8.4 Types of Facilities and Implementation Criteria

8.4.1 Water Supply

3

(1) Urban water supply

With regard to the development/expansion of urban water supply by municipality, existing conditions, future requirements and planned/on-going projects were reviewed during the preparation of this PW4SP. The potential water source for future development was also evaluated in Chapter 7, taking into account the possibility to utilize untapped spring sources. The location of urban areas of the respective municipalities/city was referred to Figure 3.4.1 in Chapter 3, Supporting Report. Table 8.4.1 presents the basic figures on the existing service coverage, water sources and future requirements. The following show the results of this rapid study by municipality.

Baungon

Only one Level III system exists which is managed by the municipality (served population is 1,000, or 21% of urban population). Water source (estimated supply amount of 100 cu.m/day) is a combination of spring and deep well. The project to augment transmission line and expansion of distribution system is under way waiting funding from the ADB-urban and LGU-urban project. Expansion work will cover part of rural barangays, since the transmission line passes these areas. Spring source is sufficient for the project.

<u>Cabanglasan</u>

There is no Level III system at present. The Poblacion area (4,000 population) uses Level I with deep wells. There is an on-going Level II project using spring source (however, supplementary spring source is necessary; about 20km away from the service area is costly and requires river crossing). Investigations on both spring and wells shall be proceeded.

Damulog

There is no Level III system at present and instead uses Level I and II systems. The water source is deep well. Upgrading from Level II to Level III was made at some systems, but only adopted the so called "spaghetti connection". Proper plan and design for the upgrading are requisites. Urban population to be served is less than 4,000.

Dangcagan

There is one Level III system with Level II service (combined sources; spring and deep well are used) which is managed by the municipal government. About 20% of the urban

Unit consumption: 100 lpcd Additional population served in 2010 includes the served populations that will be absorbed by Level it! system.

population (urban population is only 4,500) is served by the system. Expansion of the system is required. There is a good spring source, 8km away from the service area (pumping system is required). Study on the expansion with reference to the source shall be conducted considering the services to the barangays where transmission line will pass.

Don Carlos

There is one WD covering about 2,100 population (9% of urban population). Promotion of the users to join the WD is under way. Currently, they use shallow wells (more than 1,000 in number). Water sources of the WD are lake water and deep well. Expansion shall be provided with sufficient information dissemination.

Impasugong

One Level III system exists which is operated by the RWSA (2,300 persons are served, 43% of urban population). Water source is a spring (deep well is stand-by). Expansion shall be done using spring (sufficient quantity) with emphasis on the distribution line (financial arrangement is the subject).

<u>Kadingilan</u>

There in no Level III system at present. There are two Level II systems using deep wells. Urban population is 4,800 and about 34 % are covered by the Level II systems. Expansion plan using deep wells shall be studied.

Kalilangan

There is one Level III system managed by the municipality. The system covers 1,200 population (7% of urban population). Spring source is used for the supply. Majority of the people use free flowing Level I (abundant water available). LGU- urban water supply project is planned for expansion of the system.

Kibawe

One WD exists. Served population is 2,800 (64% service coverage of urban population) Water sources are deep wells. Expansion of the system is planned by the WD using deep wells. Financial support is being sought from LWUA.

<u>Kitaotao</u>

No Level III system exists at present. They use Level I and II systems. Level II service covers only 1,000 persons (10% of urban population, 10,000 people). Water source is deep well. Water quality (iron and manganese) problem is prevalent. A simple treatment facility shall be considered.

<u>Lantapan</u>

One Level III exists which is operated by the municipality. The system serves 1,000 persons (7% of urban population; 4 urban barangays exist). Water source is spring. This municipality is one of the recipient of LGU-urban water supply.

<u>Libona</u>

One Level III is operated by the RWSA. Service population is 940 (40% of the urban population). Water source is deep well. Expansion of the system to cover 11 barangays (including 10 rural barangays) is being planned using surface water. Financial support from ADB is being sought.

Malaybalay

There is one WD. Service population is 25,000 (88% of urban population). Deep well and surface water are utilized. Insufficient water source and limited capacity of treatment plant are current problems. The WD requested LWUA for financial assistance for the improvement needs.

Malitbog

No Level III system exists at present. Majority of the people uses Level I facilities and supplemented by limited Level II systems. Water source is spring. The plan for Level III shall be prepared in consultation with the people.

