Chapter
FUTURE REQUIREMENTS IN WATER
SUPPLY AND SANITATION IMPROVEMENT

# 8. FUTURE REQUIREMENTS IN WATER SUPPLY AND SANITATION IMPROVEMENT

#### 8.1 General

)

3

Phased investments for provincial sector development are planned in almost the same manner as adopted in the 1998 Philippine National Development Plan (PNDP) and the National Sector Master Plan (NSMP), Medium-Term Investment covering the years 2000 to 2004 and Long-Term Development covering the period 2005 to 2010.

Targets of provincial service coverage for the two phases are established as percentages of beneficiaries or utilities to be served by sub-sector. Service coverage in the base year (1998) and national sector targets indicated in the National Sector Master Plan (NSMP) and the updated Medium-Term Philippine Development Plan, 1996 - 1998 (MTPDP) are the bases of the study. Sector targets which are not prescribed in the national plan; school and public toilets as well as sewerage are assumed based on the current conditions. In addition, preliminary discussions on solid waste management are included as a vital component of sanitation sector.

Projection of frame values by municipality is undertaken for respective sub-sectors; future population by urban and rural area, the number of student enrollment to public schools and the number of public utilities. Reference base figures for the study of framework are the 1995 Census of Population and Housing, the statistical data of the province and the information from relevant agencies. Provincial population by target year and the base year (1998) is estimated referring to the NSO population census results (past 10 census periods: 1903 - 1995), the 1995 Census-based National and Regional Population projection prepared by NSO, the 1995 Census-based Regional and Provincial Population projection prepared by the NEDA Regional Office VIII and the Provincial Physical Framework Plan/Comprehensive Provincial Land Use Plan. While, the population distribution to urban and rural areas prepared by NSO in 1995 is modified to meet actual conditions in the classification of the areas.

Types of required facilities and their implementation criteria according to service level standards are referred to the NSMP and the NEDA Board Resolution No. 12 (s. 1995). Some planning conditions and assumptions not prescribed in the national plan are conferred to the relevant standards of sector agencies and provincial government. For sewerage requirements, the deficit in sanitation must first be addressed. Partial upgrading of on-site disposal to a sewerage system (off-site disposal) is envisaged in the final target year.

In estimating future requirements by municipality, additional population (or number of students/public utilities) to be served by sub-sector is first calculated as a shortfall at target years in comparison between each target and its base year service coverage. In this regard, planned/on-going projects to be completed by respective base years are considered as part of existing services for each target year. Required number of facilities by sector component is then estimated corresponding to the said additional population (or number of students/public utilities) to be served. Rehabilitation work for Level I facilities limited to new deep wells to be constructed under PW4SP is taken into account. Generally, rehabilitation of deep wells and shallow wells constructed by means of conventional method is difficult.

()

Logistic support is considered as a minimum requirement of LGUs for community development and training, and other relevant activities along with the implementation of PW4SP. The types and number of well drilling/rehabilitation equipment and supporting vehicle for Level I facilities are also suggested as reference information. Also, minimum requirements for setting up a provincial laboratory to support drinking water quality surveillance and monitoring are described. This will include building, instrument/equipment and reagent/chemical requirements. The 1993 Philippine National Standards for Drinking Water (PNSDW) requires that initial examinations of water from newly constructed sources should first be undertaken before operation for public use and henceforth periodic examinations of these water supply sources/facilities.

Project priority for medium-term development is discussed entailing general criteria to identify specific projects. However, at the provincial level master plan, it is suggested that municipal priority ranking be used for allocation of provincial fund.

## 8.2 Targets of Provincial Sector Plan

Provincial sector targets for the years 2004 and 2010 are determined as the provincial average of the desirable minimum level for each sub-sector. Table 8.2.1 summarizes the target percentages to be served by sub-sector. Details by sub-sector are discussed in this sub-section.

#### (1) Water supply

The base year (1998) service coverage was calculated as a total of 1998 figures and expected by planned/on-going projects scheduled to be completed by 1999. Table 8.2.2 shows service coverage for the planning purpose (details are referred to Supporting Report).

**Table 8.2.1 Provincial Sector Targets**

       Total	Color

The base year service coverage in urban area (82%) is higher than the updated MTPDP sector target (69%) for the year 1998, while rural area (59%) is far behind the sector target of 79%. As identified in Chapter 4, lower service coverage in rural area is considered to arise from existence of high percentage of underserved population.

For Phase I development, targets of service coverage for water supply by urban and rural were set up considering the following conditions:

- at least the existing service coverage shall be secured to meet population increase;
   and
- ii) viable investment using available IRA to be allocated to water supply sector shall be considered.

Thus, the existing service coverage of 82% for urban and 59% for rural area shall be kept in the medium-term period, respectively.

Phase II targets are planned to increase urban and rural water supply coverage to 95% and 93%, respectively, as envisaged in the NSMP.

## (2) Sanitation

## 1) Household toilets

As with water supply, the base year service coverage is calculated as shown in Table 8.2.3 reflecting any planned or on-going projects scheduled to be completed by 1999 (details are referred to Supporting Report).

The province has base year service coverage of 69%, which is a little above the current national average coverage of 60%. Urban area registers a level of 78% that is well above the national average coverage. Rural area however, has only 66% owing to the presence of numerous unsanitary facilities. By type of sanitary toilet facility, the existing percentage composition to total households is as follows:

Type	Urban (%)	<u>Rural (%)</u>
Flush	33	10
Pour-flush	65	85
VIP latrine	2	5

To attain sufficiency and equitable access to basic services, provincial target of Phase I for urban household toilets is planned at 80%, while, for rural household toilets, 75% is projected. This is almost equal to the existing urban service coverage of 78% that is pursued to lessen the gap of the coverage between the urban and rural areas

and to achieve a balanced distribution of this basic facility as embodied in the PNDP. For Phase II, 93% as set by the NSMP is adopted for urban household toilets, while, 90% is arranged for rural household toilets.

The existing composition of the 3 facility types serves as an indicator in the distribution for Phase I, while for Phase II, VIP and sanitary pit privy/latrine (dry-type) is phased-out.

## 2) School toilets

The base year service coverage of public school students is shown in Table 8.2.4 counting expected coverage of any planned or on-going projects scheduled to be completed by 1999 (details are referred to Supporting Report).

Base year service coverage is 58% applying the standard number of public school students to be served by one (1) unit of toilet facility. The low level is due to a large number of unsanitary or absence of facilities.

Table 8.2.4 Base Year Service Coverage of Public School Toilets and Public Toilets

In the absence of national targets for school toilets, the existing level of service coverage is the base in setting up the targets. It is expected that all new construction of school-buildings will entail sanitary toilets enabling the coverage to increase on a high level. For Phase I and II, 75% and 90% are set, respectively.

#### 3) Public toilets

The base year service coverage considering expected additional coverage by 1999 is shown in Table 8.2.4 (details are referred to Supporting Report).

Almost all existing public utilities are served with at least one sanitary toilet giving a 99% coverage. This can be attributed by the fact that almost all public utilities (mostly public markets) are provided with sanitary toilet facilities.

Without national targets as of now, the indicator in setting up provincial targets would be the existing level of coverage. Accordingly, 100% coverage for both Phase I and Phase II are assumed.

