| Mr. Graybill                                    | 1-1 | Since the 1st Committee meeting, progress of the Study Team has been excellent. The Study Team is to be congratulated for its accomplishments to date in defining project dimensions that are relevant for environmental and social impact assessment, in developing environmental and social baseline information, and in consulting affected populations and other stakeholders.  |  |         |         |        |         |         |     |         |     |     |     |     |  |  |          |     |     |      |      |  |  |         |     |       |      |      |  |  |            |     |       |      |      |  |       |  |  |  |  |  |  |  |             |     |       |      |      |  |  |          |     |       |      |      |  |  |             |     |       |      |      |  |  |      |     |       |      |      |  |  |          |     |       |      |      |  |  |        |     |       |      |      |  |  |       |     |       |      |      |  |       |            |     |       |      |      |  |  |        |     |       |      |      |  |  |        |     |       |       |      |  |     |            |     |       |   |      |  |  |         |     |       |   |      |  |  |          |     |       |   |       |  |     |  |  |  |  |  |  |  |
|   | 1-2 | <p>New information on the reservoir profile and the vertical distribution of population up to EL.400m was presented to the Committee during the meeting. |                    |  |
|--------------------|--|
| <p>Mr.Graybill</p> | <p>about 45% of the total population below FSL.360m, about 38% of the total population below FSL.400m, and nearly double the population of the lower reservoir area (to FSL.310m). If this zone is extended to 14 m to include EL.319m, then it includes 7 villages, 2,417 persons, about 54% of the total population below FSL.360 m and about 46% of the total population below FSL.400m.</p> <p>(iii) About 81% of the population below FSL.360m is also below EL.332m (the approximate elevation of village B.Naxay). This population is approximately 3,624 persons.</p> <p>(iv) Between EL.335m and EL.360m, there are 3 villages, about 851 people, about 19% of the total population below FSL.360m and about 16% of the total population below FSL.400m.</p> <p>(v) Between EL.360m and EL.370m, there are 3 villages, 729 persons and about 14% of the total population below FSL.400m.</p> <p>(vi) Between EL.370m and EL.400m, there are no villages.</p> <p>On the basis of this information, plus tentative information that the vertical distribution of cultivated land is closely linked with this vertical distribution of population, the Committee offers the following suggestions for optimization of the reservoir FSL:</p> <p>(i) Considerations involving the vertical distribution of population and cultivated land do not appear to provide a strong basis for choosing FSL.300m to be the low-elevation case for cost-benefit analysis (i.e., the case suggested in the work program). A higher FSL, in the vicinity of FSL.315m (i.e., just downstream of the cultivated land and structures associated with village B.Pou/Naphang at EL.319m), may offer greater economic benefits without causing notably greater adverse impacts, and should be given due consideration as the low-elevation case.</p> <p>(ii) For any FSL higher than the village and cultivated land around EL.332m, considerations involving the vertical distribution of population and cultivated land do not appear to provide a strong basis for influencing the choice of the high-elevation case for cost-benefit analysis.</p> <p>(iii) For the interval between approximately EL.319m and EL.332m, several considerations appear to make it very difficult to accurately quantify social and environmental effects associated with any particular FSL. The conditions include low relief, high densities of population and cultivated land, the limited number of points of corrected topographic data (elevations), and the potential importance of cumulative effects of sediment deposition and flood backwater curves on future flooding of population and cultivated land.</p> <p>As a result of these considerations, the Committee advises against choosing any FSL within this interval as a case for cost-benefit analysis, unless the choice is accompanied by further detailed analysis of (a) the elevations of villages and cultivated land and (b) cumulative effects, within this zone of elevations, of flood backwater curves and sediment deposition in the reservoir.</p> |

|     |  |  |
|-----|--|--|
| 1-3 | <p>Information concerning the natural environment of the reservoir and other project impact areas, that is available to the Committee in early June 1999, does not appear to provide a strong basis for choosing or avoiding any particular FSLs as cases for cost-benefit analysis.</p>   |  |
| 1-4 | <p>Suitability of resettlement sites has not yet been addressed. To date the demographic, cultural and socioeconomic features of affected villages have been fairly well characterized and three (3) candidate resettlement sites have been identified very tentatively on the basis of a sole criterion – low topographic relief. One of these sites is within an area described as elephant habitat. Another is adjacent to such an area.</p> <p>It is clear that the Study Team understands the current international standards for resettlement, recognizes the sensitivities and complexities of the resettlement process (including pitfalls of simplistic or monolithic approaches), and intends to account for population growth that will occur before project implementation. Also, the Committee realizes that detailed resettlement planning and detailed social acceptance assessment are tasks for a later stage of the project.</p> <p>Nevertheless, the Committee wishes to clarify and emphasize the need for the final report to include a clear demonstration that realistic and concrete possibilities actually exist for accomplishing socially acceptable resettlement, to international standards, of all persons affected (at the time of project implementation) by the case with the recommended FSL, or by the case with the higher FSL, if the recommendation includes options for FSLs. This means:</p> <p>(a) Specific concepts for restoration of income and amenities of the affected population should be described. The concepts should be consistent with available data on demographic, cultural and socio-economic features of the affected population; should be broadly acceptable to potentially affected villages and should be broadly acceptable to concerned government authorities. Examples of land-based concepts include subsistence farming, cash-crop farming, animal husbandry and fishpond aquaculture. Examples of non-land-based concepts include government employment in forest or conservation management, floating net aquaculture in the reservoir, training and permanent employment in construction, manufacturing, retail sales, driving vehicles, driving boats or maintaining the power project and access roads.</p> <p>(b) Specific candidate resettlement sites should be identified. The sites should have features that are suitable for implementation of the aforementioned concepts; that are broadly acceptable to potentially affected villages; that are broadly acceptable to concerned government authorities; and that are available for use as resettlement sites. Examples of suitability parameters include access, drainage, soils, absence of flooding, absence of numerous hosts or intense current use, and size of area (to accommodate all affected persons at the time of project implementation, allowing for population growth).</p> |  |

Mr.Graybill

|      |   |             |
|------|---|-------------|
|      | <p>(c) Viability and special needs of villages left behind (i.e., not resettled) should be addressed in the context of the overall scope and cost of resettlement.</p> <p>(d) Special problems involving hosts and neighbors of candidate resettlement sites should be addressed in the context of the overall scope and cost of resettlement.</p> <p>(e) Environmental impacts of resettlement should be addressed, as agreed during the first Committee meeting.</p>  |             |
| 1-5  | Possible risks to resettlement planning and cost estimating, such as unusual influx of outsiders into the reservoir area, should be addressed, and remedies suggested, in the final report.   |             |
| 1-6  | The Committee clarified that the cost estimate for each cost-benefit case will include estimates or allowances for all project costs of social and environmental investigations, planning, public participation, mitigation and monitoring (including recommended resettlement, regional development planning and environmental management planning). Resettlement costs will include allowances for population growth until project implementation.  |             |
| 1-7  | Agricultural inventories have not yet reported data on production or yields of food crops that would be lost through inundation, but the Committee clarified that this information will be forthcoming and will be addressed in the final report.   |             |
| 1-8  | New data on fish consumption were presented to the Committee during the meeting. The Committee clarified that further data will be forthcoming and that project impacts on fish consumption will be addressed in the final report.  | Mr.Graybill |
| 1-9  | Reservoir clearing is not yet prioritized (Comment No.1-9 from the first Committee meeting), but the Committee clarified that priorities for clearing will be described in the final report, to facilitate preparation of a reasonable cost estimate for partial reservoir clearing to support reservoir transportation and fisheries.  |             |
| 1-10 | The Committee clarified that downstream issues referred to in Comment Nos.1-5 and 5-6 will be addressed in the final report along with the issue of riparian release (and the quality of released water) during impounding. A deregulating pond has been incorporated into the project since the first Committee meeting, but a multi-level intake has been rejected on the basis of high cost of construction.   |             |
| 1-11 | The Committee agrees with the tentative conclusion of the study team that without a multi-level intake structure, or biomass removal program, water passing through the turbines or a bottom outlet is likely to be deoxygenated and heavily loaded with BOD and H <sub>2</sub> S, from decaying soil and vegetation, for at least a couple of years after impounding; and that significant improvement in the quality of discharged water can be expected thereafter. The Committee questions whether BOD input/output modeling, or other water quality modeling of the reservoir, can refine available knowledge of this situation enough to influence the decision on a biomass removal program. |             |

|      |             |  |  |
|------|-------------|--|--|
|      |             | <p>The Committee therefor suggests that if this modelling is included in the work program for the next stage, it should be accompanied by an explanation of the extent to which the modelling is expected to refine the knowledge needed for a technically competent decision on a biomass removal program; or for other reasons, such as design decisions on the specifications of structures and components that could be corroded by H<sub>2</sub>S derivatives.</p>  |  |
| 1-12 |             | <p>Malaria appears to be a public health problem in a number of affected villages. The final report should reveal the species of malaria vectors and parasites that occur in the project region and address risks and mitigation for the construction labor force, project neighbors and resettlers.</p>   |  |
| 1-13 |             | <p>The Committee suggests that the tentative proposal for "alternative river basin conservation" should be revisited. Mitigation efforts such as environmental management plans, integrated regional development plans, watershed management and habitat restoration should focus, at least initially, on the basin which contains the project, and particularly on upstream areas where environmental degradation could adversely affect project performance.</p> <p>If there are special circumstances which justify mitigation activities outside of the project basin, especially while the project basin is experiencing degradation, they should be carefully explained.</p>   |  |
| 1-14 |             | <p>It would be convenient for readers of the final report, if villages in the reservoir area were always listed in the same sequence (in order of elevation) in all tables and figures, throughout all volumes of the report.</p>  |  |
| 1-15 | Mr.Graybill | <p>Information on cultural heritage is cursory and appears to be based solely on the village and household surveys. The Committee suggests that the final report should include an initial examination of the risk that the reservoir area may include significant archaeological materials. The examination should be based on a review of literature and secondary data on regional archaeology by a competent archaeologist.</p>  |  |
| 1-16 |             | <p>Presentations on reservoir assets are silent on the subject of mineral resources beneath the reservoir area. The Committee suggests that the final report should include an initial examination of the risk that the reservoir area could be underlain by exploitable reserves. The examination should be based on review of literature, available maps and secondary data on regional geology.</p>   |  |
| 1-17 |             | <p>Regarding the suitability of resettlement sites, in response to discussions in the final session of the second Committee meeting, the Committee offers the following additional suggestions concerning the presentation of this subject in the final report:</p> <ul style="list-style-type: none"> <li>(a) To include a detailed enumeration and description of realistic possibilities for employment and income restoration through non-land based activities associated with developments that accompany the construction and operation of the project. Examples are given in 4 (a) above. The report should suggest approximately how many resettlers could be employed through each possibility.</li> <li>(b) To enumerate and describe recognized possibilities for scattered remote resettlement (e.g., joining family members in another town) that were identified through public consultation</li> </ul> |  |