Manolo Fortich

One Level III exists which is operated by the municipal government. About 4,300 persons are served by the system (78% of urban population). Water sources are combined ones (spring and deep well). The area is covered by the ADB assisted project. Expansion of the system using spring shall be sought.

Maramag

There is one WD. Water source is spring. There are 12 urban barangays. The WD serves for 5,900 persons (11% of urban population). Many Level II systems also serve urban barangays. The upgrading from Level II to Level III is a requisite in the future.

Pangantucan

One Level III exists which is operated by the RWSA. Service population is 1,200 in 8 urban barangays (5% of urban population). Water source is spring. Majority of the urban barangays is served by Level II systems. Upgrading of such systems is a requisite using spring sources.

Quezon

ð

One Level III exists that is operated by the municipality. About 7,600 persons are served by the system (53% of urban population). Water source is spring using pumps. Water source is sufficient, but costly due to the pumping measures. Expansion shall be planned to increase service coverage using a spring (17 km away from urban area) with gravity system.

San Fernando

No Level III exists at present. Either Level I (majority) or Level II systems serve them. Water source is spring and deep well. Development of Level III shall be planned using deep well, since potential spring sources have insufficient quantity or are located in remote area.

<u>Sumilao</u>

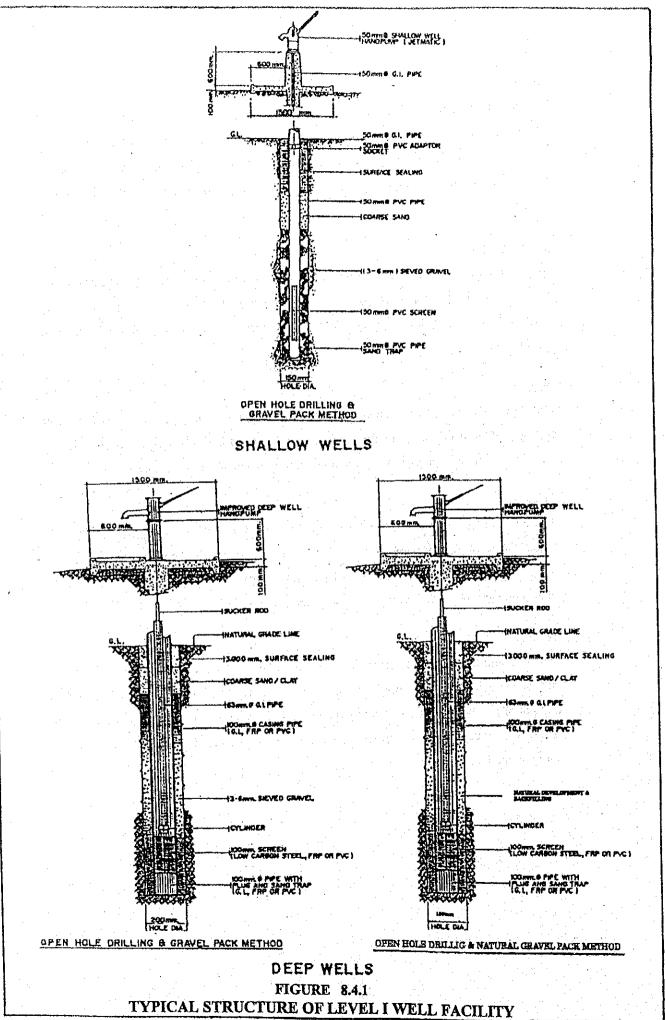

One Level III exists being managed by the municipality. The system serves for 3,900 persons (36% of urban population). Water source is spring. Expansion/construction of Level III shall be implemented by the municipality using spring sources.

