CONTENTS OF SUPPORTING REPORT

PART AI: GENERAL

APPENDIX-1 INSTITUTIONAL CONSIDERATIONS

I. STUDY ON PRIVATIZATION PROCESS	A[-]-1
1.1 HISTORY OF PRIVATIZATION OF PUBLIC SERVICE SECTOR	AI-1-1
1.2 THE OWNERSHIP OF SEWERAGE FACILITIES	AI-1-1
1.3 CONCESSION	Al-1-1
1.3 CONCESSION	AI-1-2
2. STUDY ON LOCAL PUBLIC FINANCE	
2. STUDT UN LUCAL PUBLIC FINANCE	Al-1-3
2.1 GENERAL	Al-1-3
2.2 LOCAL PUBLIC FINANCE LAW 2.3 PUBLIC DEBT LAW	Al-1-3
2.3 PUBLIC DEBT LAW	AI-1-5
3. STUDY ON FINANCIAL INSTRUMENTS	AI-1-7
3.1 EBRD LOAN	Al-1-7
3.2 ISPA	AI-1-7
 STUDY ON FINANCIAL INSTRUMENTS	AI-1-9
APPENDIX-2 PEOPLE'S AWARENESS SURVEY	;
1. INTRODUCTION	ener i ante de la
1. INTRODUCTION	AI-2-1
2. ECONOMIC QUESTIONNAIRE SURVEY 2.1 OBJECTIVES OF THE SURVEY 2.2 SURVEY DESIGN	AI-2-1
2.1 OBJECTIVES OF THE SURVEY	AI-2-1
2.2 SURVEY DESIGN	AI-2-2
2.3 PRE-TEST	AI-2-3
2.4 FULL SCALE SURVEY	Al-2-5
2.6 VERIFICATION OF DATA RELIABILITY	AI-2-9
 2.2 SORVET DESIGN 2.3 PRE-TEST 2.4 FULL SCALE SURVEY 2.6 VERIFICATION OF DATA RELIABILITY 2.7 ESTIMATION OF ECONOMIC BENEFIT 	AI-2-12
3 FINANCIAL QUESTIONNAIRE SURVEY	41.0.16
3.1 OBJECTIVES OF THE SURVEY	AI-2-16
3.1 ODJECTIVES OF THE SURVET	Al-2-10
3 3 FIELDWADY	AI-2-10
3.2 SURVEY DESIGN 3.3 FIELDWORK	AL 2 16
3.5 ESTIMATION OF WTP FOR SEWERAGE SERVICE	AI-2-10
3.6 HOUSEHOLD INCOME AND MISCELLANEOUS EXPENSES	AT 2.21
ATTACHMENT 1 THE QUESTIONNAIRES (VERSION E1)	AI-2-24
ATTACHMENT 2 THE FINANCIAL QUESTIONNAIRE	AI-2-29
APPENDIX-3 SELECTION OF TREATMENT PROCESS	
1. GENERAL	AI-3-1
2. PROCEDURES FOR EVALUATION OF TREATMENT PROCESSES	4120
2. TROCEDORESTOR EVALUATION OF TREATMENT PROCESSES	AI-3-2
3. PLANNING BASIS	AI-3-3
 PLANNING BASIS STUDY ON TREATMENT PROCESS	AI.3.3
4.1 PRELIMINARY TREATMENT SYSTEM	AI-3-3
4.2 BIOLOGICAL WASTEWATER TREATMENT SYSTEM	AI-3-3
4.3 SLUDGE TREATMENT	AI-3-8
4.4 ADVANCED WASTEWATER TREATMENT	
 4.2 BIOLOGICAL WASTEWATER TREATMENT SYSTEM 4.3 SLUDGE TREATMENT	
3. CONSIDERATION FOR LAND RESTRICTION	Al-3-15
5.2 COMPARISON OF ALTERNATIVE SCENARIOS	Al-3-15
J.2 COMPARISON OF ALTERNALLYE SCENARIUS	Al-3-16

GENERAL

APPENDIX-1 INSTITUTIONAL CONSIDERATIONS

1. STUDY ON PRIVATIZATION PROCESS

1.1 HISTORY OF PRIVATIZATION OF PUBLIC SERVICE SECTOR

Privatization of public service sectors, including water and sewerage service bodies, started soon after the political change of 1989. The first step was an enactment of the law 15/90 concerning reorganization of state economic units to Regia Autonomas or commercial companies. The law allows public service sectors to transform into either a Regia Autonoma or a private company. Majority chose a Regia Autonoma, however, there were some cases to be private companies. Among seven (7) cities in the Study Area, only Drobeta Turnu Severin chose a private company.

Second step of the privatization process was issuance of a series of governmental urgent ordinances related to commercialization and privatization of Regia Autonomas in 1998. Here the commercialization means transformation of Regia Autonomas into commercialized companies of which shares are owned by relevant local councils, and the privatization means transferring the shares to the State Ownership Fund followed by selling the shares to private sector by the State Ownership Fund. Currently, except the case of Drobeta Turnu Severin, each local council in the Study Area has not transferred the shares of public service companies to the State Ownership Fund.

Privatization of public services may result in higher efficiency of the service and lighter financial burden of local administrative authorities. However, progress of privatization of public services is far behind against the Romanian government's expectation. One of the main reasons is uncertain stipulation concerning ownership of relevant assets. Most public service companies recognize that they will render their services based on concession contract with relevant local council, however, they have no chance to conclude an actual contract without clear definition of their asset. To solve this problem, the public patrimony law and the concession law were recently enacted in 1999.

1.2 THE OWNERSHIP OF SEWERAGE FACILITIES

The public patrimony law No.213/98 specifies two types of public assets, i.e. inalienable public assets and private public assets. Inalienable public assets can not be transferred or sold but private public assets can be. The law is annexed with a list of inalienable public assets. According to the list, sewer network and wastewater treatment plant with related installation and land are inalienable public assets.