|          |     |   |  |
|----------|-----|---|--|
|          |     | <p>meetings; to clarify how income would be restored by this approach; and to estimate how many families could be resettled through each possibility.</p> <p>(c) To enumerate recognized possibilities for land-based resettlement top specific downstream areas that were identified through public meetings; to estimate the number of families interested in these possibilities; and to find and evaluate specific downstream candidate resettlement sites to accommodate these families.</p> <p>(d) To tentatively identify villages with the most promising opportunities for resettlement and income restoration near the reservoir; to describe the opportunities; and to estimate the numbers of families that could be resettled through these opportunities.</p> <p>(e) To enumerate the other families in the reservoir area and add an allowance for population growth; to find and evaluate additional land-based candidate resettlement sites for all of these families, and to confirm that all candidate sites (including those mentioned in (c)) satisfy basic suitability criteria such as are listed in 4 (b) above.</p> <p>To sketch illustrative site layouts (e.g., showing cultivation, grazing, fuelwood, housing and community infrastructure) and preferred house types for various affected groups.</p> |  |
| Mr.Inoue | 2-1 | <p>Since this investigation is the Environmental Impact Study prior to the Feasibility Study, the geological investigation can not be carried out in detail. However, if geological condition for constructing structure is unsuitable, the environmental study is little meaning. The followings are the comments to the Interim Report by the above background on the geological environmental study for during and after the construction.</p> <p>The evaluation of geological investigation result without boring and adits is very difficult. However, field investigation was carried out in spite of the difficulty of access to the planned dam and surrounding structure. The Interim Report described the adequate results on the important points for the evaluation of construction cost and discussed whether there are fatal geological and/or topographical conditions or not.</p>   |  |
|          | 2-2 | <p>The dam height is estimated 10 m higher than the previous report in FSL, 360m high water level case. The river deposits are not estimated for designing dam height at this investigation, but, if it is considered, the dam height will be almost 200m. The highest dam by CFRD in operation in the world is less than 200m, but some plans of more than 200m dams by CFRD are underway.</p>   |  |
|          | 2-3 | <p>(1) The open cracks were found in the basement rock at the high elevation of the left bank, of which I have pointed at the last meeting. The creeping of the cliff caused the phenomena. The open cracks should be found also at the right bank. This implies that it is not inadequate for construction of dam, but it needs for extra cost estimation by the increase of excavation volume or improvement design to the depth to the downside and inner part of the basement.</p>  |  |

|     |  |  |
|-----|--|--|
| 2-3 | <p>(2) Though the uni-axial compressive strength of muddy rocks as a basement of the dam is 2-10 Mpa, the specimens for the test seem to be used weathered rock due to the difficulty of the sampling. The muddy rock is estimated to have stronger bearing power, because surrounding conglomerate and sandstone is consolidated to hard, and the stratum is Cretaceous age. The muddy rock is estimated to have sufficient bearing power for the CFRD dam of 200 m – height class.</p> <p>(3) The dam axis is fixed as one line in this report, the dam axis enables to set up to some alternatives in response to geological and/or topographical condition and this strategy should be reported in the final report.</p> |  |
| 2-4 | <p>According to the Interim Report, the quarry site is described including far away site from dam, the site should be located inside the reservoir from the environmental and economical points of view. The site of 1 or 2 in the figure 3.6.8 inside the reservoir is recommended to prior of the first selection. The site of 4 or 5 where it is the down stream of the dam site will give an environmental load, because large amount of rock volume will be moved. The site of 7 or 8 with suitable rocks as the shell materials are found far away from the dam. However, it is not realistic, because it is far from the dam site and new road should be constructed in order to select as a quarry site.</p>         |  |
| 2-5 | <p>The sedimentation study is carried out referring to the Nam Theun-2 planed and Nam Ngum-1 results. It depends on the elevation of the high water level. However, it is estimated suitable, in this investigation level.</p>   |  |
| 2-6 | <p>It is possible to construct the main dam, re-regulation dam and surrounding structure technically even in the alternative plans of among 320 m and 360 m water level. If the water level is more than 360 m, the elevation of the ridge of the end of Nom-Sau river will be deeply affected to the project including the accuracy of the elevation of the topographic map.</p>  |  |
| 3-1 | <p><b>General</b><br/>On myself opinion for the resettlement of people, we should be concerning for the ethnic people into 2 important issues in the implementation policy.</p>  |  |
| 3-2 | <p><b>The spirit factor</b></p> <ul style="list-style-type: none"> <li>- An Education campaign to public awareness should be considered.</li> <li>- A Comprehensive of the specific aspect and the psychology of ethnic people should be considered.</li> </ul>  |  |
| 3-3 | <p><b>The material factor</b></p> <ul style="list-style-type: none"> <li>- The impact compensation</li> <li>- The new location should be better than the previous site and the weather condition should be considered to.</li> <li>- Improved necessary infrastructure benefit and service facilities for their sustainable livelihood.</li> <li>- Arrange a new job opportunity for them and others.</li> </ul>   |  |

## SUPPORTING REPORT(V)

|                  |   |
|------------------|---|
| 4-1              | General speaking, I agree with this draft document because it provides adequate information and it also can be used as the basic information for applying in the future study. However, I find that this study should provide more detailed in the following issues:  |
| 4-2              | The study on wildlife and habitat should indicate the relationship between the numbers of wild animals and their habitats so as we can understand which habitats or forest types are needed to conserve.  |
| 4-3              | The study is not mentioned which wildlife species are the most affected in the project area and what mitigated measures should be applied.  |
| 4-4              | In the report on Environmental Assessment, page 5-8, table 5.3 said that the tiger and the python are classified as the conservation species (2) but in fact these species are classified as the protected species (1). The pangolins is classified as the conservation species (2).  |
| 4-5              | The study on aquatic species is not also indicated which species are endangered or endemic and what mitigated measures should be applied to make sure they can survive.   |
| 4-6              | The study on the ethnic group, it unveils only the main groups. Are there the subgroups in the project area. If so, which subgroups are the most affected when the resettlement take place and what measures should be applied to make sure their cultures be conserved.  |
| 4-7              | In the resettlement context is also not yet clearly explained about where people exactly prefer to live in and if they prefer to live in the project area where are the most suitable sites for them and what kinds of occupations are the most relevant to them.   |
| 4-8              | In the case of removal of biomass from the basin, the study should explain how long does it take to remove all biomass from the basin and what mares should be applied to make sure people will not cut trees beyond the reservoir.   |
| 4-9              | The study doesn't clearly tell the positive and negative impacts before and after dam construction particularly in the reservoir, upstream and down stream and if there are the negative impacts. What are the mitigated measures should be implemented.  |
| 4-10             | The study is not yet clearly shown what project scale is the most suitable in term of economy and environmental protection.   |
| 4-11             | The study raises several risks of the project but I think the electric sale to only one market (Thailand) is also the major risk. Regarding this matter, how to negotiate with Thailand to the reasonable price because in the past Thailand needed to by electricity at a very low cost.   |
| 5-1              | On behalf of myself as the rural developer, I am agreed for this development project. After listening to the presentation report from study team on the investigation collected data and analyzed the project situation, I have impression that the data collected is satisfactory as the condition of survey can provide. The impacts for the project are in many domain., personally, I will be comment on the issues concerning to the impact people in the reservoir area. There are concerning about their spirit and their material factor. For the material factor, the study team already sufficient reported in detail in their presentation. But, for the spirit of the people, we must take time for implementation on each stage and process. That means the psychology of the people should be considered such as: |
| Mr. Venevongphet |   |
| Mr. Songhoa      |   |

|     |   |  |
|-----|---|--|
| 5-2 | The condition of livelihood, social and ethnicity consideration, family relationship, and the weather condition is very important for the resettlement. Therefore, the new location for the resettlement should be near condition as the previous location.   |  |
| 5-3 | The resettlement is not considered only for the ethnic people who had their own house flooding in the reservoir area. Other relationship of their families and their neighborhood should be considered to. Because, after the resettlement, the condition of livelihood are favorable. This people will be moved and concentrated in the same location.   |  |
| 5-4 | Some people received from their parents and heritage of cultivation land. So, this people are living outside the inundated area. Due to the resettlement, these people must moved follow to, because their cultivation land are inundated. Therefore, if the resettlement is not soundness study, we will have a problem in further.  |  |
| 5-5 | One of the important priority for the people in the new location is provide an electricity supply should be considered.   |  |
| 5-6 | Other important point on the resettlement, additional to the agreed of the local authority, the recommendation from the National Front and the Elders of the village is very important. Because, their recommendation can considered as the unity of the village.   |  |
| 6-1 | The Study Team has been proceeding the hydropower planning and the economic evaluation under the preliminary assumption of hydrology and other technical information. It is expected that the final assessment in the stage would be obtained by the end of November 1999, with enough accuracy to judge the continuation of the study into the feasibility study in cooperation with other environmental factors. To achieve the target, a monetary amount of the incremental net benefit is substantial between several scales of the project. The interim report involves the preliminary observation on economic analysis, presenting the capitalized incremental net benefit of US\$ 75 million, approximately, between FSLs.320m and 360m.  |  |
| 6-2 | The Study Team has proposed the daily peaking of 16 hours for the decision of the installed capacity. The 16-hour proposal might be based on the present daily demand in Thailand system and on the experience of negotiation process in other projects. It is observed that the 16-hour-peak is composed of combination between the day-peak and the evening-peak, and that the situation of the 16-hour-peak may be on the transition in the course of the economic growth. It is very sure that the 8-hour-day peak would be emerging after several years, if the economic recovery would be as expected. In this regard, it is advised that the final installed capacity should be based on the 8-hour-day peak, and that the installed capacity at the first stage could be based on the 16-hour peak. The economic evaluation in the final report would be expected based on the two-stage development. |  |

