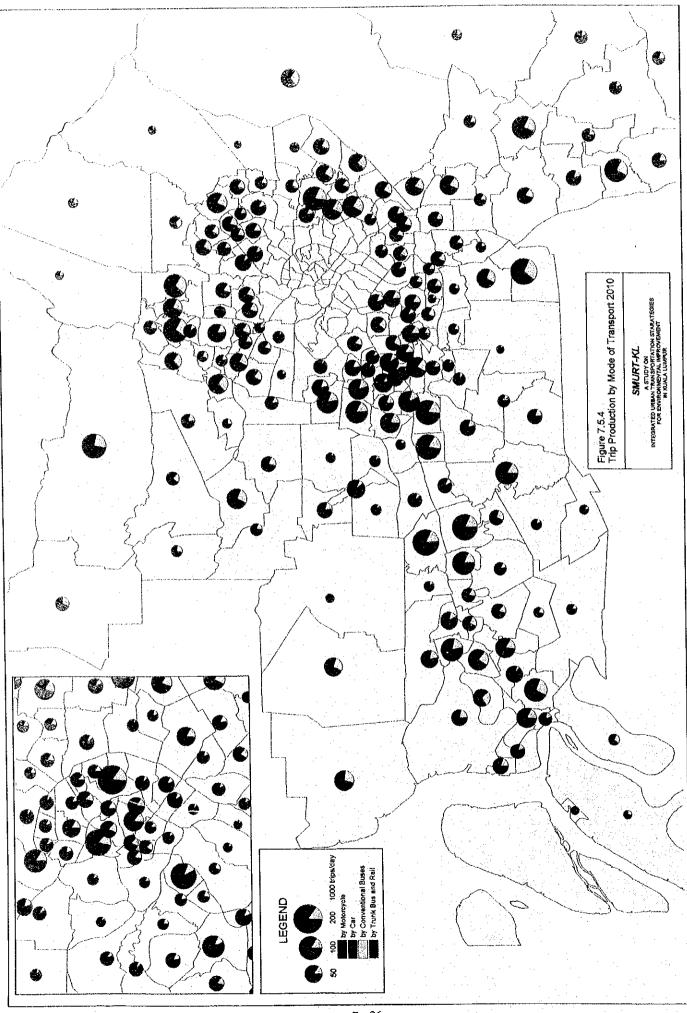

Source : SMURT-KL Estimate

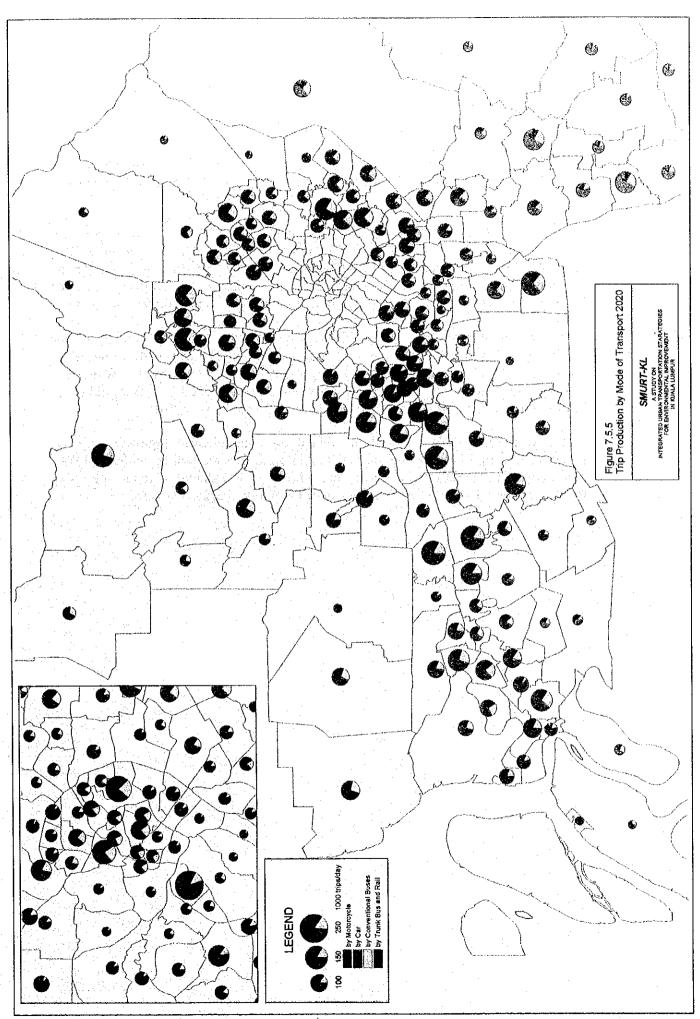

The trip production by mode of transport in 2000, 2010, and 2020 is depicted in Figures 7.5.3 through 7.5.5.

