LIST OF APPENDIX

APPENDIX A. PHOTOGRAPHS OF ASSESSMENT OF THE SITE

APPENDIX B. UNIT COST OF CONSTRUCTION

APPENDIX C. COLLECTED DATA AND INFORMATION

APPENDIX D. SITE SURVEY AND ASSESSMENT

APPENDIX E. WATER QUALITY SURVEY

APPENDIX F. USER SURVEYS

APPENDIX G. FIELD SURVEY OF TRUNK SEWER

APPENDIX H. MINE CLEARANCE PROJECT

APPENDIX I. TERMS OF REFERENCE OF THE FIELD SURVEY AND ASSESSMENT

APPENDIX J. Vik's ORGANIZATION DATA

APPENDIX K. VIK'S FINANCIAL DATA

APPENDIX L. MINUTES OF MEETINGS

APPENDIX M. DRAWING LISTS FOR PRELIMINARY DESIGN

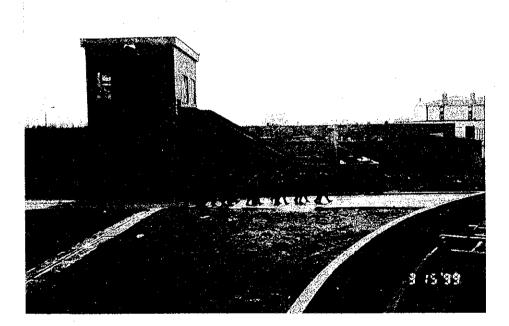

APPENDIX N. ENVIRONMENTAL IMPACT ASSESSMENT

APPENDIX O. PROCESS CALCULATIONS

APPENDIX P. BILL OF QUANTITIES & COST ESTIMATES

APPENDIX Q. ELECTRICAL LOAD & EQUIPMENT LISTS

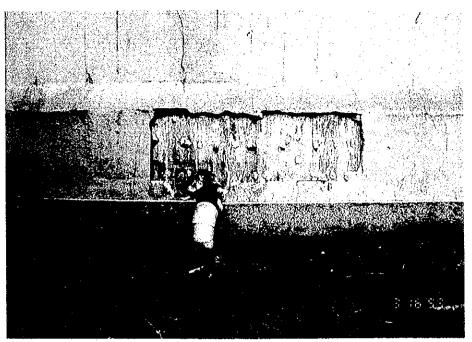

A. PHOTOGRAPHS OF ASSESSMENT OF THE SITE

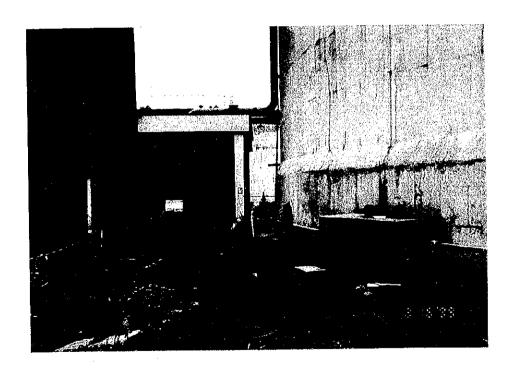

APPENDIX A. PHOTOGRAPHS OF ASSESSMENT OF THE SITE

1. Butila Wastewater Treatment Plant	A- 2
2. Water Quality Testing	A- 5
3. Solid Waste Disposal Area	A-11
4. Questionnaire Survey	A-13
5. Water Bill Collection	A-15
6. Field Survey of Trunk Sewer	A-16