Mr.Adachi

|                      |     |  |  |
|----------------------|-----|--|--|
| SUPPORTING REPORT(V) | 6-3 | <p>The accuracy of inflow data is substantial for the decision of the study continuation. However, it is recognized that the hydrological analysis is complex, and that the conclusion should be waited until the next report. It is not clarified yet whether or not the back-water-effect from the Mekong mainstream is affecting to the existing Muang Mai water level gauging station. Further, it is reported that the basin rainfall estimation of 2,900 mm, may be optimistic, if the Nam Theun 2 study is referred to. The Study Team explained the difficulty to break through the estimation obtained in the Nam Theun 2 case, because of information shortage for the hydrology in the Nam Ngiep basin. It is advised that the actual measurement results at the new gauging stations could be compared with the Nam Theun river flow data, after one-year measurement, to make decision whether the Nam Theun study results could be applied or not.</p> |  |
| Mr. Adachhi          | 6-4 | <p>The Study Team has proposed to construct the re-regulating pond at the downstream of the powerhouse site. It may be proper solution from the view-point of the downstream river environment. The idea is supported, also, by the reason that the reliability of kW provision to the system is essential. It is observed that the project may not be viable without evaluating the kW value, and that the re-regulating pond is substantial to secure the reliability of kW provision to the system. It is recommended to scrutinize whether or not the pond capacity is enough to re-regulate the peak discharge of the final stage for 8-hour-peak operation.</p>  |  |
|                      | 6-5 | <p>The layout of the project is agreed including the dam type of a concrete-faced rock-fill dam (CFRD). However, the CFRD type of dam is sensitive for rock condition of dam foundation and dam material for embankment. It is recommended that the rock foundation and dam material should be discussed in the final report to clarify the CFRD type is proper solution in the project. It should be also discussed that the CFRD could be applied for the designated height of more than 150 m referring to actual results in the world.</p>   |  |
|                      | 6-6 | <p>General observation says that the cost for environmental mitigation measures including resettlement may be short. More discussion is expected in the final report. It is advised that comprehensive measures should be discussed on, not only actual compensation but contribution to economic development and environmental enhancement of the basin. Several opinions to be presented in the public hearing may contribute to plans of the comprehensive measures. The comprehensive measures may involve the establishment of road network in relevant provinces, of water supply and sewage systems in the downstream villages, and so on. The project should not only compensate the people's loss but also contribute to the relevant rural development.</p>  |  |

2. ENVIRONMENTAL ASSESSMENT  
COMMITTEE (EAC)

2.4 3RD EAC REPORT AND STUDY TEAM'S COMMENTS

3RD COMMENTS OF ENVIRONMENTAL ASSESSMENT COMMITTEE  
AND  
REVIEW RESULTS OF JICA STUDY TEAM

| Name         | No. | Comments   | Review Results |
|--------------|-----|--|----------------|
| Mr. Graybill | 1-1 | <p>The JICA study team is to be congratulated for its progress on most environmental and resettlement aspects of the study, since Committee Meeting No.2. Especially notable are its continuing public consultation efforts, which included the addition of a gender consultant; its thorough documentation of these efforts; its attention and responsiveness to public comments; and the overall high quality of its draft reports and presentations to the Committee.</p>   |                |
|              | 1-2 | <p>The November 1999 drafts of the environmental and resettlement reports are technically very substantial; are responsive to earlier comments of the Committee; give due consideration to applicable standards and guidelines (including those of multilateral donors such as ABD and World Bank); are appropriate and adequate, for this first stage of the feasibility study, in their coverage of issues, impacts, mitigating measures and proposals for future work; and are on track to satisfy rigorous international standards and guidelines as the project unfolds.</p> <p>The draft reports show the EIA (environmental impact assessment) and SIA (social impact assessment) being finalized during the feasibility stage. However, these documents cannot be finalized until the project dimensions and operating rules are finalized during the detailed design stage. Therefore, it would be better to refer to EIAs and SIAs for various stages in the same way that the design is referred to for various stages, e.g., "Feasibility Stage EIA", "Final (design-stage) EIA", etc. and to include some time for updating the EIA and SIA during the detailed design stage.</p> <p>Existing descriptions of environmental and resettlement activities, schedules and costs have been prepared on the assumption that the second stage feasibility study would address only one FSL case. If the decision is confirmed to continue to study more than one FSL case during the second stage feasibility study, then some of the existing descriptions of environmental and resettlement activities, schedules and costs will need to be revised, either to address both cases, or to be postponed until a single project description becomes available.</p> <p>The environmental discussion of initial reservoir filling should include reference to the engineering limitations on speed of filling that are addressed by the Geologist in another part of the report for this EAC Meeting No.3.</p> <p>Other corrections and clarifications of the draft reports were discussed with the respective authors. Some suggestions were made for reorganizing the early sections of the resettlement report; and for more explicit linkage of cost estimates with discussions and schedules of activities, to confirm that all resettlement activity components that are described and scheduled are also included in the cost estimate.</p> |                |
| 1-3          |     | <p>Information concerning the natural environment of the reservoir and other project impact areas, that is available to the Committee in December 1999, does not appear to provide a strong basis for choosing or avoiding FSL case 320 m or 360 m.</p>  |                |

## SUPPORTING REPORT(V)

|     |   |
|-----|---|
| 1-4 | <p>Regarding the decision to adopt El. 320 m as the FSL for one of the two cases studied in detail, the Committee refers back to its June 1999 recommendation concerning the relationship between reservoir FSL, the vertical distribution of cultivated land villages, and the cumulative effects of backwater curves and sediment deposition between elevation 319 m and 332 m. In response to the absence of new information on these topics, the Committee reiterates this recommendation and suggests that until detailed studies of the cumulative effects of backwater curves and sediment deposition prove otherwise, El. 320 should be considered to be a reservoir flood water level, rather than an FSL. Economic and financial conclusions about the El. 320 m case should be interpreted conservatively in this direction. Approaches that would increase the seriousness or frequency of flooding events in the Thaviang area should be avoided, as they would be inconsistent with the commendable environmental principles of the project. Studies of water discharge and sediment load should emphasize event-based sampling for high flow events in the vicinity of El. 320, to facilitate rapid development of a data base for high flow conditions (i.e., simultaneous measurements of water and sediment discharges); and should assume, until local measurements prove otherwise, that local sediment deposition (including bed load) could be a problem for the Thaviang area, even if basinwide sediment transport is very low and reservoir lifetime is predicted to be very long.</p> |
| 1-5 | <p>Three risks that could significantly affect project costs, schedules, land availability or public acceptance in some areas, are raised, but not put to rest in the draft reports: unexploded ordnance (UXO); banditry and other security risks; and agent orange residues. Provisions for UXO reconnaissance are included among EIA tasks and cost estimates but are not shown as line items. UXO maps were shown in the oral presentations, but are not included in the reports. Unit costs for UXO reconnaissance, planning and clearance were cited during discussions with the Study Team. UXO risks appear to be most notable for the candidate resettlement sites located north of the reservoir and possibly for parts of the upper reservoir area. Security risks occur broadly throughout parts of the catchment area and candidate resettlement sites. Little is known of the possibility of agent orange residues, except that the chemical was used in the region during the Vietnam war. In response to this situation, (a) candidate resettlement sites should be screened for the likelihood of UXO (using maps already in hand), and the findings (including cost of clearance or decisions to avoid certain candidate sites) reported in the final reports of the Phase I study; and (b) provisions (i.e., scope, schedule and cost) for evaluating and determining a final disposition of all three risks, probably during Phase II feasibility studies, should be explicitly described and cost estimated in the final reports of the Phase I study.</p>                                  |
| 1-6 | <p>Cost estimates presented in the main report, for environmental mitigation and resettlement, seem not to match the corresponding figures in the resettlement report and the EIA report. The computations and presentations of environmental and resettlement costs should therefore be reviewed and amended as necessary to insure internal consistency and tractability through all three reports. It may be useful to</p>   |

Mr. Graybill

|           |   |  |
|-----------|---|--|
|           | arrange all such costs in a matrix with project stage (e.g., second stage feasibility study, detailed design, construction, impounding and operation) and responsibility (engineered structures, social/resettlement activities and other environmental activities) as the axes.  |  |
| 1-7       | Sixteen candidate resettlement sites were identified but information on the sites is cursory, and less than expected, due mainly to difficulties of access. The sites may be sufficient for accommodating project resettles but their adequacy has not yet been confirmed and the environmental impacts of resettlement have not yet been addressed. Therefore the suitability and adequacy of candidate resettlement sites, and the environmental impacts of resettlement, require urgent attention for the second stage of the feasibility study.   |  |
| 1-8       | Planning of environmental mitigation measures (i.e., development of specifications and measures to insure implementation) would be facilitated by a brief description, in the main report, of the expected procurement process and documents for project implementation.  |  |
| 1-9       | Future water quality monitoring efforts should begin with a review of quality control and quality assurance procedures through the sampling, transport, laboratory testing and reporting process, to insure that resulting data are highly reliable. The review should include inspections and audits of laboratory facilities and procedures; and performance testing and inter-laboratory comparisons (round robins) involving reference standards, blanks and spiked samples. Water quality monitoring should not proceed until reliability of data has been demonstrated to be high.  |  |
| 1-10      | The site visits and other activities of the gender consultant should be described in the "Records during Field Investigations".   |  |
| 2-1       | The draft final report describes about the study from the comprehensive view-points in order to evaluate the effect on the construction and operation of the Nam Ngniep-1 power plant from the environmental points.<br>Especially, the tasks, for engineering geologic stand-point, is included in this report, very shortly, such as sedimentation at the end of the reservoir, construction effects of the dam and road, etc. They are the location of quarry sites and the re-regulation dams etc. which have been discussed at the 1-st and 2-nd Environmental Assessment Committee. Small amount on above topics is reasonable because this survey is the early stage of the investigation, which is aiming to the environmental assessment.                |  |
| 2-2       | The height of dam<br>The flood level is proposed at El. 320 m from the multi environmental points by the study team. Higher dam than the proposed one will be able to construct from the technical and economical viewpoint. However, the El. 320 m reservoir is born from the 156 m height dam, which is still classified into high-class dam. So, in order to design the dam even preliminarily, careful geological investigation is desirable.<br>The philosophy of brief geological investigation procedures is described shortly as follows.<br>i) Geomorphologic and economical suitable dam axis should be selected by making large-scale topographic.<br>ii) Geologically suitable dam axis should be selected by the careful surface geological mapping. |  |
| Mr. Inoue |   |  |

## SUPPORTING REPORT(V)

|     |   |
|-----|---|
|     | <p>iii) Boring excavation procedure will be performed after the careful selection of dam axis, as mentioned above. Geophysical exploration is also desirable with the boring. However if previous results are close to the new axis, it could be utilized as a reference.</p> <p>iv) The most important engineering geological points at this dam site are as follows:</p> <ul style="list-style-type: none"> <li>a) The permeability tests, especially at the both wing of dam must be carefully performed in order to investigate whether there are big open joints or not.</li> <li>b) Weathering extent and underground water level at the both wings of dam must be also investigated in order to decide the excavation line.</li> <li>c) Careful boring core investigation is enable to check whether limestone is distributed underneath dam or not.</li> <li>d) The thickness of talus deposits at the both riversides and the depth of gravel sediment at the riverbed must be checked.</li> </ul> <p>v) If large open cracks are found deep in the basement of dam by boring geological investigation, the excavating adits is desirable even at the early stage of investigation.</p> <p>vi) Location of borings should be planned not only below the flood water level, but higher level than that, because water table, weathering extent etc. should be estimated in order to design the slope.</p> |
| 2-3 | <p>Quarry site</p> <p>It is very important point to locate quarry in the reservoir in order to minimize the environmental affects with the big construction works. This report describes that quarry site is planned in the reservoir and near the dam site.</p> <p>The quality and volume of rocks for dam materials should be investigated by boring excavations in the early stage. In spite of quarry is located in the reservoir, the artificial slope will be appear upward high water level. The stability of the slope and plantation will be important design for the conservation of the environment.</p>   |
| 2-4 | <p>Sedimentation estimation</p> <p>It is reasonable to estimate the sedimentation at the end of the NNPI reservoir by the experience of the NG1 reservoir and the estimation at the NT2 in this early stage of investigation.</p>   |
| 2-5 | <p>Re-regulation dam</p> <p>Re-regulation dam is planned at the wide river area, down-stream of the main dam. The important engineering geological points here are the depth of the river bed deposits. Hence, combined geological investigation of the seismic exploration and boring investigation are effective to this site.</p>  |
| 2-6 | <p>Stability of slope during the operation of generation</p> <p>The landslide including avalanche is a very few before the construction. However, the amount of up-and-down of water during generation is 36 m in the 320 m case, so unvegetated area will expose very</p>  |
| 2-7 | <p>Difference of the construction term between 320 m and 360 m case is not discussed in the report. If 320 m case is adapted, more than one year is saved. This is one of the large merit for 320 m case.</p>   |