## (3) Sewerage

Given the non-existence of sewerage systems in any municipality at the present time, this plan does not consider the service during Phase I. For Phase II, a target of 50% coverage was applied to urban population of municipalities with more than 10,000 urban population provided by Level III water supply systems.

## (4) Solid waste

The municipal level data in 1998 on the number of households served by the municipal refuse collection revealed that the current practice is concentrated to urban areas. The base year service coverage for urban area by municipality is reflected in Table 8.2.5.

About 55% of the total households in the province relied on municipal refuse collection using trucks or 89% urban household coverage. These municipalities have a total of 65 units of collection truck.

No national targets have yet been set. However, considering the present level of coverage, a 90% urban household coverage is applied for the medium-term period (2000-2004).

Table 8.2.5 Base Year Service Coverage of Municipal Solid Waste System in 1998

## 8.3 Projection of Frame Values

## 8.3.1 Population Projection

Future population for all municipalities by urban and rural areas was projected for the target years of 2004 and 2010 together with the present population in 1998 as a planning base year.

The future regional population is published by the NSO, while the projections at provincial and municipal levels were not available during the study. On the other hand, the NEDA Regional Office VIII projected regional and provincial population for year 2006. The future population of LGUs was therefore projected (details are included in the Supporting Report). Available information for the study at present is as follows:

- NSO population census results from 1903 to 1995
- 1995 Census-based National and Regional Population Projection prepared by the NSO
- 1995 Census-based Regional and Provincial Population Projection prepared by the NEDA Regional Office-VIII
- Provincial Physical Framework Plan/Comprehensive Provincial Land Use Plan (1997-2006) prepared by the Provincial Office

## (1) Comparison of regional population projected by NSO and NEDA

The NSO conducted the national population projections for the period 1995-2040 and the regional projections for the period 1995-2020. The assumptions take into account future trends in the demographic processes of fertility, mortality and migration required by the cohort-component method for projecting population.

In the regional population projection of Region VIII (Eastern Visayas), the subject region that is composed of the 3<sup>rd</sup> batch provinces of this study is classified as medium-sized region (projected population of at least 5 million but less than 10 million by year 2020).

On the other hand, the NEDA Regional Office-VIII projected the regional population together with the provincial population for year 2006 based on the 1995 census result.

Comparing the population by NSO with the NEDA projection, the latter is rather conservative, which reflects the past trend.

Table 8.3.1 Comparison of Regional Population Projection by the NSO and NEDA

Ye	ar	1980	1990	1995	2000	2005	2010
	Population	2,799,534	3,054,490	3,366,917			
Census	Growth Rate		0.88%	1.97%			_
NSO	Population			3,356,854	3,743,895	4,132,242	4,523,76
Projection	Growth Rate			•	2.21%	2.00%	1.82%
NEDA	Population		!	3,366,917	3,538,661	3,719,171	
Projection	Growth Rate				1.00%	1.00%	

Note: The 1995 population as of July 1995 was used as a basis for NSO population projection.

The Growth Rates were estimated as an annual average using the compound formula.

# (2) Provincial Physical Framework Plan/Comprehensive Provincial Land Use Plan: Leyte: Planning period 1997-2006

The projection of the provincial population is referred to the projection prepared by the NEDA Regional Office. The provincial population for the year 2006 was projected with the base year 1995. The provincial growth rate of 1.02 % from 1995 to 2006 is about half of the regional growth rate adopted by the NSO, while almost the same as the regional average growth rate assumed by the NEDA in the subject period was applied for the provincial projection.

## (3) Population projection of the Province

The following conditions are considered/assumed in the population projection for the PW4SP.

#### Regional Population

The growth rate projected by the NEDA Regional Office that is adopted in the Land Use Plan is considered rather conservative compared with the recent population development. In consideration of the current development (between 1990 and 1995), the NSO projection may be applicable for the PW4SP.

Year	<b>Population</b>	Growth Rate
1995	3,366,917	Census result
2000	3,356,854	2.21% (1995 - 2000)
2005	4,132,242	2.00% (2000 - 2005)
2010	4,523,762	1.82% (2005 - 2010)

## Provincial Population

The regional population projected by the NSO may be used with conditions. The growth rate experienced between 1990 and 1995 (provincial average of 2.00% in the study area) indicates an almost the same figure for the region (1.97%). Assuming

that the tendency of the population growth by the province will follow that of the region, the growth rates of 2.00% for the short/medium-term projection and 1.82% for the long-term projection may be employed in the provincial population projection. Table 8.3.2 presents a comparison of the estimated provincial population using the growth rates adopted by the NSO and the NEDA. The additional provincial population in 2010 projected by the NSO compared with the NEDA projection (261,046) is only 7% of the regional population in 2010 by NEDA base. In this connection, the applied method to the province (NSO based) will not affect the other provinces, even if the NEDA based regional population may be used by the other provinces concerned.

(1)

Table8.3.2 Comparison of Projected Population for Province

		NSO Base		NED/	\ Base	Comparison
Year	Pop. Leyte <sup>9</sup>	Pop. Study Area	Growth Rate	Pop. Leyte 2)	Growth Rate	1) / 2) - 1
1995	1,511,251	1,367,248	_	1,511,251	+	-
1998	1,603,752	1,450,935	2.00%	1,557,966	1.00%	2.9%
2004	1,806,085	1,633,988	2.00%	1,655,686	1.00%	9.1%
2010	2,012,504	1,820,738	1.82%	1,751,458	0.91%	14.9%

Note: Population of Leyte includes Ormoc City.

#### Municipal/City Population

- 1) The provincial population for target years is fixed as shown in the above table.
- 2) The experienced growth rates (1990 1995) of the municipality will be employed both for short/medium-term and long-term population projections. However, for the municipality of Matalom, the population will be fixed with the figure in 1995 to avoid negative growth. Likewise for the municipality of San Isidro, the growth rate of 2.69% (1980 1995) will be employed, since the growth rate of 6.32% (1990 1995) is considered too high compared with the figures of other municipalities.
- 3) Finally, the population by municipality/city was adjusted to meet the fixed provincial population by distributing the balance between the initially calculated results and the fixed figures applying the share to the province. Table 8.3.3 presents the projected population of concerned municipalities.

## Population Projection by Urban/Rural Area

## 1) Past population development

With regard to the ratio of the urban population to the total population, the provincial averages in 1980 and 1990 were 26.5% and 32.1%. likewise, it slightly increased to 32.6% in 1995. Meanwhile, the provincial average growth rate of 3.27% between 1980 and 1990 slightly decreased to 2.35% in 1995.

While the rural population to provincial population in 1980 (73.5%) decreased to 67.4% in 1995 with growth rates of 0.24% (1980 - 1990) and 1.84% (1990 -1995).

The population distribution in 1995 based on NSO data was modified applying the currently revised classification of barangays in terms of urban or rural area.

(

2) Projection of urban and rural population for the years 1998, 2004 and 2010 Urban population by municipality/city was first projected and the rural population was calculated as a balance to meet the aforementioned total population.

In the projection of municipal urban population for the short/medium term and long-term period, the following are assumed.

- Short/Medium-term target: 1998 and 2004
   Updated census results in 1995 are basically applied in terms of the share of urban population to total population by municipality/city.
- Long-term target: 2010
   It is assumed that the share of urban population to total population by municipality/city will not change drastically. Thus, the same share in short/medium-term will be applied to municipal population in long-term period.

