PREFACE

In response to a request from the Government of the Republic of the Philippines, the Government of Japan decided to conduct a development Study on Provincial Water Supply, Sewerage and Sanitation Sector Plans for Visayas and Mindanao and entrusted the study to the Japan International Cooperation Agency (JICA).

JICA selected and dispatched a study team headed by Mr. Masatoshi Momose of Nippon Jogesuido Sekkie Co., LTD. and dispatches to the Philippines, four times between January 1998 and May 2000, and especially to the Southern Leyte province, one time between January 1999 and December 1999. In addition, JICA set up an advisory committee headed by Ms. Keiko Yamamoto, Development Specialist, Institute for International Cooperation, JICA between December 1997 and May 2000.

The Team held discussions with the officials concerned of the Government of the Philippines, and conducted field surveys at the study area. Upon returning to Japan, the Team conducted further studies and prepared this final report.

I hope that this report will contribute to the promotion of the project and to the enhancement of friendly relationship between our two countries.

Finally, I wish to express my sincere appreciation to the officials concerned of the Government of the Philippines for their close cooperation extended to the Team.

December 1999

Kimio Fujita
President
Japan International Cooperation Agency

Letter of Transmittal

December 1999

Mr. Kimio Fujita
President
Japan International Cooperation Agency
Japan

Dear Mr. Fujita,

We are pleased to submit herewith the Final Report of the Study on Provincial Water Supply, Sewerage and Sanitation Sector Plan in the Republic of the Philippines.

The Study was completed through discussions with the officials of the Government of the Philippines and the field investigation during four visits from January 1998 to May 2000.

The Final Report consists of four volumes: Summary Report which succinctly describes the study and recommendations; Volume I - Main Report which covers not only the long-term and medium-term development plans on water supply, sewerage and sanitation sector, but also institutional, operation and financial strengthening plan for the local governments; and Volume II - Supporting and Volume III - Data Report including detailed analysis, relevant information and collected data.

In view of the urgency of water supply and sanitation improvement as well as the need for socio-economic development in the study provinces, we hope that the said plans will be realized in an early stage.

We wish to take this opportunity to express our sincere gratitude to your agency and the Ministry of Foreign Affairs. We also would like to show our appreciation to the officials of the Department of the Interior and Local Government, the JICA Philippine Office, and the Embassy of Japan in the Republic of the Philippines for their kind cooperation and assistance throughout our field survey.

Very truly yours,

Masatoshi Momose
Team Leader for the Study on
Provincial Water Supply, Sewerage
and Sanitation Sector Plan in
the Republic of the Philippines

Republic of the Philippines
Province of Southern Leyte
OFFICE OF THE PROVINCIAL GOVERNOR
Maasin

MESSAGE

Water is a universal need for survival. Without it, no life would exist on earth. Likewise, sanitation is also vital for the promotion and preservation of the health and hygiene of our people. A healthy constituency ensures peace, economic progress and sustainable development of a community.