Mr. Inoue

## SUPPORTING REPORT(V)

|                  |     |  |  |
|------------------|-----|--|--|
| Mr. Inoue        | 2-8 | The pouring water speed in the reservoir should be decided by not only from hydrological point but also watching the behavior of dam, because CFRD dam is considered to be very sensitive to the load of water. It should be referred to the standard.   |  |
|                  | 3-1 | After listening to the presentation of the Nam Ngiep 1 Study Team on the 3 <sup>rd</sup> meeting of the Environmental Assessment Committee for the Environmental Impact Study on Nam Ngiep 1 Hydroelectric Power Project in Lao PDR. I have the following comments.  |  |
|                  | 3-2 | Firstly, I'd like to congratulate the Study Team on the success of each stage of the study's progress. The Study Team has shown two alternatives for the Environmental Impact Study. 1/. FSL 360m and 2/. FSL 320m. At the 2 <sup>nd</sup> workshop in Pakxan, on 9-11 June 1999, both alternatives were confirmed to be the most appropriate for further environmental study.   |  |
| Ms. Tongsy       | 3-3 | <p>On behalf of the member of the Environmental Assessment Committee, I have some comments on the resettlement plan, as follows:</p> <ol style="list-style-type: none"> <li>1/ Try to explain more to the local people for them to understand the purpose of the project so that they can accept the project.</li> <li>2/ Compensation policy to the effected people should be implemented properly and fairly, and the people are able to have opportunity to improve their standard of living.</li> <li>3/ Vocational training for local people must be arranged according to the Government Policy on the reduction of shifting cultivation.</li> <li>4/ Resettlement area should be located where the projected rural electrification will be.</li> <li>5/ Representatives of concerned agencies should be involved in every implementation process of the project. These agencies including Lao Front for National Construction, Youth Organizations and the representatives of the effected people.</li> </ol> |  |
|                  | 4-1 | After two days hearing the report from the study team. First of all, I would like to appreciate the study team for its hard work in preparing the study report.  |  |
|                  | 4-2 | It was observed that the presentation made by the team has answered the major questions given by people concerned in the last meeting.   |  |
| Mr. Venevongphet | 4-3 | <p>However, there are something remained to be done in the main study for example:</p> <ul style="list-style-type: none"> <li>• We understand that EL 320m is good only for environmental protection, but it is not economical. Therefore, it was proposed that the study team should study again in term of economical viability.</li> <li>• The Study Team has developed the environmental management plan, but I think in the next study it should also develop a detailed rules and procedures in specific areas for the environmental protection.</li> <li>• The resettlement action plan should be incorporated with provincial and regional development plan. The compensation must be fair and life in the resettlement areas must be better off.</li> </ul>   |  |

| SUPPORTING REPORT(V) |  |
|----------------------|--|
| Mr. Venevongphet     | 4-4<br>The study team should find out exactly which parts of the project area were affected by the unexploded ordnance, including in the proposed construction and in the resettlement sites. This is to avoid the problem may happen during the resettlement and the project cost's estimation as well.   |
|                      | 5-1<br>After listening to the 2 day presentation of Nam Ngiep 1 Study Team, I have a very good impression. I congratulate the JICA Study Team and Department of Electricity for the successful preparation of the 3 <sup>rd</sup> Environmental Assessment Committee Meeting on the Environmental Impact Study on Nam Ngiep 1 Hydroelectric Power Project in Lao PDR.  |
|                      | 5-2<br>The 2 <sup>nd</sup> General Workshop in Pakxan in June 1999, the FSL 320 alternative was acceptable by the villagers. Although there are some difficulties with resettling people from the reservoir area, I believe that when the project is approved for construction, the resettlement can be done properly.   |
| Mr. Songhoa          | 5-3<br>On behalf of the member of the Environmental Assessment Committee, I have some comments as follows:<br>1/ Local people, villagers, representatives from Lao Front for National Construction, Youth Organization and Lao Women's Union should have opportunity to involve in all resettlement processes;<br>2/ The resettlement plan should focus on improving the standard of living of the local people;<br>3/ The compensation plan should be clear, fair and reasonable; and<br>4/ The resettlement plan should consider not only the technical aspects of moving they should also consider the local religion of each group of people to be resettled.  |
|                      | 6-1<br>The comparison between the 360 and 320 alternatives have been intensively discussed in the meeting. It has been recognized that the 320 alternative would be unable to be economically viable, as far as the present basis of the power purchase agreement between GOL and EGAT is referred to. I myself very confidence, it is possible that the 320 alternative would be viable very near future, even if the Thavian rejects to be submerged, but not now. Therefore, for the time-being, I recommend to continue also to pursue the economics of the alternative 360 in corporation with the investigation for further step, maintaining two alternatives of the 360 and 320. The significant factors may be inflow data and peaking hours. |
| Mr. Adachi           | 6-2<br>The Study Team has proposed the daily peaking of 15 hours for the decision of the installed capacity. The 15-hour proposal might be based on the present daily demand in Thailand system and on the experience of negotiation process in other projects. It is observed that the 15-hour-peak is composed of combination between the day-peak and the evening-peak, and that the situation of the 15-hour-peak may be on the transition in the course of the economic growth. It is very sure that the 8-hour-day peak would be emerging after several years, if the economic recovery would be as expected.  |

|     |  |  |
|-----|--|--|
| 6-3 | The accuracy of inflow data is substantial. However, it is recognized that the hydrological analysis is complex, and that the conclusion should be waited until the next stage. It has been clarified in this stage the back-water-effect from the Mekong mainstream is not affecting to the existing Muang Mai water level gauging station. If so, the records at the Muang Mai gauging station should be reviewed in corporation with the actual measurement results at the new gauging stations after one-year measurement complete. It is advised that the review should be made in the early stage of the next step.                                  |  |
| 6-4 | The Study Team has proposed to construct the re-regulating pond at the downstream of the powerhouse site. It may be proper solution from the view-point of the downstream river environment. The idea is supported, also, by the reason that the reliability of KW provision to the system is essential. It is observed that the project may not be viable without evaluating the KW value, and that the re-regulating pond is substantial to secure the reliability of KW provision to the system. It is recommended also to scrutinize the capacity of re-regulating pond to respond to the peak discharge of the final stage for 8-hour-peak operation. |  |
| 6-5 | The layout of the project is agreed including the dam type of a concrete-faced rock-fill dam (CFRD). However, the CFRD type of dam is sensitive for rock condition of dam foundation and dam material for embankment. It is recommended that the rock foundation and dam material should be discussed in the next step to clarify the CFRD type is proper solution in the project. It should be also referring to actual results in the world.   |  |
| 6-6 | The 320 alternative may be very sensitive at the end of the reservoir in terms of back-water effect to the cultivated areas for the compensation. In the next step, micro adjustment of FSL is essential on the basis of more accurate and comprehensive topographic data, and the careful computation of the back-water effect.   |  |

Mr. Adachi

## **3. GENERAL WORKSHOP**

### **3.1 1ST GENERAL WORKSHOP**

#### **3.1.1 PROGRAM AND ATTENDANCE LIST**

## The Nam Ngiep-I Hydroelectric Power Project

ACTUAL PROGRAM  
ON  
GENERAL WORKSHOP FOR INCEPTION REPORT

| First Day (November 26, Thursday, 1998) |               |   |                                |
|---|---------------|---|--------------------------------|
| No.                                     | Time          | Program   | Presented By                   |
| 1.                                      | 8:30 - 9:25   | Registration  | HPO/MIH staff                  |
| 2.                                      | 9:25 - 9:30   | Time schedule of Workshop, Introduction of : ① Chairmen, ② E/A Committee & JICA member, ③ JICA Study Team       | Facilitators                   |
| 3.                                      | 9:30 - 9:40   | Opening Speech  | Vice-Minister of MIH           |
| 4.                                      | 9:40 - 9:50   | General description of Power Policy in Lao PDR  | HPO (Mr.Somboune)              |
| 5.                                      | 9:50 - 10:00  | JICA's Policy for the Project   | JICA (Mr.Nagata)               |
| 6.                                      | 10:00 - 10:30 | Morning Coffee Break  | Coffee service                 |
| 7.                                      | 10:30 - 11:10 | General Presentation of : ①Project general description, ②General description of Study, ③Basic approach of Study | JICA S/Team (Mr.Araki)         |
| 8.                                      | 11:10 - 11:30 | Presentation of Hydropower plan on ①Pre-F/S scheme and ②Alternative study results                               | JICA S/Team (Mr.Ikeda)         |
| 9.                                      | 11:30 - 13:30 | Lunch Break   | Lunch service                  |
| 10.                                     | 13:30 - 14:10 | Presentation of Natural environmental aspects on ① IEE results and ②Execution plan for EIA                      | JICA S/Team (Dr.Yon)           |
| 11.                                     | 14:00 - 14:40 | Presentation of Social environmental aspects on ①IEE results and ②Execution plan for EIA                        | JICA S/Team (Dr.Ragsdale)      |
| 12.                                     | 14:40 - 14:50 | General Comments of by Environmental Assessment Committee (EAC)   | Facilitator of EAC (Mr.Adachi) |
| 13.                                     | 14:50 - 15:30 | Afternoon Coffee Break  | Coffee service                 |
| 14.                                     | 15:30 - 16:30 | General Discussion / Distribution of Suggestion Sheets  | Facilitators                   |

| Second Day (November 27, Friday, 1998) |               |   |                        |
|--|---------------|---|------------------------|
| No.                                    | Time          | Program   | Presented By           |
| 1.                                     | 8:30 - 9:30   | Registration & Receipt of Suggestions Sheets      | HPO/MIH staff          |
| 2.                                     | 9:30 - 9:40   | Proposal on Discussion Items of Sub-sections      | JICA S/Team            |
| 3.                                     | 9:40 - 9:50   | Establishment of Discussion Items of Sub-sections | Facilitators           |
| 4.                                     | 9:50 - 10:30  | Morning Coffee Break                              | Coffee service         |
| 5.                                     | 10:30 - 12:00 | Detailed Discussion on each Items (I)             | Facilitators           |
| 6.                                     | 12:00 - 13:30 | Lunch Break                                       | Lunch service          |
| 7.                                     | 13:30 - 15:00 | Detailed Discussion on each Items (II)            | Facilitators           |
| 8.                                     | 15:00 - 15:30 | Afternoon Coffee Break                            | Coffee service         |
| 9.                                     | 15:30 - 16:00 | General Answers to Suggestions & Comments         | HPO, JICA S/Team       |
| 10.                                    | 16:00 - 16:10 | Schedule of Next Workshop                         | HPO (Mr.Somboune)      |
| 11.                                    | 16:10 - 16:20 | Closing Speech                                    | Vice-Minister of MIH   |
| 12.                                    | 16:20 - 16:50 | Break Time  | -                      |
| 13.                                    | 16:50 - 17:00 | Press Conference                                  | JICA, HPO              |
| 14.                                    | 17:00 - 18:30 | Internal Meeting                                  | EAC, JICA, HPO, S/Team |
| 15.                                    | 18:30 - 19:00 | Break Time  | -                      |
| 16.                                    | 19:00 - 20:30 | Dinner Reception of Workshop for Inception Report | All participants       |