1. BUTILA WASTEWATER TREATMENT PLANT

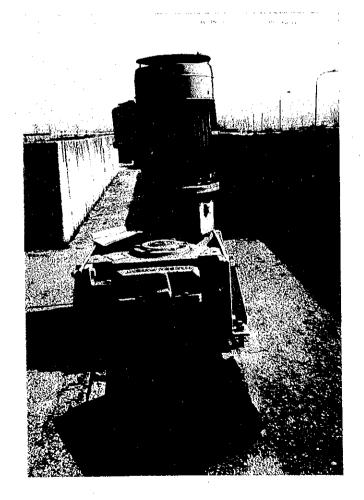

Deteriorated Insulation Wall at Digestion Tank

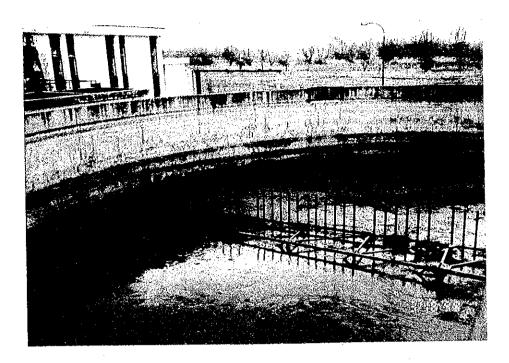

Current Situation of Mechanical Piping at Digestion Tank

Inlet Chamber of Butila WWTP

Deteriorated Slab at Aeration Tank

Ð

Accumulation of Digested Sludge in Sludge Holding Tank

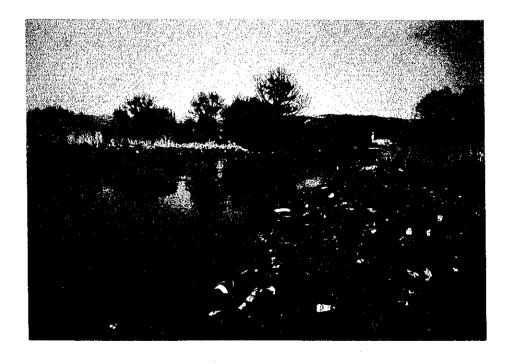

Cleaning of Sludge Holding Tank

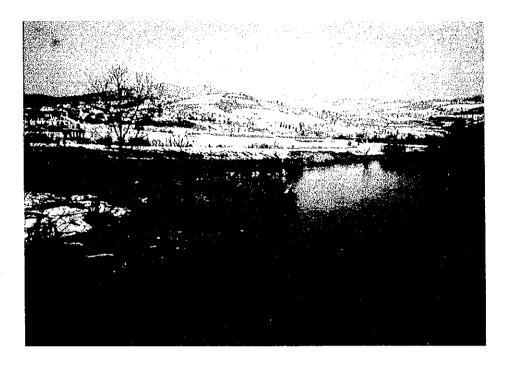

2. WATER QUALITY TESTING

Bosna Springs - Beginning of Beautiful Bosna River

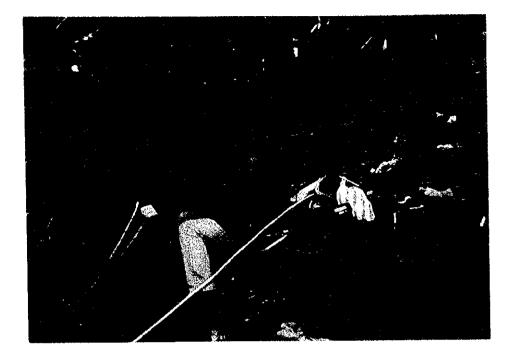

Bosna River near Treated Water Discharge Point of Wastewater Treatment Plant

Confluence of Miljacka River and Bosna River - Dry Weather

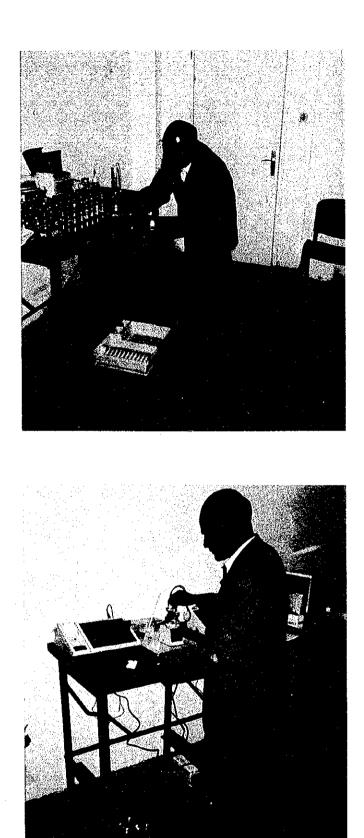

Confluence of Miljacka River and Bosna River - Wet Weather

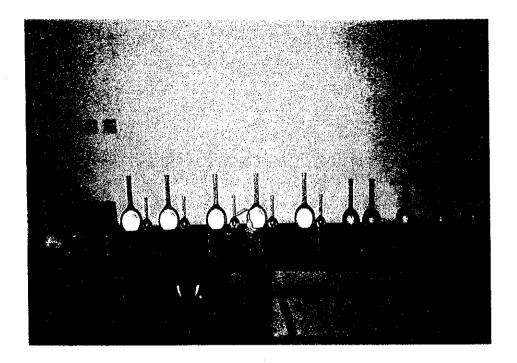

Collecting Sample of Miljacka River Upstream of Main Collector By-pass

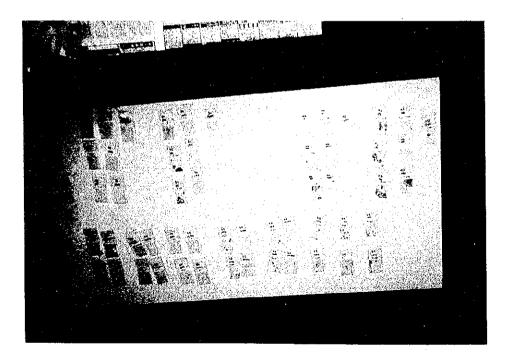

Flow Measurement on the Main Collector By-Pass to Miljacka River

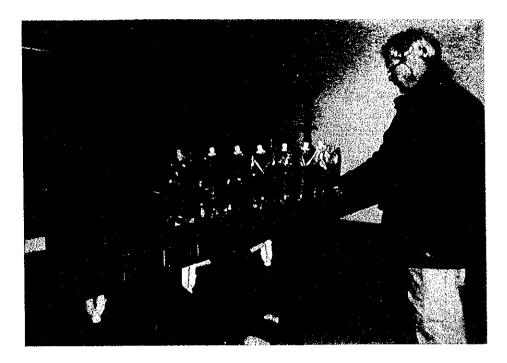

Water Quality Analysis - Biochemical Oxygen Demand (BOD₅)