<u>Talakag</u>

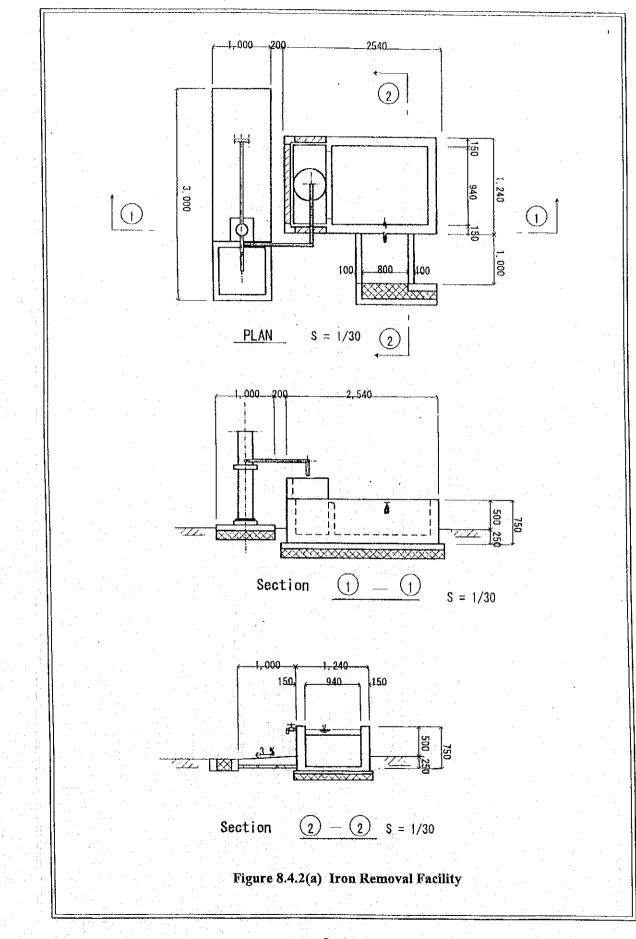

There is one Level III together with Level II operated by RWSA. Service population is 5,000 (90% of urban population). Water sources are spring and deep well. This municipality is one of the recipients of the ADB project. A supplemental spring source identified shall be used for the extension of the system.