**Nam Ngiep-I Hydroelectric Power Project**  
**ATTENDANCE LIST (1/3)**  
**GENERAL WORKSHOP FOR INCEPTION REPORT**  
 In Vientiane, Lao PDR, On November 26 - 27, 1998

**I. Chairman**

## 3. GENERAL WORKSHOP

### 3.1 1ST GENERAL WORKSHOP

#### 3.1.2 MINUTES OF MEETING

**The Nam Ngiep-I Hydroelectric Power Project**  
**Minutes of Discussion**  
**of**  
**The 1st General Workshop for Inception Report**  
**(in Vientiane on November 26-27, 1998)**

| No. | Name and Position                      | Questions and Comments   | Study Team's Comments  |
|-----|--|--|--|
| 1.  | Representative from Mekong Committee   | As the medium and small schemes are in doubtful from the economic viewpoint, it is recommended to evaluate carefully those from economic and financial aspect.             | At the present that the topographic and hydrological conditions are not clear, economic evaluation for the project seems still early, but it will be analyzed during this phase. We think this phase is mainly applied for environmental assessment, but a certain result on economic aspect would be reported at the next Workshop though its accuracy might not be satisfactory, because topographic survey for the reservoir area and geological drillings for the dam site have not been performed yet.  |
| 2.  | Representative of a consulting firm    | It is assumed difficult to carry out EIA at this stage when definite scale of the development has not been consolidated. Therefore, screening of EIA should be made first. | Alternative study will be carried out in parallel with EIA, so that satisfactory result of EIA will be obtained at the final stage of this study. In the contract with JICA, such intention has been reflected.  |
| 3.  | Representative of an international NGO | He confirmed first whether or not an official contact with local people has been made.   | <p>Several times of field investigation have been carried out at the prospective dam site and reservoir area. Especially for the Thaviang Region, hydrological observation and topographic survey are now being done. But, the formal presentation on the Project to the inhabitants has not yet been made. For this General Workshop, people in the project area were invited. Communication with local people will be continued through the social-environmental survey and close contact with them will be maintained further.</p> <p>The above questioner directly asked to the representatives of local people upon consent of the chairmen and confirmed them of the impression to this project implementation. One of the participants of Thaviang Region expressed intention of welcome for the Project as the representative opinion of them on the condition that the living standard is improved by the resettlement.</p> |

|     |   |   |   |
|-----|---|---|---|
| 4.  | Representative from d/s of dam site       | He expressed his mind of welcome for the Project. But he demanded the project to improve living standard of the local people as the present conditions are vary bad at traffic, communication and electricity.  | - |
| 5.  | Representative from Kethpiseth Xaisomboun | Local people are in a big anticipation for the regional economic growth by the development of hydro-potential in the Nam Ngiep river basin. Looking upon the present condition, merit of the Project seems to be larger than demerit, therefore, it is requested for sufficient consideration for the regional development. He proposed the establishment of a trust-fund for the regional economic development.  | - |
| 6.  | Representative from Bolikhamxay Province  | He explained there is a provincial intention to secure in the local people's livelihood by the chance of the Project. The Province agreed with execution of the project, as it is assumed there is a lot of merit of the Project. Detail of his wishes was on stable electric supply, improvement of irrigation facilities, traffic improvement, increasing job opportunity, well supply of public services like well-equipped hospital, etc. to be included in the Project facilities. For further process, he requested for close contact with Provincial Office to have respect for a democratic approach in the project implementation. | - |
| 7.  | Representative from Ministry of Justice   | He proposed a thorough watershed management under the Project, because it is great concern about shifting cultivation in the river basin. Also he requested to take care for influence upon water quality at the downstream reach.  | - |
| 8.  | Representative from STENO                 | He stressed for the point that economic development of Lao PDR is strongly depending on the maximum use of hydro-potential in the country and argued necessity of this project implementation.  | - |
| 9.  | Representative from MIH                   | He explained present status and policy on electricity in Lao PDR, and touched upon the exchanged MOU for trading national power with Thailand and Vietnam. In which, he introduced on-going national plan about 3,000MW export to Thailand by the year 2006 and 1,500 to 2,000 MW to Vietnam by the year 2010.  | - |
| 10. | Other comments                            | There were several questionnaires occupying interest of the people about concrete time schedule for project construction, definite area to be inundated, so on.   | - |

## 3. GENERAL WORKSHOP

### 3.1 1ST GENERAL WORKSHOP

#### 3.1.3 QUESTIONNAIRES AND STUDY TEAM'S COMMENTS

The Nam Ngiep-1 Hydroelectric Power Project  
SUGGESTION PAPERS

AT

GENERAL WORKSHOP FOR INCEPTION REPORT  
(In Vientiane, November 26 & 27, 1998)

| No. | Name / Position   | Suggestion  | S/Team's Comments  |
|-----|---|---|--|
| 1.  | Xiangmay Phiakeo<br>Head of Village Hatkham   | I am a representative of people in this area. If this project is going on, so we will have: (i) transportation facilities (road), (ii) electricity supply and (iii) irrigation system. Even if there will be some impacts, we are not worried, because you have the plan to resolve these problems. We hope this project will be proceeded successfully.  | Some facilities will be prepared by the Project and GOL as a rural development plan.   |
| 2.  | Mr.Souator Phiengluang, Lao<br>Chief of Economy of Hom District                                 | 1. After completion of the dam, can people still live and cultivate at the upstream of the dam, or not. If not, what is reason? I want to know the policy, so we have to train the people and to make a plan for the resettlement area, because people in our district want to live around there.<br>2. Please explain more details about resettlement policy and inform us what we want to know in order to answer to the people correctly.                        | 1. People and cultivated area in Hom District should be moved even in the case of low dam scheme.<br>2. More details will be explained in the next workshop. |
| 3.  | Mr.Thongten Vannabouathong,<br>Lao<br>Director of Lao National Front in<br>Borikhamsay Province | I agree with the Inception Report of F/S on the Nam Ngiep-1 HEPP, because the local people waited for this project for long time already. Therefore, I have no any comments in this Workshop.   | -  |
| 4.  | Mr. Socelasan, Lao<br>Teacher (Lao Youth Union)   | 1. The important problem is the benefit and losses of trade in future including environmental issues.<br>2. For the resettlement people we have to train and arrange a new job for them before the project implementation.<br>3. We have to explain the people around project area to understand about working process.   | 1. Comparative list of benefit and loss due to the Project will be prepared by S/Team.<br>2.& 3. More details will be explained in the next workshop.        |
| 5.  | Mr.Thongma Souvanasan, Lao<br>Chief of Cabinet of Borikhan<br>District                          | 1. I agree with the Project, because it's relationship with our rural development and the needs of local people.<br>2. I don't worry about environmental-social impacts, because I believe that S/team will collect all data and time the best alternative.<br>3. The alternatives of dam scale and installed capacity should be optimized.<br>4. I want to see the Project in the implementation stage as soon as possible, so we try affording good coordination. | The S/Team appreciated the suggestions. More details will be explained in the next workshop.   |
| 6.  | Mr.Saytham, Lao<br>Deputy Chief Spuic of Industry<br>Handcraft                                  | 1. The Division of Industry and Handcraft of Borikhamray Province are ready to work with JICA S/Team at every stage for competing the Project in time.<br>2. The development plan of the Project should coordinate with the development plan of the Local area.   | The S/Team will contact with the local government for execution of the Study.  |

|     |   |  |   |
|-----|---|--|---|
| 7.  | Mr. Bounton Chanthaphone, Lao<br>The Chief of Investment<br>Management and Foreign Relation<br>Division of Xiengkhuang Province | <p>1. I am a representative of Xiengkhouang Province and I agree with the Government and foreign investment to build the Nam Ngiep-I HEPP. Xiengkhouang Province is the source of the Nam Ngiep River. So we are ready to work with the Project for natural protection and we will explain the local people for their understanding.</p> <p>2. The S/Team should inform more that:</p> <p>a) If the full supply level is EL.360 m, it can supply capacity about 440 MW.</p> <p>b) If it is EL.320 m, how about the installed capacity and it will be economic or not.</p> <p>c) If it is EL.240 m, how about the capacity, and I rise these questions because I would like, 1) to help the Government to make the right decision, have the high effective in the economic, minimize the environment and social impacts. The investors are sure in the investment.</p> <p>2) to help the Local Authority to find the resettlement area instead of flooded area, explain them to understand about the project, to make sure the respective of human rights.</p> <p>3) to establish watershed conservation fund relating with the social economic development (it should be in the contract).</p> | <p>1. More detailed information will be given to people about differences of merit and demerit in both development scales.</p> <p>2. (a) According to the Pre-F/S. 377MW by our Study. (b) About 246MW, it is still economic. (c-1) investors are not decided. (c-2) some prospective resettlement area will be shown at the next Workshop. (c-3) the fund will be studied later.</p> |
| 8.  | Mr. Ounchanthavong, Lao<br>Deputy of Trade Union<br>Borikhaunsay Province   | <p>I am a deputy of trade union and agent of the Borikhaunsay province. So, for efficiency of the Project, detailed social and environmental impacts should be considered in the Project after finishing of this Workshop.</p> <p>1. To carry out the study of mental ethnic group in the Project area for preparation of resettlement.</p> <p>2. Project community had to coordinate with security of province and local, because of Special Zone.</p> <p>3. To mobilize people to participate in the Project for implementation plan.</p>  | <p>These matters are under survey by the S/Team in cooperation with HPO and the local consultant.</p>   |
| 9.  | Mr. Phonesay, Lao<br>Chairman of Women's Union  | <p>1. We are agreed with you to continue the Project to be completed.</p> <p>2. We agree with you to build the Project for supplying electricity to local people, because they hope to develop their life.</p>   | <p>The S/Team will make a rural development plan with the Project later.</p>  |
| 10. | Mr. Somsy Chanethamisay, Lao<br>Deputy Secretary of Youth Union   | <p>The Nam Ngiep-I HEPP has a positive impact for local people. The Project will make life better for local people. They will have a good transportation. The Project is not dangerous to the Environment or the ecosystem.</p>  | <p>The S/Team will study not only positive impacts but also negative impacts.</p>   |
| 11. | Mr. Khamphay Khanthavong, Lao<br>Department of Archaeology &<br>Museum  | <p>I agreed with the Nam Ngiep-I HEPP. Because our country is under development and has the low income. We should take a chance for the Project in realization. Therefore, I recommend you below:</p> <p>1. For the tasks of survey on the socio-economic, land use and resettlement, you should include the archaeology survey at cultural sites, religion sites and other. It means that the survey team had better to make survey in one unit for socio-economy, archaeology and cultural site survey.</p> <p>2. You should include the study of the work opportunity for the resettlement people to the new area.</p>  | <p>1. The S/Team will survey including the archaeology and cultural issues.</p> <p>2. The S/Team will make a resettlement plan including work opportunity for the people.</p>   |

