Aforementioned studies were carried out by the following sequence:

- Review of existing water supply systems and water sources;
- Review of planned/on-going projects;
- Establishment of planning conditions covering service level, utilization of existing facilities, water sources, and number of systems; and
- Recommendations for overall development strategy.

Table 8.4.1 presents a summary of the study results by municipality.

1) Review of existing water supply systems and water sources

At present, there are only three (3) Level III systems in the province. WDs exist in the municipalities of Catarman and San Isidro. While one privately owned small Level III system is in Catarman. Population served by these systems range from about 400 persons at the privately owned system to 2,700 persons at the Catarman WD. Water sources are wells or spring sources.

The remaining 22 municipalities out of the total 24 have no Level III system in their urban areas and are presently served by Level II systems and/or Level I facilities.

Preference is made to utilize spring sources owing to less O&M activities and cost compared to deep well with electric motor pump.

2) Review of planned/on-going projects

At present, there are no specific planned/on-going projects such as foreign donor assisted project/s.

- 3) Establishment of planning conditions
 - a. Service level

It shall be noted that a national policy for urban water supply is a Level III system as the most suitable measure. Therefore, for the investment needs of the sector development, it is assumed in this PW4SP that underserved or unserved urban population at present and in the future will be provided with individual house connections. However, it does not intend in the future to exclude Level I and II facilities from being implemented in urban areas as individual cases.

b. Utilization of existing facilities

The existing Level I and II facilities are considered to be utilized during the Phase I period. The population served by these facilities is to be absorbed by Level III service in Phase H. Table 8.4.1 Summary of Urban Water Supply Development by Municipality

Municipality	Existing Condition	On-going/ Planned Project	Water Source Availability	Fature Requirements
Allen	There is no Level III system at present. They use Level 1 with deep wells in uban area (8.500 population). The municipal government is seeking for a sufficient water source for the poblacion, since the shallow wells have high iron contents. The municipality has plans of the establishment of a Level III system and made negociations with LWUA for its realization before the year 2004. FS is on process at present.	Level 111)	The spring is only potential source for the development of Level III water supply. Deep well development may be very risky. Solo shallow well area covers urban barangays. But water quality of fronto groundwater is locally observed.	Creation of new Level 111 system is required. LWUA study shall be proceeded.
5 3	Biri is an island municipality. There is no Level III system at present. They use Level I with shallow wells in poblacion area (2.600 population).	None	The potential water sources are springs. There are a few springs near urban area, but their yields may be small. The improved dug well with large diameter is recommendable for future establishment of Level III water supply.	The potential water sources are springs. New system shall be created. F/S including There are a few springs near urban area, but itechnical study on water source development heir yields may be small. The improved (radial well with percorated pipes for dug well with large diameter is collection of ground water) is required. Recommendable for future establishment of collection of ground water) is required.
13 obon	There is no Level 111 system at present. They use Level 1 with deep wells in poblacion area (5.000 population).	Nonc	Deep well development is recommendable for future establishment of Level III water supply. Deeper aquifers may have water quality problems such as ironic water and agine water incrusion. Thus: deep well depto 40m is recommendable. Target aquifers exist in the fluviatile deposits along bobon River. Production capacity is estimated at about 1,000 cum/d or more. The Colgantic River may be alternative water source in the fluture.	New system shall be created. F/S including lecthnical study on ground water source development is required.
Capul	Capul is an island municipality. There is no Level 111 system at present. They use Level II systems and Level I facilities in poblacion area (4.300 population). The municipality has made representations with LWUA for the upgrading from existing Level 11 system to Level 111.	Plan (upgrading to Level	There is high possibility of existence of New system shall t untapped springs having high yield available shall be proceeded for Level 111 water supply.	New system shall be created. LWLA study shall be proceeded.
Cataman S	There are Catarman WD and privately owned small level III system. About 2,600 population in urban area (%%, of urban population) are screed by these waterworks. The WD and private waterworks are using deep and shallow wells as their water sources, respectively. The WD practices scheduled water supply due to insufficient water source. The WD is planning to develop another deep well at present.	On-going (construction of) Macagras Dam)	Deep well development is recommendable for expansion of the system. Deeper aquifers may have ironic water and sulfne- water infrusion. Thus, deep well depth of dom is recommendable. Target aquifers exist in fluviatile deposits along Cataman Ruver. Production capacity is estimated at about 1,000 cu m/d or more.	System expansion with water source augmentation is required. Study on deep well development is a requisite

אמנטנין	Laoang is an island municipality. There is no Level 111 system at present. Urban population is about 11,000. Through water supply program of the Northern Samar Integrated Rural Development Project (NSIRDP), a waterworks system was constructed with a reservoir and two diesel ergine pumps. However, the system was a complete failure because there was no sufficient water from two production wells. Presendy town propoet is supplied from mainland barangays.	None	If there is no spring sources with enough Cost effer yield for Level III water supply near urban be studied area, alternative water source is deep well in practices. mainland where is made of fluviatile deposits along Catubig River. The deep well specifications are: 40m in depth and production of about 1,000 cu.m/d or more.	Cost effective mamer of water supply slug be studied considering current water supply practices.
ginigat	There is no Level III system at present. They use Level Ifacilities (shallow/deep wells) in urban area (3.700 population). The municipality has six principle rivers to be tapped for future water supply.	None	The river water intake point shall be studied. Creation of Level 111 system is required, with a due consideration of quality and quantity. Thus, the river water quality examination shall be conducted through the syster. Spring is alternative source. Deep well development is not recommendable becutes of poor yields. Saline water intrusion is observed in coastal area.	Creation of Level 111 system is required. Technical study on water source development is a requisite.
kavak Alavak	There is no Level 111 system at present. They use Level 11 system in urban area (3.700 population). Las Navas is one of unget areas for HCAAP in which the negociation is still on-going.	None	The recommendable water source is a spong. Alternative water source is improved to guell. Such dug well field is located on fluviatile deposits an one y fields. River: Deep well may have poor yields. deeper depth and lower static water level.	The proposed Level 11 system under HCAPP shall be extended to the municipality.

Ċ

Municipality	Existing Condition	On-going/ Planned Project	Water Source Availability	Future Requirements
Lavezares	There is no Level III system at present. They use Level I lactifies of Level II systems in urban area (0,300 population).	None	There are 24 spring sources that can be tapped.	New system shall be created. Technical study on spring development is a requisite. Upgrading from existing Level II system shall be considered.
Lops de Veça	There is no Level III system at present. They use Level Flacitities and Level 11 systems in urban area (2,500 population). There are some principal rivers and major river (Catarman River) that can be tapped for future water supply.	Nunc	The spring is better water source for future establishment of Level III water supply. Deep well is good for Level I only. Hence, inver water from Catarman River may be considered finally. The intake point of river water shall be studied with water quality.	Creation of Level 111 system is required. Technical study on water source development (spring) is a requisite.
Mapanas	There is no Level III system at present. They use Level I (shallow/doep wells) in urban area (2.200 population).	None	The spring is only potential and economical water source for Level III water supply. Deep well development is not recommendable because of poor production.	New system shall be created. Technical study on spring development is a requisite.
Mondration	No Level III system exists at present. They use Level I facilities in urban area (5.500 population). There are many water sources (groundwater and Bugko River) can be feasible for Level III.	Nonc	Groundwater development has avilability for future establishment of Level 111 water supply. The well specifications are: depth of 40m and production capacity of about 1.000 cum/d or more. Deep well field may be expected along Bugloo River, where Divanile deposits exist,	New system shall be created. Technical study on water source development (deep well with due considernation of saline water intrusuin) is a requisite.
nedeled n	No Level III system evists al present. They use Level I facilities in urban area (6.200 population).	Nonc	Groundwater source may have enough capacity for future establishment of Level [1] water supply. The well specifications are: depth of 40m and production capacity of about 1,000 cum/d or more. Deep well field may be located along river. Spring source is also considered as alternative source source.	New system shall be created. Technical study on water source development (deep well) is a requisite.
Pambulan	No Level III system exists at present. They use Level I factifies and Level II systems in urban area (10,000 population). Illegal connection to Level II systems is a current problem.	None	Groundwater development may have enough New system shall be created. Technical capacity for future establishment of Level study on water source development (dec till water supply. The well specifications are well with due consideration of saline wa depth of 40m and production capacity of about 1,000 cu.mVd or more. Table 8.4.1 Summary of Urban Water Supply Development by Municipality (Cont'd.)

c. Water sources

Possibility/availability to utilize surface water and groundwater (spring and deep well) is evaluated as potential water sources for water supply development.

Ć

From the viewpoints of cost effectiveness and easy O&M of water supply system, utilization of spring sources is given due priority in the course of urban water supply planning. Application of deep wells for water source is regarded as the second priority in principle. Surface water is, on the other hand, not adopted at this moment, because of large capital investment requirements and complexity of surface water treatment.

d. Number of systems

In principle, one (1) Level III system is considered for urban area of every municipality. In the municipalities with an existing Level III system/s, the expansion of the system was first considered. In case of no existence of Level III system/s, a new system was recommended. Existing plan/s on the development of Level III/WD are also taken into account to determine the respective systems of the municipalities.

Possibility and necessity to merge service area of some neighboring municipalitics to an urban water supply system were also studied from the viewpoints of:

- water source constraints, and
- cconomical development/scale merit of water supply system by cost reduction of water source development and other common facilities as well as O&M cost/minimized number of technical staff.

Any rural barangay/s being served by an existing urban Level III system are considered to continue throughout the future.

e. Rehabilitation

Rehabilitation of existing and future facilities is assumed to be undertaken by the operating bodies.

4) Overall development strategy

Expansion of the existing system/s was planned for those with WD/Level III, while creation of the system is considered for those without systems at present.

Merging of municipal systems (physical arrangement) in long-term is considered. Integrated management systems shall also be sought. Conditions to be studied include; water source availability, willingness by concerned municipalities and technical study on cost recovery/economic construction.

Integration of small Level III systems for operation and management shall be sought, although these systems are currently managed individually.

Some municipalities may have high potential in spring development for urban water supply. However, detailed survey to ensure appropriate developments of spring sources shall be conducted in the implementation of the projects.

(2) Rural water supply

1) Service level

Level I systems (deep well/shallow well/developed spring) are generally planned for rural areas where houses are scattered. In the PW4SP, public investment for Level I facilities covers 50% of the total number of required facilities, considering the existing share between public (44%) and private facilities (46%).

Level II systems are considered where houses are clustered and suitable untapped spring is available.

Service level standards are set forth as 15 households per source for Level I and 5 households per communal faucet for Level II, as defined in the national plan.

Application of Level III systems in rural areas may be considered in a case to case basis during actual implementation.

2) Utilization of existing facilities

The existing facilities/systems in all service levels are considered to be utilized throughout the future.