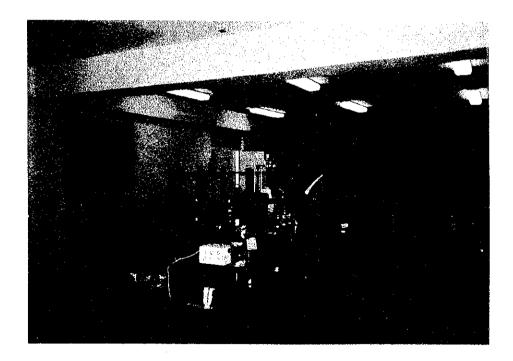

Water Quality Analysis – Dilution for Fecal Coliform

Evidence of Fecal Coliform in Rivers and in Collector

Raw Sewage Samples from Main Collector

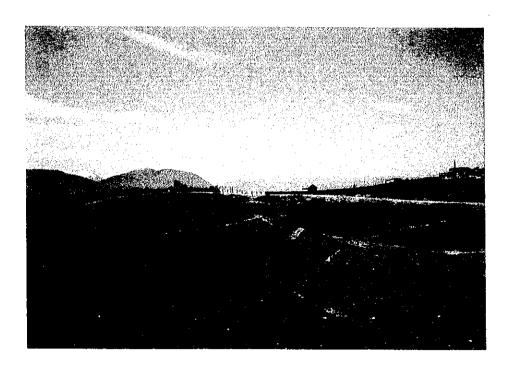

Water Quality Analysis at WWTP Laboratory

3. SOLID WASTE DISPOSAL AREA

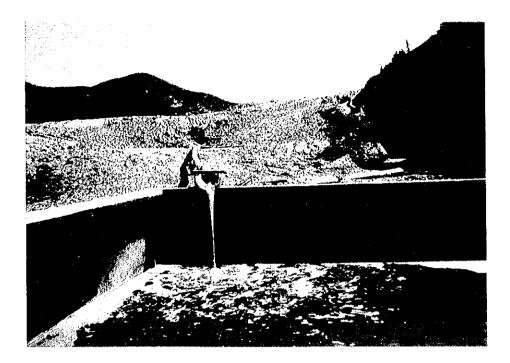

Entrance to the Landfill Site at Buca Potok

50

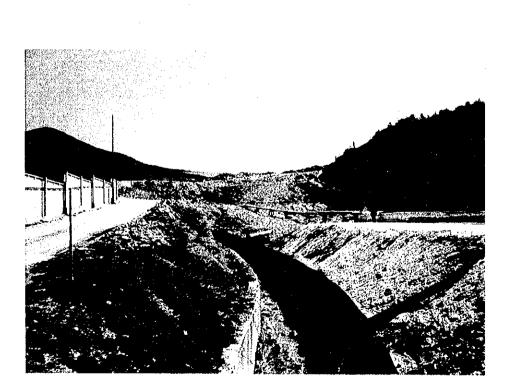

Landfill Site

Leachate Collection from Lanfill

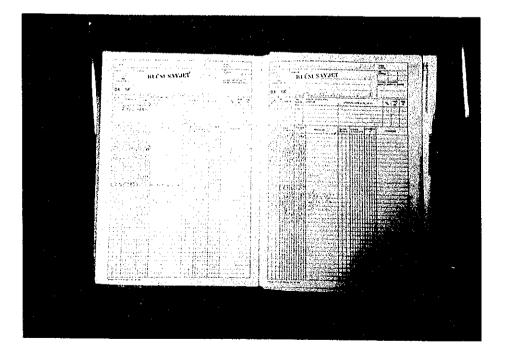

}

Discharge of Settled Leachate to Lepenica Stream

Street survey in front of a shopping center

Water meter reading log book (A4 size)

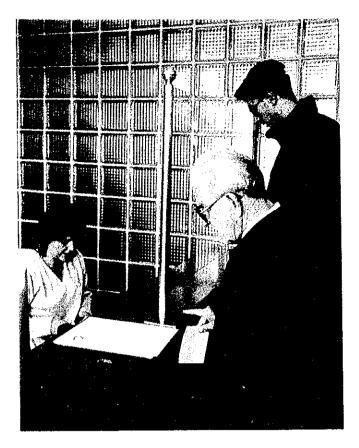

)

Door to door survey at an individual house

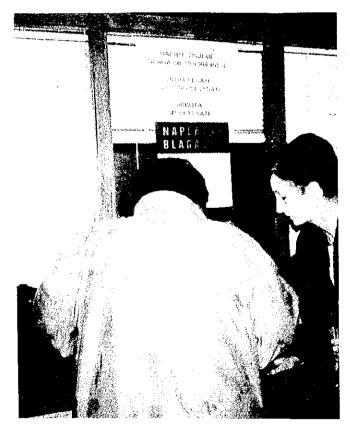

Door to door survey at a socially-owned apartment

5. WATER BILL COLLECTION

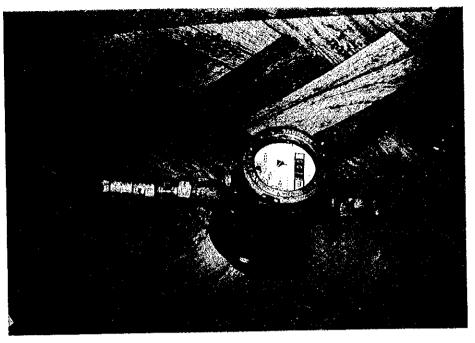

Water bill collection place at ViK GIS office Working hours 7:30 to 15:30 (Mon.-Fri.) and 8:00 to 16:00 (Sat.)

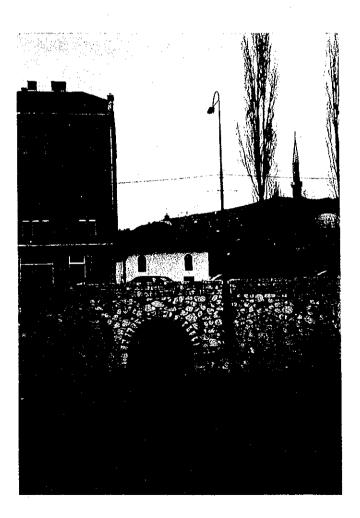

Social houses and utility bill collection place at Sarajevostan Working hour 8:00 to 14:00 and 17:00 to 20:00 (Mon. - Sat)

6. FIELD SURVEY OF TRUNK SEWER

Damaged Water Meter at Kiosk in Bistrik Area

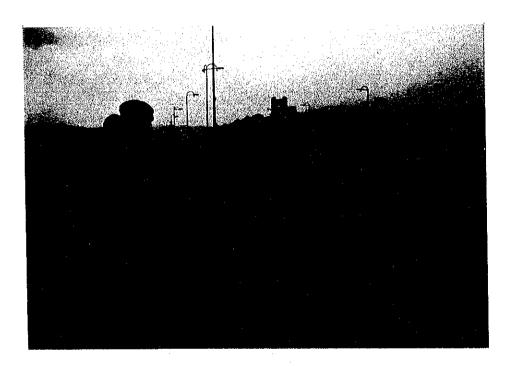

Discharged Point of Raw Sewage

MANHOLES ALONG PEDESTRIAN SIDEWALK

MH No. D0-1A @ Dobrinja, Novi Grad

Uncovered Manhole @ Butila

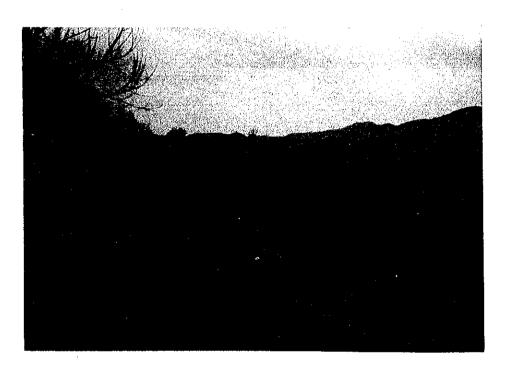

Broken Manhole Top Part @ Butila

.