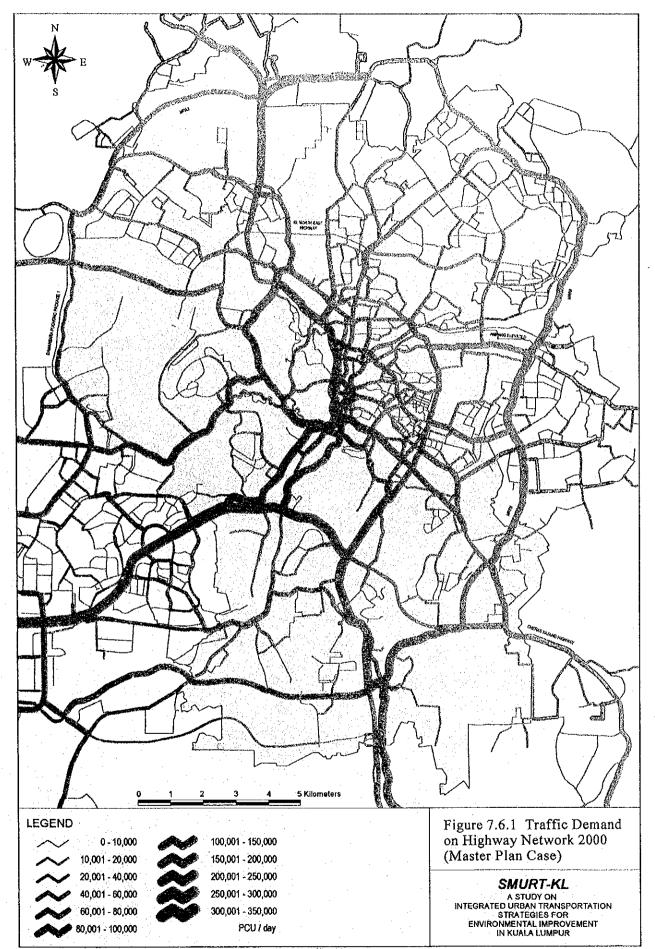

### 7.6 Future Traffic Demand on Highway Network

Figures 7.6.1, 7.6.2, and 7.6.3 show the predicted highway traffic volume for the years 2000, 2010, and 2020 for Master Plan cases (both highway development and trunk bus system development, and with an area pricing scheme).