|     |  |   |   |
|-----|--|---|---|
| 12. | Mr. Khampheng Vanabouathong,<br>Lao<br>Director Department of Labour<br>Protection and development<br>(Lao Trade Unions) | <p>1. I think that this Workshop is very important. And the implementation of the Project should be begun soon, because the Project is a basic condition to develop the country.</p> <p>2. We should make the soft explanation to the people who will be asked to move from the Project area.</p> <p>3. We should establish the new place with the facilities keeping their living condition step by step.</p> <p>4. You should propagate or explain them for their understanding about the socio-economic development through public consultation with local people.</p>   | <p>1. The Workshop is held for the smooth execution of the Project.</p> <p>2. The S/Team explained to the people directly at the Site Workshop at the Project area in March 1999.</p> <p>3. The S/Team will make the resettlement plan with infrastructures.</p> <p>4. The S/Team will hold future Site Workshop in June and December 1999.</p> |
| 13. | Mr. Bountheung Menevilay, Lao<br>Disaster preparedness Delfev Dept.<br>LAO CROSS/HQ.                                     | <p>1. Except the inundation by reservoir, are there another impacts to the natural resources due to the Project?</p> <p>2. The comprehension of the people in the Project area is very important particularly in public consultation and hearing. What are their benefits from the Project? The result we are the impact for they longhand.</p>   | <p>1. Comparative list of benefit and loss due to the Project will be prepared by S/Team.</p> <p>2. The S/Team will hold the Site Workshop at the Project area three times.</p>   |
| 14. | Mr. Chanthaviphone Inthavong,<br>Lao   | <p>You have to study and make recommendations to the Lao Government at the maximum useful for the F/S on the infrastructures and the rural developments follows:</p> <p>(i) fund for watershed management, (ii) torsion and hotels, (iii) agriculture and irrigation at downstream, (iv) manufacture and handicraft and (v) education and sanitary for people.</p>  | <p>These matters will be studied in the resettlement plan as well as the rural development plan of the Project, including a regional industrial promotion center.</p>   |
| 15. | Dr. Vileyvone, Lao<br>Ministry of Health   | <p>1. For the resettlement of people, potential risk of epidemic diseases, malison, etc., mitigation measure should include medical treatment place, medicament, sanitary and feed supplies.</p> <p>2. Education program for people on risk of transmitted disease HIV/AIDS also should be included.</p>  | <p>The issues of the medical services and education for the resettled people will be studied in the resettlement plan of the Project.</p>   |
| 16. | Unknown  | <p>1. We are supporting the international organization providing the assistance for development in Lac PDR. We express the high appreciate the Workshop, but you should coordinate with the concerned organization for implementing your duty in the right way such as the ethnic group. We have the committee for the ethnic group in the Lao PDR.</p> <p>2. For implementation of each project, we take care to get the detailed information or database for these projects.</p> <p>3. The Project should be supported by the fund, and it will expand the right of ethnic group. The ethnic group should be monitored as the Project's responsibility.</p> <p>4. We need the management plan and monitoring plan for the purpose of the Project.</p> | <p>Care of ethnic group will be considered in the socio-economic study through the field investigation. And the survey results will be presented at the future Workshop and be shown in the Study Report.</p>   |
| 17. | Unknown  | <p>1. In the EIA Report of the Nam Ngiep-1 HEPP, if the EIA survey will not be clear, more survey should be carried at the next phase of the study, especially for the socio-economic and natural environment impacts.</p> <p>2. For the study on EIA, you should take care the experiences of the Nan Theun 2 HEPP.</p>  | <p>1. The EIA survey will be continued at the next stage of the Study.</p> <p>2. The S/Team is under review of the Nam Theun 2 HEPP by JICA's instruction.</p>  |

|     |  |   |  |
|-----|--|---|--|
| 18. | Mr. Singkham Sivongkham<br>Head of Industry Division of<br>Xaysomboun Special Zone | <p>1. Basically, we agreed the Project. But for the resettlement of peoples, does the Project prepared the new location? Where are there situated?</p> <p>2. For the reunification of Industry Division at Xaysomboun Special zone, we planned to construct 22 kV transmission lines at Thaviang to Yhom and Phalavek to B.Sopyouk. The 115 kV at the Nam Leak HEPP to Xiengkhouang will be passed Thavieng. What is recommendation and comment for this plan from the Nam Ngiep-1 HEPP.</p>  | <p>1. Some resettlement area is under survey.</p> <p>2. The T/L route is subject to change due to the alternative study results.</p> <p>3. Administrative disposition will be explained in the Interim Report.</p> |
| 19. | Mr. Phetdouangchan Ekioanlang.<br>Lao<br>Government Office                         | <p>1. The infrastructure for the new resettlement area should include roads, schools, hospitals, water supply and others.</p> <p>2. The revenue from the export of electricity on the Project should be confirmed by the financial analyses and it should be guaranteed for the long period.</p>  | <p>1. The resettlement plan will include the items of infrastructures as well as a rural development plan.</p> <p>2. The financial analysis will be carried out by the S/Team.</p>                                 |
| 20. | Mr. Onchanth<br>The representative of the Ministry<br>of Defense<br>General Major  | <p>According to the F/S Report on the Nam Ngiep-1 HEPP, there are some items relating with the Ministry of Defense. For contributing to the Workshop, I have some idea relating with the security during the implementation of the Project as follows:</p> <ol style="list-style-type: none"> <li>1. For location of the Project             <ul style="list-style-type: none"> <li>This Project is located in two (2) province and one (1) special zone such as: Borikhamxay Province (in the lower part); Xiengkhouang Province (in the upper part) and Xaisomboun Special zone (in the middle part).</li> </ul> </li> <li>2. This Project is recommended to use the light plane/helicopter for survey in the Project area.</li> <li>3. For site survey by land             <ol style="list-style-type: none"> <li>a) Safety is the first during the survey, it is necessary to have some people protect the survey team every time.</li> <li>b) In the above three (3) areas, it is requested to be closely coordination with Ministry of Defense in the activities for the security at the Project area. So, I would like to have some ideas such as:                 <ul style="list-style-type: none"> <li>- The working schedule in each section should be informed to the concerned authorities and to the Ministry of Defense at least 7 or 10 days before go to the Site to secure the safety during the survey by controlling by the Ministry of Defense through the Laws.</li> <li>- The S/Team need to accompany some people to protect them. The S/Team should inform of the number of people for protection. And the S/Team should provide them the allowance during the working time.</li> </ul> </li> </ol> </li> </ol> <p>I really hope that the S/Team should consider the above ideas and we are looking forward to have the answer from you. Finally, I wish the Workshop will be completed with the successful.</p> | <p>The S/Team agreed to inform to the Ministry of Defense of their survey schedule prior to the field survey.</p>  |

|     |  |   |   |
|-----|--|---|---|
| 21. | Mr. Boun ieng, Lao   | <p>1. The S/Team should identify that many villages will be inundated by the Project in the Thavieng areas.</p> <p>2. When will the Project be commenced after finishing the investigation? Because, we have to discuss with local people.</p>  | <p>1. The S/Team made the detailed topographic survey at the Thavieng area by GPS survey and grand survey. The survey results will be presented at the next Workshop.</p> <p>2. Generally, it takes time more than 10 years after completion of F/S.</p>  |
| 22. | Mr. Khamfanh, Lao<br>Deputy Director of Fishery Department                             | <p>1. Is it possible to use the water in the reservoir for irrigation? (for compensation of flooded field in the reservoir)</p> <p>2. We request you to study about fish migration and possible provision of the migration facilities. Do you have the ideas about its?</p>   | <p>1. Irrigation for resettlement area will be studied in the resettlement plan as well as rural development plan.</p> <p>2. Fishery aspects are under investigation.</p>   |
| 23. | Mr. Phouong Onysaleum<br>Engineer of Evaluation and Estimation of Environmental Impact | <p>1. The dam height should be selected in appropriate to minimize the impacts, but the height will affect its economy.</p> <p>2. Please make the detailed study on the impacts to the resettlement people at the upstream and downstream of reservoir.</p> <p>3. The resettlement plan should conformed to the Lao standard and the international standard.</p>  | <p>1. The economic and financial analysis will be carried out by the S/Team.</p> <p>2. The environmental survey at the proposed reservoir area is under implementation.</p> <p>3. The S/Team will follow them.</p>  |
| 24. | Mr. Tes Sopharith, Cambodia<br>Basin Planner, Makong River Commission                  | <p>As the Nam Ngiep River flood into the Mekong River, we would like to ask you the impacts of this dam construction to the Mekong River: (i) flow condition, (ii) water quality, (iii) fishery, etc.</p>   | <p>Influences to the Mekong River will be studied by using data from MRC.</p>   |
| 25. | Mr. Inthapanya.<br>Legal Officer   | <p>Please distribute the document or report of the Study to the participants of the Workshop, because speakers talk only in general.</p>  | <p>JICA has an intention to distribute any documents to people who require.</p>   |
| 26. | Mr. Nguyen Duc. Len, Vietnam<br>Senior Project Officer MRCS                            | <p>1. More available information should be collected from various sources, such as MRCS, LAS Natural Mekong counties, summities, and point field investigations.</p> <p>2. Power export, especially to Thailand, should be for peaking as anticipated. Different assumptions should be considered.</p> <p>3. Fisheries and resettlements issues, together with socio-economic aspects, should be considered seriously so that the Project would be proceeded with confidence.</p> <p>4. Study of HWZs should be for in two (2) steps: (i) a coarse step with EL.360m, EL.320m and EL.240m as proposed, (ii) the different HWZs around the selected level should be fore (if EL.320m will be selected, EL.300m and EL.340m should be examined for example).</p> <p>5. Curative effect to the Mekong River should be indicated. The future possible aspects at the upstream reservoir of the Nam Ngiep basin should also be examined.</p> <p>5. If possible, the reports of the Nam Ngiep-1 HEPP shall be sent to MRES for his information and followed up for activities (MRCS, P.O Box 1102, Phnom Purl, Cambodia).</p> | <p>1. The S/Team agreed to proceed the Study as suggested.</p> <p>2. The S/Team will study 16-hour and 8-hour peak generations.</p> <p>3. Fisheries issues are under investigation.</p> <p>4. The S/Team will select among the three alternatives (EL.360m, EL.320m &amp; EL.240m) at first, then the most suitable EL. will be recommended.</p> <p>5. The S/Team agreed to study.</p> <p>6. The S/Team will give their reports through the Workshop.</p> |