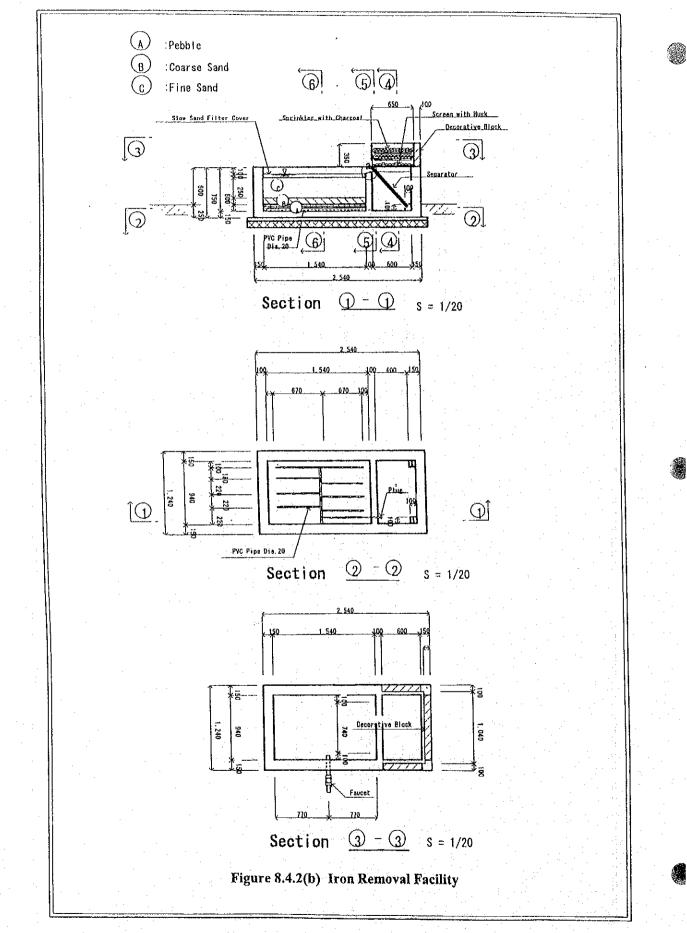

Valencia

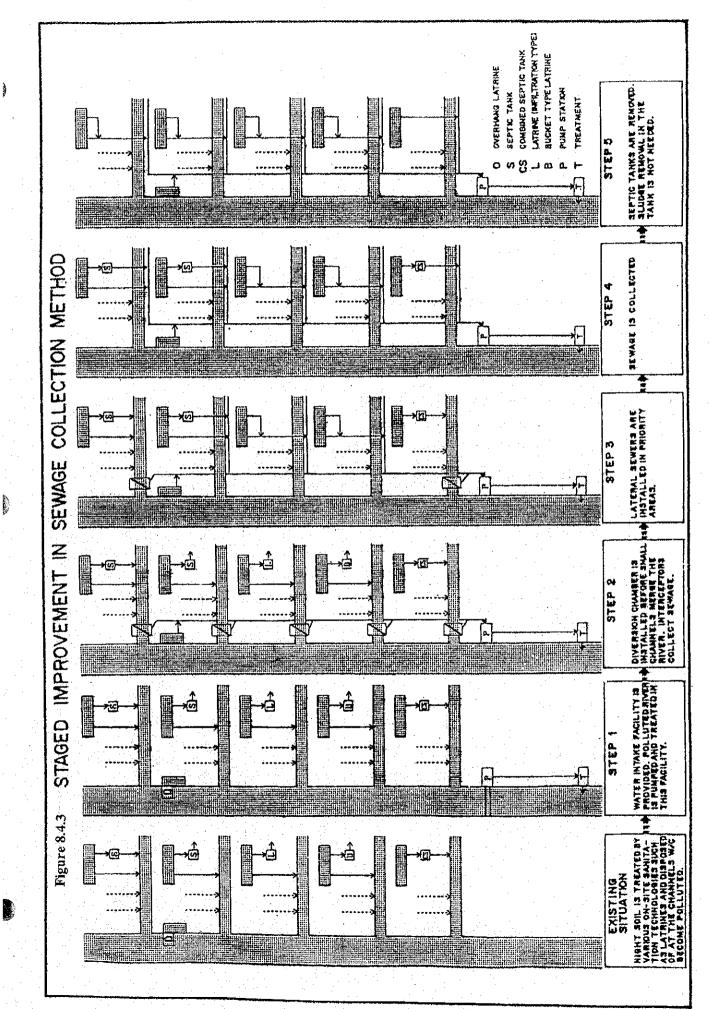

One WD and another Level III (RWSA) exist. Water source is a combination of spring and deep well. Served population by these two systems is 20,600 (56% of urban population). The WD has a plan to expand the system covering one rural and one urban barangays with financial support from the Land Bank. Deep well may be the supplemental water source.

8 - 30

8 - 33

8.5 Service Coverage by Target Year

8.5.1 Water Supply

(1) Population to be served by Level II system in Phase I

Ninety (90) untapped spring sources were confirmed to be suitable for Level II systems in rural water supply during the PW4SP preparation as shown in Table 8.5.1. The conditions and assumptions applied for this estimate are as follows:

Source capacity:

The average source capacity of untapped spring was assumed to meet the needs of 100 households based on the review of existing Level II systems with spring sources.

Number of system:

Of the 90 untapped springs identified, 73 were considered to serve 73 Level II systems in 73 rural barangays of 14 municipalities.

Municipality/City	Number of Untapped Spring	Number of Barangay to be Served	Number of Households to be Served	Population to be Served

 Table 8.5.1 Population to be Served by Level II System in Phase I

 Part 2 of 2

(2) Population to be served by target year

<u>Phase I</u>

122

For urban area, the additional service coverage was estimated to be served by Level III service. For rural area, the population to be served by Level II systems with untapped springs was first calculated and the rest of the additional service coverage was estimated to be served by Level I facilities.

Phase II

For urban area, the population served by Level I and II facilities in the base year was considered to be absorbed by Level III service aside from the additional service coverage to be estimated by the sector target. For rural area, all existing facilities in Phase I were assumed to be utilized throughout the future.

The population to be served by target year is exhibited in Table 8.5.2 and Table 8.5.3.

Table 8.5.7 Additional Number of Public Utilities with Sanitary Toilets in Phase 1 and 11 (cont'd.)

8.6 Facilities, Equipment and Rehabilitation Required to Meet the Target Services

8.6.1 Water Supply

(1) Required water supply facilities

Urban water supply:

Urban water supply facilities required by target year shown in Table 8.6.1 were estimated as the required number of house connections based on the additional service coverage.

As reference, the following requirements were also estimated:

- daily average water demand at 100 lpcd consumption rate, and
- number of deep wells to meet the daily maximum water demand based on the groundwater productivity.

(daily maximum water demand = $1.3 \times daily$ average water demand)

Information pertaining to the expansion plan of Level III systems was arranged and indicated in Table 8.6.1 and the details are presented in Table 8.6.2 (the required data however, were not available during this PW4SP preparation).