MANHOLES LOCATED AT LAND MINES INFESTED FIELDS

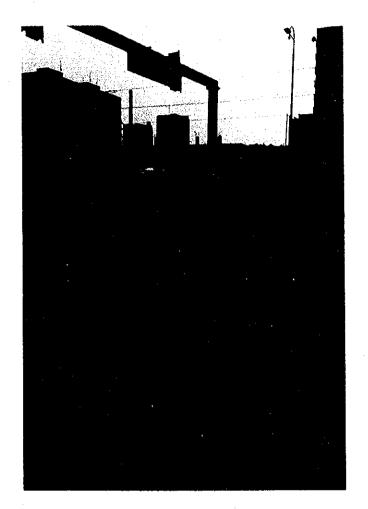

MH No. H0-1 @ Rajlovac, Novi Grad

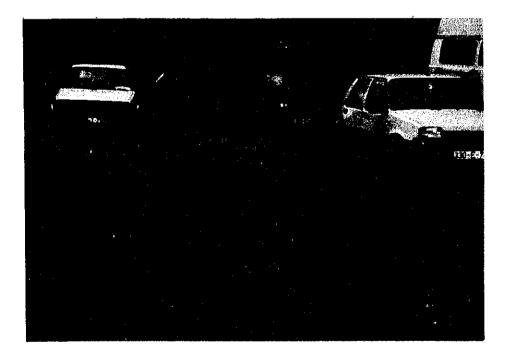

MH No. G2-F8 along banks of Bosna River Tributary (unlocated)

MANHOLES ALONG BUSY STREETS

MH No. A5-6 @ Zmaja Od Bosne, Novo Sarajevo

)

MH No. A3-4 @ Marsala Tita, Centar

OVERFLOWING MANHOLES

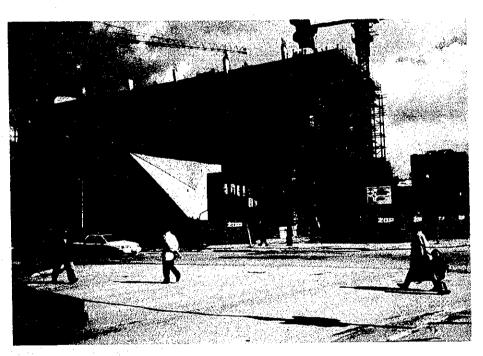

MH No. A12-WWTP @ WWTP, Butila

MH No. A11-12 @ Butila

B. UNIT COST OF CONSTRUCTION

Table B. 5	UNIT PRICES USED FOR CIVIL WORKS COST ESTIMATE	B- 7

APPENDIX B. UNIT COST OF CONSTRUCTION

Table B.1 LABOR COSTS IN SARAJEVO

			As of March 1999
Type of Labor	Unit	Cost (DEM)	Remarks *
Common Worker	day	19	
Concrete Mixer Operator	day	26	
Steel Worker	day	26	
Capenter	day	21	
Brick Builder	day	22	
Plumber	day	24	
Operator	day	26	
(construction machine)			
Electrician	day	23	
Welder	day	26	
Plasterer	day	22	
Site Engineer	day	33	
Site Manager	day	37	
Office Boy	day	20	
Driver (light vehicle)	day	23	
Driver (heavy vehicle)	day	24	
Typist	day	22	
Foreman	day	28	
Clerk	day	25	
Watchman	day	22	

* 1. Labor cost include the following items:

a) Food allowance = DEM 4/day

b) Transportation = DEM 40/month

2. Work experience is added to basic pay per month at the following rates:

a) Male worker = 0.5% per year

b) Female worker = 0.57% per year

Table B.2 UNIT PRICE FOR MATERIALS

* Note : The following unit prices are AT SITE IN Sarajevo basis as of March 1999, and the Exchange rates are as follows;

```
1 US$ = 116 JPY
1 US$ = 1.65 DEM
```

[A] DUCTILE CAST IRON PIPES

· · · · · · · · · · · · · · · · · · ·	DEM	UNIT COST/m
900 mm x 5.00 m	3,025	605

D. SITE SURVEY AND ASSESSMENT

APPENDIX D. SITE SURVEY AND ASSESSMENT

	rage
1. Assessment of the Treatment Facility	D-2

Daga

LIST OF TABLE

Table D. 1 RESULTS OF ASSESSMENT OF THE TREATMENT FACILITY D-2

APPENDIX D. SITE SURVEY AND ASSESSMENT

1. ASSESSMENT OF THE TREATMENT FACILITY

Table D.1 RESULTS OF ASSESSMENT OF THE TREATMENT FACILITY

Name of facility	Type of process	Diagnosed facility	Status of the facility and results of the sight inspection	Problems/issues
		Storm outfall facility	The storm water facility is located at the point where the untreated waste water is discharged into from the ϕ 2000mm main sewer before it enters the WWTP. The raw sewage is then discharged from the overflow weir into the River Miljacka. Since the inflow pipe is full, several intermediary ducts up are under pressure, which results to overflow of raw sewage.	The structure is unknown and the pipe height cannot be checked. For this reason, inflow, outflow and storm outfall pipe (by-pass pipe) must be investigated using some method.
			The structure itself presents no particular problem despite the fact that the surface of the floor panel is rough.	
ation	ring work	Inflow duct	The inflow duct is structurally made up of combine ducts diameter 2,000 mm and 800 mm so as to prevent inflow into the pump tank. The raw sewage from the 800 mm diameter duct overflows prior to the inflow duct and is directly discharged into the passageway of the compound.	
Raw water pumping station	Civil engineering work		The surface of the inflow duct structure is rough and damage to the inflow gate has been left unrepaired. The same is true to the opening in the floor plate where repairs are required.	With respect to the floor plate, the balance weight of the inflow gate needs to be checked.
1. Raw v			Details of the structure are not known and the status with respect to blockage in the raw sewage inflow is not grasped.	The duct needs to be emptied in the secondary on-site inspection to obtain information detailed.
		Inflow weir	There is no emergency gate valve on the inflow weir, thus this function is performed at the inflow duct prior to the inflow weir. From the onto appearance, the surface of the upper where portion of the walls and the stairway show wear where half of the steel railings are damaged. Moreover, the steel reinforcement is exposed in some sections that lead to rusting.	The stairway railings are under water and it is not possible to confirm the strength of this structure. Details of the structure need to be investigated after water has been drained. Sediment on the floor and in the inflow pipe needs also to be confirmed.
	Mechanical work	Propeller pumping	From outer appearance, the propellers are not rusted and are generally in good condition. Howevery the lower bearings are submerged in water and cannot be inspected. Moreover, the blades of the propeller are not worn. The pumping drive is rusted and partially broken.	The bearings need to be inspected after the inflow weir has been drained.