|   |   |  |
|---|---|--|
| 27.<br>Mr. Bounsalong Southidara., Lao<br>Deputy Division of Investment,<br>EDL | <p>1. Why do you make EIA before the F/S?</p> <p>2. The S/Team should confirm to the local people that (i) this Project is under study, and (ii) the S/Team does not know exactly which the Project will be proceeded or not.</p> <p>3. The survey of social issues will need to take care the livelihood and tradition.</p> <p>4. The social environment issue and economic issue shall be composed together.</p>  | <p>1. Project alternatives at each stage could be studied following the results of EIA.</p> <p>2. The S/Team confirmed at the Site Workshop.</p> <p>3. The S/Team will take care for them.</p> <p>4. The S/Team carried out both at once.</p>  |
| 28.<br>Mr. Tatsuya Watanabe, Japan<br>JVC (NGO)                                 | <p>1. NGO participation is very limited. How have they been informed and invited to the Workshop? Why does the organizer think they have not participated?</p> <p>2. The S/Team seems to favor EL.320 m option. The whole process seems to justify selecting the EL.320m option, then what is the meaning of the process?</p> <p>3. Is not a year-and-half study period too short to carry out any meaningful environmental studies?</p> <p>4. Have the S/Team learned from experience of Nam Theun-Hirbun HEPP, which is causing a lot of problems to its downstream inhabitation's?</p> <p>5. The Environmental Assessment Committee (EAC) is, to our mind, supposed to be an independent body. However, it belongs to the Government of Lao PDR (GOL) officials of its members. Could the impartiality and subjectivity be guaranteed by having GOL officials?</p> <p>(Detailed S/Team's comments)</p> <p>JICA is proceeding EIA of the Project from a standpoint of impartiality, and he is trying to carry out the Study and data collection with objectivity as much as possible.</p> <p>The EAC has been established by JICA to make discussions and comments to the S/Team's technical appropriateness on the Study. The S/Team, the Consultant, was entrusted to with duty by JICA.</p> <p>The EAC is an advisory group to JICA in other word. Therefore, it is expected to play a role in making comments on the S/Team's study methods and results through their evaluations from each professional standpoint, since all members of the EAC are the experts in their fields respectively.</p> <p>Consequently, the members from GOL also have joined the EAC at a standpoint of impartiality and they wish to make appropriated comments to the S/Team based on their rich experiences in their fields in Lao PDR.</p> <p>In the above context, we will judge it is inappropriate to meet with criticism on the Lao members of EAC.</p> | <p>1. S/Team already tried to invite NGOs in and out of Lao PDR in cooperation with MIH/HPO. However, limited NGO replied to participate.</p> <p>2. Process of the Project is to identify all feasible alternatives at first, then study for each.</p> <p>3. Years of 1.5 is not for EIA period, it will be continued in the next stage.</p> <p>4. Not considered yet. NGOs are also required to inform the S/Team of useful information.</p> <p>5. EAC will be described in Interim Report in details. EAC members even from GOL can make comments on the Project at the middle position due to their specialties.</p> <p>Detailed S/Team's comments are shown in the left.</p> |

SUPPORTING REPORT(V)

1st General Workshop

|            |   |   |   |
|------------|---|---|---|
| <p>29.</p> | <p>Mr. Izumi Tsukamoto, Japan<br/>JVC (NGO)</p> | <p>1. In Lao PDR, there are many plans of dam construction. How GOL advance these plans considering environment and economical efficiency?</p> <p>2. How many dams are most beneficial for Lao People, especially domestic people to make sustainable and self-reliant living?</p> <p>3. Many explanatory meetings should be held in each concerning village. Then the president should explain good points and bad effects for corresponded plan. They should give much time to villagers to consult by themselves. Much information for villagers is important.</p> | <p>1. As most of large-scaled dams in Lao PDR are to be constructed for power selling, benefit from projects will be obtained by GOL directly. However, we have to remind that all rural development projects will be carried out by their finance.</p> <p>2. Hydropower from small-scaled dam and run-of river type project will be used for Lao people, but large-scaled one is for power selling. This is Lao power policy.</p> <p>3. JICA will carry out the Site Workshops in the relevant villages apart from the General workshop in Vientiane and Pakxan.</p> |
|------------|---|---|---|

## 3. GENERAL WORKSHOP

### 3.1 1ST GENERAL WORKSHOP

#### 3.1.4 PRESENTATION OHP SHEETS

### General Description of JICA Study

- 1st Stage of Feasibility Study (pp-1, Table-1)
- General Work Flow focused in EIA (pp-2)
- Time Schedule of Study (pp-3)
- Member of Study Team & Assignment Schedule (pp-4)

| Item                               | Content |
|------------------------------------|---------|
| 1. Project Name                    | ...     |
| 2. Project Location                | ...     |
| 3. Project Description             | ...     |
| 4. Project Objectives              | ...     |
| 5. Project Justification           | ...     |
| 6. Project Implementation          | ...     |
| 7. Project Monitoring & Evaluation | ...     |
| 8. Project Risks                   | ...     |
| 9. Project Benefits                | ...     |
| 10. Project Costs                  | ...     |

## 3. GENERAL WORKSHOP

### 3.1 1ST GENERAL WORKSHIOP

#### 3.1.4 PRESENTATION OHP SHEETS

| Item                                | Page  |
|-------------------------------------|-------|
| 1. Introduction                     | 1-10  |
| 2. Project Description              | 11-20 |
| 3. Basic Approach of JICA Study     | 21-30 |
| 4. Hydropower Plan                  | 31-40 |
| 5. Environmental Impact Assessment  | 41-50 |
| 6. Social Impact Assessment         | 51-60 |
| 7. Report on IEE results            | 61-70 |
| 8. Erosion Plan & TCR of EIA survey | 71-80 |

### Contents of General Presentation by S/Team

by Team Leader (I. Araki)

- Project General Description
- General Description of JICA Study
- Basic Approach of JICA Study
- Hydropower Plan
- by Natural Environmentalist (B. Yon)
- by Social Environmentalist (T. Ragsdale)
- Report on IEE results
- Erosion Plan & TCR of EIA survey

| Item                                | Page  |
|-------------------------------------|-------|
| 1. Introduction                     | 1-10  |
| 2. Project Description              | 11-20 |
| 3. Basic Approach of JICA Study     | 21-30 |
| 4. Hydropower Plan                  | 31-40 |
| 5. Environmental Impact Assessment  | 41-50 |
| 6. Social Impact Assessment         | 51-60 |
| 7. Report on IEE results            | 61-70 |
| 8. Erosion Plan & TCR of EIA survey | 71-80 |

### Project General Description

Location of Project Area (Map 1, p. 3)  
 Back Ground History of Project (Table 1)  
 Project Features being compared with the Nam Ngum-1 & the Nam Theun-2 (Table 2)

| Item                                | Page  |

| 3. Basic Approach of JICA Study     | 21-30 |
| 4. Hydropower Plan                  | 31-40 |
| 5. Environmental Impact Assessment  | 41-50 |
| 6. Social Impact Assessment         | 51-60 |
| 7. Report on IEE results            | 61-70 |
| 8. Erosion Plan & TCR of EIA survey | 71-80 |

Overall Summary of EIA Study Tasks

| Task                                     | Start | End  | Status      | Remarks |
|--|-------|------|-------------|---------|
| 1. Feasibility Study                     | 1998  | 1999 | Completed   |         |
| 2. Environmental Assessment              | 1999  | 2000 | In Progress |         |
| 3. Public Consultation                   | 1999  | 2000 | In Progress |         |
| 4. Environmental Impact Assessment       | 2000  | 2001 | In Progress |         |
| 5. Preparation of EIA Report             | 2001  | 2002 | In Progress |         |
| 6. Review and Approval                   | 2002  | 2003 | In Progress |         |
| 7. Implementation of Mitigation Measures | 2003  | 2004 | In Progress |         |
| 8. Monitoring and Evaluation             | 2004  | 2005 | In Progress |         |

### Basic Approach of Study (1/2)

- EIA Study prior to Feasibility Study
- No MOU between GOL & Developer
- Public Involvement
  - Workshop (Nov '98, Jul '99 & Dec '99)
  - Free Access to Information
  - Detailed Socio-economic survey
- Environmental Assessment Committee
  - Advisory committee for JICA
  - Facilitator & 4 members

1-9

### Basic Approach of Study (2/2)

- EIA by Local Consultant under JICA S/Team
  - STS Consultants
  - 10 months from Dec '98 to Sep '99
- Execution of Accurate leveling survey (Map-1)
  - Thavang District at Upper Reservoir Area
  - GPS Survey at 25 points (~33.88m & -15.36m)
  - Additional cross section survey at Thavang District
    - Frame survey by Satellite Photo (SPOT)
    - Point survey of Villages, Paddy field & Dry field
- Establishment of Hydrological Station

INCEPTION REPORT WORKSHOP  
LIST OF OVERHEAD TRANSPARENTIES FOR ENVIRONMENTAL  
PRESENTATION BY BERNARD VON**

1. Project goal
2. Content 1: PROJECT AREA
3. Project Area (Map)
4. Dam and lower valley (Photo)
5. Lower reservoir (Photo)
6. Upper reservoir (Photo)
7. Work program for EIA
8. Content 2: ENVIRONMENTAL ISSUES
9. Water Quality Issues
10. Water Quality Issues
11. Aquatic Ecology Issues
12. Terrestrial Ecology Issues
13. Forest Ecology Issues
14. View of Integrated Forest (Photo)
15. Land Use and Forestry Issues
16. Land Cover in Future Reservoir
17. Content 3: EXECUTION PLAN
18. Schedule for Environmental surveys
19. Water Quality Survey
20. Aquatic Ecology Survey
21. Terrestrial Ecology Survey
22. Vegetation Biomass and Forestry Survey
23. Land Use and Cultural Survey

**LIST OF OVERSEAS TRAVEL AGENCIES FOR SOCIAL ENVIRONMENTAL PRESERVATION BY TPO/BAGDADE**

- GENERAL INTRODUCTION**
1. Cover Page
  2. General Introduction
  3. Map of Project Area
  4. Photos of Downstream Area - River, Trees, Fish Ponds
  5. Photos of Lower Reservoir Area - B. Support Road - B. Support School
  6. Photos of Upper Reservoir Area - B. Support Road - B. Support School
  7. Total Upstream & Downstream Affecting Villages, Households, Population