However, there remains a possibility to transfer inalienable public assets to private public assets. The article 10 of the public patrimony law describes how this transfer can be achieved. It is stipulated that the transfer from the public domain into private domain can be done through a governmental decision or a decision of local administrative authorities, unless the decision breaches the Constitution.

1.3 CONCESSION

1.3.1 FORMS OF CONCESSION

Concession is one of schemes for utilizing private sector in public services. Various types of concession has been developed and practiced mainly in England, France, and Germany.

Recently the British government widely promotes PFI (Private Finance Initiative), one of the

most advanced form of concession. Under the scheme of PFI, not only investment and operation of public services but also planning, fund raising, and management of the public services are contracted out to private contractors.

On the other hand, a typical concession contract in France covers only operation and maintenance based on inalienable public assets, and investment should be done by the owner of assets, namely the local council.

1.3.2 POSSIBLE CONCESSION FORMS IN ROMANIA

The concession law No.219/98 provides a framework of concession procedure in Romania. According to a MPWTP's study on institutional restructuring in the field of district heating, supported by GTZ (German Technical Co-operation Company), following three types of concession will be possible, theoretically.

Investment concession:

Concession contract includes necessary investment on the facilities relating to the public service. The concessionaire (private contractor) is responsible for fund raising for the investment, however, the concessionaire can not own the constructed facilities which is automatically regarded as inalienable public assets.

In practice, this scheme seems to be unrealistic due to difficulty in fund raising. The reason of the difficulty is that inalienable public assets can not be used as security for a bank loan.

Concession based on lease contract:

Concessionaire renders public services using inalienable public assets leased by the local council. The local council exclusively makes necessary investment.

This concession form seems the most realistic in Romania.

Concession based on transferring inalienable public assets to public private assets:

If the local council would transfer inalienable public assets to private public assets, the fund raising problem of the abovementioned investment concession can be solved. Under this type of concession, the concessionaire owns relevant facilities and takes responsibility for investment. However, it is not clear that whether this transfer is practically possible or not.

1.4 PROSPECT OF PRIVATIZATION IN ROMANIA

The most likely prospect of privatization process within the present legislative framework is as follows:

- Construction, extension, or large scale rehabilitation of sewerage facilities will be exclusively done by local councils.
- Operation companies will render operation and maintenance service based on concession contract based on the lease of facilities from the local council.

This scenario may not be preferable from the viewpoint of privatization, on the other hand, it may be advantageous to apply financial assistance of international financial sources.

2. STUDY ON LOCAL PUBLIC FINANCE

2.1 GENERAL

As mentioned in Appendix 2 either the operation body of sewerage service is a regia autonoma or a commercial company, facilities for the service including wastewater treatment plant and sewer network are inalienable local public properties, which are owned by local councils. It means that the investor for the sewerage facility construction or development must be a local council.

What determines the financial feasibility for construction of the wastewater treatment plants is thus the capability of local public finance. In this appendix the local public finance law and the public debt law, which are the most relevant laws for local public finance, are studied.

2.2 LOCAL PUBLIC FINANCE LAW

2.2.1 GENERAL

The local public finance law No.189/98 came into force on 1st of January 1999. As stated in Article 3 of the law, it targets de-centralization through transferring the financial management of certain local public expenditures with the financial resources needed for these expenditures from the state to the local administrative authorities.

The law consists of following six (6) chapters and two (2) annexes:

Chapter I :	General provisions
Chapter II:	Revenues and expenditures of local budgets
Chapter III:	The preparation, approval, and execution of local budgets
Chapter IV:	Finance of public institutions and services
Chapter V:	Loans contracted by local public authorities
Chapter VI:	Transitory and final provisions
Annex I:	List of local taxes, fees and other local budget revenues
Annex II:	List of expenses provided in the local budgets

This law has significant influence on feasibility of the project. In particular, provisions related to following issues are crucial for the project:

Revenue and execution of local budget

Approval of local public investments

Special fees for local public services

External loans contracted by local administrative authorities and sovereign guarantees

This section focused on studying these provisions, from the viewpoint of local administrative authority. Please note that in this section the term "local" means only local level though this term in the law covers not only local level but also county level.

2.2.2 REVENUE AND EXECUTION OF LOCAL BUDGETS

In old regime, local public authorities obtained their budget via the state government. The more projects they applied, the more budget the state distributed. One of the serious problems

Part AI: Appendix-1 Institutional Considerations

was that distributed budgets from the state were earmarked for each of all applied projects, which resulted in severe deficit to required project costs. Furthermore, there was quite large time lag between application and distribution of the state subsidies to the local budget.

The local public finance law transfers the competence of collecting income tax from the state to the local public authorities. The income tax collected by a local public authority distributed among the state budget, the budget of county in which the local public authority locates, and the local budget. The proportion of this distribution can be modified annually by the state budget law. Currently it is 50%, 15%, and 35% to the state, county, and local, respectively. At the same time subsidies from the state budget have been drastically diminished. Hearing with seven cities in the Study Area showed that almost no state subsidy is allocated to the local budget in 1999.

For most local administrative authorities local portion of the income tax is the main local budget revenue. The law provides local governments with competence to make their investment plan based on estimable their own revenue. In other words, the local government can intensively invest their budget to certain important project as he wishes. It makes implementation of their investments more effective and realistic.

2.2.3 APPROVAL OF LOCAL PUBLIC INVESTMENTS

Execution of a local public investment financed by local budget and loans needs a registration of the investment in an investment plan of a local government and an approval on the investment plan as an annex to the local budget by the local council. For the registration in an investment plan, an approval on the feasibility study of the investment according to the law is requisite.

Approval process on the feasibility study varies depending on financial sources and amount of the investment. If the financial source of an investment is exclusively covered by a local budget or any loans engaged directly by a local administrative authority, the feasibility study of the investment can be approved by the local council. Otherwise, along with previous agreement of the Ministry of Finance, the feasibility study should be approved by an authority as follows.

	and the second second second second	19 - 19 A.		a shi tu (Unit: Billion Lei)
		Executive body of investment			
Apj	proval authority	County*	City	Town	Commune
Mayor (Pres	dent of county council*)	< 2	< 2	< 2	<2

The	state government	> 80	> 45	> 35	> 25
Natal Columba of	to construct and and an add to a section of the				

Note) Criteria of investment amount is revised every three (3) months considering an inflation.