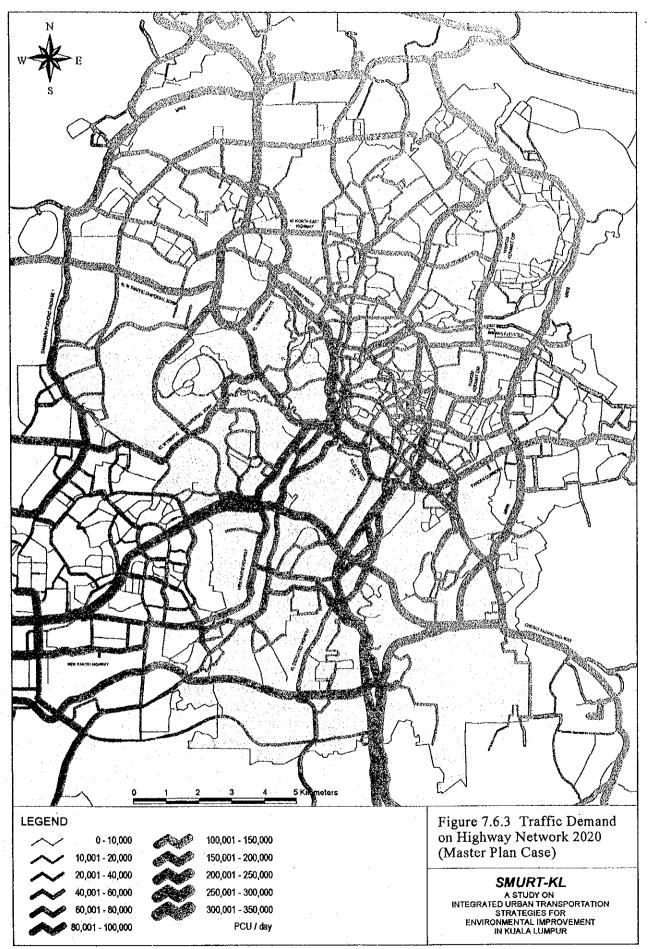

In the year 2000, the eleven highway projects including new construction and improvements will be completed. Among them, the eastern part of the Middle Ring Road II, with a traffic volume 100,000 p.c.u. per day, will be effective in alleviating the congestion in the inner city area. On the contrary, the Ampang Elevated Highway and the North East Highway will carry less traffic due to the high toll rate.

In the year 2010, more road space will be provided outside the CPA mostly by the expressway projects, but little road space will be augmented within the CPA. Furthermore, many new expressway development projects such as Wangsa – Keramat, KL Transit, start from or end at the Middle Ring Road I. This would result in further worsened traffic congestion within the CPA in the year 2010.

In the year 2020, traffic is well distributed over the planned highway network. However it should be noted again that limited arterial roads will be added onto the road network in the CBD, thus traffic demand in the CBD should be reduced by both traffic restraint measures and enhancement of the public transport system.

#### 7.7 Future Passenger Demand on Public Transport Network

(1) Alternatives for future public transport network

Alternatives for future public transport network were established based on the understanding of the following items,

- Existing public transport passenger demand (Figure 7.7.1)

- Existing railway services and feeder bus services (Figure 7.7.2)

- Existing bus operation (Figure 7.7.3)

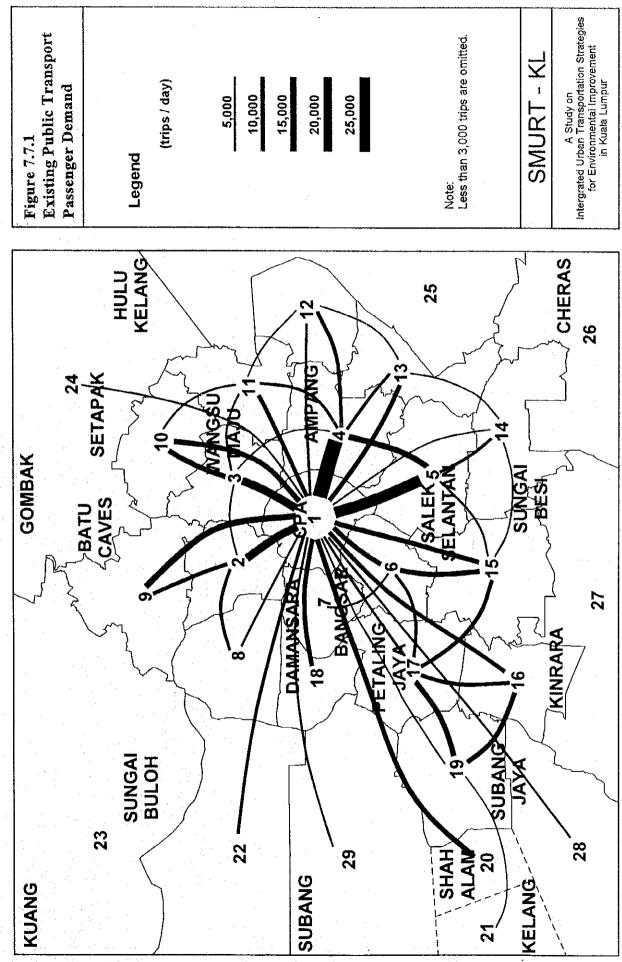

- Rail-based transport network development plan

First of all, the areas left out by the railway services were extracted and the corridors which need an enhanced public transport system were identified. These corridors include a) Kepong, b) Damansara, c) Puchong, d) Cheras, e) Ampang, f) Genting Klang/Gombak.