Under the above assumptions, the provincial share of the urban population for the year 2010 was arrived at 34.0%, slightly higher than the figure in 1995 (31.3%). Table 8.3.4 presents projected urban and rural population. The shares on rural population are calculated using estimated rural population.

## 8.3.2 School Enrollment Projection

From the 1995 total population of the province, the number of children who would be enrolling in elementary and high school levels for all municipalities is derived.

School age population is extrapolated from the NSO age group classification of 5-9, 10-14 and 15-19 years old bracket by municipality. The age group for the elementary level is from 6 to 13 years, while that for the high school level is from 14 to 17 years. The percentages of school age population for the target years are based on the existing composition or structure of the 1995 population.

From the school age population, the number of children who would attend either private or public school, by target year is computed using the projected participation rate. The partici-

pation rate by target year varies depending on the socio-economic condition of the province. Generally, an improved economy will result to a higher participation rate. For the province, an increase in the participation rate in both private and public schools is foreseen by year 2010.

(

The number of public school students by target year is then derived from the projected number of children who will attend school. A participation rate for public school enrollment is established based on the existing participation rate of public school students to the total school age population. Based on the projection, an increase of 3% from the 1998 rate is foreseen in 2004 and another increase of 7% from the 2004 rate in 2010 (details are referred to Table 8.3.6, Supporting Report). It should be noted that some municipalities had participation rate in 1998 of over 100%, an indication that a number of school enrollees are over-aged.

Table 8.3.2 shows the projected number of public school students by municipality, by target year. About 247,411 and 293,928 public school students are estimated to enroll for years 2004 and 2010, respectively.

## 8.3.3 Projection of the Number of Public Utilities

The number of public utilities (limited to public markets and bus/jeepney terminals) by target year is projected in urban areas for all municipalities. The provincial physical framework plan and the provincial comprehensive development plan serve as references in the projection. Bus or jeepney terminals are considered in major transport routes of the province.

There are no proposed construction for both target years of 2004 and 2010. Refer to Table 8.3.5 for the number of public utilities by municipality by target year (details are referred to Supporting Report).

## 8.3.4 Planning Area and its Projected Population for Sewerage

Urban areas with more than 10,000 population provided by Level III water supply systems in 2010 serve as the planning area. Population in the area is considered as the potential population to be served.

Eleven (11) municipalities with a total urban population of about 229,472 are considered (refer to Table 8.5.4).

# 8.3.5 Number of Households to be Served by Municipal Solid Waste Collection System

The number of urban households in 2004 is the potential households for the planning (refer to Table 8.3.5, Supporting Report).

(

## 8.4 Types of Facilities and Implementation Criteria

In principle, types of facilities and their implementation criteria as prescribed in the NSMP and the NEDA Board Resolution No. 12 (s. 1995) are adopted to this PW4SP.

## 8.4.1 Water Supply

The following are the major conditions and assumptions applied to urban and rural water supply, which are intended as a guide for the implementation of sector projects.

## (1) Urban water supply

Prevailing situation of urban water supply in each municipality was firstly reviewed mainly focusing on existing water sources and magnitude of service coverage. Planned/on-going projects for concerned municipalities were also studied and reflected in the planning, with due attention to merging of municipalities into an integrated water supply system. Potential water source for future development was then evaluated based on the study results in Chapter 7, taking into account the possibility to utilize untapped spring sources. Recommendations arising from these studies were also incorporated as overall development strategy.

Aforementioned studies were carried out by the following sequence:

- · Review of existing water supply systems and water sources;
- Review of planned/on-going projects;
- Establishment of planning conditions covering service level, utilization of existing facilities, water sources, and number of systems; and
- · Recommendations for overall development strategy.

Table 8.4.1 presents summary of the study results by municipality.

Review of existing water supply systems and water sources
 The municipalities/city of Abuyog, Barugo, Bato, Baybay, Calubian, Capoocan, Carigara, Hilongos, Hindang, Isabel, Jaro, Merida, Palo, Palompon, Pastrana, Tabontabon, Tacloban, Tanauan, Tolosa and Tunga are served by WDs.

Table 8.4.1 Summary of Urban Water Supply Development by Municipality

9

Table 8.4.1 Summary of Urban Water Supply Development by Municipality (Cont'd.)

Municipality	Existing Condition	On- going/Planned	Water Source Availability	Future Requirements
Burauen	aged by municipality exists. The system covers (79% of urban population, 15,000, is covered). Water At present, data on water consumption is under reduled water supply is being practiced due to er of transmission and distribution pepclines. Proper is a current issue. The municipality needs to conduct on of the facilities, but financial source is not yet.		The capacity of spring sources are enough to System expansion together with cover this area. Deep well may have water rehabilitation of transmission/diquality problem (high PerMn and slight pipes is required. Financial societic groundwater) with low yields.  Sought.	System expansion together with rehabilitation of transmission-distribution pipes is required. Financial source shalf be sought.
Calubian	Overload presence.  One WD exists. Served population in urban area is 300 (57% service coverage of urban population), while population served in rural area is 3.200. Water source is Obispo spring. The WD needs rehabilitation or improvement of the present facilities.	None	Spring sources exist.	System expansion together with additional spring source development is required. Rehabilitation/improvensent of existing facilities is a requisite.
Capocan	Capoocan is one of the recipient municipalities being served from Metro Plan Cangara WD. Served population is about 600 (7% of urban population, (Improvement of 5.200).	rovement of VD)	See Cangara.	(See Cangara) Expansion of distribution pipelines in the municipality is required.
Carigara	Merro Carigara WD covers 5 barangays in Cangara together with other municipalities of Tunga, Barugo and Capoocan. The system serves for 1,600 persons (13% of urban population). Water source is a combination of surface water from Maulaog River and spring source located in Capoocan with production amount of 1,650m3/d and 550m3/d, respectively. However, dirty water appears in the settling basin. The WD is therefore planning to improve the system by putting up a rapid sand filtration plant, but WD's financial constraints hampers the realization of the plan.	Plan (Improvement of system of MCWD)	Many springs exist far from populated System expansion with improvement of Coastal area. Deep wells have water quality existing facility is required. Study on water system of MCWD) problems of high Fe/Mn contents, slight cource (aditional surface water) shall be conducted. Financial source shall be sought	System expansion with improvement of existing facility is required. Study on water source (aditional surface water) shall be conducted. Financial source shall be sought.
Dagami	covered by Leyte Metropolitan Water pulation is only 130 (3% of the urban	Plan (expansion of See Tacloban City service area of LAWD)	See Tacloban City	(See Tactoban City). Expansion of discribility is distribution pipelines in the municipality is required.
Duing	There is a LGU-managed waterworks. Presently, one barangay is being served by the system. Population served is 250 (only 1% of urban population). Water source is a deep well.	None	Deep well can be developed for future expansion of Level III water supply. Deep well capacity is estimated at about 1,000 cu.m/d with depth of 40m.	System expansion together with ground water development(deep well) is required. Due consideration of saline water intrusion shall be necessary. Integrated water supply system with La Paz, MacAuthur and Mavorga shall be studied.

Table 8.4.1 Summary of Urban Water Supply Development by Municipality (Cont'd.)