2.2.4 SPECIAL FEES FOR LOCAL PUBLIC SERVICES

The local public finance low allows local councils to charge special fees for their public services. The tariff of these special fees shall be calculated to cover, at least, the invested funds and the operation and maintenance cost of the services.

The special fees should be collected exclusively from the beneficiary of the service.

The special fees are determined, collected, and distributed only by own bodies of the local councils.

2.2.5 EXTERNAL LOANS CONTRACTED BY LOCAL ADMINISTRATIVE AUTHORITIES AND SOVEREIGN GUARANTEES

(1) External Loans Contracted by Local Administrative Authorities

The law provides the local administrative authorities with a competence to contract internal or external loans, under following provisions:

Total of the annual debts, which consist of the due installments, interests, and commissions incurred by loans, is less than 20 % of the total current revenue of the local budgets.

The due installments, interests, and commissions incurred by loans shall be reimbursed by the local budgets.

Furthermore, an approval of the Commission for the authorization of loans is prerequisite to external loans contracted by the local administrative authorities. The law stipulates that the Commission shall be made up of representatives of following authorities:

The local administrative authority

The state government

The National Bank of Romania

However, at the time of writing this report, the Commission has not been established yet.

(2) Applicability of State Guarantees

The law focused on the procedure for local administrative authorities by themselves to contract internal or external loans. In this case the law clearly stipulates that the local public debt does not represent a debt or responsibility of the state government and the state government has no payment obligation whatsoever. It is also stipulated in same chapter that the credibility or taxation capacity of the state government must not be used for guaranteeing loans contracted by local administrative authority.

However, still there is a possibility for local administrative authority to apply external loans via the ministry of finance. This process is not mentioned in the local public finance law but in the public debt law. The Article 55 in Chapter VI of the law merely says that the state government may offer guarantees to external loans contracted by local administrative authorities, under the provisions of the public debt law.

2.3 PUBLIC DEBT LAW

2.3.1 GENERAL

The public debt law No.81/99 came into force on 10^{th} of May 1999. The law consists of following seven (7) chapters:

Chapter I :	General provisions
Chapter II:	Internal public debts
Chapter III:	External public debts
Chapter IV:	State guarantees for internal loans
Chapter V:	State guarantees for external loans
Chapter VI:	Records and administration of public debts and state guarantees
Chapter VII	Final provisions

Practically financial arrangement for large-scale public investments relies on external loans. Since most international financial sources require the state guarantee for concluding their loan agreements, realistic fund raising method is an external loan guaranteed by the state. The public debt law deals with this matter.

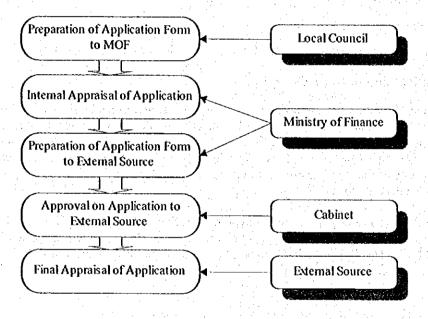

2.3.2 APPLICABILITY FOR STATE EXTERNAL LOANS AND STATE GUARANTEE

Article 22 of the public debt law allows local administrative authorities to apply state external loans for financing the investment in the field of infrastructure development and social services.

Under same criteria, the state guarantees can be issued for external loans to finance selected investment projects. For issuing the state guarantees, not only the inter-ministerial committee but also the Export-Import Bank of Romania participates the appraisal procedure.

2.3.3 PROCEDURE TO APPLY STATE EXTERNAL LOANS

Application procedure for state external loans is shown below.

Application Procedure for State External Loans

Application to the ministry of finance (MOF) should consist of following information:

- Description of the project
- Project cost
- Implementation schedule
- Financial arrangement for the project (especially for local own portion)

In the past, the ministry of finance has obliged to pay not few bad debts of local governments and now is careful for examining the repayment capability of applicant local governments. This repayment capability can be proved by the cash-flow statement which shows the total debt amount will never exceed 20% of the current revenue.

The state government establishes a maximum external debt level every year. Romanian

government concluded a loan agreement with IMF (International Monetary Fund) in August 1999. The conditionality imposed by IMF contains restriction of external loans. Nevertheless it probably affects the maximum external debt levels for next a couple of years, a drop of the level will not so significant.

3. STUDY ON FINANCIAL INSTRUMENTS

3.1 EBRD LOAN

European Bank for Reconstruction and Development (EBRD) is to help mobilize domestic and foreign direct investment, to support private sector development by;

providing loans and equity to create/modernize/expand private companies,

- strengthening financial institutions, and

developing the public infrastructure needed to support the private sector.

Public sector can be covered by EBRD financing through its second and third activities. For financing public sectors, EBRD requires sovereign guaranty. Terms of loans differ between loans to the public sector and the private sector. Typical terms are as follows:

Sector	Interest Rate	Payment Period	Grace Period	Remarks
Public	LIBOR*+1%	15	2~3	Sovereign guaranty
Private	LIBOR*+2~6%	5~7	1~1.5	Negotiable
#TIROR + Lon	don Inter-bank Offere	d Rate		

* LIBOR : London Inter-bank Olfered Rate

There are 47 EBRD projects in Romania as at the end of 1998. Among them, 14 projects are of the public sector and 33 projects are of the private sector. A total portfolio counts USD 1,561.02 million with 51% of the public and 49% of the private. EBRD has guidelines for the distribution of portfolio between the public and private sectors, *i.e.* 40% and 60% respectively. Therefore, there is less possibility to finance further public sector projects in Romania.