3) Water source

For Level I facilities, deep well construction is given priority wherever applicable considering safety against possible contamination and stable water supply. Standard specifications of shallow and deep wells are summarized in Table 8.4.2 based on the water source evaluation results presented in Chapter 7. Conventional construction method (driven well) may be employed under favorable substrata or hydrogeological

conditions. The standard structure of wells in the application of "open-hole drilling and gravel pack" is presented in Figure 8.4.1, Supporting Report. In addition to this, for deep well with high iron content, application of iron removal facility is recommended. The standard structure of iron removal facility is presented in Figures 8.4.2 (a) and 8.4.2 (b), Supporting Report.

0

Spring development is also included in Level I planning by adopting its share of 25%. This takes into account the existing percentage of developed springs (20%) among public Level I facilities in terms of safe water sources.

Specification	Shallow Well	Deep Well
Construction Method	Open-hole dri	illing and gravel pack
Casing Diameter	50mm	100mm
Borchole Diameter	150aum	200mm
Ranges of Well Depth	Star	adard Depth
0 - 20m	20m	Not Applicable
21 - 50m	Not Applicable	40m
51 - 100m	Not Applicable	80m
101 - 150m	Not Applicable	120m

Table 8.4.2 Standard Specifications of Level I Wells

Profile between gravel packed well and natural gravel packed well for Level I water supply:

The open-hole drilling method is employed for well construction to ensure yield of ground water from adequate aquifer in provision of proper screen location and specifications. The conventional "cased-hole driven well" shall be used only in cases where well specifications are established in the specified area with sufficient information on the hydrogeological condition including the existence of natural gravel at the expected aquifer.

It is important to study the potential areas to adopt natural gravel method, which can perform the same level of function as gravel-packed wells. Such areas are usually limited to the upper stream of larger rivers in alluvial fans and alluvial plains. The arial proportion between those in application of gravel-packed and natural gravel pack wells will be worked out referring to the condition of the province. Modification needs of riser pipe diameter according to the water level of deep wells: The standard specification of riser pipe of deep well hand pump is set with a diameter of 2-1/2 inch in the plan. However, water level of the deep wells may range between 20 m and around 40 m, depending on the aquifer conditions.

Although, the Malawi type deep well pump with a cylinder that is currently used in the Philippines has an operational experience of up to 40 m in pumping water level, the diameter of riser pipe shall be adjusted between 1" to 2-1/2" in order to lower required power at the pump handle (calculating required power under the specific pumping water level).

For Level II systems, only untapped springs suitable for water supply purpose are considered. However, the information on untapped springs is not available at this moment.

4) Number of systems/facilities

The number of Level I wells and spring development is estimated based on the service level standard; while the number of Level II systems coincides with the number of untapped springs.

5) Rehabilitation

Rehabilitation of existing Level I wells is not considered, since most of the wells constructed by driving method are not suited for rehabilitation to recover their functions. However, minor repair work for hand-pump and concrete apron is a requisite.

8.4.2 Sanitation

The conditions and assumptions are established for the different sanitation components to serve as guides in the implementation of projects.

(1) Household toilets

Three types of sanitary toilet facilities for individual houses are considered for Phase I; flush, pour-flush and VIP/sanitary pit privy (dry-type). While for Phase II, flush and pour-flush are planned considering the improvement of living standard.

The type of toilet facilities is dependent on the existing or planned service level of water supply in the community. In urban and rural areas with Level I or II water supply facilities, only pour-flush and/or VIP/dry type are considered, while in urban areas with Level III water supply systems, flush type toilets requiring a piped water connection are included. Isolated rural areas where there is dearth of water supply, sanitary pit privy (dry type) is taken into account.

(2) School toilets

Standard service level currently used by DECS (40 students per unit facility) is employed for both phases.

6

The standard toilet facility (1 building) with 5 units of toilet bowl to serve for 200 students is adopted for the planning purpose, which is modified from FW4SP design to provide a shallow well as a water source. Since DECS is currently promoting the "one classroom-one toilet" concept, the PW4SP also adopts this concept on a 50-50 basis, that is, 50% of the school toilet requirements will be allocated using the JICA-RESP design and the other 50% will be using the new concept.

(3) Public toilets

As a minimum requirement, at least 1 sanitary toilet facility is assumed to be provided for respective utilities: public market and bus/jeepney terminal.

The standard design of DOH with 6-units of toilet bowl for the market is adopted. In this design, it is assumed that water supply will be tapped from the existing system, hence an elevated water tank is provided.

8.4.3 Urban Sewerage

The commencement of staged implementation of the sewerage program is planned in Phase II for the limited urban area (50% of urban population served by Level III system for the municipalities with urban population of more than 10,000). It is practical to start the program fully using the existing facilities to allow for lower initial investment cost than starting at once a conventional sewerage system (refer to Figure 8.4.2 Staged Improvement in Sewage Collection Method, Supporting Report).

Low cost off-site technologies such as small-bore sewer for collection of effluent from septic tank are to be adopted. Improvement of sewage collection method may be gradually achieved from combined sewer to separate sewerage system. Sewage treatment facilities may range from community scale septie tank or Imhoff tank to aerated lagoon systems and to a more advanced treatment process such as oxidation ditch. For this PW4SP, aerated lagoon is assumed as a representative treatment facility for planning purpose. Daily average wastewater quantity is assumed to be 100 liters per capita per day.

8.4.4 Solid Waste

In terms of facility requirements, this PW4SP only studied the number of refuse collection trucks required for the year 2004. A rated capacity of 5 cu.m truck/vehicle is considered for calculation of required units of truck. Disposal of solid waste shall be studied in detail through investigations, F/S and D/D. Unit solid waste generation for urban area is assumed to be 0.418 kg. per capita per day.

8.5 Service Coverage by Target Year

8.5.1 Water Supply

-10

The service coverage in terms of population to be served by target year was estimated by urban and rural area by municipality. The service coverage in rural area was further subdivided by service level (Level I & Level II) to finally come up with physical requirements.

Base figures applied to estimate the future service coverage and the additional population to be served are:

provincial sector targets,

population projection by target year, and

base year service coverage (served population) by existing facilities.

Future requirements in terms of additional population to be served were then estimated by urban (Level III) and rural (Level I & II) area by municipality as a shortfall to meet the population to be served in each target year. The population served in base year is adopted as the population served in target year, when the former population exceeds the population to be served in the target year/s. Manner of calculation is specifically presented by phase.

(1) Phase I requirements

Additional service coverage was estimated as a shortfall of the population to be served in Phase I comparing with the population served in base year. In this connection, existing facilities both in urban and rural areas are assumed to be utilized during the Phase I period.

The utilization of untapped springs for Level II systems was given priority during Phase I period for rural water supply. At the time of this plan preparation, information on untapped springs was not available.

(

(2) Phase II requirements

Additional service coverage was estimated as a shortfall of the population to be served in Phase II comparing with the population served in Phase I. In this regard, existing facilitics in rural area were assumed to be utilized through the two Phases, while urban population served by Level I and II facilities in base year was assumed to be absorbed by Level III service during Phase II period.

Table 8.5.1 presents the service coverage by target year and by level of service as well as the additional population to be served (details are referred to Supporting Report).

Through Phase I development, approximately 31,000 persons in the province will be served by additional water supply services, of which 9,300 persons or 30% of the total will be urban population and 21,700 persons or 70% will be rural population.

For Phase II period, a total of 287,200 persons, of which 141,600 persons or 49% in urban area and 145,600 persons or 51% in rural area, will be further benefited by water supply services. This additional service coverage in urban area includes the upgrade of service level for about 84,000 persons served by Level I and II facilities in 1998.

8.5.2 Sanitation

(1) Household toilets

The service coverage (number of households to be served) by different types of sanitary facility is estimated by urban and rural area by municipality for the years 2004 and 2010. The future service coverage and additional households to be served are estimated to meet the provincial targets using the number of household served in the base year and the number of households in target years.

Additional number of households to be served by different type of facility by urban and nural area by municipality is the shortfall of the number of households to be served in target years comparing with either that in base year or in Phase I (details are referred to Supporting Report). However, when the number of households to be served in target year/s is less than or equal to that in base year, no additional number of households to be served is counted.

Table 8.5.1 Population to be Served by Target Year (Water Supply) (Cont'd.)

8 - 34

)

Ċ

In the determination of the number of households to be served by flush type toilet, when the number of households to be served in the target year is higher than in base year, the target coverage is applied with conditions. When the target coverage is higher than Level III water supply coverage, the latter coverage is adopted, while in the other case, the target coverage is applied. In cases where the target coverage is less than that in base year, the base year coverage is adopted.

For Phase I, any type of existing sanitary facilities both in urban and rural areas is to be utilized during Phase I period. For Phase II, water-sealed toilet facilities in Phase I both in urban and rural areas are to be utilized.

The projected number of served households at the end of the Phase I period is 66,404. Additional households to be served totaled to 13,643, of which 31% is urban households and 69% is rural households. While at the end of Phase II period, the number of served households are 130,130 with an additional households to be served at 64,305. Table 8.5.2 provides the number of households to be served by target year for urban and rural areas by municipality.

(2) School toilets

The service coverage or the number of public school students to be served is estimated by municipality for the years 2004 and 2010.

The future service coverage and additional number of students to be served are estimated using the number of students served in the base year, the number of students in target years and the provincial sector targets.

Additional number of students to be served by municipality is the shortfall of the number of students to be served in targets comparing with either that in base year or in Phase 1 (details are referred to Supporting Report). However, when the number of students to be served in target/s is less than or equal to the base year, no additional number of households to be served is considered.

The existing facilities are to be utilized during Phase I period, while the facilities in Phase I are to be utilized during Phase II period.

Table 8.5.3 Additional Number of Public School Student to be Served by Target Year (School Toilets)

(3) Public toilets

The service coverage of public utilities with sanitary toilet facility by municipality is estimated for the years 2004 and 2010.

The future service coverage and additional coverage are estimated using the existing number of public utilities with sanitary toilets in the base year, the number of public utilities in target years, and provincial sector targets. The additional number of public utilities with sanitary toilets needed by municipality is the shortfall of the number of public utilities in target year comparing with either the existing coverage or Phase I coverage (details are referred to Supporting Report).

The existing sanitary facilities are to be utilized during Phase I period. The facilities in Phase I are to be utilized during Phase II period.

The number of served public utilities at the end of Phase I period is 24. The additional public utilities to be served are 6. While at the end of Phase II period, the number of served public utilities are 36 with an additional public utilities to be served at 12. Table 8.5.4 summarizes the additional number of public utilities to be served by municipality by target year.

Table 8.5.4 Additional Number of Public Utilities with Sanitary Toilets by Target Year

10---

8.5.3 Urban Sewerage

The service coverage in 2010 (Phase II) is estimated for the municipalities with population of more than 10,000 in urban area provided by Level III water supply. It is assumed that half of the population in the area/s is to be served by the sewerage systems. Table 8.5.5 shows the population to be served in Phase II.