)

	The state of the s	On-		
Municipality	Existing Condition	going/Planned Project	Water Source Availability	Future Requirements
Hilongos	There is Metro Hilogos WD to serve for one urban barangay in Hilongos None together with the municipalities of Bato and Hindang at present. Water source is deep well. Served population in Hilongos is about 1.500 (17% of urban population).	None	Deep well can be developed for future expansion of Level III water supply. The deep well capacity is estimated at about 1,000 cu.m/d or more with depth of 40m.	System expansion of MHWD is required. Study on deep well source with due consideration of saline water intrusion shall be necessary.
Hindang	Hindang is a recipient municipality being served from Metro Hilogos WD. Current population served is 2,200 (61% of urban population, 3,600).	None	See Hilongos.	(See Hilongas) Expansion of distribution pipelines in the municipality is required.
Inopacan	There is no Level III system at present. The urban population (about 2,300) relies on Level I facilities. There is, however, an identified adequate spring source located at Barangay Maljo and Esperanza, 10 km away from the poblacion, which could be tapped for urban Level I(I) system,	None	Spring is the only potential source for development of Level III water supply. Deep well has poor yield of less than 500 cu.m/d in this area.	New Level III system using spring shall be created. Study on spring development is a requisite.
Isabel	There is a WD serving for 3 urban barangays with served population of 2.600 (about 20% of urban population, 13,900). Water source is deep well.	Plan (F/S & D/D) on water source development)	Deep wells have insufficient capacity (less than 500 cu.m/d) in urban area. Spring is better source for Level III water supply, but springs have small yields and are located mountainous areas.	System expansion together with water source augmentation is required. Combination of deep well and spring source shall be studied. Financial source shall be sought.
Jaro	There is a WD serving for 4 urban barangays with served population served 3,400 (43% of urban population). Water source is deep well. Water shortage is a common problem being experienced by the concessionaries of the system. The WD has a plan to tap the spring (5 km away from poblacion).	None	Deep well development is available in this area. Deep well depth is estimated about 40m. Water quality problem (high Fe contents) is locally observed.	System expansion with water source augmentation is required. Study on water source development(deep well/spring) is a requisite. Integration with MCWD shall be studied.
Javier (Bugho)	There is a LGD-managed Level III system. The waterworks supplies water to about 800 persons or 31% of urban population. Water source is a spring having sufficient production amount (2,400 m3/d).	None	Numerous spring sources are located within System expansion using spring source 5km to 6km away from populated area. Those springs have enough yields for future fransmission/distribution pipolines is repansion of Level III water supply.	System expansion using spring source together with improvement of transmission/distribution pipchines is required.
Juhta	No Level III exists in urban area. Urban population is about 4,300. They use Level I facilities.	None	Deep well development is available in this area. Deep well depth is estimated about NOm. Water quality problem with high Fe contents is observed locally.	New Level III system shall be created. Technical study on deep well development is a requisite.

Table 8.4.1 Summary of Urban Water Supply Development by Municipality (Cont'd.)

		- <u>i</u> Ö		
Municipality	Existing Condition	going/Planned Project	Water Source Availability	Future Requirements
Kananga	There is one LCiti-managed Level III system which utilizes Mahawan spring as its source. The urban barangay is 100% (7,100 persons) served by the system. At present, water supply is not enough due to insufficient water source/capacity of the facility.		Spring sources can be developed as System expansion togethe additional water source for future expansion laugmentation is required. of Level III water supply. Deep well development is also available with depth of 40m and production of 1,000 cu.m/d or more.	System expansion together with water source augmentation is required.
La Puz	The municipality has no Level III system at present. Utban population is about 4,200. They rely on Level I and II system. There is a favorable untapped spring source located in Brgy. Mag-aso. 2.5 km away from poblacion.	None	Both spring and deep well are potential New Level III system using spring water sources for new establishment of shall be created. Technical study Level III water supply. Among them, spring source development is a requisite is better source, because groundwater has a water quality problem (high Fe contents).	New Level III system using spring source shall be created. Technical study on water source development is a requisite.
Leyte	There is a LGU-managed Level III system utilizing Danus spring as its source. One urban barangay is served by the system with served population of about 800 (20% of urban population). There are no existing data on water consumption and water quality and these are still subject to verification.	None 1	Spring is the only potential source for Lovel III water supply. Deep well development has problems in terms of quality and quantity.	System expansion together with water source augmentation is required.
Mac Arthur	No Level III exists in urban area. Urban opulation is about 3,300. They None use Level I facilities.		Deep well development is available in this area. Deep well depth is estimated at about 80m. Water quality problem with (high Fe contents) is locally observed.	New Level III system shall be created. Technical study on water source development is a requisite. Integrated water supply system with La Paz, Dulag and Maxorra shall be studied.
Mahaplag	There is no Level III system in urban area. They use Level I facilities. It Urban population is about 3.700.	None O H	Spring is a potential water source for Leve! New system shall be created. Study on III water supply. In case of using deep well, spring source development is a requisite, deep well specifications are: depth of 80m. production of less than 500 cu.m/d and water level of 40 mbgs.	New system shall be created. Study on spring source development is a requisite.
Matag-ob	There is a LGU-managed Level III system utilizing spring source located at Barangay Riverside (poblacion). Three urban barangays are served by the system but current population served is about 400 (10% of urban population). People are not willing to pay water charges.	None	Spring is a better water source for future expansion of Level III water supply. When deep well development is necessary in the future, well fields, located in fluviatile deposits along the inversiball be considered.	System expansion (distribution pipes) with getting concurrence of beneficiaries is required. Study on additional water source (spring/deep well) is a requisite.

()

Table 8.4.1 Summary of Urban Water Supply Development by Municipality (Cont'd.)

)

Municipality	Existing Condition	going/Planned	Water Source Availability	Future Requirements
Matalom	There is a LCiC-managed waterworks utilizing Agbanga spring as its water source. Three urban barangays are covered by the system with current population served of 3,000 equivalent to 88% of urban population. The system's production capacity is sufficient to fully serve the urban population and a portion of the rural population.		Spring is the only potential source for Level System expansion with water source augmentation is required. Integrated augmentation is required. Integrated capacity in this area.	System expansion with water source augmentation is required. Integrated system with MHWD shall be studied.
Mayorga	No Level III exists in urban area. Urban population is about 2,300.	o co.	Deep well development is available in this area. Deep well depth is estimated at about 40m. But water quality problem (saline water intrusion) is observed in coastal area.	New Level III system shall be created. Technical study on ground water development with due consideration of saline water intrusion is a requisite.
Merida	rida has two (2) Level III systems, namely. 1) ret that gets its water allocation from the LIDE (C) in Isabel, and 2) the Merida Water System ring. As a whole, service coverage of these 2 surban barangays is about 2,400 (71% of urban LIDE is planning to cut off water supply to the cipality has a plan of spring development.	Plan (F/S including spring development)	Spring development is available in this area. Deep well with depth of 40m is also available, but deep well yields may be 500 cu.m/d or less. Shallow wells are contaminated by fertilizer.	Spring development is available in this area. System expansion with spring development Deep well with depth of 40m is also is required. Financial source shall be sought, available, but deep well yields may be 500. On-going study to ensure water source shall be unif or less. Shallow wells are broceeded.  be proceeded.
Palo	applicance for Level 11. Urban barangays are served by Levie Metropolitan Water District. Population surved in Palo is about 17,700 (77% of urban population).	Plan (expansion of Sec Tactoban City service area of LMWD)	Sec Tactoban City	(See Tacloban City) Expansion of distribution pipelines in the municipality is required.
Palompon	There is a WD covering ten (10) urban barangays with current population served of 3,100 (26% of urban population). Water source is a combination of deep well and spring. The production capacity is insufficient to meet the average daily requirements of the whole urban population.	None	Both spring and deep well are potential sources for future expansion of Level III water supply. Among these, development priority shall be given to spring source.	System expansion with improvement of transmission/distribution pipeleines is required. Study on additional water source development (spring/deep well) shall be necessary.
Pastrana	Urban barangays are covered by Leyte Metropolitan Water District. Population served in Pastrana is about 100 (only 3% of urban population).	Plan (expansion of See Tacloban City service area of LMWD)	See Taeloban City	(See Tacloban City). Expansion of distribution pipelines in the municipality is required.
San Isidro	There is no Level III system at present. The urban population (5.200) relies on Level II system with deep well as its water source. As of to date, there has not been any water source identified as potential for Level III services.	None	Potential water source of spring may be located in the southern mountainous area. Deep well production has low yields for Level III water supply.	New system shall be created considering upgrading from existing Level II system to Level II in use of deep well. Construction of transmission/distribution pipelines is necessary. Alternative water source shall be sought for future demand.