Name of facility	Type of process	Diagnosed facility	Status of the facility and results of the sight inspection	Problems/issues
	Electrical work	Propeller pumping	The motor is partially destroyed and none of the power belts are in satisfactory condition. The electronic control panels have all been removed and there are no cables.	The motors are completely destroyed and detailed inspection needs to be performed at the next stage.
	Civil engineering work	Screening station	On sight inspection, both the inner and outer walls are in satisfactory condition with apparent marks showing cracks have been repaired. Cleaning in the inflow section prior to the screening station is completed. Moreover, the structure of the screening station itself is in satisfactory condition.	Since the section prior to the screening station is prone to sediment deposit, to the structure needs to be reviewed, in order to ensure minimum flow velocity.
	ork	Screening station	Most part are in satisfactory condition. While degradation can be seen in the finishing the outside wall, there seems to be no problem structurally.	Water proofing of the roof needs to be checked in the next inspection.
Screening station	Construction work		Window panes are all broken. The travel crane has no cables and is apparently not operable. Moreover the retrofit digestion system is completely destroyed. Electrical equipment is all destroyed and nonexistent.	
5.		Electrical station	The structure itself is in satisfactory condition but the equipment is all destroyed.	Equipment needs to be reviewed.
	Mechanical work	Screening station	The manual gate value is not severely damaged but is wholly rusted. The mechanical screen is completely superannuated and accessory equipment is broken.	The manual gate valve needs to be checked to ascertain opening and closing operation. The mechanical screen needs to be diagnosed in detail.
	trical	Electrical station	The power cables and plants show signs that these had been removed.	
	Electric work	Screening station	As above.	
Aerated grit chamber	Civil engineering work	Silting basin	The bottom plate and walls are in satisfactory condition. However, the surface of the floor plate is partially worn and rough, which show signs of cracks been repaired. The handrails are rusted, wooden flash-boards are rotten.	Repaired cracks and scaled joints could be ascertained by performing water leak test.
ated	Civil work		Cleaning of sediment has been completed.	
3. Aer	Constructi on work	Blower station	While most part of are in satisfactory condition. The finishing and window panes are not. Electric equipment are missing.	An overall check needs to be performed.

Name of facility	Type of process	Diagnosed facility	Status of the facility and results of the sight inspection	Problems/issues
Aerated grit chamber	Mechani- cal work	Silting basin	The diffuser is rusted and the nozzles will not last for the next 6 months. There are no motors on the pumping well and the drive is rusted.	The system needs to be tested whether still function.
3. Aer char	Electrical work	Silting basin and electric station	There are no cables and the facility is completely devastated.	Precision check of motors needs to be performed.
sentation tank	Civil engineering work	Primary sedimentation tank	The above ground structure in satisfactory. While there are repaired cracks and construction joints, the overall condition is well maintained. Cleaning is also satisfactory. However the top sections of the walls are worn and the surface is rough. There are signs of water seepage from the construction joints.	Water seepage from the construction joint needs to be confirmed in the leak test performed by filling water.
Primary sedimentation tank	Mechani- cal work	Primary sedimentation tank	The outer appearance is generally in satisfactory condition but the drive equipment such as motors, are missing.	Functional check of the clarifier unit needs to be performed.
4	Electrical work	Primary sedimentation tank	There are no cables and motors.	
	vil engineering work	Aeration tank	The structure, both the interior and exterior walls, is in satisfactory condition. While there are signs of repairs on cracks and dowel drive processing, the finishing the work is satisfactory. However, the floor plate is completely worn and steel reinforcements are exposed in certain parts. The inflow weir is partly damaged and partly non-existent.	It is necessary to check leakage from construction joints by performing water leak test. Moreover, opening and closing operation of the tank discharge gate valve also needs to be checked.
Aeration tank	Ğ		Most part of the bypass is in satisfactory condition, but the wooden flash-boards are rotten.	A loading test needs to be conducted on the floor plate.
5. Aer	Mechanical work	Aeration tank	Generally, the manual gate valve is in satisfactory condition. The emanator itself is in satisfactory condition from the visual inspection but the motors are generally in poor condition.	
	Electrical work	Aeration tank	There are no cables for all 36 motors. The condition of the interior of the motor is unknown.	The possibility of a loading test needs to be considered in order to ascertain the overall condition when load is applied.

Name of facility	Type of process	Status of the facility and results of the sight inspection	Problems/issues
n tank	Civil engineer- ing work	The structure of the final sedimentation tank is maintained in a significantly satisfactory condition. Although the upper walls show wear as in other cases, the condition is satisfactory.	Leakage needs to be checked by water leak test.
Final sedimentation tank	Mechanical work	Although there are no motors on the drive mechanism, the clarifier is, for the most part, in satisfactory condition. All 4 gratings on the platform are in satisfactory condition.	Detailed inspection of the clarifier itself needs to be performed.
6. Fi	Electrical work	There are no power cables or motors.	
Flow metering	Civil engineering work	Both the floor plate and walls of the structure are in satisfactory condition but as with other facilities, the upper portion shows some wear.	There are certain aspects of the structure that are not known and detailed inspection needs to be performed.
7. Flow	Mechani- cal work	The flow meter has been removed.	Review of flow metering equipment utilizing the current structure needs to be performed.
ttion	Civil engineering work	From outer appearance, both the interior and exterior walls show no signs of wear seen in the floor plate. The railings are severely rusted and the gates cannot be operated. The mortar finish of the stairs has peeled off.	
ge pumping station	Construc- tion work	The structure is in satisfactory condition but there are no window panes or glass. Moreover, there are no electrical installations.	A detailed check of the roof needs to be performed.
8. Recycling sludge	Me chanical work	The propeller is in satisfactory condition from outer appearance but the condition of the lower bearings is unknown. The drive mechanism is in poor condition and seems to be inoperable. The travel crane is inoperable.	A detailed check of the drive mechanism needs to be performed.
~	Electrical work	There are no switch panels or cables and the motors are destroyed.	A detailed check of motors and related equipment needs to be performed.