8.5.4 Solid Waste

Future requirements in the sub-sector are studied giving priority to urban area for the Phase I. Staged improvement for the rural area shall be studied in the future.

Service coverage in Phase I was assumed at 65% with reference to the present service coverage of 56% in urban area. Additional service coverage in Phase I is calculated as a shortfall of target coverage in Phase I comparing with current service coverage. Table 8.5.6 presents additional service coverage for Phase I in the urban area.

Name of Municipality	Urban Population in 2010	Level III Water Supply Coverage	Population to be Served

8.6 Facilities, Equipment and Rehabilitation to Meet the Target Services

8.6.1 Water Supply

ø

(1) Required facilities

Water supply facilities required by service level were estimated by urban and rural area by municipality based on the additional service coverage by target year and summarized in Table 8.6.1 (details are referred to the Supporting Report).

Urban water supply:

Physical requirements of Level III systems were estimated as the number of required house connections. The mode of project indicates whether future urban water supply will be implemented as expansion of existing system or construction of a new system. The number of water sources was also estimated based on the water source evaluation results in Chapter 7.

Rural water supply:

Physical requirements of Level II systems were estimated as the number of systems and number of communal faucets, while that of Level I facilities were first estimated as the number of wells with classification of deep and shallow wells. Deep wells were further subdivided in terms of three different standard depths based on the water source evaluation results.

Furthermore, as for Level I facilities, in this PW4SP, 50% of the total required facilities will be implemented by public (LGUs) and 25% of these public Level I facilities will be allocated to spring development.

(2) Rehabilitation

Rehabilitation requirements were estimated as 10% of the total number of deep wells to be constructed under PW4SP. Rehabilitation work will be mainly redevelopment of wells by means of air surging, while minor repair of concrete apron and hand-pump will be undertaken by respective beneficiary organizations.

(3) Equipment

Logistic support:

For rural water supply development, 1 unit each or set of the following equipment was considered necessary for the provincial government to conduct various activities of PW4SP implementation:

				đ	Phase 1 (2004)	(2004) Requirements	nents							Phase 1	(2010) Re	Phase 1 (2010) Requirements	sic

	chine and copier
Field equipment-	sound system, tape recorder and tools for maintenance

For urban water supply, no hardware was considered.

Well drilling and rehabilitation equipment:

As a reference information, necessary types and number of well drilling and rehabilitation equipment were studied considering the existing equipment of sector agencies in the province.

During Phase I, a total of 92 Level I deep wells shall be newly constructed by public (LGUs) and 10% of these deep wells shall be rehabilitated annually (details are referred to Supporting Report). Presently, neither the provincial government nor the DEO-DPWH has available drilling rig at present.

Therefore, a total of 2 sets of drilling rigs (medium size percussion type) together with 1 set of well rehabilitation equipment, 1 unit of support vehicle for well rehabilitation and 2 units of service truck for deep well construction shall be mobilized/procured either by the private sector or the LGUs (details are referred to the Supporting Report).

Selection of well drilling machine

An appropriate type of well drilling machine with its specifications shall be selected after comprehensive study on the technical requirements, local capability in O&M of the machine and cost effectiveness.

From the technical viewpoint, geological conditions in the province allow for the use of either rotary or percussion type drilling machine (no rock drilling is expected). While, in view of economical and O&M experience on the machine in the local area, a percussion type is recommendable. Although, the rotary type machine is quite effective to reduce construction period under soft soil condition, special training on mud-circulation, handling manner, etc. are required together with additional equipment and materials as compared with percussion type. The drilling speed of the percussion type is rather slow, but has advantages in drilling boulder and cobble formations.

One unit of truck mounted percussion drilling machine was considered to be procured in the long-term development period.

Ő.

1

(4) Laboratory

Instrument/Equipment and Other Laboratory Accessory:

The provincial government will need at least 3 sets of instruments/equipment in order to ensure regular water quality monitoring and surveillance activities for the entire province. The distribution would be in 3 strategic municipalities where provincial/municipal hospitals are located. These are in the hospitals of Catarman, Allen and Laoang. Water samples have to be examined on time to avoid unpredictable changes of the quality due to long storage.

The laboratory equipment requirement for Catarman hospital is designed to upgrade the existing facility so as to efficiently cover the municipalities of San Roque, Mondragon, Lope de Vega, Bobon, San Jose, Biri, Rosario and Silvino Lobos. The 2 new laboratories will cover the following municipalities:

- · Allen hospital Lavezares, Victoria, San Isidro, San Antonio, Capul and San Vicente
- Laoang hospital Lapinig, Gamay, Mapanas, Palapag, Catubig, Las Navas and Pambujan.

The following are the requirements:

8.6.2 Sanitation

This sub-section refers to physical requirements by target year covering household, school and public toilet facilities. Table 8.6.2 presents the required sanitation facilities by target year. Rehabilitation for the sanitation facilities is considered as part of recurrent cost.

(1) Household toilets

Future requirements in the number of household toilets by different type for urban and rural areas were estimated based on additional households to be served by type of facility both for urban and rural areas by target year (details are referred to Supporting Report).

(2) School toilets

The future requirements in the number of toilet facilities were estimated based on the standard number of students to be served by a 5-unit standard facility or a toilet in every classroom (50-50 sharing) and the additional students to be served by target year (details are referred to Supporting Report).

Total required facilities were further broken down into urban and rural areas by applying the percentage share of urban and rural population.

(3) Public toilets

Future requirements in the number of toilet facilities were estimated based on the additional number of toilets for public markets and bus/jeepney terminals located in urban areas (details are referred to Supporting Report).

8.6.3 Urban Sewerage and Solid Waste

Physical requirements for the sewerage facilities are not discussed in this sub-section. Further study shall be conducted in the future.

As reference information, the number of refuse collection trucks is estimated for the urban area in Phase I. Seventeen (17) additional units of truck are required to meet assumed service coverage as reflected in Table 8.6.3.

8.7 Identification of Priority Projects for Medium-Term Development Plan

In general, the present service coverage by municipality with reference to the target coverage indicates the direction of development effort for implementing PW4SP with municipal priorities.

Specific projects shall be selected subject to detailed studies and will not be discussed in the provincial master plan. In addition, pertinent information to identify priority projects is not available both at provincial and municipal level during this PW4SP preparation, except some future expansion work for WDs.

The general criteria for identifying priority projects as guide for implementing the PW4SP are summarized below.

The first level of priority should be given to projects with positive feasibility studies and identified funding. Next level of priority should be given to projects with positive feasibility studies, although no funding source has been identified. The third level should be for which

feasibility study has been conducted. Within each level, if funds were insufficient, a ranking could be carried out applying some factors, such as willingness to pay, water-related diseases status and per capita cost. Under the above-mentioned conditions, the implementors should prepare a list of projects.

Due attention shall be paid on the importance of integrated development of relevant subsectors to maximize the effects and benefits through simultaneous implementation of water supply and sanitation projects. On a municipal level priority, synthetic evaluation of sector components for concerned municipalities (which is studied in the financial arrangements, Chapter 11) may be used for implementation arrangements.

Chapter SECTOR MANAGEMENT FOR MEDIUM-TERM DEVELOPMENT

9. Sector Management for Medium-Term Development

9.1 General

In order to manage the water and sanitation sector effectively, the provincial and municipal governments of Northern Samar will have to make some adjustments in their current policies and structures.

9.1.1 Purpose of Policy and Structural Adjustment

The adjustments should be aimed at coordinating these local policies and structures more closely with the overall policies, institutional and regulatory frameworks, and resource-sharing systems of the water sector, so that the Province and its municipalities would be in the best position to realize available opportunities to improve water services, specifically:

- (1) to effect immediate improvements in the physical infrastructure for water, sanitation, and related environmental services; and
- (2) to acquire permanent capabilities to (a) plan, manage and institutionalize gains in sector services, (b) to nurture constructive partnerships with the private sector, and (c) to set in place and maintain the mechanisms for sustainability.

To the extent that additional resources are provided by programs like the World Bank-assisted LGU Urban Water and Sanitation Sector Project; and to the extent that the national government has instituted facilitative mechanisms to improve the sector, the provincial and municipal governments must seize the opportunities that, for the present, are available in order to achieve and expand current sectoral targets, and to ensure the long-term sustainability of sectoral gains.

9.1.2 Perspectives

In making the needed adjustments, the LGUs will do well to keep the following realities in clear perspective:

(1) That the nature of public accountability dictates certain rigidities and procedural constraints in all governmental systems. Thus, while government must fulfill its mandate as the necessary and enabling institution for the provision of basic services, it is not the most responsive, efficient, and cost-effective agent for directly implementing these services. For this reason, local governments must clearly define their role in the investment, operation, and maintenance of water service utilities;

- (2) That the public and even many local officials still lack a deep realization of the importance of institutionalizing water services. This lack of realization reflects the transitional stage of most of Philippine society, to which the pervasive effects of urbanization (effects that extend even to the rural areas) and their demands on social participation in sustaining basic services are very recent and unfamiliar experiences. For this reason, the sector's social marketing endeavor must include a primary thrust of helping the community and all LGU officials understand the fundamental role of safe water and sanitation in the actualization of their most cherished of aspirations that is, to secure a better future for their children.
- (3) That large sectors in many communities, as well as some entire communities, do not have the capacity to shoulder the full cost of institutionalized water and sanitation services. LGUs are especially challenged to devise ways and means to ensure their disadvantaged constituents basic access to safe water and related services -- even as they seek fair participation from those who can afford to pay, and as they continue to exert efforts to establish these services on a permanent, self-sustaining basis.

This Chapter proposes the mechanisms, processes and structures needed in the medium-term to achieve the coverage targets with sustainability. Not all recommendations can be laid out with the same level of detail at this time as some are dependent on further policy guidelines being formulated at the national level. These include the on-going study on access of LGUs to external financing assistance and the sector devolution process.

9.2 Sector Management

9.2.1 Development of the Vision

One glaring institutional need at the local level is a common vision that could focus and mobilize the water sector's resources and the efforts of the different shareholders within a practical structure that delivers the desired services effectively in a sustainable manner. Such a common, shared vision can only be achieved if all the share shareholders realize the importance of managing water as a basic economic commodity and place value on their family's access to safe water within the framework of their own needs and aspiration.

Both the policy makers and the officials at all levels of governance and public service and a critical mass of the consumers themselves must internalize and share in the vision so that their efforts and resources could be mobilized for project implementation. Local planners need to focus on the long-term requirements i.e., beyond the technical requirements of forming users' associations, drilling wells, distributing bowls, etc. They need to work as "change agents" to

prepare themselves and their constituents to participate in ensuring that basic services like water and sanitation become available and are placed on a sustainable basis in their respective communities. With these considerations, and based on a realistic assessment of constraints, opportunities and demand, the province has set its vision and mission for the sector.