Table 8.4.1 Summary of Urban Water Supply Development by Municipality (Cont'd.)

Municipality	Existing Condition	On- going/Planned Project	Water Source Availability	Future Requirements
San Miguel	There is no Level il system at present. The urban population (about 3,200) relies on Level i facilities. The municipality, however, plans to have a Level III system either through grant or loan from a financial institution.	ő	The yield of spring source is generally small in northeastern mountainous area. Deep well development is considered as better source for Level III water supply. The specifications of deep well is depth of 40m and production capacity of 1,000 cu.n/d. This municipality is outside the groundwater quality problem area. The Maaral creek may be an alternative water source.	The yield of spring source is generally small New system shall be created. P/S including water source development (deep well) is a source for Level III water supply. The specifications of deep well is depth of 40m and production capacity of 1,000 cu.m/d. This municipality is outside the groundwater may be an alternative water source.
Santa Fe	There is no Level III system at present. The urban population (2,100) relies on Level I facilities. The municipality, however, is identified as a service area under the proposed expansion program of the Leyte Metropolitan Water District (LMWD).	Plan (expansion of See Tactoban City service area of LMWD)	See Tactoban City	(See Tacloban City) LMWD will cover the municipality as its service area.
Tabango	There is no Level III system at present. The urban population (4,900) relies on Level-I facilities. The municipality, however, plans to put up a Level III system to serve the poblacion. World Bank is identified as a funding source therefor.	Proposed (LGU- Urban Water Suply Project)	Spring is the only potential source for Level New system shall be created. Technical fill water supply. Deep well development is study on water source development (springitteult, secured under LGU-Urban Water Supply project.	Spring is the only potential source for Level New system shall be created. Technical fill water supply. Deep well development is study on water source development (spring) is a requisite. Financial source shall be secured under LGU-Urban Water Supply project.
Тавоптавоп	Presently, urban barangays are served by Leyte Metropolitan Water District. Population served in Tabontabon is about 200 (8% of urban population).	Plan (expansion of See Tacloban City service area of LMWD)		(See Tacloban City) Expansion of distribution pipelines in the municipality is required.
(Capital)	The Leyte Metropolitan Water District (LMWD) covers the urban area of the City together with the municipalities of Pastrana, Dagami, Tabontabon, Tolosa, Tanauan and Palo. Current population served in urban area of the city is estimated at about 160,000 (95% of urban population). The WD is utilizing surface water from Binahaan River and practicing water treatment adopting rapid sand filtration (in Pastrana). LMWD's existing capacity is sufficient to fully serve the total urban population of the above mentioned areas. At present the WD has a plan to expand its service area to the municipalities of Alangalang and Sta. Fe by introducing BOT.	Plan (expansion of service area of LMWD)	Additional surface water development of System expansion of LMWD (into 0.28 cu.m/sec is planned at Binahaan River incatment plant, Transmission pipe, by the LMWD. The available river water to and Distribution pipes) is required be further developed was estimated at more factional water existing than 1.00 cu.m/sec according to F/S surface water (Binahaan River) without of this river is classified into class will be constructed in Pastrana wit adulty of this river is classified into class will be constructed in Pastrana wit Criteria for Fresh Water*.	System expansion of LMWD (Intake, Water freatment plant, Transmission pipe. Reservoir and Distribution pipes) is required. Additional water source is existing from surface water (Binahaan River) with a water rights of 1 m²/sec. Water treatment plant will be constructed in Pastrana with the same capacity (24,200m²/d) of the existing plant.
Tanauan	Presently, urban barangays are served by Leyte Metropolitan Water Discrice. Population served in Tanauan'is about 140 (only 1% of urban lyopulation).	Plan (expansion of Sce Tacloban City service area of LMWD)	see Tacloban Otty	(See Tacloban City) Expansion of distribution pipelines in the municipality is required.

**(** 

Table 8.4.1 Summary of Urban Water Supply Development by Municipality (Cont'd.)

)

Municipality	Existing Condition	On- going/Planned Project	Water Source Availability	Future Requirements
olosa	Presently, urban barangays are served by Leyte Metropolitan Water District. Population served in Tolosa is about 1.600 (97% of urban population).	Plan (expansion of see Lacloban City service area of LMWD)		(See Tacloban City) Expansion of distribution pipelines in the municipality is required.
Lunga	Presently, urban barangays are served by Metro Carigara Water District. Plan Population served in Tunga is about 1,600 (38% of urban population).  Level III system)	1	See Cangara.	(See Tacloban City) Expansion of distribution pipelines in the municipality is required.
/i]laba	There is a LGU-managed Level III system utilizing Hinabuyan spring as None its water source. Two (2) urban barangays are served by the system with served population of 1,600 equivalent to 50% of urban population. Insufficient water supply is a current problem.		The spring is the only potential water source System expansion with water source (so fource expansion of Level III water augmentation is required. Improvement supply. Deep well development is difficult. Iransmission/distribution pipelines is a requisite.	The spring is the only potential water source System expansion with water source (spring) for future expansion of Level III water augmentation is required. Improvement of supply. Deep well development is difficult. Transmission/distribution pipelines is a requisite.

Among them, Tacloban City, Pastrana, Dagami, Tabontabon, Tolosa, Tanauan and Palo are covered by the Leyte Metropolitan Water District; Carigara, Capoocan, Bargo and Tunga are covered by the Metro Carigara Water District; and Hilongos, Hingang and Bato are covered by Hilongos Metro Water District. While the municipalities of Babatngon, Burauen, Dulag, Javier, Kananga, Leyte, Matag-og, Matalom, Merida, and Villaba are served by Level III systems operated either by the municipal government or the local community.

Population served by existing Level III systems range from about 250 persons at LGU-managed waterworks in Dulag to 180,000 persons at the Leyte Metropolitan Water District. The average size of served population is about 13,500 persons. Majority of the existing Level III systems in urban areas is utilizing spring sources.

The remaining 12 municipalities, out of the total 42 municipalities/city have no Level III system in their urban areas and are presently served by Level II systems and/or Level I facilities.