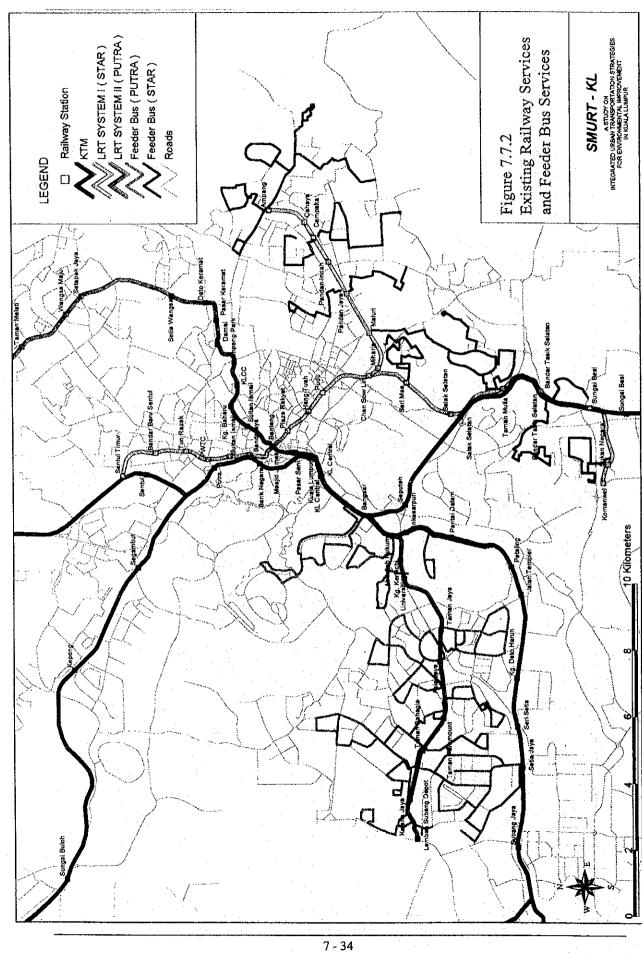

To examine the magnitude of the passenger demand on the selected corridors, a trunk bus system was applied for all the corridors. Figure 7.7.4, Figure 7.7.5, and Figure 7.7.6 shows the predicted trunk bus and railway passenger demand for the years 2000, 2010, and 2020 for the BASE cases. The predicted passenger demand on each line will increase gradually as indicated in Table 7.7.1, and the average number of passengers per distance is also listed in Table 7.7.2.

In the year 2000, although it is assumed that the northern part of the LRT System(I) SATR from Sultan Ismail to Sentul Timur, the LRT System (II) Putra Phase(II) section between Pasar Seni and Gombak Terminal, the circular part of PRT Monorail in CBD, and the KTM Batu Caves extension are all completed in addition to the existing railway network, moderate passenger demand is predicted.