Initial vision statement: The province will adopt a two-phased plan, which seeks to dramatically improve the provision of water supply and sanitation. In the medium-term (2000-2004) plan, the province manages to maintain present service level; water supply coverage in urban areas 65% and in rural areas at 60%. On the other hand, household toilets will be made available to 68% of the urban population and 65% of the rural population; 50% of the students in public schools will have adequate sanitary toilet facilities; 100% of public utilities will have sanitary toilets; and 65% of the urban population will be covered by solid waste collection services. For its long-term (2005-2010) plan, the province will pursue a more vigorous program to increase water supply coverage in urban areas to 95% and in rural areas to 93%. For the sanitation subsector, individual household toilets will increase up to 93% in urban areas and 90% in rural areas; public school toilets will rise up to 90%; public utilities will have 100% sanitary toilet coverage; while sewerage service will cover 50% of the urban population.

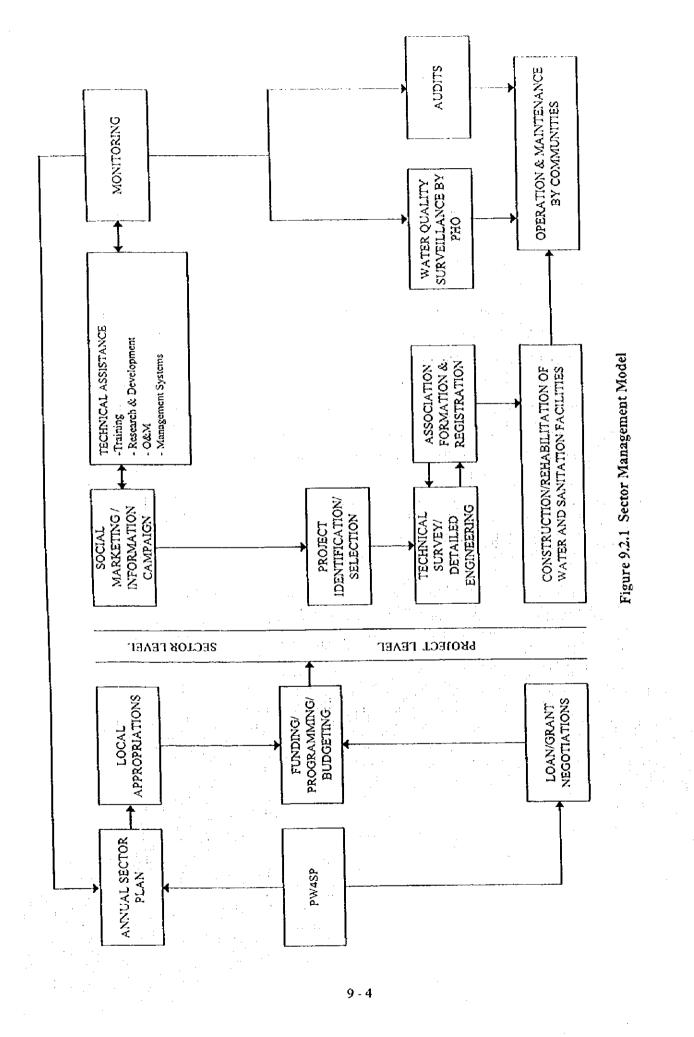

9.2.2 Sector Management

A Sector Management Model is presented in Figure 9.2.1 for sector management and project development. It is envisaged that this PW4SP will be used as a basis for the Annual Sector Plan and/or as input into Loan or Grant Negotiations in the future. The Annual Sector Plan, together with the budgets, will be reviewed by the Governor and passed upon by the legislature as part of the provincial budget approval process.

The sector level implementation activities consist principally of three broad areas: social marketing, technical assistance; and monitoring. Project selection follows on from a selfselection process that includes the identification of a responsible community-based association and the preparation of technical studies, as needed. Construction or rehabilitation will take place only after the institutional, financial and technical studies have been done. Operation and maintenance, including arrangements for finances of the system, will be the responsibility of the community organization. The Monitoring Function, on the other hand, will be implemented as a sectoral program, augmented with water quality surveillance by the Provincial Health Office (PHO) and operational audits done by the LGU.

1

ŝ

E

()

9.2.3 Service Provision Policies and Objectives

The LGU seeks to provide an adequate level of water and sanitation facilities defined as follows:

- Level I facilities serve at most 15 (fifteen) households per source; Level II public taps serve
 5 (five) households per faucet; and Level III systems provide individual household connections.
- Water supply provision will be at least 20 lpcd for Level I; 60 lpcd for Level II; and 100 lpcd for Level III.
- A critical mass of 90% of the individual households in every barangay has sanitary toilet facilities.
- All schools shall have adequate water supply and at least one sanitary toilet facility for every 40 students.

9.2.4 Operating Policies

9

The following policy and strategy statements are adopted by the Provincial Government. These may be reviewed and revised from time to time by the Provincial Government. The key policy statements include the following:

- (1) Sustainability shall be promoted through increased community responsibility for management of facilities. Unless potential users demonstrate initiative and commitment (beyond making the request for assistance) to maintain the systems, no support shall be provided by the LGUs. To the extent possible, the LGUs should utilize existing local resources (self-reliance).
- (2) Selection and prioritization of projects shall be based on demonstrated commitment of the beneficiaries to participate in the project and their willingness to pay; the current water, sanitation and overall health conditions; potentials for growth; and cost implications.
- (3) Technology to be used for the projects shall be appropriate to local conditions and resources. While economical facilities should be the objective of design and selection, construction costs should not compromise quality, reliability, and provisions for future upgrading and expansion. Phased upward integration and future upgrading of systems and facilities shall also be promoted utilizing to the extent possible previously constructed facilities. In urban centers, a range of technologies may be adopted for wastewater collection and treatment, as well as for drainage.

(4) An integrated approach to the provision of potable water supply, sanitation and hygiene education shall be promoted. All projects to be developed by the LGU must involve these three elements.

(

Ć

(5) As part of the overall social marketing efforts for the sector, the Province shall implement an "Information, Education and Communication Program" with the primary thrust of promoting safe water and sanitation values. A nationwide tEC Program to Create "Safe Water" Value among communities is described in the Supporting Report. At the provincial level, the IEC Program shall start with the orientation of all local government officials down to the barangay level, and be coordinated with and draw the participation of other agencies, NGOs, and civic groups throughout the province, particularly those involved in community development, social projects, and health and education services. The program shall include, among others, a component to train individuals selected from the LGUs, participating agencies and organizations, and volunteers from the communities themselves as communicators/change agents for safe water values. Figure 9.2.2 shows the schematic design of the IEC Program.

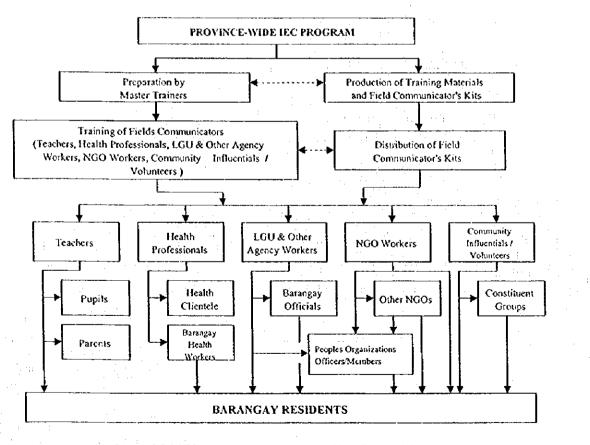

Figure 9.2.2 IEC Program Implementation Flow (Provincial Level)

(6) The LGU shall seek, to the extent possible, to provide water and sanitation services equally to all their constituents, whether they reside in rural or urban areas, or in wealthy or depressed areas.

9

- (7) Cost Recovery and Cost Sharing (Subsidy Policies): The LGU shall enforce a rational and consistent policy on the application of subsidies and toans for water supply and sanitation. In May 1996, the Investment Coordination Committee (ICC) of the NEDA adopted a policy "to support the financing of devolved activities with social and/or environmental objectives" based on three considerations namely: Equity, Externalities and Economics of Scale. Accordingly, NEDA advised DILG of the revised cost-sharing arrangement which clearly limited the national government subsidy to Level I water supply systems for 5th and 6th class municipalities up to a maximum 50% of the total project cost. No subsidy from GOP is provided for Level II and III. For sanitation facilities, the national government subsidy for the 3r^d to 6th class municipalities shall be from 50% to 70% of the total project cost.
- (8) Private Sector Participation: The government shall give the private sector a substantial and preferential role in the attainment of the PW4SP objectives. In harnessing their participation, less government intervention shall be exercised in areas where the private sector is or can be a key player. An environment designed to empower them to absorb new social responsibilities and proactively convey to the government their aspirations and interests shall be established. The formation of private sector groups, NGOs, community organizations, cooperatives and people's organizations shall be encouraged. The implementation of programs to develop their capabilities in the sector development programs shall be promoted.
- (9) The province's fiscal management, in terms of capital funds generation capability, budget and disbursement, shall be improved. The assistance of the legislative branch in the enactment of the proposed revenue-generating measures shall be sought. Financing through the private sector will also be encouraged.
- (10)Sector development shall be consistent with broader concerns for environmental protection and management. Pollution control, conservation and proper utilization of water and land resources are critical issues to be considered in development plans at all levels, including municipal land use plans. Among the specific concerns in relation to water resources that the LGUs shall address through a proactive, environmentally responsive management approach to resource use, are the preservation and enhancement

of watersheds, the prevention of pollution of streams and groundwater resources, and the protection of riverbanks and natural hydro-geological formations.

(

Ć

(11)Disaster Response and Emergency Coordination: The LGU shall formulate, as part of its contingency plans, a program to address emergency conditions. The program shall include maintenance of stocks of chlorine, organization and training of local communities on restoration of water supplies, and provision of emergency sanitary facilities. The LGU should coordinate closely and regularly with the local officials of the Regional Disaster Coordinating Council (RDCC).

9.2.5 Regulatory Policies

In coordination with appropriate national and local agencies, the LGU shall endeavor to set up an effective regulatory framework considering the following:

- (1) Water allocation and water rights policies (conflict resolution) which are within the mandate of the National Water Resources Board. The LGUs or the concerned water utility shall apply for water rights from the Board, prior to implementing a project that would require extraction of water.
- (2) Water Rate Review: While the rate setting and approval functions remain largely a concern of the associations or the Water Districts (and LWUA), a vehicle for resolving grievances against unrealistic tariffs (or other practices) can be instituted by the LGUs. The court system, of course, remains as the final arbiter in conflicts.
- (3) Association Registration: The LGUs shall likewise adopt a registration and franchising system for associations responsible for water supply facilities outside the WD franchise areas. Annual reporting requirements will have to be established for monitoring and possibly, auditing purposes.
- (4) Water Quality: The National Drinking Water Standards have been established. The LGUs will have to establish a viable mechanism, including water testing and standards enforcement, to ensure that water delivered meets the potability standards. The DOH currently has the responsibility and the regulatory power to stop the operations of water systems not delivering potable water.