Meanwhile, EBRD welcomes the implementation of Local Public Finance Law 189/98 from a view point of the promotion of decentralization. To support local public projects, EBRD likely introduces a new scheme to finance municipality projects directly. The scheme is expected to provide a new finance source to municipalities responsible for the implementation of local projects such as the construction of wastewater treatment plants. However, since the terms for the private sector are to be applied to the new scheme, it would be not easy for the municipalities to utilize the new scheme.

3.2 ISPA

3.2.1 GENERAL

ISPA (Instrument for Structural Policies for Pre-accession) is a new pre-accession aid of the European Union (EU) established by the Council Regulation (EC) No.1267/1999 (hereinafter the ISPA Regulation) in June 1999.

Pre-accession aids are EU's aid tools for 10 EU applicant countries, *i.e.* Bulgaria, Czech Republic, Estonia, Hungary, Latvia, Lithuania, Poland, Romania, Slovakia, and Slovenia. Originally PHARE was established as the sole pre-accession aid in 1989. In 1999 ISPA and SAPARD (Support for Agricultural and Rural Development) were newly established to strengthen support for infrastructure development. ISPA aims to support investment projects in fields of environment protection and transport infrastructure improvement.

It is proposed to grant Euro 3 billion per year as pre-accession aids, of which breakdown is Euro 1.5 billion by PHARE, Euro 1.0 billion by ISPA, and Euro 0.5 billion by SAPARD, during the period from 2000 to 2006.

An allocation of ISPA money between beneficiary countries will be decided by the European Commission (EC) based on the population, per capita GDP in purchasing power parities, and surface area of each beneficiary country. It is said that the annual allocation for Romania will be Euro 200 million. This allocation might be modified taking into account of implementation of the investment supported by ISPA in previous year.

3.2.2 FORMS OF ASSISTANCE

ISPA provides mainly two (2) forms of assistance, namely non-repayable direct assistance and repayable assistance. Non-repayable direct assistance is so called grant. Repayable assistance is a grant for managing authority or another public authority who loan the grant money to executive bodies of the investment projects in the fields of environment protection and transport infrastructure improvement. Under repayable assistance, reimbursed money to the managing authority or another public authority shall be reapplied for the same purpose.

ISPA assistance can cover up to 75 % of initial investment cost born by public bodies or bodies regarded as equivalent to public bodies. In case of repayable assistance the rate of assistance shall be reduced from 75 %.

3.2.3 ELIGIBILITY REQUIREMENTS

According to the ISPA Regulation the eligible projects for ISPA assistance shall satisfy following requirements:

- In case of environmental field, the project enables the beneficiary countries to comply with the requirements of Community environmental law and with the objectives of the Accession Partnerships.
- In case of transport infrastructure field, the project promotes sustainable mobility and enables the beneficiary countries to comply with the objectives of the Accession Partnerships.
- Total project cost exceeds Euro 5 million.

The Accession Partnership is a kind of action program clarifying the priority areas in which large efforts should be made to realize EU accession. To complement it, each applicant country prepares own National Program for the Adoption of the Acquis, which gives detailed program for adopting the 'acquis communautaire' (the European Communities' legislation framework).

The ISPA Regulation also requires that a balance be struck between environmental projects and transport infrastructure projects.

3.2.4 APPLICATION FORM

Required content of applications is described in Annex I of the ISPA Regulation. In brief, a core of the application shall be an international level feasibility study containing an implementation schedule, a cost-benefit analysis, an environment impact analysis, and a financing plan. Furthermore, information on the place and priority of the project in the national environmental strategy laid down in the National Program for the Adoption of the Acquis is required.

3.2.5 APPLICATION PROCEDURE

Each beneficiary country shall establish management system as well as control system for ISPA assistance. In Romania, MWFEP (the ministry of water, forest, and environmental protection) is regarded as candidate for the central management body for ISPA.

The central management body will compile applications and prioritize them. Compiled and prioritized applications will be delivered to EC through EC delegation office of each beneficiary country.

EC appraises delivered applications based on the criteria mentioned in Annex II of the ISPA Regulation. A management committee composed of the representatives of the Member States of EU and chaired by the representative of EC shall assist this appraisal process.

The management committee will be held three times a year. Deadlines of applications are about six (6) months before the management committee.

3.3 JBIC LOAN

Japan Bank for International Cooperation (JBIC, former OECF) of Japan is a bilateral financing organ for ODA (Official Development Assistance) to foreign countries. It is widely recognized in the world for having helped develop infrastructures in developing countries.

There are two routes to provide loans: one is a yen loan which is the government to government loans, and another is overseas investment/financing to the private sector. In both cases, the currency used is the Japanese yen.

In Romania OECF signed agreements to provide yen loans to the road and harbor projects in 1998. The lending terms for the two projects are shown in the table below. The loans used to be targeted to the foreign portion of the capital cost, but today the percentage of the capital cost to which the loans are applicable is determined case by case (usually 70% to 80%). According to JBIC, joint financing with other international financial organs is desirable.

In the case of overseas investment/financing to the private sector, the lending terms are directly influenced by the domestic situation surrounding investment/financing by the Japanese government. At the present moment they are as shown in the table below. In providing loans, JBIC needs bank guaranty to protect its creditor's position. If sovereign guaranty can be arranged, there is no problem. Loans will be provided to 70% of the capital cost, the balance being borne by the debtor.

Sector	Interest Rate	Repayment Period	Grace Period	Remarks
Public	Construction : 2.7%	30 years	10 years	Joint financing is
	Consulting : 2.3%	an an an an an an an Arthur. An an an Arthur an an Arthur		desirable.
Private	2.0%	15 - 20 years	5 - 10 years	Sovereign guaranty
			1	is preferable.

Typical Lending Terms of JBIC

APPENDIX-2 PEOPLE'S AWARENESS SURVEY

1. INTRODUCTION

The people's awareness survey in the Study consists of the following two (2) different questionnaire surveys.

- Questionnaire survey for project economic evaluation which aims to evaluate the socioeconomic benefits borne by the project
- Questionnaire survey for project financial evaluation which aims to determine the sewerage service tariff

To avoid any confusion of respondents, sampling of these two surveys were separately made.