Rural water supply:

Rural water supply facilities required by target year shown in Table 8.6.3(a) were estimated as the number of Level II systems with the number of communal faucets and the number of Level I wells broken-down to deep and shallow wells. Seventy three (73) untapped springs suitable for Level II system were confirmed during this PW4SP preparation.

(2) Required well drilling and rehabilitation equipment

Currently, the Waterworks Division of the province has rotary type drilling rig and the DPWH-DEO have 4 units of percussion type drilling rigs (2 units are necessary for overhaul) and 1 rotary type drilling rig applicable for more than 8" bore hole diameter.

Taking into account the maximum utilization of existing equipment, the additional number of required equipment is estimated as described below.

Applicable type of well drilling equipment is determined considering the geological formation of the province and the easiness to operate technically. Both types of rigs are suitable for soft and hard formations, but compared with the latter, the percussion type can be easily operated and maintained without special training to drillers. Also, it is very useful to bore in boulders or cobbles formations. Thus, the percussion type drilling equipment is recommended to be selected in the PW4SP preparation.

199 (S. 199

ł

Medium size percusion drilling rig (truck-mounted type for deep well):

Average performance

1 well/30 days (5 m/day of drilling rate with finishing work)
 Annual accomplishment

- 9 wells/year (365 days/year ÷ 30 days/well x 0.75) Required number

- 1 sets for the total 48 deep wells

Well rehabilitation equipment:

Average performance

- 1 well/7 days (well redevelopment and finishing work Annual accomplishment

- 39 wells/year (365 days/year ÷7 days/well x 0.75) Required number

1 set for 10% of 48 Level I deep wells

Support vehicle:

Type - pick-up truck with winch, double cab

Required number

1 unit for well rehabilitation

Considering the utilization of the existing percussion/rotary drilling rigs, it is enough for the province to procure 1 unit medium-size percussion rig for the long-term development plan. However, the following equipment shall be considered for the medium-term plan to accomplish the physical targets:

1 set of well rehabilitation equipment for 10% of deep wells (at least 1 set shall be held by the provincial government); and

1 unit of support vehicle for well rehabilitation.

In addition to the above, 1 unit service truck equipped with crane is required for the percussion rig for hauling drilling tools and water for the long-term plan.

SECTOR MANAGEMENT FOR MEDIUM-TERM DEVELOPMENT

9.2 Sector Management

Accessing ODA Funds for Level III Systems

When considering sources of financing for new Level III systems or for existing Level III systems that are expanding, LGUs may tap their IRA or they may borrow funds from commercial or ODA institutions. In the case of LGUs that have formed a Water District to operate their system, a ready source of loan funds is the LWUA.

This section discusses how an LGU can access funds from an ODA agency in order to develop its Level III water system. It is presumed that the proposed Level III project has gone through the Project Development process stipulated by the NEDA in Rule 7, Articles 24 - 26 of its IRR of Board Resolution No. 4 (Series of 1994), Clause (G). Specifically, the proposed Level III project must be consistent with the Provincial/City/Municipal Water Supply, Sewerage and Sanitation Sector Plan that has been prepared and annually updated by their respective Planning and Development Office(s). On the basis of these local council approved sector plans, water supply investments will have been identified and developed into a local investment program that includes an appropriate financing plan.

It is worthwhile to reiterate the following NEDA prescriptions regarding project identification:

"proposed investments shall be developed according to a demand-driven approach that would allow beneficiaries to select from among cost-effective technical options and from financing options. The LGUs may avail of technical assistance from the DILG in the preparation of these project packages (Rule 5)."

"LGU systems shall be constructed on the basis of choosing among technical options that are affordable through the financial resources made available by users, communities and LGUs. The process of determining demand for a particular service delivery shall be concluded through a negotiated agreement between the LGU, water utility and the users, on how the costs will be shared at the town, barangay, and household levels."

"for any Level III service, at least two technical options shall be explored: those of an inter-LGU service delivery organization involving amalgamation of service areas and of single LGU management systems."