9.2.6 Financing System

(1) Water supply investment financing

In financing water supply investments, the LGUs may tap their Internal Revenue Allotment (or IRA) and/or locally generated revenues, or leverage these resources to borrow from government and private financial institutions. Overall, it is the LGU's responsibility to raise funds to support capital development sector projects and to ensure that adequate O&M reserves are raised by the beneficiary communities.

In the medium-term, the primary sources of funds are envisaged to be provincial and local taxes, allocation from the IRA 20% Development Funds, and the Municipal Development Fund. Also, in the medium-term, it is envisaged that national and external funds will continue to be channeled through local offices of central agencies.

Studies are underway to look into the feasibility of direct access of LGUs to external funds. The LGU will continue to monitor the developments and policy decisions to be established, as these will invariably affect local financing mechanisms. (For reference, "Accessing the ODA Funds" is presented in the Supporting Report.)

(2) Financing for sanitation activities

To support sanitation activities, housing improvement loans for installing in-house sanitary facilities should be studied and instituted by the LGU. Such a mechanism can be organized with the rural banks or the existing credit cooperatives. Seed funding for this revolving fund also needs to be raised. Upon agreement by the parties, the enabling local legislation establishing the sanitation revolving fund will have to be enacted.

The total resources for the above purpose could be augmented by establishing formal linkages with the home improvement loan facilities available through the Social Security Service (SSS), the Government Service Insurance System (GSIS), and the Pag Ibig Fund.

(3) Project owners should be fully responsible for providing sufficient funds for the sewcrage, waste treatment and disposal, and sanitation requirements of their projects. Through their Municipal Engineering Office (MEO) and Health Office (MHO), and in coordination with the DENR, municipalities should strictly enforce the sanitation and sewerage requirements of the Building Code and environmental laws in issuing building permits, approving subdivision plans, and inspecting buildings and constructions.

9.2.7 Other Available Financial Arrangements

As previously mentioned, provincial and municipal leaders should monitor developments relative to the studies that are underway on the feasibility of giving LGUs direct access to external funds. Policy decisions on this would provide additional opportunities to accelerate improvements in the water sector.

(

In the meantime, LGUs should consider tapping existing programs that support the sector, particularly two major programs that are underway.

(1) ADB-assisted Rural Water Supply and Sanitation Sector Project

THE RW3SP is a 5-year project that supports the provision of Level 1 facilities in rural communities. It covers 20 provinces, including Biliran, Eastern Samar, and Southern Leyte in Region VIII, and is expected phase out the Year 2001.

- 1) Eligible Communities:
 - The project is aimed at communities that:
 - are deficient in water supply and have poor sanitation conditions;
 - are willing to establish a BWSA; and,
 - demonstrate willingness to be responsible for operation and maintenance costs, including depreciation, and to contribute labor for the construction of the facilities.
- 2) Implementing Agencies

The lead implementing agency is the DPWH, which manages and coordinates the project with other national agencies, particularly the DILG and the DOH.

The DILG coordinates and implements capacity building and community management training programs and, through NGOs, initiates community and LGU participation. DILG also carries out the socioeconomic surveys and community participation activities for the water projects, through its own and NGO resources and with the assistance of consultants.

The DOH, with technical assistance from the DPWH, assists the LGUs and the communities in the construction of public and household toilet facilities. It also implements training for health, hygiene education, and water quality control and surveillance programs. The DOH is also involved in the establishment and operation under the project of 50 Water Analysis Laboratorics in the 20 provinces covered. Of

these, 8 will be located in Region VIII as follows: 2 in Biliran, 3 in Eastern Samar, and 3 in Southern Leyte.

4) LGU participation

The mayor, as chief executive of the municipal LGU, will be responsible for initiating projects with the assistance of the DILG. He/she will manage project activities at the municipal level, particularly the selection and formulation of water project proposals, project implementation, and training, in coordination with the DEO, the DOH office, and the DILG and NGOs.

At the provincial level, the governor will have overall responsibility for a provincial board which will appraise (through the PPDO) and approve project proposals submitted by the mayors.

5) Project opportunities for LGUs

This ADB-assisted project opens up for eligible LGUs a very wide range of opportunities that include the following, among others:

- Funding of up to 90% of the total cost of water and sanitation facilities (with labor contributions being eligible for the 10% counterpart).
- Technical assistance for overall community education, organization, skills training, and other types of capability development.
- Development of specific capabilities in relation to rural water projects, such as
 organizing BWSAs, community-based operation and maintenance, carrying out
 sanitary inspection of WSS facilities, collection and analysis of water samples, and
 implementing water projects.

(2) World Bank Assisted LGU-Urban Project

The Local Government Unit – Urban Water and Sanitation Project (LGUUWSP) is a World Bank-assisted lending facility administered by the DILG with the Development Bank of the Philippines (DBP) as the depository institution, that local governments can tap to provide, expand or rehabilitate Level III water systems, as well as sanitation, drainage and other environmental services for their urban populations. This facility is most practical for municipalities whose urban population has expanded to create a demand level of at least 1,000 households. Where the water source is more than 7 km from the distribution area, a larger base of household users would be needed to make the project viable. 1) Eligible municipalities/cities

The lending facility is intended to support small and medium sized municipalities/cities, regardless of income class, which

(

- have not formed a water district;
- have a water district but are not in LWUA's current program of assistance.
- 2) Basic Project Rules
 - a) The project promotes full cost recovery; that is, the tariff to be paid by the consumers should cover the cost of operation and maintenance and the repayment of the LGU DBP loan, and to the extent possible, the reimbursement of LGU equity; and
 - b) The system shall be operated by a private operator under long-term lease contract with the LGU.
- 3) Description of loan facility
 - a) Debt/equity: The LGUUWSP can finance from 75%-90% of the project cost, with the municipality/ city putting up from 25% to as little as 10% of the equity.
 - b) Eligible cost:
 - Feasibility study
 - Technical design
 - Construction of the water facility
 - c) Interest, project duration: 15% per annum, 15 years (with 3-year grace period)
- 4) Availment procedures
 - a) Submission to the WSSPMO-DILG of the following:
 - Letter of Intent/Interest to participate in the project (duly signed by the Mayor)
 - Supporting Sangguniang Bayan resolution expressing interest and willingness to secure loan from the DBP to fund the water project cost
 - LGU financial data
 - b) Initial screening by DILG / DBP / WB technical group
 - Validation and analysis of financial data
 - Initial determination of LGU financial capability / borrowing capacity
 - c) Preparation of feasibility study and detailed engineering design
 - Study to review scope of proposed water project, check availability / adequacy
 - of source of water supply
 - Review of bases for population growth projections and consumer demand

- · Formulation/ recommendation of LGU's technical options
- Presentation to the community prospective end users of the technical option approved by the SB
- d) Passage of SB resolution authorizing
 - Inclusion of the proposed project in the local development plan and public investment program (Section 296, LGC)
 - Loan for the proposed project
 - Appropriation of equity requirement
- e) Perfection of Loan Agreement between the LGU and DBP
- f) Construction of the facility
- g) Start of operation of the facility
- 5) Project opportunities

Ì

While the main thrust of the LGUUWSP is to provide financing to cover the eligible cost items indicated under "Description of Loan Facility" (Item #2), it also covers other non-loan project components to assist the LGUs build up their capabilities to handle water sector projects.

The complete project components of the LGUUWSP are as follows:

- a) Water and sanitation facilities component:
 - Construction/improvement/rehabilitation of Level III water facilities
 - Provision / improvement of sanitation facilities
 - Construction /improvement of urban drainage
- b) Institutional development components
 - Training of LGUs in decentralized planning, implementation and management of water facilities applying the following commercial principles:
 - Demand driven approach
 - Private sector participation
 - Full cost recovery
- c) Technical assistance component
 - Feasibility study
 - Detailed engineering

9.3 Institutional Arrangements

This section of the report discusses both existing and proposed roles and responsibilities of agencies involved in WATSAN sector projects. Agencies that are presently involved include

national government offices precisely because the devolution of functions related to WATSAN activities is not yet complete. As the province's capability to implement WATSAN projects is enhanced in the medium-term, there will be a need for a unit that will coordinate WATSAN project implementation activities between and among national and local office. This coordinating body is the proposed PWSU (Provincial Water Supply and Sanitation Unit: tentative name).

Ć

9.3.1 Roles and Responsibilities of Agencies Concerned

In the implementation of WATSAN sector projects, respective governmental agencies from national to barangay levels shall play their roles as described below.

- (1) National government Agencies
 - 1) Department of the Interior and Local Government

The DILG, through its Water Supply and Sanitation Program Management Office or WSS-PMO shall coordinate with the funding agency, LGUs and other national government agencies involved in the project implementation. It shall be responsible to:

- a) develop the capacity of PWSU and MSL members in planning, training and organizing, WATSAN technologies, health and hygiene education, gender responsiveness, implementing, monitoring and evaluation of water and sanitation projects. The formation and tasks of PWSU and MSL are discussed in the following section (9.3.2).
- b) provide staff and administrative support, and development cost for the project. A Coordinator in each province shall be assigned to ensure project coordination at the provincial level. Its field personnel at the regional, provincial and municipal offices shall be utilized to assist in the capability building programs for LGUs. Monitoring of WATSAN projects shall be integrated in their regular functions.
- c) execute a Memorandum of Agreement (MOA) with the concerned LGUs. MOA shall include cost sharing arrangements with concerned province and municipality, utilization of vehicle and equipment support and possible allocation of LGU's amount out of their internal revenue allotment for the operation, repair and maintenance in the future.
- d) select NGOs to assist its capability building and community management programs for the LGUs and project beneficiaries to improve the delivery of project services and ensure sustainability.

- conduct orientation and information dissemination for the provincial officials on the project including requirements and strategies to obtain their support and commitment in pursuing the project;
- f) coordinate and utilize the technologies of DPWH and DOH including equipment and existing facilities; and
- g) procure vehicle, well rehabilitation equipment, maintenance tools, and water quality testing kits by means of bulk contract.

The other national government support agencies concerned and their respective functions in the project are:

2) Department of Public Works and Highways

The DPWH shall be responsible to:

- a) set and/or update, as and when necessary, technical standards for engineering surveys, design, construction, operation and maintenance of water supply system.
- b) upon agreement with the LGUs, assist in the conduct of engineering surveys and in the preparation of plans, specifications and programs of work, through its District Offices.
- c) upon agreement with the LGUs, assist in construction management, through its District Offices.
- d) conduct technical researches in coordination with the LGUs
- c) in the light of present-day directions in health management, emerging habits in water use, concerns arising from urbanization, environmental degradation, and the overall increase in pollutive activities, it is recommended that the DPWH conduct, on a priority basis, a thorough review to update existing technical standards in relation to water supply and sanitation systems.