2. ECONOMIC QUESTIONNAIRE SURVEY

2.1 OBJECTIVES OF THE SURVEY

For the project economic evaluation it is necessary to estimate socio-economic benefits born by "the Project" that is defined as the construction of wastewater treatment plants in the Study Area. This estimation is the objective of economic questionnaire survey in the Study.

In general, expected benefits of wastewater management projects are as follows.

Sanitary improvement by eliminating untreated wastewater from roadside ditches

Additional water uses due to water quality improvement of sewage recipient watercourse

Amenity improvement due to water quality improvement of sewage recipient watercourse

In the Study, however, it is difficult to expect these benefits. First, sewer networks have been installed in the Study Area and there are no sanitary problems caused by wastewater. Second, flow quantity of Danube River downstream reach is so huge that expected positive impact of the Project could not result in additional water use.

What could be expected as a positive impact of the Project was nature conservation and environmental protection of Danube Delta. The Delta is widely regarded as one of precious natural resources and national heritages of Romania.

Nevertheless, the following facts make it extremely difficult to say that the Project improves water quality of Danube River so much that the biodiversity and good landscape of the Delta can be conserved.

Not only water pollution of Danube River but also various interactive factors have influenced the biodiversity of Danube Delta.

Volume of treated wastewater will be negligible compare to the flow volume of Danube River, and the positive impact on water quality improvement will be intangible.

It is a fact that the proper management of communal wastewater is given high priority in the Danube Strategic Action Plan. People may appreciate the effort for the environment protection and nature conservation although any tangible benefits can not be expected.

Finally, the economic questionnaire survey was designed to estimate the value of

"implementation of the Project as the first step of a policy towards nature conservation and environmental protection of the Danube Delta".

2.2 SURVEY DESIGN

2.2.1 METHOD

The survey method is summarized below.

Sampling design	- 1,800 samples in total.		
an an an Arabahan an an Arabahan Arabahan Arabahan	300 samples each from Tulcea, Galati and Braila as F/S target citics and 300 samples each from Bucharest, Brasov and Constanta as national samples		
	- Respondents are the heads of households		
	- Random sampling		
Collection method	- Interview method		
Elicitation method	- Double bounded dichotomous choice method		
Payment vehicle	- Contribution		

(1) Sampling Design

The Danube Delta is more than a precious natural resource of Romania, which is registered in the list of World Natural Heritages. Beneficiary of the Project may include at least all Romanian citizens since the Project is related to the nature conservation and environmental protection of the Danube Delta. It is necessary to collect samples from F/S target cities and other cities.

Since the unit of samples is defined as household, respondents were sampled from heads of household in this people's awareness survey.

(2) Collection Method

Interview method was applied to this people's awareness survey because this method can convey exact information to respondents. In this study, the surveyors visited each house to interview the head of each household.

(3) Elicitation Method

Close-end method was applied to this people's awareness survey. If open-end method is applied to evaluate things without any market prices, respondents tend to be embarrassed and to tell extremely high or low amounts.

This survey employed a dichotomous choice referendum method out of various close-end methods. In this method, respondents are asked to vote 'yes' or 'no' on the proposed project on condition to pay a certain amount for the project. It is said that this method can minimize various biases pertaining to the elicitation process.

There are mainly two (2) procedures widely used in the dichotomous choice referendum method, namely the single bounded procedure and the double bounded procedure. These procedures are as follows.

Single bounded procedure: A second second statement

The respondents are asked to vote 'yes' or 'no' once.

Double bounded procedure:

The respondents are asked to vote twice. If the first vote is 'yes', higher amount is presented to respondents for voting, otherwise, lower amount is presented.

Double bounded procedure can narrow down the confidence intervals of estimated WTP. On the other hand, it is said that double bounded procedure has a potential to be biased. When respondents vote for the first amount, some respondents tend to regard the first amount as the 'proper' amount, and, as a result, to vote against the second amount. This phenomenon is called as downward bias.

In this survey, the double bounded procedure was employed. The downward bias was compensated by a bias-included estimation model explained in the sub-section 2.7.2.

(4) Payment Vehicle

In general, the word "contribution" or "tax" is applied to this kind of people's awareness survey as the payment vehicle. In this survey, the word contribution was chosen as the payment vehicle, based on the result of pre-test, as mentioned later.

2.2.2 DESIGN OF QUESTIONNAIRE

The questionnaire consists of the following four (4) sections.

General information of the Danube Delta and explanation of the flora and fauna observed in the Delta. If necessary, the pamphlet of the Danube Delta is shown to respondents.

Information of negative impact to the Danube Delta, such as water pollution, industrial pollution and construction of dams.

Purpose, effects, and cost of the project.

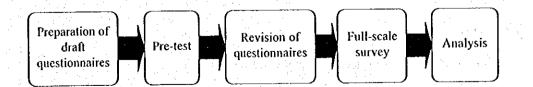

Series of questions on WTP as well as respondent's attributes.

The project is defined as the construction of wastewater treatment plants with biological treatment process in the seven cities.

It is emphasized in the third section that the effect of the Project on nature conservation and environmental protection of the Danube Delta would be intangible.

2.2.3 SURVEY PROCEDURE

Following figure shows the main survey procedures.

2.3 PRE-TEST

The objectives of the pre-test are summarized below.

- To confirm Romanian people's awareness
- To find out and correct inappropriate expressions in questionnaire

To confirm the Romanian people's consent to project

To roughly estimate the range of WTP

This survey aims to estimate the project benefits based on respondent's WTP. If respondents are not aware of environmental issues, it is difficult to achieve the survey purpose because such respondents do not recognize themselves as beneficiaries of the project. Thus, it is necessary to confirm people's awareness to environmental issues before starting the full-scale survey.

It is said that inappropriate expressions may distort actual WTP. For example, in some countries the word "tax" cause strong downward bias because people has been accustomed to pay "contribution" instead of "tax". It is essential to find out and correct inappropriate expressions for the improvement of survey accuracy.