## 2) Review of planned/on-going projects

At present, there is a proposed project such as the WB-assisted LGU Urban Water Supply project being coordinated by the DILG. The recipient municipality is Tabango. In addition to this, the LMWD is planning to expand its service area to the municipalities of Alangalang and Sta. Fe. However, the details of this said project have not been clarified during the preparation of this PW4SP.

#### 3) Establishment of planning conditions

#### a. Service level

It shall be noted that a national policy for urban water supply is a Level III system, as the most suitable measure. Therefore, for the investment needs of the sector development, it is assumed in this PW4SP that underserved or unserved urban population at present and in the future will be provided with individual house connections. However, it does not intend in the future to exclude, as individual cases, Level I and II facilities from being implemented in urban area.

#### b. Utilization of existing facilities

The existing Level I and II facilities are considered to be utilized during the Phase I period. However, the population served by these facilities is to be absorbed by Level III service in Phase II.

## c. Water sources

Possibility/availability to utilize surface water and groundwater (spring and deep well) is evaluated as potential water sources for water supply development.

From the viewpoints of cost effectiveness and easy O&M of water supply system, utilization of spring sources is given due priority in the course of urban water supply planning. Application of deep wells for water source is regarded as the second priority in principle. Surface water is, on the other hand, not adopted at this moment, because of large capital investment requirements and complexity of surface water treatment.

## d. Number of systems

In principle, one (1) Level III system is considered for urban area of every municipality. In the municipalities with an existing Level III system/s, the expansion of the system was first considered. In case of no existence of Level III system/s, a new system was recommended. Existing plan/s on the development of Level III/WD are also taken into account to determine the respective systems of the municipalities.

Possibility and necessity to merge service area of some neighboring municipalities to an urban water supply system were also studied from the viewpoint of:

- · water source constraints, and
- economical development/scale merit of water supply system by cost reduction of water source development and other common facilities as well as O&M cost/minimized number of technical staff.

Any rural barangay/s being served by an existing urban Level III system are considered to continue throughout the future.

#### e. Rehabilitation

Rehabilitation of existing and future facilities is assumed to be undertaken by the operating bodies.

## 4) Overall development strategy

Expansion of the existing system/s was planned for those with WD/Level fff, while creation of the system is considered for those without systems at present.

Merging of municipal systems (physical arrangement) in the long-term is considered. Integrated management systems shall also be sought. Conditions to be studied in-

elude; water source availability, willingness by concerned municipalities and technical study on cost recovery/economic construction.

The following municipalities may be studied for the integration both in physical and management systems.

- Leyte Metropoplitan WD, Alangalang and Sta. Fe
- La Paz, Dulag, MacArthur and Mayorga
- · Metro Carigara WD and Jaro

Integration of small Level III systems for operation and management shall be sought, although these systems are currently managed individually.

Some municipalities have high potential for spring development due to the presence of a number of untapped spring sources favorable for urban water supply that were identified during the course of PW4SP preparation. However, a detailed survey to ensure appropriate development of spring sources shall be conducted in the implementation of the projects.

## (2) Rural water supply

#### 1) Service level

Level I systems (deep well/shallow well/developed spring) are generally planned for rural areas where houses are scattered. In the PW4SP, public investment for Level I facilities covers 50% of the total number of required facilities, considering the existing share between public (38%) and private facilities (62%).

Level II systems are considered where houses are clustered and suitable untapped spring is available.

Service level standards are set forth as 15 households per source for Level 1 and 5 households per communal faucet for Level II, as defined in the national plan.

Application of Level III systems in rural areas may be considered in a case to case basis during actual implementation.

#### 2) Utilization of existing facilities

The existing facilities/systems in all service levels are considered to be utilized throughout the future.

#### 3) Water source

For Level 1 facilities, deep well construction is given priority wherever applicable considering safety against possible contamination and stable water supply. Standard specifications of shallow and deep wells are summarized in Table 8.4.2 based on the water source evaluation results presented in Chapter 7. Conventional construction method (driven well) may be employed under favorable substrata or hydrogeological conditions. The standard structure of wells in application of "open-hole drilling and gravel pack" is presented in Figure 8.4.1, Supporting Report. In addition to this, for deep well with high iron content, application of iron removal facility is recommended. The standard structure of iron removal facility is presented in Figures 8.4.2 (a) and 8.4.2 (b), Supporting Report.

Spring development is also included in Level 1 planning by adopting its share of 10%. This takes into account the existing percentage of developed springs (12%) among public Level I facilities in terms of safe water sources.

Table 8.4.2 Standard Specifications of Level I Wells

Specification	Shallow Well	Deep Well
Construction Method	Open-hole drilling and gravel pack	
Casing Diameter	50mm	100mm
Borehole Diameter	150nun	200mm
Ranges of Well Depth	Standard Depth	
0 - 20m	20m	Not Applicable
21 - 50m	Not Applicable	40m
51 - 100m	Not Applicable	80m
101 - 150m	Not Applicable	120m

Profile between gravel packed well and natural gravel packed well for Level I water supply:

The open-hole drilling method is employed for the well construction to ensure yield of ground water from adequate aquifer in provision of proper screen location and specifications. The conventional "cased-hole driven well" shall be used only in cases where well specifications are established in the specified area with sufficient information on the hydrogeological condition including existence of natural gravel at the expected aquifer.

It is important to study the potential areas to adopt natural gravel method, which can perform the same level of function as gravel-packed wells. Such areas are usually limited to the upper stream of larger rivers in alluvial fans and alluvial plains. The

arial proportion between those in application of gravel-packed and natural gravel pack wells will be worked out the referring to the condition of the province.

Modification needs of riser pipe diameter according to the water level of deep wells: The standard specification of riser pipe of deep well hand pump is set with a diameter of 2-1/2 inch in the plan. However, water level of the deep wells may range between 20m and around 40m, depending on the aquifer conditions.

Although the Malawi type deep well pump with a cylinder that is currently used in the Philippines has operation experience up to 40 m in pumping water level, the diameter of riser pipe must be adjusted between 1" to 2-1/2" in order to lower required power at the pump handle (calculating required power under the specific pumping water level).

For Level II systems, only untapped springs suitable for water supply purpose are considered. Identified untapped springs are presented in Table 7.4.1, Supporting Report.

## 4) Number of systems/facilities

The number of Level I wells and spring development is estimated based on the service level standard; while the number of Level II systems coincides with the number of untapped springs having an estimated discharge of 0.5 lps. or more.

#### 5) Rehabilitation

Rehabilitation of existing Level I wells is not considered, since most of the wells constructed by driving method is not suitable for rehabilitation to recover their functions. However, minor repair work for hand-pump and concrete apron is a requisite.

## 8.4.2 Sanitation

The conditions and assumptions are established for the different sanitation components to serve as guides in the implementation of projects.

## (1) Household toilets

)

Three types of sanitary toilet facilities for individual houses are considered for Phase I; flush, pour-flush and VIP/sanitary pit privy (dry-type). While for Phase II, flush and pour-flush are planned considering the improvement of living standard.

The type of toilet facilities is dependent on the existing or planned service level of water supply in the community. In urban and rural areas with Level I or II water supply facilities, only pour-flush and/or VIP are considered, while in urban areas with Level III water supply systems, flush type toilets requiring a piped water connection are included. Isolated rural areas where there is dearth of water supply, sanitary pit privy (dry type) is taken into account.

#### (2) School toilets

Standard service level currently used by DECS (40 students per unit facility) is employed for both phases.