Name of facility	Type of process	Status of the facility and results of the sight inspection	Problems/issues
nping station	Construc- tion work	The overall condition of the structure is satisfactory but there are no window panes, glass or electrical equipment.	Inspection on conformance to the specifications of the primary sedimentation tank needs to be performed.
Primary sludge pumping station	Mechani- cal work	There are no plants. Supplementary materials are rusted.	
9. Primar	Electrical work	This is the same as in the mechanical work.	
ened	Civil engineeri ng work	The condition is about the same as in the primary sedimentation tank.	Inspection based on initial specifications needs to be performed.
Sludge thickened	Mechani- cal work	The condition is the same as for the clarifier in the primary sedimentation tank but it is unclear whether the equipment is operable and blocking can be expected in sludge removal.	
10.	Electrical work	The motors are destroyed and cables have been removed.	
t pumping	Con- struction work	While there are no particular problems in the outer appearance, there are no windows or window panes. The condition of the roof waterproofing is unknown.	Inspection based on initial specifications needs to be performed.
Sludge thickening pumping station	Mechani- cal work	All removal pumps are destroyed and there are no supplementary materials.	
11. Slud	Electrical work	There are no motors and power cables.	
ster	Civil engineer- ing work	External wall heat insulation mortar is peeling of certain section and the reinforcing steel is partially exposed. The roof waterproofing mortar is severely damaged and the safety shelf is partially collapsing.	Detailed inspection on all aspects needs to be performed.
Sludge digester	Con- struction work	The exterior wall of the stairwell is partially damaged and almost all window panes are destroyed. There are no window glasses. The condition of the interior walls is not good.	As above
12.	Mechani- cal work	All mechanical facilities such as humidifier, receiving equipment and removal equipment are inoperable. Moreover, all piping is believed to be blocked.	A detailed inspection needs to be performed.

Name of facility	Type of process	Status of the facility and results of the sight inspection	Problems/issues
	Electrical work	There are no power cables. The condition is extremely poor.	As above.
es	Con- struction work	Both the interior and exterior of the structure is in poor condition with sanitation facilities and electrical facilities almost all destroyed.	A detailed inspection needs to be performed.
Boiler house	Mechani- cal work	Humidifier equipment is all destroyed including supplementary materials.	
13.	Electrical work	The electric plant facility is close to complete destruction.	
ation I	Con- struction work	Both the interior and exterior of the structure is in poor condition with sanitation facilities and electrical facilities almost all destroyed.	A detailed inspection needs to be performed.
Compressor station I	Mechani- cal work	Humidifier equipment is all destroyed including supplementary materials.	
14, C	Electrical work	The electric plant facility is close to complete destruction.	
15. Gas storage tank	Civil engineer-ing work	There are no problems in the outer appearance of the structure and while the gas dome is rusted, the condition is satisfactory. The condition of the gas piping is unknown.	Detailed inspection on operation needs to be performed.
lding tank	Civil engineer- ing work	The outer appearance of the tank interior and exterior is in satisfactory condition. While there are signs of cracks having been repaired, there are no indications of leakage.	A detailed inspection of the piping needs to be performed.
16. Homogenization holding tank	Mechani- cal work	While the outer appearance of the clarifier itself is in satisfactory condition, there are no motors and the condition of the drive mechanism is unknown.	A detailed inspection needs to be performed.
16. Homog	Electrical work	There are no motors and cables.	A detailed inspection needs to be performed.

Name of facility	Type of process	Status of the facility and results of the sight inspection	Problems/issues
g station	Con- struction work	The exterior wall is in somewhat satisfactory condition but the interior wall is not. There are no electrical facilities.	Inspection based on materials used when initially constructed needs to be performed.
Sludge pumping station	Mechani- cal work	There are no motors and pumps.	
17. Sh	Electrical work	There are no motors and pumps.	
	work	While the structure itself is in satisfactory condition, part of the walls (blocks) is destroyed. The waterproof condition of the roof is unknown but from sight inspection there seem to be no cracks.	A detailed inspection needs to be performed.
ion	Construction work	There are no window panes and glass and a part of the walls are like bee hives with bullet marks.	
ehydrat	Const	Electrical equipment and sanitation equipment are all destroyed.	
Sludge dehydration		The guide rail of the travel crane seems to be in working condition.	
18. SI	Mecha- nical work	The dehydrator together with supplementary equipment is destroyed and there is no equipment that is in working condition.	
	Electrical work	There are no power cables or wiring.	
ation II	Con- struction work	While the structure itself is in satisfactory condition, there are no windows and doors. There are also no sanitation equipment and electrical equipment.	A detailed inspection needs to be performed.
Compressor station	Mechani- cal work	While the compressor remains, it is believed to be inoperable.	
19. C	Electrical work	There are no motors and power cables.	

D- 8

Name of facility	Type of process	Status of the facility and results of the sight inspection	Problems/issues
Power station	Construction work	The structure (pillars) does not seem to have any problems. Only the skeleton of the roof remains. There are no windows and doors. Only the guide rail of the travel crane remains.	A detailed inspection needs to be performed.
20. Po	Electrical work	The two generators are both destroyed and without cables. There are also no supplementary materials.	
21. Substation		2. Refer to section on screening station.	
22. Reception	Construction work	Both the interior and exterior show no problems in the outer appearance. There are no problems with lighting fixtures and sanitation equipment and the windows and doors are in good condition. The heating equipment is in poor condition. Waterproofing and down pipes are also in satisfactory condition.	Inspection on the steam piping and the sanitation equipment needs to be performed.
23. Administration building	Construction work	 While the front entrance is somewhat destroyed from outer appearance, the rest of the structure is in satisfactory condition. Most of the windows and doors, interior paint finish, lighting fixtures and sanitation equipment have been restored by the Vodovod I Kanalizacija's direct project. Some of the doors are defective. Heating equipment has been completely destroyed and the digestion equipment is in poor condition. Electrical facilities are not complete. 	In the WWTP compounds, this structure has been restored mostly but detailed follow-up will be required to bring it back to the original condition.
guidmn	Con- struction work	There are cracks in the outer appearance and the interior walls have also been destroyed.	A detailed inspection needs to be performed.
Service water pumping station	Mechani- cal work	The pumps and motors have been left destroyed or in defective condition and the piping is also defective.	
24. Se	Electrical work		