**DOWNSTREAM AREA INTRODUCTION**

8. Total Villages, Households, Population in Downstream Area
9. Total Villages, Households, Population in Reservoir Area
10. Summary of Situation in Downstream Area - (Bahrain & Pakistan Districts)
11. Summary of Situation in Reservoir Area - (Bahrain & Pakistan Districts)
12. Summary of Situation in Reservoir Area - (Bahrain & Pakistan Districts)
13. Summary of Situation in Reservoir Area - (Bahrain & Pakistan Districts)
14. Photos of River Life - Transportation by Boats, Downstream Area

**UPSTREAM AREA INTRODUCTION**

15. Map of Reservoir Area
16. Estimated Fish and Wildlife Found in Reservoir Area
17. Map of Reservoir Area
18. Map of Reservoir Area
19. Summary of Village, Households, Population in Lower Reservoir
20. Map of Upper Reservoir
21. Summary of Village, Households, Population in Upper Reservoir

**POSSIBLE IMPACTS OF PROJECT**

25. Possible Impacts Upstream at 2020
26. Possible Impacts Upstream at 2020
27. Possible Impacts Upstream at 2020
28. Possible Impacts Upstream at 2020
29. Summary of Village, Households, Population in Upper & Lower Reservoir
30. Summary of Village, Households, Population in Upper & Lower Reservoir
31. Summary of Village, Households, Population in Upper & Lower Reservoir

**POSSIBLE MITIGATION STRATEGIES**

32. Possible Mitigation Downstream
33. Possible Mitigation Upstream
34. Possible Mitigation Upstream
35. Survey Directives, State
36. Survey Directives, State
37. Field Survey, Analysis & Reporting

**FIELD VISIT RESULTS**  
Mid-August to Mid-September, 1988

**UPSTREAM & DOWNSTREAM VILLAGES POSSIBLY AFFECTED BY PROJECT**

|   |
|---|
| TOTAL OF THIRTY-TWO (32)  |
| DOWNSTREAM VILLAGES IN BOLSHAN & FAKHAN DISTRICTS, BAKHAWATI PROVINCE |
| UPSTREAM VILLAGES IN BOLSHAN & FAKHAN DISTRICTS, BAKHAWATI PROVINCE   |
| POPULATION: 11,117  |
| HOUSEHOLDS: 1,917   |

**FIELD VISIT RESULTS**  
Mid-August to Mid-September, 1988

**DOWNSTREAM (Bolshan and Fakhon Districts):**

- Six Thousand Seven Hundred (6,700) Population
- One Thousand One Hundred (1,100) Households
- Little Irrigation Development
- Much Reliance on Rain Niyah for Drinking Water, Fishing, Transport

**FIELD VISIT RESULTS**  
Mid-August to Mid-September, 1988

**TOTAL OF SIXTEEN (16) DOWNSTREAM VILLAGES IN BOLSHAN & FAKHAN DISTRICTS, BAKHAWATI PROVINCE**

|                   |
|-------------------|
| POPULATION: 4,719 |
| HOUSEHOLDS: 1,090 |

- ACTIVITIES CARRIED OUT**  
Mid-August to Mid-September, 1988
1. Reconnaissance Fieldtrip to the Project Area, August 25-28
  2. Visits to Provincial & District Offices
  3. Microtour Visit to Downstream Area
  4. Village Visits in the Reservoir Area
  5. Preparation of Socioeconomic Survey Forms of Reference

**FIELD VISIT RESULTS**  
November 20th, 1988

**JICA FEASIBILITY STUDY**  
Inception Report Workshop

**FIELD VISIT RESULTS**  
Mid-August to Mid-September, 1988

**FIVE (5) DOWNSTREAM VILLAGES IN BOLSHAN DISTRICT, BAKHAWATI PROVINCE**

|                   |
|-------------------|
| POPULATION: 4,028 |
| HOUSEHOLDS: 850   |

**FIELD VISIT RESULTS**  
Mid-August to Mid-September, 1988

**ELEVEN (11) DOWNSTREAM VILLAGES IN FAKHAN DISTRICT, BAKHAWATI PROVINCE**

|                   |
|-------------------|
| POPULATION: 4,944 |
| HOUSEHOLDS: 1,011 |

**PRELIMINARY INVESTIGATION**  
Mid-August to Mid-September, 1998

**EXECUTION PLAN FOR SOCIOECONOMIC SURVEY**

**MAIN OBJECTIVE**

- Assess social impacts upstream and downstream of Nam Ngiep-1 Dam

**UPSTREAM OBJECTIVES:**

- Provide basis for proposing alternative design changes, minimizing as possible resettlement, as per WB/ADB policies
- Provide initial data for draft Preliminary Resettlement Plan

**DOWNSTREAM OBJECTIVES:**

- Provide basis for mitigation strategies for loss of water, decrease in water quality; to be coordinated with fishery surveys.

**REPORTING**

- Prepare Survey Design - Random sampling 10-20% Upstream; 5-10% Downstream lots.
- Field Test Questionnaires
- Carry out Survey - December/January, period of reduced agriculture, dry season.
- Analysis & Reporting - January/February, report presentation during 2<sup>nd</sup> Workshop in June 1999
- Baseline Data - Resettlement planning, mitigation strategies
- Basis for decision to advance next phase feasibility/design studies.

**FIELD SURVEY, ANALYSIS & REPORTING**

**PRELIMINARY INVESTIGATION**  
Mid-August to Mid-September, 1998

**EXECUTION PLAN FOR SOCIOECONOMIC SURVEY**

**MAIN OBJECTIVE**

- Assess social impacts upstream and downstream of Nam Ngiep-1 Dam

**UPSTREAM OBJECTIVES:**

- Provide basis for proposing alternative design changes, minimizing as possible resettlement, as per WB/ADB policies
- Provide initial data for draft Preliminary Resettlement Plan

**DOWNSTREAM OBJECTIVES:**

- Provide basis for mitigation strategies for loss of water, decrease in water quality; to be coordinated with fishery surveys.

**REPORTING**

- Prepare Survey Design - Random sampling 10-20% Upstream; 5-10% Downstream lots.
- Field Test Questionnaires
- Carry out Survey - December/January, period of reduced agriculture, dry season.
- Analysis & Reporting - January/February, report presentation during 2<sup>nd</sup> Workshop in June 1999
- Baseline Data - Resettlement planning, mitigation strategies
- Basis for decision to advance next phase feasibility/design studies.

**FIELD SURVEY, ANALYSIS & REPORTING**

**PRELIMINARY INVESTIGATION**  
Mid-August to Mid-September, 1998

**EXECUTION PLAN FOR SOCIOECONOMIC SURVEY**

**PREPARATION STAGE**

- Review Law/WB/ADB policies on Emphory Resettlement, Indigenous Peoples
- Recognition to Project Area - Determine logistics, explain purpose of survey.
- Prepare Questionnaires
- Village - General social, economic, land use situation - bridges, tracks, schools, communal forest, etc
- Hot - ethnicity, demography, migration, family structure, income, preferences, assets, resettlement

### 3. GENERAL WORKSHOP

#### 3.2 2ND GENERAL WORKSHOP

##### 3.2.1 PROGRAM AND ATTENDANCE LIST

The Nam Ngiep-I Hydroelectric Power Project  
**ACTUAL PROGRAM**  
 ON  
**GENERAL WORKSHOP FOR INTERIM REPORT**

| First Day (June 9, Wednesday, 1999) |               |   |                             |
|-------------------------------------|---------------|---|-----------------------------|
| No.                                 | Time          | Program   | Presented By                |
| 1.                                  | 8:30 - 9:30   | Registration at Vientiane   | HPO/MIH staff               |
| 2.                                  | 9:30 - 11:30  | Transportation from Vientiane to Pakxan   | -                           |
| 3.                                  | 11:30 - 12:00 | Accommodation at Pakxan   | HPO/MIH staff               |
| 4.                                  | 12:00 - 13:00 | Lunch Time  | -                           |
| 5.                                  | 13:00 - 13:30 | Registration at Pakxan, Distribution of Suggestion Sheets                                 | HPO/MIH staff               |
| 6.                                  | 13:30 - 13:40 | Introduction of Time schedule & Participants  | Facilitator                 |
| 7.                                  | 13:40 - 13:45 | Opening Speech (Ministry of Industry & Handicrafts)                                       | Vice-Minister (Mr.Somboune) |
| 8.                                  | 13:45 - 13:50 | General Speech (JICA/Tokyo)   | Director (Mr.Nagata)        |
| 9.                                  | 13:50 - 14:00 | General Speech (Bolikhamsay Province)   | Deputy (Mr.Khamphanh)       |
| 10.                                 | 14:00 - 14:30 | Brief Presentation of (i)Project, (ii)Study, (iii)Basic Approach                          | JICA S/Team (Mr.I.Araki)    |
| 11.                                 | 14:30 - 15:00 | Afternoon Coffee Break  | Drink service               |
| 12.                                 | 15:00 - 15:25 | Report on Previous Workshops  | JICA S/Team (Mr.I.Araki)    |
| 13.                                 | 15:25 - 16:30 | Presentation of Hydropower plan on (i)Alternative study results and (ii)Economic Analysis | JICA S/Team (Mr.H.Ikeda)    |
| 14.                                 | 16:30 - 17:20 | Detailed Discussion (I)   | Facilitator                 |

| Second Day (June 10, Thursday, 1999) |               |   |                           |
|--------------------------------------|---------------|---|---------------------------|
| No.                                  | Time          | Program   | Presented By              |
| 1.                                   | 8:30 - 9:00   | Registration  | HPO/MIH staff             |
| 2.                                   | 9:00 - 10:10  | Presentation of Natural envir. aspects on EIA interim results | JICA S/Team (Dr.B.Yon)    |
| 3.                                   | 10:10 - 10:50 | Morning Coffee Break  | Coffee service            |
| 4.                                   | 10:50 - 11:00 | Detailed Discussion (II)                                      | Facilitator               |
| 5.                                   | 11:00 - 12:30 | Presentation of Social envir. aspects on EIA interim results  | JICA S/Team (Dr.Ragsdale) |
| 6.                                   | 12:30 - 14:00 | Lunch Break   | Lunch service             |
| 7.                                   | 14:00 - 15:30 | Detailed Discussion (III)                                     | JICA S/Team               |
| 8.                                   | 15:30 - 16:00 | Afternoon Coffee Break  | Coffee service            |
| 9.                                   | 16:00 - 17:30 | Detailed Discussion (IV)                                      | JICA S/Team               |
| 10.                                  | 17:30 - 18:30 | Official Meeting with Provincial and District Officers        | HPO, JICA, EAC, S/Team    |
| 11.                                  | 18:30 - 19:30 | Break Time  | -                         |
| 12.                                  | 19:30 - 21:30 | Dinner Reception of Workshop for Interim Report               | All participants          |