The standard toilet facility (1 building) with 5 units of toilet bowl to serve for 200 students is adopted for the planning purpose, which is modified from FW4SP design to provide a shallow well as a water source. Since DECS is currently promoting the "one class-room-one toilet" concept, the PW4SP also adopts this concept on a 50-50 basis, that is 50% of the school toilet requirements will be allocated using the JICA-RESP design and the other 50% will be adopting the new concept.

## (3) Public toilets

As a minimum requirement, at least 1 sanitary toilet facility is assumed to be provided for respective utilities: public market bus/jeepney terminal and parks/playground.

The standard DOH design with 6-units of toilet bowl for the market is adopted. In this design, it is assumed that water supply will be tapped from the existing system, hence an elevated water tank is provided.

## 8.4.3 Urban Sewerage

The commencement of staged implementation of the sewerage program is planned in Phase II for the limited urban area (50% of urban population served by Level III system for the municipalities with urban population of more than 10,000). It is practical to start the program fully using the existing facilities to allow for lower initial investment cost than starting at once

a conventional sewerage system (refer to Figure 8.4.2 Staged Improvement in Sewage Collection Method, Supporting Report).

Low cost off-site technologies such as small bore sewer for collection of effluent from septic tank are to be adopted. Improvement of sewage collection method may be gradually achieved from combined sewer to separate sewerage system.

()

Sewage treatment facilities may range from community scale septic tank or Imhoff tank to acrated lagoon systems and to a more advanced treatment process such as oxidation ditch. For this PW4SP, acrated lagoons are assumed as a representative treatment facility for planning purpose. Daily average wastewater quantity is assumed at 100 liters per capita per day.

#### 8.4.4 Solid Waste

In terms of facility requirements, this PW4SP only studied the number of refuse collection trucks required for the year 2004. A rated capacity of 5 cu.m truck/vehicle is considered for calculation of required units of truck. Disposal of solid waste shall be studied in detail through investigations, F/S and D/D. Unit solid waste generation for urban area is assumed to be 0.418 kg. per capita per day.

## 8.5 Service Coverage by Target Year

### 8.5.1 Water Supply

The service coverage in terms of population to be served by target year was estimated by urban and rural area by municipality. The service coverage in rural area was further subdivided by service level (Level I & Level II) to finally come up with physical requirements.

Base figures applied to estimate the future service coverage and the additional population to be served are:

- provincial sector targets;
- population projection by target year; and
- base year service coverage (served population) by existing facilities.

Future requirements in terms of additional population to be served were then estimated by urban (Level III) and rural (Level I & II) area by municipality as a shortfall to meet the population to be served in each target year. The population served in base year is adopted as the

population served in target year, when the former population exceeds the population to be served in the target year/s. Manner of calculation is specifically presented by phase.

## (1) Phase I requirements

Additional service coverage was estimated as a shortfall of the population to be served in Phase I comparing with the population served in base year. In this connection, existing facilities both in urban and rural areas are assumed to be utilized during the Phase I period.

The utilization of untapped springs for Level II systems was given priority during Phase I period for rural water supply. At the time of this plan preparation, 32 untapped springs in 8 municipalities were identified.

## (2) Phase II requirements

Additional service coverage was estimated as a shortfall of the population to be served in Phase II comparing with the population served in Phase I. In this regard, existing facilities in rural area were assumed to be utilized through the two Phases, while urban population served by Level I and II facilities in base year was assumed to be absorbed by Level III service during Phase II period.

Table 8.5.1 presents the service coverage by target year and by level of service as well as the additional population to be served (details are referred to Supporting Report).

Through Phase I development, approximately 128,000 persons in the province will be served by additional water supply services, of which 62,400 persons or 49% of the total will be urban population and 65,600 persons or 51% will be rural population.

For Phase II period, a total of 742,500 persons, of which 272,400 persons or 37% in urban area and 470,100 persons or 63% in rural area, will be further benefited by water supply services. This additional service coverage in urban area includes the upgrade of service level for 124,700 persons served by Level I and II facilities in 1998.

For Phase II period, a total of 692,500 persons, of which 268,500 persons or 39% in urban area and 424,000 persons or 61% in rural area, will be further benefited by water supply services. This additional service coverage in urban area includes the upgrade of service level for 124,700 persons served by Level I and II facilities in 1998.

#### 8.5.2 Sapitation

### (1) Household toilets

The service coverage (number of households to be served) by different types of sanitary facility is estimated by urban and rural area by municipality for the years 2004 and 2010. The future service coverage and additional households to be served are estimated to meet the provincial targets using the number of household served in the base year and the number of households in target years.

Additional number of households to be served by different type of facility by urban and rural area by municipality is the shortfall of the number of households to be served in target years comparing with either that in base year or in Phase I (details are referred to Supporting Report). However, when the number of households to be served in target year/s is less than or equal to that in base year, no additional number of households to be served is counted.

In the determination of the number of households to be served by flush type toilet, when the number of households to be served in the target year is higher than in base year, the target coverage is applied with conditions. When the target coverage is higher than Level III water supply coverage, the latter coverage is adopted, while in the other case, the target coverage is applied. In cases where the target coverage is less than that in base year, the base year coverage is adopted.

For Phase I, any type of existing sanitary facilities both in urban and rural areas is to be utilized during Phase I period. For Phase II, water-sealed toilet facilities in Phase I both in urban and rural areas are to be utilized.

The projected number of served households at the end of the Phase I period is 251,638. Additional households to be served totaled to 75,285, of which 35% is urban households and 65% is rural households. While at the end of Phase II period, the number of served households are 414,328 with an additional households to be served at 166,779. Table 8.5.2 provides the number of households to be served by target year for urban and rural areas by municipality.

#### (2) School toilets

The service coverage or the number of public school students to be served is estimated by numicipality for the years 2004 and 2010.

Table 8.5.2 Additional Number of Households to be Served by Target Year (Household Toilets)

														Phase II (	Phase II Coverage (2010)	:010)

				1															

The future service coverage and additional number of students to be served are estimated using the number of students served in the base year, the number of students in target years and the provincial sector targets.

Additional number of students to be served by municipality is the shortfall of the number of students to be served in targets comparing with either that in base year or in Phase I (details are referred to Supporting Report). However, when the number of students to be served in target/s is less than or equal to the base year, no additional number of households to be served is considered.

The existing facilities are to be utilized during Phase I period, while the facilities in Phase I are to be utilized during Phase II period.

The projected number of served students at the end of Phase I period is 220,446. The additional students to be served are 76,848. While at the end of Phase II period, the projected number of served students are 322,776 with an additional students to be served at 102,512. Table 8.5.3 summarizes the number of public school students to be served by target year.

## (3) Public toilets

)

The service coverage of public utilities with sanitary toilet facility by municipality is estimated for the years 2004 and 2010.

The future service coverage and additional coverage are estimated using the existing number of public utilities with sanitary toilets in the base year, the number of public utilities in target years, and provincial sector targets.

The additional number of public utilities with sanitary toilets needed by municipality is the shortfall of the number of public utilities in target year comparing with either the existing coverage or Phase I coverage (details are referred to Supporting Report).

The existing sanitary facilities are to be utilized during Phase I period. The facilities in Phase I are to be utilized during Phase II period.

As mentioned earlier, there are no proposed public utilities for both target years.