(1) Project Initiation Stage

Based on their respective approved water sector plans, the province/municipality proposes a specific Level III water system following the NEDA guidelines on project identification. The provinces and component municipalities may submit their respective project proposals for ODA funding to the DILG. The DILG examines such requests and ensures that they are in conformity with the NEDA's Medium Term Public Investment Program (MTPIP), a master list of projects from which ODA agencies can select specific projects that they can fund. From the MTPIP, the ODA loan agency prepares its own short list of potential province and municipality beneficiaries/ grantees of its loan program. The ODA loan agency then proceeds to conduct its own feasibility study concerning its loan program and discusses this extensively with both the NEDA and the DILG (since the DILG will be the implementing agency for the ODA loan).

While the DILG is designated as the implementing agency for the ODA loan program, a domestic lending institution (e.g. the Development Bank of the Philippines or DBP) can be contracted to administer the loan package and on-lend ODA funds to specific LGUs. [Note that the LWUA has served and continues to serve as a conduit for loans to Water Districts.] Under such a working arrangement, the DILG, the ODA agency, and the domestic lending institution affix their signatures on the ODA program loan documents.

The DILG now pre-screens LGUs who have expressed intent to borrow funds from the ODA loan facility. Together with consultants from the ODA agency, the DILG conducts briefings on the loan conditions to make sure that the province/municipality fully understands the financial and institutional commitments they have to make once they contract the loan. The respective local councils (e.g. Sanggunians) deliberate whether they are able to and will partake of the loan. Should the Sanggunian decide that they can meet the loan commitments, they submit an official letter of interest (LOI) to the DILG. The DILG, with assistance provided by the ODA agency, evaluates the various LOIs from different LGUs and selects which specific projects will be eligible to borrow from the ODA loan facility.

(2) Project Implementation Stage

At this point, the province/municipality with the Level III system project can now sign the loan documents with the designated local on-lending institution. For the construction of the Level III water system, the LGU itself (or the LGU company formed to undertake the project) is expected to bid out the job to contractors from the private sector. The bidding process should be a transparent one with a public announcement of the bidding,

publication of pre-qualified construction companies, and a well-documented decision by the bids and awards committee. During the construction of the Level III water system, the LGU unit tasked to monitor the construction activity should carry out periodic inspections. Final inspection is done upon completion of the construction contract. Throughout the period of the bidding process and actual construction, the DILG can be tapped by the LGU for assistance on various technical and institutional-building matters.

The private sector contractor submits its periodic billings to the LGU. After the necessary inspections are done, the LGU in turn forwards this bill to the domestic lending institution for payment. Given that all documents are in order, the domestic lending institution requests for fund remittance from the ODA agency. Once the funds are remitted, the domestic lending institution settles the bills with the private contractor.

As far as repayment of the loan is concerned, the LGU is responsible for paying the loan since it was the signatory of the loan. Through the operations of the completed Level III water system, the LGU is able to collect the corresponding tariffs from the different consumer households. From these revenues, the LGU re-pays the loan capital and interest to the domestic lending institution, which in turn remits these proceeds to the ODA loan agency. This process is repeated throughout the term of the loan.

9.4 **Project Management Arrangements**

9.4.1 Project Approach/Strategy

Integration of Waterworks

The province may also initiate the establishment of an Integrated Waterworks (IWW) facility that will merge the management operations of adjoining municipalities, which have existing or proposed Level III water systems. This may not necessarily involve the integration of the physical facilities because of the distance and sparse location of municipalities, but rather only the management aspect of it. Article 8 of the IRR of NEDA Board Resolution No. 4 (Series of 1994), Clause (G) states that: "An LGU may also consider amalgamating or consolidating its system with that of its neighboring LGUs in order to benefit from economies of scale that could expand water supply services to consumers at the lowest possible cost."

The advantages of an IWW facility are as follows:

- Comprehensive water sector planning at the provincial level is facilitated. Investments in developing larger water sources and reservoirs can be considered at the planning stage (in the case of municipalities that are in close proximity with each other).
- The overhead cost involved in maintaining and operating a large waterworks system can be reduced since redundancies in equipment and manpower resources will be eliminated. Municipalities will no longer have to purchase and maintain their own waterworks construction equipment. As a result, there will be greater utilization of such equipment. Engineering and management staff that are currently needed to run the municipal waterworks system can be transferred to other functions.
- The province will be able to hire and retain professional engineering and management staff who will assume greater responsibilities and duties. This will eventually translate to a higher level of service to the communities served by the IWW facility.
- Access to loan funds (from both ODA and commercial sources) for the construction of the waterworks system will be easier since the lending institution will deal with a single entity. Lending institutions prefer such a set-up since the loan evaluation and the corresponding loan monitoring is simpler.
- The IWW facility will be more attractive to more reputable private sector corporations, both local and foreign. The province will be able to generate more interest from private sector players who may want to develop waterworks systems on a BOT/BO/BOO basis or jointly with the LGU. The LGU may also tap these same private sector players to operate and maintain the existing distribution network under any form of contract – service, management, lease, or concession.