In general, this kind of people's awareness survey is applied to the projects which results in tangible environmental improvements. However, as mentioned before, it is extremely difficult to describe the effects of the project quantitatively. It is the reason why to confirm the Romanian people's consent to the project is necessary prior to conduct full-scale survey.

As mentioned in 2.2.1, close-end method was applied to this people's awareness survey. In close-end method, in case that presented amount is far from the actual WTP, the survey accuracy may decrease. Thus, the range of WTP should be estimated prior to asking WTP for the improvement of survey accuracy.

2.3.2 PROCESS OF PRE-TEST

(1) Focus Group Session

Focus group sessions were held in Bucharest and Tulcea. Eight (8) to nine (9) participants attended each focus group session.

After the general discussion on environmental problem, all of participants discussed environmental problems and image of Danube Delta. Then, the draft questionnaires were presented and outline of the project was explained to participants. Discussion on the questionnaires was carried out to confirm the aforementioned issue. Finally, all participants were asked their WTP.

(2) Preliminary Interview Survey

Preliminary interview survey was conducted in the same way as full-scale survey. Surveyors visited respondents and interviewed them one by one. Purposes of this survey are not only rough estimation of WTP but also training of surveyors.

2.3.3 RESULT OF PRE-TEST

Following facts were confirmed through the pre-test.

- Romanian people's awareness of the environmental problems and the protection of the Danube Delta.
- Romanian people's consent to the implementation of the Project is confirmed

In addition, following issues were pointed out by the focus group sessions.

The word "contribution" is more acceptable than "tax" as the payment vehicle, because

many people feel there are too many kinds of taxes.

It is necessary to emphasize that collected contribution is correctly utilized for the implementation of the project, because not a few people distrust the budget allocation of their governments.

Furthermore, WTP for the implementation of the Project was roughly estimated.

2.4 **FULL SCALE SURVEY**

2.4.1 FINAL VERSION OF QUESTIONNAIRE

The questionnaire was finalized based on the result of the pre-test.

In order to improve accuracy of WTP estimation, the respondents in each city were divided into three (3) groups and given one of three (3) versions of the questionnaires. The difference of three versions is only the asked amounts as summarized below.

	Unit: lei/housel	iold/month
TL	T ₀	T _H
2,000	5,000	10,000
10,000	15,000	20,000
20,000	30,000	50,000
	10,000	TL To 2,000 5,000 10,000 15,000

Note: T_0 : the first vote amount,

 T_1 : the lower second vote amount for the respondents voting against T_0 ,

T_H: the higher second vote amount for the respondents voting for T₀.

Please note that respondents were inquired whether they will pay the asked amount every month for five (5) years.

The finalized questionnaire (version E1) is shown in attachment 1 at the end of this appendix.

2.4.2 FIELD SURVEY

Interview survey was conducted in six (6) cities, namely, Braila, Galati, Tulcea, Constanta, Brasov, and Bucharest, from 15th to 22nd of July.

2.4.3 REFUSAL RATE OF FIELD SURVEY

The following table shows the refusal rate of field survey in each city.

	Braila	Galati	Tulcea	Constanta	Brasov	Bucharest	Total
Number of visits	366	430	357	356	443	506	2,458
Available samples	320	322	320	321	317	317	1,917
Number of refusals	46	108	37	35	126	189	541
Refusal rate	12.6%	25.1%	10.4%	9.8%	28.4%	37.4%	22.0%

SAMPLING RESULT 2.5

2.5.1 ACCEPTANCE OF PROJECT IMPLEMENTATION AND WILLINGNESS TO PAY (WTP)

The following table shows the results concerning respondents' acceptance of project implementation and WTP at presented amount. It should be noted that more than 95% of all

respondents agreed to implement the project.

	В	raila	G	alati	Tu	ilcea	Con	stanta	Br	850¥	Buc	harest	Т	otal

	I		ļ I		<u> </u>	in the second s	L			· · ·				

Due to the above result, national samples have better knowledge about environmental issues than samples in F/S target cities.

2.5.3 DANUBE DELTA EXPERIENCES

(1) Experience of Visit to the Danube Delta

The following table shows how many respondents have ever been to the Danube Delta.

	В	raila	G	alati	Tı	ilicea	Сол	stanta	Br	asov	Buc	harest	Ť	olal
	No.	Ratio	No.	Ratio	No.	Ratio	No.	Ratio	No.	Ratio	No.	Ratio	No.	Ratio
Q5: Visit to Danube Delta											1			
Yes	121	37.8%	156	48.4%	277	86.6%	158	49.2%	161	50.8%	. 133	42.0%	1006	52.59
No	199	62.2%	166	51.6%	43	13.4%	163	50.8%	156	49.2%	181	58.0%	911	47.5%

It seems to be natural that 86.6% of Tulcea respondents has been to the Danube Delta, considering the fact that Tulcea is the main access to the Delta.

(2) Details of the Visit

	8	aila	G	alati	Τι	lcea	Constanta		Brasov		Buc	harest	Ţ	otal

Maintenance fee largely varies among cities. Especially the fee in Brasov and Bucharest

seems to be much higher than those of remaining cities.

2.5.5 ATTRIBUTES OF RESPONDENT, AND HOUSEHOLD SIZE

In this people's awareness survey, a household head is defined as the person who carns the most in the household.

The attributes of respondents' and the number of household members are summarized in the following table.

· · ·	B	raila	G	atati	Ĩı	alcea	Cor	istanta	Br	asov	Buc	harest	· T	otal

A quite high ratio of female household head, more than 30%, may reflect the fact that females play important roles in Romanian society. It should be noted that ratio of housewives is less than 2 %.

The ratios of more than 56 years old and pensioner are conspicuously high, and these two ratios seem to be corresponding.