3) Department of Health

The DOH shall be responsible to:

- a) set and/or update, as and when necessary, standards on water quality testing, treatment and surveillance, and sanitary practice.
- b) provide technical assistance to the LGUs in the conduct of periodic water quality control (once in every three months as stipulated in the Philippine National Standards for Drinking Water) and surveillance-related activities.
- c) monitor and evaluate, on a regular basis, health and hygicne education programs implemented by local health officers, particularly in areas where waterworks systems are expected to be constructed.

4) National Water Resource Board

The NWRB shall be responsible to:

 a) regulate the use of water resources through the issuance of water rights (for the Level I water supply projects, water right permit shall be confirmed upon the site selection is completed); and

િ

C

- b) establish and manage a user-friendly water resources data management system.
- (2) Local Government Units
 - 1) Provincial Government

The province, through its PWSU that is to be newly organized, shall handle all activities related to the development of the sector in the province. As the WSS technical group at the provincial level, the PWSU shall provide the overall planning framework, technical support, and monitoring to enable the province to fulfill its sectoral targets.

The PWSU shall have combined functions of PPDO, PEO and PHO in the implementation of the sector projects. The role and responsibility of each member as well as the joint tasks to be undertaken among them shall be clearly defined. The head of the unit decides on WATSAN project issues and problems arising therein. The team member shall work hand-in-hand with the CO/NGO supervisor who shall be primarily responsible for the coordination of project activities at the municipal level. A focal person shall be designated from the PWSU members to serve as understudy of the CO/NGO to ensure social technology transfer before the phase out of the NGO intermediary. The PWSU, together with MSLT shall be primarily responsible to:

- a) annually update the PW4SP;
- b) prepare the program of work and implementation schedule;
- c) conduct information dissemination and consultation with the municipal and barangay officials;
- d) select and prioritize project sites using the selection criteria developed for the project;
- e) assist in organizing BWSAs for Level I water supply and RWSAs for Level II, and skills training for the BOD/officers, bookkeeper and caretakers of the operating body on operation, maintenance and repair;
- f) periodically apprise the Governor of the project developments;

- g) manage and monitor the utilization of vehicle and equipment procured under the project;
- h) monitor, evaluate and prepare reports on the progress of project implementation for submission to WSS-PMO in case of ODA assisted projects; and
- i) provide continuing technical and institutional assistance to the MSL and project beneficiaries.

A priority concern of the PWSU as soon as it is organized is to launch a provincewide IEC Program (as discussed in 9.2.4 item no. 5) to create strong awareness and active support for the sector's targets, based on the creation of safe water and sanitation values.

2) Municipal Government

<u>i</u> 195

Each municipality shall create a Municipal Sector Liaison Team (MSLT) from MPDO, MEO and MHO. The role and responsibility of each member as well as the joint tasks to be undertaken among them shall be clearly defined. A focal person shall be designated among them, preferable from MPDO, to serve as understudy of the CO/NGO to ensure social technology transfer before the phase out of CO/NGO intermediary. The MSLT shall work hand-in-hand with the CO/NGO and with the PWSU support. It shall be responsible to:

- a) select the priority sites/barangays in close coordination with the Municipal Development Council;
- b) conduct consultation nectings with the barangay officials/development councils and community members;
- c) facilitate the barangay water and sanitation survey and spot map, and prepare the survey summary report and spot map;
- d) organize BWSAs for Level I water supply and RWSAs for Level II, if necessary, and conduct skills training for the BOD/officers, bookkeeper and carctakers of the operating body on operation, repair and maintenance;
- e) assist the operating body in the establishment of proper systems and procedures for the collection of water charges, sanction for delay and non-payment, opening and operating bank accounts and budget allocation for the operation, repair and maintenance and cost recovery of the facilities;
- f) through its MHO/RHU and its network of barangay health workers and volunteers, conduct information campaign on proper health and hygiene education in the community;
- g) periodically apprise the Mayor of the project development;

- h) manage and monitor the maintenance tools and water quality testing kits procured under the project;
- i) monitor and prepare report on the status of project implementation for submission to the PWSU; and

6

- j) provide continuing technical and institutional assistance to the project beneficiaries.
- 3) Barangay

The barangay acts as a basic unit for the development. Barangay officials and development councils serve as the entry point for all development activities in the community.

The barangay officials will play an important role in planning and implementation of WATSAN projects. They shall collaborate with the PWSU/MSLT in gathering data/ information and in undertaking various activities in the barangay such as in conducting survey and spot mapping by men and women volunteers, general assembly meetings and mobilization of resources in the community. The barangay officials/development council shall serve as advisor/facilitator of the operating body and community members.

(3) Communities

1) Barangay water association

Upon completion of the Level I water supply project, the facilities shall be turnedover to the operation body. A certificate of acceptance serves as a document of ownership of the beneficiaries and acceptance of their responsibility in the project. Upon decision of the community members, existing people's/community based organization, or a new water association (BWSA) shall be formed as an operating body.

The operating body shall own the project and shall undertake the responsibility for the operation, repair, maintenance and cost recovery of the facilities. Specifically, it shall be responsible to:

- a) regularly collect contributions from member-users for the operation, repair, maintenance and cost recovery of the facilities;
- b) maintain proper and updated financial records and transactions of funds;
- c) undertake minor repair of the facilities for Level I and II water supply facilities and in case of major repair, request assistance from the MSLT/PWSU members;

- encourage members to attend meetings and training activities mainly for Level 1 water supply;
- e) implement policies and procedures approved by the BOD/officers; and
- f) encourage members to observe proper health and sanitation practices.

2) Member-users

藰

The duties and responsibilities of member-users include the following:

- a) pay monthly water charge contribution to the operating body;
- b) attend meetings and training activities designed for members;
- c) observe rules and regulations and policies approved by the BOD/officers;
- d) remind other water users to use the facility properly, especially for Level I and II water supply;
- c) keep the premises of the water facility clean, sanitary and free from excess water which may cause contamination of the water source; and
- f) adopt proper health and sanitation practices.

9.3.2 Institutional Arrangements

(1) Provincial Level - PWSU

In the medium-term, it is recommended that a full-time Provincial Water Supply and Sanitation Unit (PWSU) shall be operational. This is because of the expected large volume of work that will be required by the PW4SP and other ODA – and locally-funded WATSAN projects. The main functions of the PWSU will be:

- 1) to coordinate the planning and implementation activities related to the PW4SP, among the concerned national, provincial and municipal agencies; and
- 2) to continue to implement, assist and monitor all water supply and sanitation services in the province in coordination with the municipalities.

Over the long -term, the PWSU may be elevated to the same level as the PPDO to underscore the importance of the WATSAN sector in the development of the province.

The provincial government should ensure that the unit should be provided adequate logistical and financial support. The DHLG-WSS/PMO should also continue providing technical and managerial assistance to the unit. Upon agreement with the LGU concerned, the DPWH – DEO should also continue to lend its water supply facility development capability to the province.

The initial professional-level staffing of the proposed PWSU will be as follows:

Provincial Water Supply & Sanitation Coordinator	1
Assistant Provincial Water Supply & Sanitation Coordinator	l
Community Development & Training Specialist	2
Water Supply & Sanitation Engineer	2
Monitoring Specialist	1
Total Personnel Required	7

 The Provincial Water Supply & Sanitation Coordinator (PWSC) will lead an interdisciplinary PWSU. The PWSC will ensure timely preparation, implementation and reporting of sector and project progress based on the annual sector plan. For dayto-day operations, the PWSC will report to the Governor. The PWSC will also liaise with all project implementors at the municipal level. The PWSC shall be the key contact person of the DILG-WSS/PMO. Specific duties include: 6

- a) Prepare guidelines, work plans and schedules for project implementation work at the municipal level; coordinate the work of consultants and NGOs in their various tasks.
- b) Prepare a detailed work plan and program of activities for project implementation at the provincial level (including technical, financial and organizational aspects) and ensure regular reports on the progress of activities.
- c) Guide the conduct of sector and project management and the supervision, and coordination of the PWSU; ensure the quality and timeliness of the outputs of the other agencies and consultants.
- d) Assess all future inputs required for project planning, design, supervision of construction and monitoring in subsequent phases of project implementation.
- e) Take steps to ensure that adequate financing is available to support the sector capital development requirements.
- f) Assist in the negotiations for external grants and loans.
- g) Recommend policy and policy revisions to govern sector and project management activities.
- 2) An Assistant Provincial Water Supply and Sanitation Coordinator will likewise be appointed to assist the PWSC in discharge of his/her duties and responsibilities of the PWSU.

- 3) The Community Development and Training Specialist (CDTS) will be particularly responsible for implementing the community development and involvement aspects of the project. His/her task will include frequent contact with the municipal liaison staff and barangays to ensure that all project activities are demand-driven and sustainable. The CDTS will report to the PWSC. Specific duties include:
 - a) Identify initial areas and develop implementation arrangements for launching the project in the various municipalities.
 - b) Conduct regular dialogue and disseminate information among local leaders on water, sanitation and health issues.
 - c) Assist municipalities in overseeing the organization (or accreditation) of associations which will be responsible for water supply and sanitation facilities.
 - d) Coordinate the health and hygiene education program province-wide.
 - c) Review past training programs for water supply and sanitation, hygiene and sanitation education, and community organization and development, including any manuals or other training materials used.
 - f) Guide municipal liaison staff in developing/adapting a community training strategy and methodologies based on the principles of participation, adult education, experiential learning and task specific activities, including the review and development of training materials.
 - g) Prepare the overall provincial training plan enhancing management skills, institutional strengthening, improving technical skills, and community promotion, awareness and development. This should include: training methodologies; types and numbers of training events for staff and communities; training of trainers; training packages, manuals and audio visuals; management aspects of training program; and staff requirements and cost estimates for all categories of training including equipment and materials.
 - h) Assist municipal staff in identifying and selecting target communities and sites based on agreed upon criteria; develop inclhodologies and coordinate preliminary village surveys and gender analysis.
 - i) Assist in coordinating activities of the municipal liaison.
- 4) The Water Supply and Sanitation Engineer (WSSE) will be responsible for all the technical aspects of the project including feasibility studies, design, construction, operation and maintenance. The WSSE will report to the PWSC. Specific duties include:

- a) Review the existing technical and environmental situation relating to water supply and sanitation facilities and assess the needs for new facilities and rehabilitation.
- b) Prepare and update criteria and process for the selection of water supply and sanitation facilities appropriate to the conditions prevailing in the project areas focusing on systems that can be operated and maintained by the community.

ŧ.