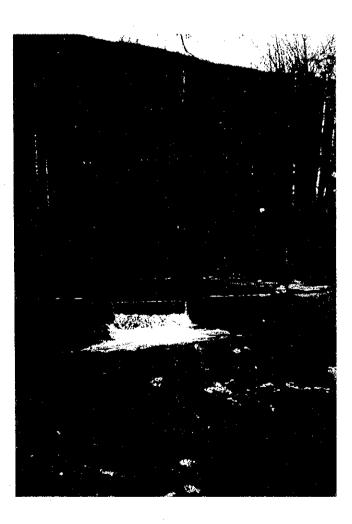

D- 9

Name of facility	Type of process	Status of the facility and results of the sight inspection	Problems/issues
Main laboratory	uction work	Both the interior and exterior are damaged but the structure itself seems to be in good condition. Windows, doors and electrical equipment of sanitation facilities are completely destroyed. The condition of the roof waterproofing is not known but judging from the above, it is believed to be in satisfactory	A detailed inspection needs to be performed.
25. M	Constru	condition. Pumps and motors have been left destroyed or defective and the piping is also defective.

·

E1 INTRODUCTION

Water quality survey carried out during this Study and pollutant load analysis of Miljacka River based on the results are reported in this Supporting Report. Past results of water quality survey carried out in 1990 was compared with the current results.

E2 OBJECTIVE AND CONTENT OF THE SURVEY

Objectives of the survey are

- a) investigate the quantity of wastewater discharged to the WWTP and the pollutant load at present, and
- b) prepare basic water quality information, which will be required for assessing water quality improvement following the implementation of wastewater treatment

Survey was conducted twice, once during winter (March) and once during summer (June-July).

E3 METHODOLOGY

E3.1 SURVEY LOCATIONS

Eight locations were selected following site survey and review of past studies as described below:

- on Miljacka River, upstream of Sarajevo City and on Bosna River, downstream of Sarajevo City- 2 locations
- 2) domestic wastewater discharges to Miljacka River in the city 2 locations
- 3) industrial wastewater discharge to Miljacka River 1 location
- 4) on Miljacka River, upstream and downstream of WWTP discharge 2 locations

Figure 2.8.1 of Main Report shows the schematic of survey locations and the notations used.

E3.2 SAMPLING AND ANALYTICAL METHODS

Samples were collected from 6:00 hrs to 22:00 hrs, for every two hours at all sampling locations except for industrial wastewater discharge. Grab samples were analyzed for domestic wastewater discharges and composite samples were made for all other locations for laboratory analysis.

Parameter		Method of Analysis	Remarks
Ambient Temperature	At the site	Thermometer	
Water Temperature	At the site	Thermometer	
pH	At the site	pH Meter	
Dissolved Oxygen (DO)	At the site	DO meter	Hydro-Engineering Institute
BOD _s at 20°C	Laboratory	Incubation at 20°C, DO measured by DO meter	
SS	Laboratory	SS analyzer	
Fecal Coliform Count	Laboratory	Fecal Coliform Test	

 Table E1
 WATER QUALITY PARAMETERS AND ANALYTICAL METHODS

Equipment shown in **Table E2** was provided by JICA for this Study and were used for analysis together with flow measuring equipment and DO meter from the Hydro-Engineering Institute. Technical staff of Hydro-engineering Institute, Sarajevo were drawn for sampling, flow measurement and assistance in analysis. Some of the staff were conducting similar work before war and are conversant with the work.

Item	Туре	Quantity
(a) Analytical Balance	HM-200	. 1
(b) pH Meter	IOL-30	1 set
(c) DO Meter	DOL-40	1 set
(d) BOD ₅ Tester	8053-02	1 set
(e) Incubator for BOD ₅	IS400	1 set
(f) SS (suspended solids) Tester	SS-064	1 set
(g) Drying oven (for SS)	DV-400	1 set
(h) Water distiller	WS-23	1 set
(i) Water sampler	8052-251	1 set
(n) Thermometer	Alcoholic Liquid	2

Table E2 LIST OF MAJOR EQUIPMENT USED

Flow of Miljacka River was determined at Dariva downstream of Mesanica Potok and at the bridge at Most Kod Stupske Peilje. Flow through wastewater by-pass at WWTP was also measured. Flow in the Bosna River was not monitored at the gauging station near Reljevo (Sampling location B2) and the flowrate was obtained from the Hydrology and Meteorology Institute.

E4 RESULTS

E4.1 MILJACKA RIVER AND BOSNA RIVER

Table E3 through E7 show the water quality of Miljacka River at sampling locations M1, M2 and M3 and that of Bosna River at sampling locations B1 and B2. In March '99, water quality of Miljacka River at M1 and Bosna River at B1 and B2 satisfied the Class II river category, in terms of BOD₅ and SS. However, Miljacka River at M2 and M3 did not satisfy the Class II and Class III river category in terms of BOD₅. In July '99, none of the sampling points satisfied the river category as expected due to lower river flowrates.

Following are the river classifications of Miljacka River and Bosna River.

Miljacka Riv		
From the spri	ng to the Sarajevo WWTP	- Class II
Sarajevo WW	TP to the confluence with Bosna River	- Class III
Bosna River		
From the con	fluence of Zeljeznica River to confluence of Miljacka River	- Class II
From the con	fluence of Miljacka River to confluence of Sava River	- Class III

Figure 2.8.2 of Main Report shows the pollutant loads at each survey location of Miljacka River and Bosna River. It also shows the results of May'90 and that of the trunk main by-pass at WWTP. Compared to May '90, pollution loads decreased significantly at M3 and at B2 due to lower pollutant load from trunk sewer by-pass at WWTP.

In March '99, pollutant load carried by Miljacka River due to direct discharges are 4,194 kg BOD_5/d (3,100 kg/d at M1 and 7,294 kg/d at M2) and 11,879 kg BOD_5/d (19,173 kg/d at M3) from trunk main by-pass. It should be noted that there is a difference of 2,559 kg BOD5/d compared to that measured at the trunk main (9,320 kg/d). SS load showed better agreement in balance than that of BOD_5 .

E - 3

In July '99, generally there was a decrease in pollutant load transported by the rivers compared to that measured in March '99 showing variation of pollutant load in winter season and in summer season.