2.6 VERIFICATION OF DATA RELIABILITY

2.6.1 OUTLINE OF QUANTIFICATION-1

Reliability of obtained samples was verified by the quantification-1, prior to the estimation of project benefits. The quantification-1 is one of the effective analysis methods to check the reliability of collected samples.

Assuming that the samples concerning the criterion variable and explanatory variable are collected as shown in the following table. In the table, explanatory variables are translated into category of items. The item means a question such as occupation, age, and so on, and the category means an option of choices such as farmer, craftsman, and so on. The variables $Y_{(n)}$ and $y_{(n)}$ are observed and estimated criterion variables, respectively. The criterion variable means a subject of the estimation, such as WTP.

Sample	lte	m 👘	1	2		R
code	Cate	gory	$1 \ 2 \ - \ c_1$	1 2 - c ₂		$12 - c_{R}$
- 1	Y ₁	y _i				
2	Y ₂	<i>Y</i> 2				
3 :	Y,	<i>Y</i> 3				
· -	-		-	· · · · ·		- **
n	Y _(n)	<i>Y</i> (n)	-	-		-
•		-			•	an an an the second
			an an an ann an an an an an an an an an			
N	· Y _(N)	Y(N)			••••••	:

To estimate the criterion variation based on explanatory variables, following equation is applied.

$$y_{(n)} = (a_{11} \times x_{13(n)} + a_{12} \times x_{12(n)} + \dots + a_{1c_1} \times x_{1c_1(n)}) + (a_{21} \times x_{21(n)} + a_{22} \times x_{22(n)} + \dots + a_{2c_1} \times x_{2c_1(n)}) + \dots + (a_{R1} \times x_{R1(n)} + a_{R2} \times x_{R2(n)} + \dots + a_{Rc_R} \times x_{Rc_R(n)}) + a_0$$

Where,

n: sample code,

 a_{ij} : category score of item i, category j, a_{0} : constant term, and

 $x_{ij(n)}$: dummy variable of sample n (when category j of item i was chosen, $x_{ij(n)} = 1$, otherwise 0).

All the category scores and the constant term are optimized by minimizing the following S.

$$S = \sum_{n=1}^{N} \left(y_{(n)} - Y_{(n)} \right)^2$$

Obtained category scores tell the relationship between the criterion variable and explanatory variables.

2.6.2 SELECTION OF EXPLANATORY VARIABLES

Prior to analysis of sample reliability, multi-collinearity of explanatory variables should be checked. Explanatory variables for the criterion variable WTP are as follows.

Item	Description and the second sec
X 1	Knowledge of the Danube Delta Strategic Plan
X 2	Knowledge of Environmental Summit
X 3	The Danube Delta Experience
X 4	Monthly Maintenance Cost
X 5	Monthly Income
X 6	Occupation
. X7	Age at the second
X 8	Sex
X 9	Number of Household Members
X 10	Place of Residence

The following tables show the correlation matrices among criterion variable and explanatory variables.

AI-2-10

In the above tables, the figures with bold italic are relatively high.

Following results are found out from the above tables.

- The result of Version E1 shows that correlation coefficients among three items, X5, X6 and X7, and between X7 and X9 are high.
- The result of Version E2 shows that correlation coefficients between X6 and X7 and between X4 and X5 are high.
- The result of Version E3 shows that correlation coefficients between X5 and X6 and between X6 and X7 are high.

To solve multi-collinearity problems, item X4, X6, X7 were eliminated.

As a result, six items, *i.e.* 'knowledge of environmental summit', 'the Danube Delta experience', 'monthly income', 'sex', 'number of household income', and 'place of residence', are employed for the quantification-1 analysis.

In the questionnaires, three subsidiary questions, 'year of last visit', 'frequency of visit', and 'length of visit' were asked to the respondents who told 'yes' for the question of 'the Danube Delta experience'. Based on the comparison of correlation coefficients with WTP, the question 'year of last visit' was selected to incorporate into the question 'the Danube Delta experience'.

2.6.3 QUANTIFICATION-1 ANALYSIS

Explanatory variables and categories were determined as shown below.

Item	Description	Category
XI	Knowledge of Environmental	Yes 1
· ·	Summit (Q4)	No statistica and 2
X2	Experience of Visit to the Delta (Q5)	No
	and Last Visit to the Danube Delta	To 1980 2
	(Q6)	From 1981 to 1990 3
		From 1999 4
		Unknown 5
X3	Monthly Income (Q12)	Less than 1,000 thousand lei
		1,000 - 2,000 thousand lei 2
		2,000 - 3,000 thousand lei 3
		More than 3,000 thousand lei 4
		Unknown 5
X4	Sex (Q13)	Male 1
		Female 2
X5	Number of Family members (Q14)	1 member 1

		<u></u>	• ·	

2.6.4 RESULT OF QUANTIFICATION-1 ANALYSIS

Based on the result of the quantification-1 analysis, following facts are found out.

Relationship between WTP and monthly income is the highest and that between WTP and the Danube Delta experience is the second highest.

Respondents who receive high income tend to pay high contribution.

Respondents who went to the Danube Delta in recent years tend to pay high contribution.

It is considered that collected samples are reliable to estimate the project benefits because these facts can be explained easily based on the common sense.

2.7 ESTIMATION OF ECONOMIC BENEFIT

2.7.1 ESTIMATION METHOD

The economic benefit of the project was estimated by the summation of beneficiaries' WTP. The summation can be calculated by the following equation.

 Σ WTP = number of beneficiaries × mean WTP

As mentioned before, the beneficiaries of the project are all the Romanian citizens.

Please note that in the survey the project is defined as the construction of wastewater treatment plants in the seven cities. Thus, the economic analysis for a certain city requires calculating the city's distributive share of WTP. As the criterion of distributive shares, the proportion of design wastewater quantity was applied. This criterion is a substitute of the investment costs of WWTPs, which might be the best criterion of distributive shares.

2.7.2 ESTIMATION OF MEAN WTP

(1) Estimation Model

1) Background

 $W = f + \varepsilon$

There are several estimation models proposed for the analysis of double bounded dichotomous choice samples. This survey applies the willingness to pay function model (hereinafter "the WFM") proposed by Cameron in 1988, because this model can quantify the effect of downward bias.