- c) Review design standards for water supply and for on-site sanitation (human excreta disposal) facilities for individual households, communal and school latrines.
- d) Establish appropriate design standards and technical specifications for water and sanitation materials and equipment applicable to systems proposed in the project. Establish quality control mechanisms for the procurement of materials and equipment as appropriate.
- e) Prepare standard contract documents, specifications and cost estimates for civil works and procurement.
- Ensure proper construction supervision and monitoring in coordination with the municipal liaison. Ensure timely transport of LGU-provided materials to project sites.
- g) Provide for adequate maintenance of LGUs equipment and tools for water and sanitation facilities, including drilling rigs and vehicles.
- h) Supervise major repair or rehabilitation work beyond the capacity of communities to undertake.
- i) Implement, in coordination with the PHO, the water quality surveillance system. Assist the PHO in enforcing sanctions or remedial measures in controlling drinking water quality.
- 5) The Monitoring Specialist (MS) will be responsible for ensuring that the status of sector projects and outputs are properly reported and fed back to management. His/her task will include frequent contact with the municipalities to ensure that all project activities are demand-driven and sustainable. The MS will report to the PWSC and liaise closely with the PPDO who has the responsibility for monitoring all development activities and needs in the province. Specific duties include:
 - a) Draft all project reports and documents including the quarterly and annual sector report.
 - b) Maintain the registry of associations responsible for water and sanitation in their respective communities.

- c) Coordinate and develop indicators for monitoring and evaluating the achievement of project objectives.
- d) Monitor actual costs for typical water supply and sanitation systems.
- (2) Municipal Level MSL

3

At the municipal level, a Municipal Sector Liaison (MSL) will be appointed by the respective mayors. The municipal development coordinator, the municipal engineer, the municipal health officer or any other qualified staff selected by the mayor may be appointed as the MSL.

The role of the MSL will be very critical at all stages of sector and project management. The MSL should ensure that the activities guided by PWSU are implemented at the barangay level, particularly information dissemination about funding opportunities. The MSL receives all requests for water and sanitation facilities including the commitment of the barangays to provide counterpart funds or labor for the projects. The MSL also recommends the programming of municipal funds (from municipal IRA allocation or other sources) to provide counterpart support or to fully finance the projects.

Supported by the PWSU, the MSL ensures that a viable organization is set up or appointed to handle the operation, maintenance and fee collection for the water system. The MSL also reviews the detailed project plan and design. During implementation, the MSL monitors the construction and drilling activities. The activities of the MSL will be closely coordinated and reported to the PWSU. If warranted, the mayor should establish a municipal water and sanitation office in the long-term future to handle all the above functions when the level of activities shall have become substantial.

(3) Barangay Level

At the barangay level, the Barangay Council (BC), through its Committee on Health, and the Rural Health Unit (RHU) plays a major role in concretizing the community aspiration for improved water and sanitation services.

The BC is the entry point for all development activities in the community. Particularly, it will play an important role in preparatory stage before setting up the association (or appointment of the responsible group). The BC prepares the request for assistance and assembles available local resources (funds, manpower, materials) to serve as initial community counterpart to demonstrate barangay commitment.

The RHUs and their network of barangay health workers (volunteers), on the other hand, have established an effective primary health care delivery system in the province. The system will continue to provide, among others, health and hygicne education services focusing on the interdependence of safe water supplies and sanitary toilet facilities to achieve overall health and environmental benefits. The RHUs will be the principal data collectors to monitor the conditions in access and coverage of water supply and sanitation services.

(

(4) National Level - DPWH, DOH, DILG

At the national level, DPWH, DOH and DILG will continue to provide technical assistance to LGUs per NEDA Resolution No.4 (series of 1994), either directly or through their local field offices. In addition, mandated government agencies, such as LWUA, will continue to provide technical and managerial services and loans to duly-organized water districts and RWSAs. Through the DOP and DBM, the IRA allocations will continue, from which a portion can be allocated for sector projects. Since this IRA allocation for water and sanitation projects will likely be very limited, the LGU will have to coordinate with appropriate national agencies to gain access to external funds. Regulations, promulgated and enforced by national regulatory bodies, like the NWRB, will have to be complied with by the LGU.

9.4 Project Management Arrangements

In implementing specific WATSAN projects, there are several approaches / strategies which are recommended that will increase the likelihood for success and sustainability over the long term. These general approaches / strategies should be treated as minimum project requirements, which can be enhanced or improved upon to further ensure the project's success and sustainability.

9.4.1 Project Approach/Strategy

- (1) Capacity Enhancement
 - a) Creation of support structure at the provincial and municipal levels (PWSU and MSL, respectively) with clearly delineated roles and responsibilities of each member as well as the joint tasks to be undertaken by them.
 - b) Improving information dissemination to and consultation with local officials at the provincial, municipal, and barangay levels to secure full support and cooperation in the execution of the project.

- e) Tapping NGO intermediaries to assist in the capability building and community management programs for the LGUs and project beneficiaries.
- d) Capability building shall be undertaken at various levels, from the national to the beneficiary levels. A Consultant shall develop the capacity of the WSS-PMO and NGOs, who in turn shall be responsible to develop the capacity of LGUs (PWSU, MSL) and CO/NGOs. Finally, LGUs shall develop the capacity of the project beneficiaries who are to operate and manage the projects.
- e) Consultancy services shall be availed of to assist the executing and implementing agencies' capabilities in the successful implementation of the project.
- (2) Service Level Determination

)

- a) The appropriate service level for a geographical area shall be determined in the following manner:
 - at the initial stage of the project, the public will already be consulted regarding their needs, desires, and willingness to pay;
 - before construction begins, all parties will sign an agreement acknowledging their respective roles and responsibilities;
- b) Communities with no existing water system will be encouraged to adopt Level II systems instead of Level I systems, subject to a validation of the technical feasibility and the prospective users' willingness to participate in the construction, operation and maintenance of the system.
- c) Existing Level III systems will be encouraged to expand their coverage to the fringe areas, subject to the results of studies on prospective demand, technical feasibility, and financial feasibility.
- d) Existing Level III systems that are in close geographical proximity to other existing Level III systems will be encouraged to merge in order to achieve economies of scale.
- (3) Community Participation
 - a) The selection criteria for the priority sites will be the community demand for the level of service. Demand assessment shall be made through participatory beneficiary assessment prior to construction of facilities in the barangays.
 - b) Tapping existing people's/community-based organizations as operating body of the project. Merger or consolidation with the existing water association in the barangay shall be considered before forming a new one.
 - c) Community participation shall be incorporated in all phases of the project from planning to evaluation. Community participation shall be undertaken through consultation and interactive participation with the community members.

- d) A greater participation of women shall be required in the planning, implementation, management, and monitoring of WATSAN projects.
- c) Integration of water supply, sanitation and hygicne education and provision of information, education and communication materials to the community members.

િ

- (4) Cost Recovery
 - a) LGUs shall adopt commercial principles in the operation and management of water utilities in order to provide cost effective and reliable services to consumers.
 - b) Community equity contributions and LGU counterpart shall be required and will serve as an indication of willingness and commitment to participate in the project.
 - c) Cost recovery through regular water charge collection from the end-users shall be a requisite of the project.
 - d) Funds collected from the end-users shall be utilized for operation and maintenance and future rehabilitation and reconstruction. The funds shall not be included in the general account of LGUs, even if the waterworks is owned by the LGU.
 - e) Merging of operating bodies may be studied to save on O&M cost and maximized the utilization of limited manpower resources.
- (5) Feedback Mechanism
 - a) A participatory monitoring and evaluation system shall be installed in partnership between the LGUs and beneficiaries.
 - b) Monitoring and evaluation shall start during the project implementation. The system must have clear objectives and the right indicators sustainability, effective use, and replicability.

The success of water and sanitation projects in most cases depends on the strength of the institutional arrangement and mechanism. Therefore, it is imperative that each institution as well as those personnel involved in the project should have a clear grasp of their respective responsibilities in the various stages of project implementation. Figure 9.4.1 and 9.4.2 in the Supporting Report shows in detail the project implementation arrangement and procedure for Level I water supply and sanitation from the national to barangay levels. These have been designed to encourage active participation of implementers and beneficiaries in undertaking the project.

9.4.2 **Project Implementation Arrangements**

(1) Level I

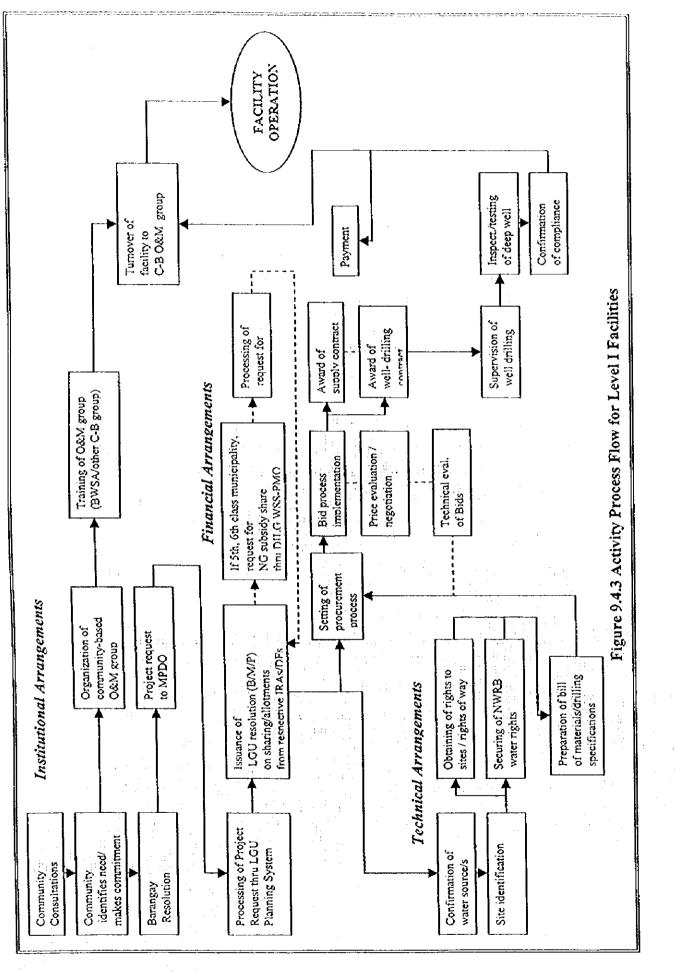

3

Figure 9.4.3 depicts the Activity Process Flow for Level I Facilities. The following key requirements should be noted:

- Project Selection: Self-selection and local initiative should be the basis. All barangays should be well-informed about sector opportunities and policies. The barangays should take the first step by assessing their needs, deciding that they want to improve their water and sanitation above all other needs and expressing their aspiration. The initial tasks of LGUs will be social marketing and information dissemination. The barangay should also decide desired service level/s, with a full understanding of the cost recovery aspects and other responsibilities.
- 2) Organization of associations: More flexibility is needed in order to tap local community resources. The issue of the necessity of forming BWSAs has been raised on several occasions. The proliferation of single-purpose associations for every government-sponsored project tends to divide barangay resources and complicate barangay structures. Many socio-civic groups have in fact "adopted" facilities and are looking after their maintenance voluntarily. Actual success rate seems to be higher in areas where water supply is extremely difficult regardless of whether there is monitoring or not.