E4.2 DOMESTIC WASTEWATER DISCHARGE

Table E8 shows the water quality data of raw wastewater flowing to WWTP which is being discharged to Miljacka River through a by-pass prior to WWTP inlet. In the absence of significant industrial activity it is considered as the domestic discharge. Table E9 shows the summary of raw wastewater characteristics in this survey as wells as in May 1990. Following can be said from the field observation and analytical results.

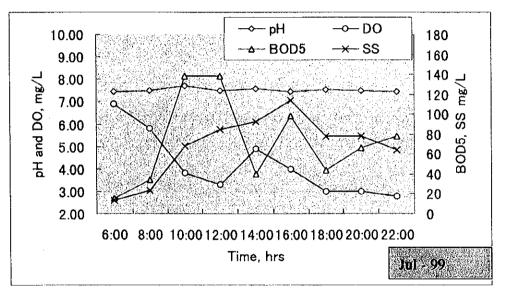

- Wastewater was very dilute and unlike of other wastewater discharges found in the city area which are discharged directly to Miljacka River. Average BOD₅ in May '90 was 131 mg/L (Table E9) while that of March '99 was only 54 mg/L and that in July '99 was 66 mg/L. However, SS didn't show a similar decline.
- 2) Flowrate in March '99 was 172,600 m³/d and in July it was 170,700 m³/d which is an increase compared to that of May '90 (151,500 m³/d). Leakage in the water distribution system and infiltration must have contributed to the increase in wastewater despite the decline in both population as well as commercial/industrial activity. (refer to industrial wastewater discharge for discussion on infiltration/leakage)
- 3) In terms of pollutant load to WWTP, BOD₅ load decreased to almost half (9,320 kg/d in March '99 and 11,266 in July '99) from that in May '90 (19,847 kg/d). Decrease is equivalent to approximately about 150,000PE. However, although SS load also decreased (10,701 kg/d) it was not as much as that of BOD₅.
- 4) In March '99, peak BOD₅ occurred at 10:00 hrs while that of SS concentration was at 12:00 hrs. Flowrate showed maximum during 12:00 to 14:00 hrs. In July '99, peak BOD₅ occurred between 10:00 hrs and 12:00 hrs when flow was also higher. Highest SS concentration was at 16:00 hrs when there was a second peak of BOD₅. Compared to the data of May '90, flowrate showed much variation during the observation.
- 5) Fecal coliform concentration was one order smaller in March '99 than that measured in May '90 but was same order in July '99. Wastewater samples at 6:00 hrs and at 8:00 hrs were very much clear and the concentration of fecal coliform was an order smaller than that observed after 10:00 hrs in July '99.

 Table E9
 RAW WASTEWATER CHARACTERISTICS IN THE MAIN COLLECTOR

Table E10 shows summary of raw wastewater quality data measured at the Collector during the pre-war period. Except for January 1988 data, there is a reducing trend for BOD5 and SS concentration. Considering the results in this investigation, improvements in the collection system is necessary to reduce infiltration and leakage in the water distribution system.

Source 3 : Izvjestaj o Odredjivanju EBS-a Uredjaja za Preciscavanje Otpadnih Voda Grada Sarajeva, Zavod Za Vodoprivredu, Sarajevo (Messrs. Zlatko Hofman and Skamo Dzevad) **Table E11** shows that of Potok Susica which receives domestic wastewater from septic tanks in unsewered area. Potok Susica is a tributary to Miljacka River. Unlike that of the trunk main bypass, water quality showed sharp variation in Potok Susica which is a general characteristic of domestic wastewater from a relatively smaller area. It should be noted that previous Study on raw wastewater discharges to Miljacka River, BOD₅ concentration of Potok Susica was 380 mg/L (refer **Table E14** in **Annex E**). Investigation revealed that one of the pharmaceutical industry which was discharging to this stream has shrunk the production (equivalent population survey conducted by the Hydrotecnic Institute showed one eighth of the pre-war level) and has connected to the sewerage system.

Table E11 DOMESTIC WASTEWATER DISCHARGE 2 - POTOK SUSICA (D2)

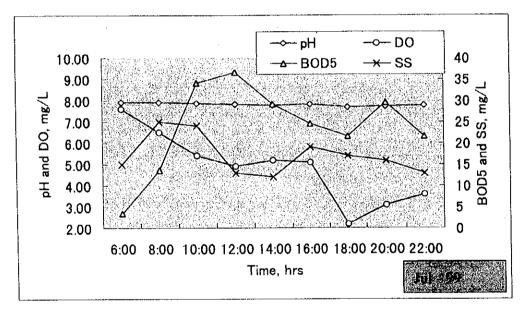

Figure E3 VARIATION OF WATER QUALITY OF POTOK SUSICA

E4.3 INDUSTRIAL WASTEWATER DISCHARGE

Table E12 shows the water quality data of wastewater discharge from an industrial area which is mainly for tile production and hardware yard. Wastewater is discharged directly to the Miljacka River at Alipasin Most (bridge). Currently, industrial activity has not resumed to pre-war level. Only small part is functioning and the wastewater is mainly of domestic origin from the workers.

 BOD_5 and SS values are higher than the water quality measured at the trunk main by-pass at WWTP. Comparing these values with that observed at the WWTP and considering that industrial production is very limited, weak wastewater strength at the trunk main must be due to infiltration and leakage.

a) Determination of Population Equivalent of Trunk Main

Note 1: Sampling was done at the main collector for 48 hours on 8th, 9th and 10th May 1990 to determine equivalent population.

6

Note 2: Population equivalent was determined to be 503,712 according to the method described in "Pravilnikom o vrstama, nacinu I obimu mjerenja I ispitivanja upotrebljene, iskoristene vode I ispustene zagadjene vode" ("Sluzbeni list SR BiH", br. 39, 30.12.1985

b) Characteristics of Trunk Main Wastewater during May-June 1990

Parameter	n	X	std	c
pH	24	7.90		
Alkalinity, mg CaCO ₃ /L	24	295	25	8.6
COD, mg/L	21	238	109	45.6
BOD5, mg/L	22	157	41	22.9
Total Kjeldahl Nitrogen, mg/L	23	27	7.6	28.2
Standard Plate Count, 20°C	14	1.96E+06		7.7
Standard Plate Count, 37°C	12	2.62E+05		10.0
Fecal Coliform, N/mL	14	6.34E+04		12.7

c = coefficient of variation (%)