The organizational structure of the IWW should contain, at the least, 5 sections – Administration, Finance, Engineering, Operations & Maintenance, and a Meter Reading and Tariff Collection unit. The Administration and Finance departments will handle matters related to human resources development, financial planning and control, and other related concerns. The Engineering section is expected to concentrate on water system planning and design. The Operations & Maintenance unit will ensure that the water system is operating efficiently (e.g. minimal system losses) and that water quality is always satisfactory by conducting strict monitoring activities. Any construction activity, including the installation of water meters, will be contracted out to the private sector so there will be no need for a large pool of both equipment and manpower. Water samples can be tested in existing private or government laboratories if the IWW will not maintain its own laboratory. The Meter Reading and Tariff Collection unit will be in charge of the all-important task of determining individual household consumption and collecting the corresponding tariff due. The actual conduct of these two activities can be contracted out to the private sector through a service contract.

The financial and operating condition of the IWW facility should be reported periodically to the provincial and municipal governments. In addition, the rates that the IWW will charge consumers will be set under the supervision of a regulatory authority and any proposed changes should first be presented and discussed in a public hearing.

The success of the IWW facility depends on the full support of the local governments of both the province and the component municipalities. Such support shall be in the form of strengthening the management and engineering capabilities of the IWW staff. Any loan needed by the IWW should be endorsed, and if possible guaranteed, by the LGUs concerned. Initial capital requirements can even be sourced from these LGUs.

9.4.2 **Project Implementation Arrangements**

ð

Project Implementation Arrangement and Procedure

Together with the Figures (Figure 9.4.1 and 9.4.2), the following are the project implementation arrangement and procedure for Level I and sanitation from national level to barangay levels, which are designed to encourage active participation of implementers and beneficiaries in undertaking the project.