The basic principle is that the community agrees that a particular group at the local level will be responsible. Existing local groups with other socio-civic objectives, an active track record and which are ready, willing and able to take on the BWSA functions may be tasked with the responsibility for the facilities. LGUs will assess the situation and, if justified, approve alternative non-BWSA arrangements. BWSA formation, of course, remains an option. An "institutional accreditation" system can be organized. If the association fails to live up to its responsibilities, it can lose its accreditation to another group.

The association can decide how to organize itself internally in coordination with the municipal sector liaison. The important condition is that all functions have to be attended to. Thus, an association may subdivide itself by "puroks" or it may choose to operate as one institution.

9 - 28

ୈ

3) Technology and Technical Design Standards: The former Rural Waterworks Development Corporation (whose functions were absorbed by LWUA) and the DPWH have developed a simplified procedure for conducting the initial data gathering. The formats, which are appended (Table 9.4.1 Supporting Report), may be adopted and used by the LGUs. If necessary, these forms can be revised to suit the specific needs of the barangay or municipality.

2)

- 4) Bidding of works and procurement of services and materials should follow provision of PD 1594 and other appropriate government policies and practices. Where possible, major capital procurement shall be sourced within the province.
- 5) Construction and Drilling: Drillers and civil work contractors will be needed for any major rural water supply and sanitation undertaking. Construction inspection shall be done with the municipal sector liaison.
- 6) Right of Way Acquisition: Deed of Donation (or written permits to grant use of land) for proposed facility sites should be executed in favor of the municipal government/barangay prior to project approval.
- 7) Major rehabilitation work, beyond the capacity of the associations, shall be referred to the municipality for action. Clear definition of "major rehabilitation work" is needed. All costs incident to the rehabilitation shall be to the account of the association O&M reserve fund. The municipality supported by PWSU will assist, if needed, the association in securing soft loans, if the reserve funds are inadequate.
- 8) Operation & Maintenance will generally be the responsibility of the association. To support the caretakers, a franchising system for major O&M activities may be instituted by the municipality (through a private firm, a major Water District in the area or any other competent group). Mechanics and plumbers can organize well-equipped "mobile service centers" which visits all the facilities monthly to check-up facilities and provide technical advice on behalf of the LGUs.

With standardization, local hardware stores will find it more profitable to stock up on needed spare parts. The LGUs should not maintain spare parts, although it is expected to maintain a ready stock of fast-moving spares.

9) Water Rate Setting: Fees and rates shall be established and approved by the community prior to construction. The fees shall be sufficient to cover all monthly operation, maintenance and administration costs, as well as to establish a reserve fund.

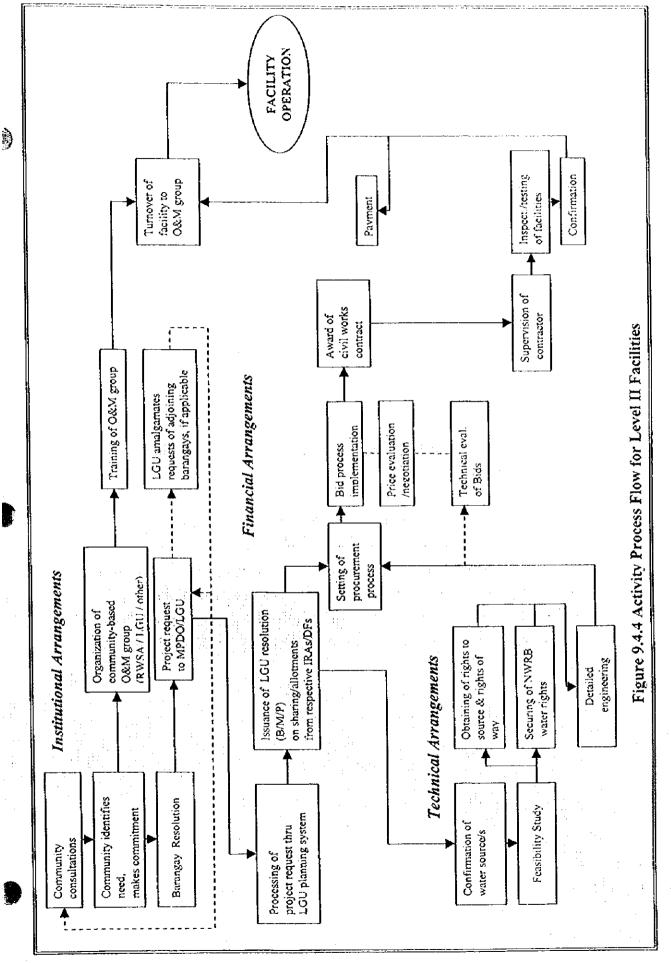

()

ę

- 10) Fees Collection and Funds Management: The association shall collect monthly fees. All funds of the association shall be deposited in a bank to be selected by the association.
- (2) Level II

Figure 9.4.4 depicts the Activity Process Flow for Level II Facilities. The following key requirements should be noted:

- Project Selection: Guidelines similar to that of Level I project selection shall be followed, i.e., self-selection and local initiative. Two or more barangays (or puroks) may agree to have a joint water and sanitation project.
- Organization: The RWSA model may be followed by the participating communities. Again, flexibility will be followed and alternative models for managing the system may be considered.
- 3) Technology and Technical Design Standards: Technical standards have been in use by LWUA for RWSAs and by DPWH for Level II systems. (refer to Table 9.4.2 with annexes, Supporting Report). As these are considered as national standards, they will be adopted by the LGUs.
- 4) Bidding of works and procurement of services and materials should follow provision of PD 1594 and all other applicable national and local legislation on bidding and award of contracts using public funds. LWUA uses standard formats and procedures for this process, which may be adopted by the LGUs.
- 5) Construction would usually be done by a contractor: Inspection would be undertaken by the RWSA; by the cooperative or the private developer; or by the LGUs depending on the institutional arrangement adopted.

9 - 31

Ì

6) Right of Way Acquisition. The association shall negotiate for the purchase of land on which facilities will be constructed. Should negotiations fail, the government may exercise the power of eminent domain to secure needed land.

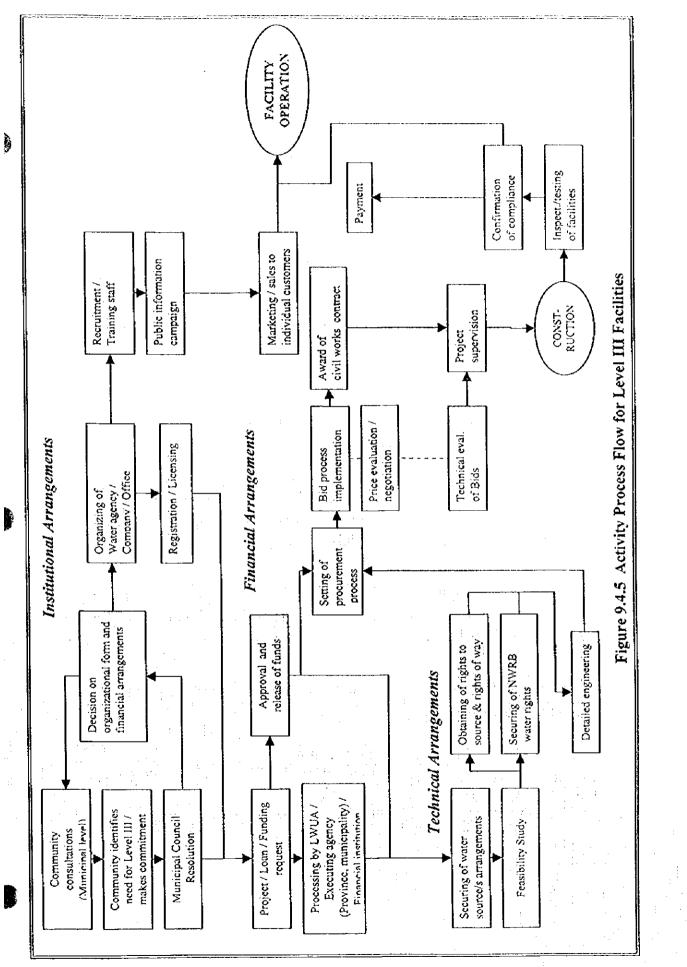

Ô

- 7) Operation & maintenance and rehabilitation will be the responsibility of the association. It shall ensure that adequate tools and spare parts are available. It shall employ needed staff and caretakers.
- 8) Water Rate Setting: All fees shall be subject to public hearing and approval by the appropriate regulatory authority.
- 9) Fees Collection and Funds Management: Same policies for Level I shall apply. However, fee computation shall include provision for debt service and possibly a higher reserve requirement.

(3) Level III

Figure 9.4.5 depicts the Activity Process Flow for Level III Facilities. The following key requirements should be noted:

- 1) Project Selection: Level III systems are to be initiated by the municipal governments. In principle, all communities (including rural areas) may request Level III services provided that they are willing and able to take on the financial and managerial obligations for higher service levels. Viability and affordability are issues, however, so that appropriate studies need to be undertaken to apprise communities of the costs and financial obligations involved. The point is that service level selection is community decisions.
- 2) Organization: There are several viable Level III models, which may be adopted: the Water District Concept; a LGU-managed system; a cooperative-run system; or a privately-owned and managed system (refer to 5.2 Data Report). The LWUA water district concept was briefly described in the preceding chapters. For detailed information, the LGUs should contact and coordinate with LWUA. The second option for the LGUs is to maintain operational control over the utility. Current experiences, however, reveal many difficulties because of numerous government controls and restrictions. Preferably a separate economic unit or enterprise may be set

9 - 33

ò

up. The private sector may be a viable option. It may use the BOT mechanism or it may invest on a long-term basis in larger systems.

6.

- 3) Technology and Technical Design Specifications: Regardless of the type of institutional model adopted, the technical design standards to be enforced should be uniform. Technical standards used by the water districts and LWUA will be adopted and enforced by the LGUs.
- 4) Bidding of works and procurement of services and materials shall follow the provision of PD 1594 and all other applicable national and local rules on bidding and award of contracts using public funds. The LWUA uses standard formats and procedures for this process and the LGUs may adopt this.
- 5) Construction by a private contractor is preferred. Inspection will be conducted by the water district; by the cooperative or the private developer; or by the LGUs depending on the institutional arrangement adopted.
- 6) Right of Way Acquisition: The waterworks will have to negotiate for the purchase of land on which facilities will be constructed. Should negotiations fail, the government may exercise the power of eminent domain to secure needed lands.
- 7) Operation & maintenance and rehabilitation will be the responsibility of the waterworks. It shall ensure that adequate tools and spare parts are available. It shall employ needed staff and caretakers.
- 8) Water Rate Setting: All rates are subject to public hearings and approval by the appropriate regulatory authority.
- 9) The waterworks shall establish a formal billing and collection system and business practice systems shall be adopted. The LWUA also established a comprehensive commercial practice system, which may be adopted by the organization.