In the WFM, it is assumed that respondents' WTP can be described as a willingness to pay function W. The function consists of an observable part f and an unobservable part ε .

To simplify the explanation, the WFM for single bounded samples is descried below.

If the asked amount for the project T is higher than W of a respondent, the respondent will reject to pay T. Otherwise, the respondent will agree to pay T. Thus, the probability to agree the payment can be described as follows.

$$Pr[Yes] = Pr[f + \varepsilon > T]$$

Here, distribution function of ε is assumed a normal distribution N(0, σ^2), then the probability can be described as follows.

Where, Φ is the cumulative distribution function of standardized normal distribution N(0,1).

Then, once the f is described as an expression, all the parameters can be optimized by the most likelihood method.

2) Applied estimation model

As mentioned before, the survey applied a double bounded procedure. For the double bounded samples the equation [1] is developed as follows.

$$Pr[NN] = \Phi\left[\frac{\log T_L - f}{\sigma}\right]$$

$$Pr[NY] = \Phi\left[\frac{\log T_0 - f}{\sigma}\right] - \Phi\left[\frac{\log T_L - f}{\sigma}\right]$$

$$Pr[YN] = \Phi\left[\frac{\log T_H - f}{\sigma}\right] - \Phi\left[\frac{\log T_0 - f}{\sigma}\right]$$

$$Pr[YY] = 1 - \Phi\left[\frac{\log T_H - f}{\sigma}\right]$$

Where, NN : reject both T_0 and T_L , NY : 'reject T_0 and accept T_L , YN : accept T_0 and reject T_H , and YY : accept both T_0 and T_H .

Please note that common logarithms of asked amounts are used in the above equations. It

Part AI: Appendix-2 People's Awareness Survey

means that respondents will agree to pay the asked amount T when W is higher than log T.

The observable part of the willingness to pay function f is assumed as follows.

$$f = \alpha$$
for $Pr[NN]$ and $Pr[NY]$ $f = \alpha + \delta$ for $Pr[YN]$ and $Pr[YY]$ where α is constant, δ is bias term.

The above expressions contain bias term δ to compensate the downward bias.

Parameters σ , α , and δ were estimated by the most likelihood method. Namely, these parameters were estimated to minimize the following log-likelihood function.

$$\ln L = \sum_{i} \left\{ d_{i}^{NN} \ln Pr[NN] + d_{i}^{NY} \ln Pr[NY] + d_{i}^{YN} \ln Pr[YN] + d_{i}^{YY} \ln Pr[YY] \right\}$$

where, *i* : sample code,

 d_i^{NN} , etc. : dummy variables. For example, if sample *i* rejected both T₀ and T_L, d_i^{NN} is 1, otherwise 0.

Furthermore, there are three versions of the questionnaires, E1, E2, and E3. Thus, the most likelihood function is written as $L = L_{E1} + L_{E2} + L_{E3}$.

(1) Result of Parameter Estimation

Result of parameter estimation is shown in Table AI.2.1.

Mean WTP is calculated by the following equation.

$$Mean WTP = \int_0^{Max} x P(x) dx$$

where, Max : Maximum level of WTP,

x : asked amount (lei/household/month), and P(x): probability of acceptance to pay x.

P(x) can be expressed as follows.

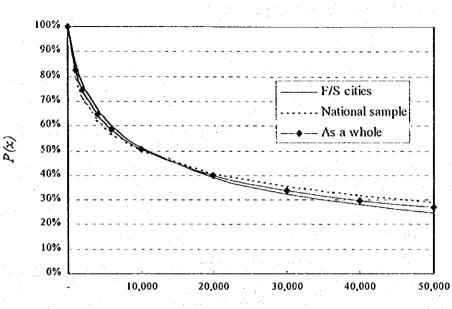

$$P(x) = 1 - \Phi\left[\frac{\log x - \alpha}{\sigma}\right]$$

The Max is set at the highest asked amount, 50,000 lei. Then, the estimated Mcan WTP is obtained as follows.

The second se	an faith th	ischold month	
Braila	20,754	Constanta	22,234
Galati	21,336	Brasov	20,585
Tulcea	18,705	Bucharest	20,086
F/S cities	20,309	National sample	20,973
As a whole	20,604		

Unit : lei/household/month

The following graph shows the relation between x and P(x).

x (lei/househokl/month)

There are no significant difference of mean WTP between the F/S cities and the national samples. It proves the validity of assumption to define the beneficiary of the project as all the Romanian citizens.

As a result, the mean WTP is estimated at ROL 20,604 per household per month.

2.7.3 RESULT OF ECONOMIC BENEFIT ESTIMATION

According to the Romanian Statistical Yearbook 1998, the Romanian population was 22,503,000, and average household size is 3.2. Based on these figures, the number of beneficiary households is estimated as 7,032,188 households. The annual economic benefit of the project is estimated as ROL 1,738,694 million/year.

ROL 20,604 hh/month × 7,032,188 hh × 12 months/year = ROL 1,738,694 million/year

In the questionnaire it is mentioned that the respondent is expected to pay the asked amount every month for five (5) years. The total economic benefit of the project is estimated as ROL 8,693,470 million/year.

As a result, the economic benefit of wastewater treatment plant construction for each city is calculated as follows.

City	Wastewater Quantity (m³/day)	Distribution factor	Annual distribution (million ROL)	Total distribution (million ROL)
Tulcea	43,000	0.0700	121,720	608,598
Galati	235,000	0.3826	665,212	3,326,059
Braila	115,000	0.1872	325,529	1,627,646
Calarasi	55,730	0.0907	157,754	788,771
Giurgiu	82,100	0.1337	232,400	1,161,998
T.Magrele	20,000	0.0326	56,614	283,069
D.T.Severin	63,400	0.1032	179,466	897,328
Total	614,230	1.0000	1,738,694	8,693,470