(1) National Government Level

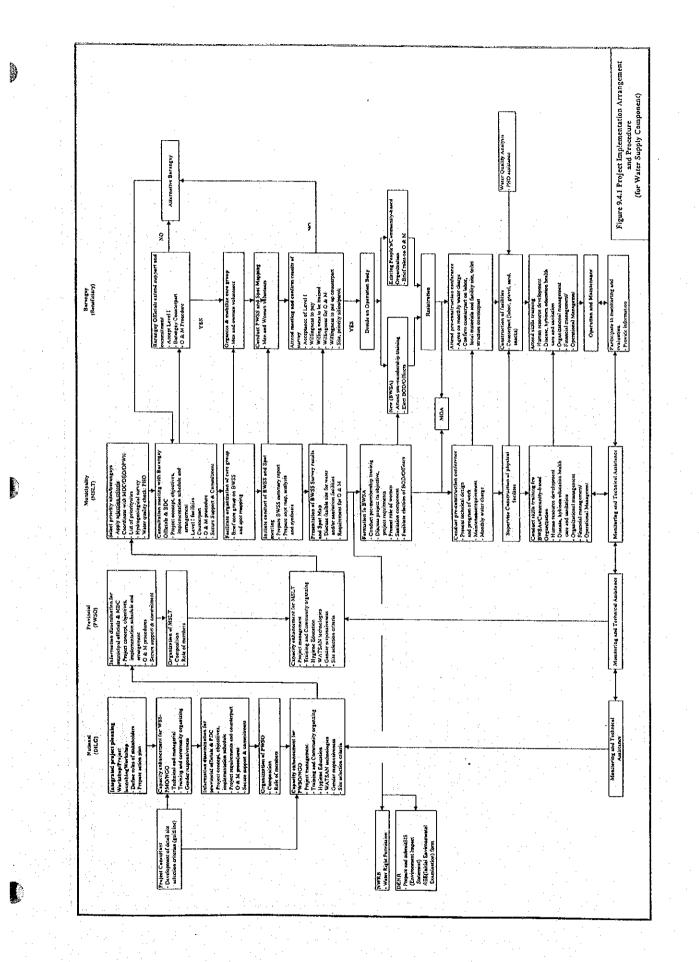

Project Planning/Launching Workshop as start-up activity will be conducted to introduce and orient the implementers on the Project, define their roles, responsibilities and relationships among them and formulate provincial action plans. The Consultant, upon completion of the training needs assessment and development of appropriate training programs shall conduct capacity enhancement for the WSS-PMO Staff, NGOs, DPWH and DOH representatives. This activity aims to strengthen their competence in technical, managerial, training and community organizing and gender responsiveness. The trained members are responsible to facilitate the organization/reactivation of the PWSU and information dissemination for the provincial officials to secure their support and commitment to the Project. With the assistance from the Consultant, they will enhance the capacity of the PWSU, the MSLT and COs/NGOs in planning, implementing, monitoring and evaluating the project.

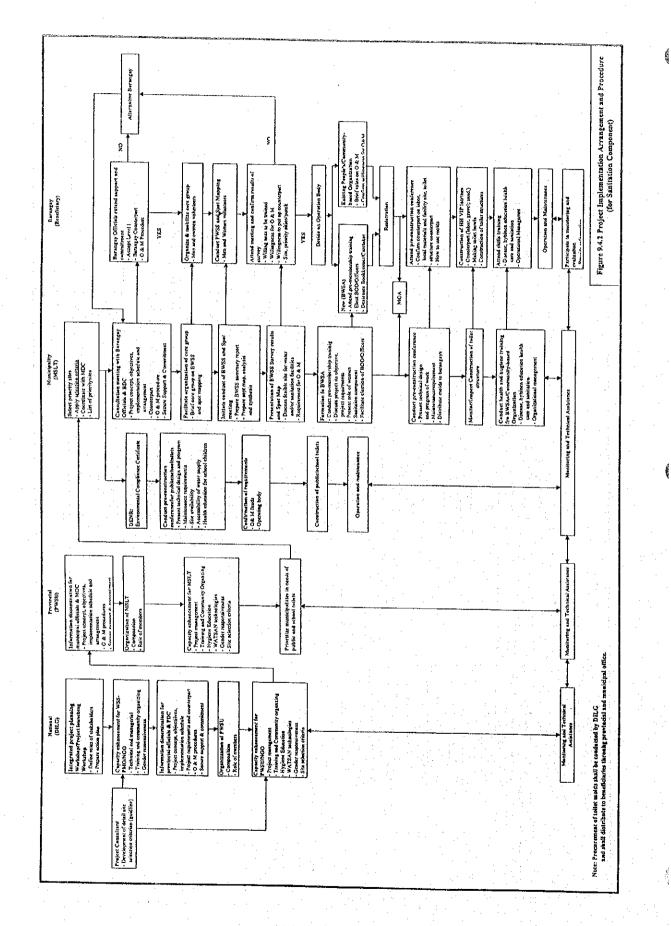

(2) Local Government Level

The PWSU shall assist the MSLT in each municipality and conduct information dissemination for the municipal officials to orient them on the project and obtain their support and commitment. With the PWSU assistance, the trained MSLT members shall select priority barangays, in coordination with the municipal development council. The Team will be responsible for facilitating barangay activities such as consultation meetings with barangay officials and community members, barangay survey and spot mapping, formation of BWSA/RWSA, pre-construction conference, and supervision of construction. Skills training will be conducted for the operating body in maintaining and managing the project. They shall also provide continuing assistance and monitor the activities of the beneficiaries and status of the project.

(3) Barangay Level

The barangay officials/development councils shall provide support to the PWSU and MSLT members in conducting activities and mobilizing resources in the barangay. Men and women volunteer shall conduct barangay survey and spot mapping to confirm their demand for the level of service, HH latrines and willingness to operate and maintain the facilities and counterpart. The community members decide on the operating body, tap existing community-based organization or organize a BWSA/RWSA. They have also to agree on the monthly water fees and provide labor and local materials during the construction of facilities. The BOD/Officers, Bookkeeper and Caretaker of the operating body shall attend skills training to develop their competence in performing their jobs. The beneficiaries shall provide information and request assistance from the PWSU/MSLT members, if necessary.