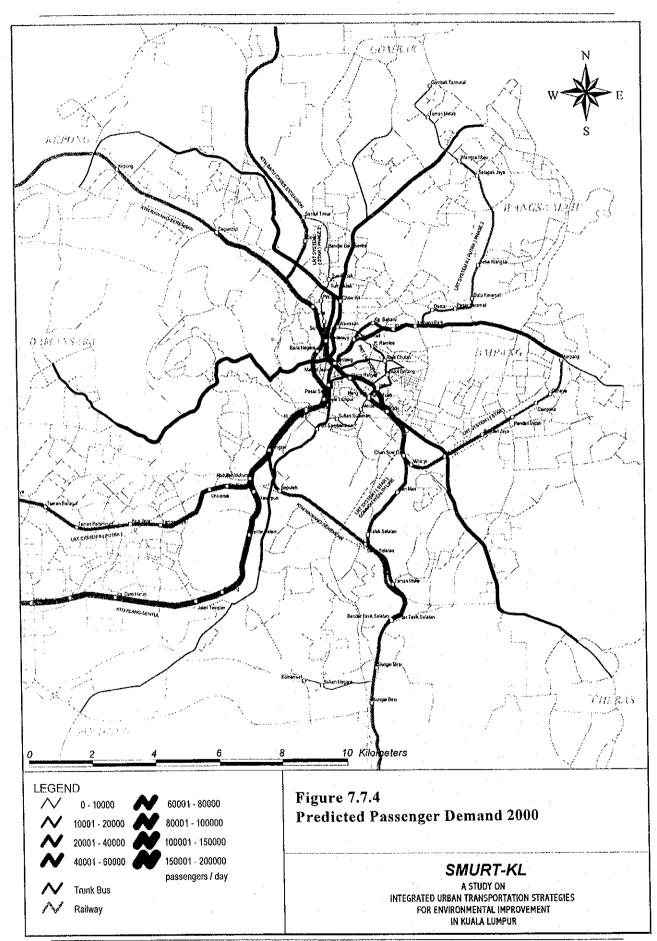

In the year 2010, the passenger demand will continue to increase, however the growth of passenger demand vary from line to line. In particular the PUTRA Phase(II) line, Genting Klang line, Damansara line will have a moderate increase compared to the passenger demand in 2000. This small increase in passenger demand can be attributed to the expressway development in these areas. The Wangsa-Keramat expressway will attract people to use cars rather than the PUTRA Phase(II) and Trunk bus Genting Klang line, while the development of the KL Transit Route and KL Western Traffic Dispersal Scheme will derive potential passenger demand from the Trunk bus Damansara line.

Source : SMURT-KL Estimate

Among the seven corridors, the Cheras corridor has the highest average number of passengers in 2020, followed by Genting Klang, Damansara, and Ampang. However these predicted demands will not meet the required passenger demand for LRT operation. (Details will be argued in the Financial Analysis on Public Transport in Chapter 13).

If the traffic restraint scheme is applied and the traffic demand in CBD is limited at the 1997 level, person trips related to the CBD will increase by 148,000 in 2010 and 237,000 trips in compared to the cases without traffic restraint. In the year 2020, the modal share of public transport in the CBD would increase to 40 percent from 17 percent in 1997 as described in Section 7.2. Under such a car use restraint scheme, the passenger demand on the railway as well as the trunk bus system were predicted as shown in Table 7.7.3. The most significant impact of the area pricing scheme on passenger demand can be seen in the number of passengers of PRT (Monorail) North Line. In the year 2020, the number of passengers on the PRT North Line will increase from 105,000 to 154,000 due to the traffic restraint scheme.

Table 7.7.3Comparison of Passenger Demand by With and Without Area Pricing<br/>and by Railway and Trunk Bus Line, 2000, 2010, and 2020

To explore the possibility of conversion from a trunk bus to LRT, three alternatives for public transport network, shown in Table 7.7.4, were examined.

Network	Description		
LRT Network (A)	The planned LRT lines, Kepong line and Cheras line, as well as PRT south section are included and the corresponding lines are eliminated. Other trunk bus routes, Ampang, Genting Klang, are converted into LRT.		
LRT Network (B)	Compared to the LRT Network (A), LRT Cheras line and LR Damansara line are cross-linked via Jalan Raja Chulan.		
Combination of LRT and Trunk Bus	Only one LRT line Damansara – Raja Chulan – Cheras line is included, and other lines are operated as truck bus system.		

 Table 7.7.4
 Alternatives of LRT Network

<b>Table 7.7.5</b>	Average 1	Number o	f Passengers	(With A	Area	Pricing)

Line	LRT (A)	LRT (B)	Combination	
LRT Ampang / Trunk Bus	32,200	27,200	21,700 *	
LRT Cheras (A)	42,200	-	<b>.</b>	
LRT Raja Chulan-Cheras (B)	-	45,800	50,200	
LRT Damansara	38,300	43,800	46,400	
LRT Genting Klang	11,800	27,900	30,000 *	
Monorail South/ Trunk Bus Puchong	20,700	22,900	31,000 *	
LRT Kepong / Trunk Bus	41,200	41,500	22,300 *	

Note: \* indicates the trunk bus operation rather than LRT on the lines.

The Combination of LRT Raja Chulan – Cheras and LRT Damansara in LRT Network (B) will carry more passengers than the combination of LRT Cheras and LRT Damansara in LRT Network (A) because the LRT network (B) passes through the Golden Triangle area. Since the other lines have less passenger demand and competitiveness against the existing and on-going railway/LRT system, a trunk bus system would be more suitable for these lines. In the case of the combination of LRT Damansara- Cheras (via Raja Chulan) and trunk bus system on the other routes, the average number of passengers on both Raja Chulan- Cheras and Damansara sections will be greater than those on the LRT Network (B).

Consequently, the combination of LRT and Trunk Bus System is the most suitable public transportation system among the three alternatives.