## 8.5.3 Urban Sewerage

The service coverage in 2010 (Phase II) is estimated for the municipalities with population of more than 10,000 in urban area provided by Level III water supply. It is assumed that half of the population in the area/s is to be served by the sewerage systems. Table 8.5.4 shows the population to be served in Phase II.

Table 8.5.4 Population to be Served by Urban Sewerage in Phase II

Name of Municipality/City	Urban Population in 2010	Level III Water Supply Coverage	Population to be Served
Abuyog	14,418	13,697	7,209

#### 8.5.4 Solid Waste

Future requirements in the sub-sector are studied giving priority to urban area for the Phase I. Staged improvement for the rural area shall be studied in the future.

Service coverage in Phase I was assumed at 90% with reference to the present service coverage of 89% in urban area. Additional service coverage in Phase I is calculated as a shortfall of target coverage in Phase I comparing with current service coverage. Table 8.5.5 presents additional service coverage for Phase I in the urban area.

## 8.6 Facilities, Equipment and Rehabilitation to Meet the Target Services

### 8.6.1 Water Supply

### (1) Required facilities

Water supply facilities required by service level were estimated by urban and rural area by municipality based on the additional service coverage by target year and summarized in Table 8.6.1 (details are referred to Supporting Report).

Table 8.5.5 Additional Number of Urban Households to be Served by Municipal Solid Waste System in Phase I

## Urban water supply:

Physical requirements of Level III systems were estimated as the number of required house connections. Mode of project indicates whether future urban water supply will be implemented as expansion of existing system or construction of a new system. The number of water sources was also estimated based on the water source evaluation results in Chapter 7.

( )

## Rural water supply:

Physical requirements of Level II systems were estimated as the number of systems and number of communal faucets, while that of Level I facilities were first estimated as the number of wells with classification of deep and shallow wells. Deep wells were further subdivided in terms of three different standard depths based on the water source evaluation results.

Furthermore, as for Level I facilities, in this PW4SP, 50% of the total required facilities will be implemented by public (LGUs) and 10% of these public Level I facilities will be allocated to spring development.

## (2) Rehabilitation

Rehabilitation requirements were estimated as 10% of the total number of deep wells to be constructed under PW4SP. Rehabilitation work will be mainly redevelopment of wells by means of air surging, while minor repair of concrete apron and hand-pump will be undertaken by respective beneficiary organizations.

## (3) Equipment

#### Logistic support:

For rural water supply development, I unit each or set of the following equipment was considered necessary for the provincial government to conduct various activities of PW4SP implementation;

Transportation- service vehicle

Office equipment- computer with printer, typewriter, mimeo machine, scanning machine and copier

Field equipment- sound system, tape recorder and tools for maintenance

For urban water supply, no hardware was considered.

## Well drilling and rehabilitation equipment:

)

As a reference information, necessary types and number of well drilling and rehabilitation equipment were studied considering the existing equipment of sector agencies in the province.

During Phase I, a total of 197 Level I deep wells shall be newly constructed by public (LGUs) and 10% of these deep wells shall be rehabilitated annually (details are referred to Supporting Report). Presently, the DPWH-1<sup>st</sup> DEO (in Palo) has one each unit of truck-mounted percussion type and rotary type drilling rig applicable for more than 8" of bore hole diameter. While 5<sup>th</sup> DEO (in Baybay) has one unit of truck-mounted percussion drilling rig.

Therefore, a total of 2 sets of drilling rigs (medium size percussion type) together with 1 set of well rehabilitation equipment, 1 unit of support vehicle for well rehabilitation and 2 units of service truck for deep well construction shall be mobilized/procured either by the private sector or LGUs (details are referred to Supporting Report).

### Selection of well drilling machine

An appropriate type of well drilling machine with its specifications shall be selected after comprehensive study on the technical requirements, local capability in O&M of the machine and cost effectiveness.

From the technical viewpoint, geological conditions in the province allow for the use of either rotary or percussion type drilling machine (no rock drilling is expected). While, in view of economical and O&M experience on the machine in the local area, a percussion type is recommendable. Although, the rotary type machine is quite effective to reduce construction period under soft soil condition, special training on mud-circulation, handling manner, etc. are required together with additional equipment and materials as compared with percussion type. The drilling speed of the percussion type is rather slow, but has advantages in drilling boulder and cobble formations.

One unit of truck mounted percussion drilling machine was considered to be procured in the long-term development period.

## (4) Laboratory

# Instrument/Equipment and Other Laboratory Accessory:

The provincial government will need at least 3 sets of instruments/equipment in order to ensure regular water quality monitoring and surveillance activities for the entire province. The distribution would be in 3 strategic municipalities where provincial/municipal hospitals are located. These are in the hospitals of Palo (existing), Baybay and Kananga. Water samples have to be examined on time to avoid unpredictable changes of the quality due to long storage.

(

The laboratory equipment requirement for Palo hospital is designed to upgrade the existing facility so as to efficiently cover central part of the province. The 2 new laboratories in Baybay and Kananga will cover the southern and western municipalities, respectively.

The following are the requirements:

			184.	
		-	Upgrading of	New Laboratories
	Item	Unit	Palo Laboratory	Baybay Kananga

#### 8.6.2 Sanitation

This sub-section refers to physical requirements by target year covering household, school and public toilet facilities. Table 8.6.2 presents the required sanitation facilities by target year. Rehabilitation for the sanitation facilities is considered as part of recurrent cost.

#### (1) Household toilets

Future requirements in the number of household toilets by different type for urban and rural areas were estimated based on the additional households to be served by type of facility both for urban and rural areas by target year (details are referred to Supporting Report).

### (2) School toilets

The future requirements in the number of toilet facilities were estimated based on the standard number of students to be served by a 5-unit standard facility or a toilet in every classroom (50-50 sharing) and the additional students to be served by target (details are referred to Supporting Report).

Total required facilities were further broken down into urban and rural areas by applying the percentage share of urban and rural population.

## 8.6.3 Urban Sewerage and Solid Waste

Physical requirements for the sewerage facilities are not discussed in this sub-section. Further study shall be conducted in the future.

As reference information, the number of refuse collection trucks is estimated for the urban area in Phase I. Twenty six (26) additional units of truck are required to meet assumed service coverage as reflected in Table 8.6.3.

# 8.7 Identification of Priority Projects for Medium-Term Development Plan

In general, the present service coverage by municipality with reference to the target coverage indicates the direction of development effort for implementing PW4SP with municipal priorities.

Specific projects shall be selected subject to detailed studies and will not be discussed in the provincial master plan. In addition, pertinent information to identify priority projects is not available both at provincial and municipal level during this PW4SP preparation, except some future expansion work for WDs.

The general criteria for identifying priority projects as guide for implementing the PW4SP are summarized below.

(

The first level of priority should be given to projects with positive feasibility studies and identified funding. Next level of priority should be given to projects with positive feasibility studies, although no funding source has been identified. The third level should be for which feasibility study has been conducted. Within each level, if funds were insufficient, a ranking could be carried out applying some factors, such as willingness to pay, water-related diseases status and per capita cost. Under the above-mentioned conditions, the implementors should prepare a list of projects.

Due attention shall be paid on the importance of integrated development of relevant subsectors to maximize the effects and benefits through simultaneous implementation of water supply and sanitation projects. On a municipal level priority, synthetic evaluation of sector components for concerned municipalities (which is studied in the financial arrangements, Chapter 11) may be used for implementation arrangements.