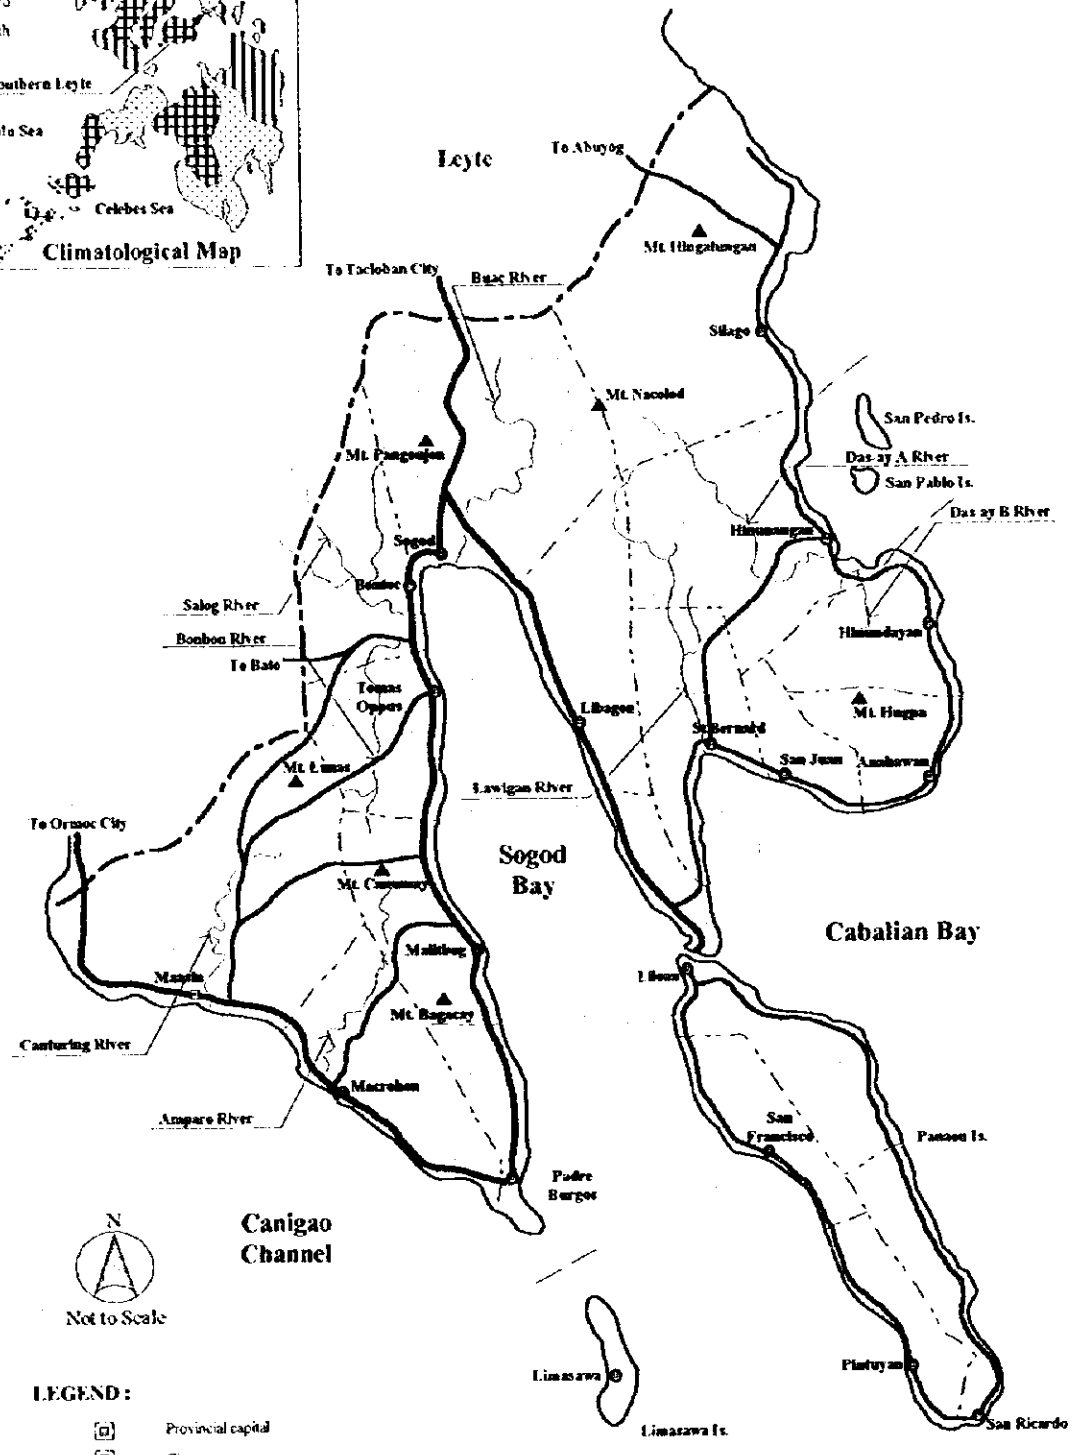

The provision of adequate and reliable potable domestic water supply as well as adequate sanitation facilities is one of the legal mandates of the national and local governments. Water and sanitation projects under the SRA-Poverty Alleviation Funds as well as the Rural Water Supply and Sanitation Sector Program of the Asian Development Bank support the objectives of the local governments of Southern Leyte to provide these facilities to the rural communities. Likewise, water and sanitation needs, including sewerage facilities of the urban areas are also addressed by the Provincial Water Supply, Sanitation and Sewerage Sector Program of the Japan International Cooperation Agency.

Complementary to these facilities are the accompanying capability building trainings for project implementors and the beneficiaries to ensure smooth and sustained operations of the projects.

However, the privilege of enjoying these facilities is accompanied by corresponding obligations on the part of the beneficiaries. Counterparts in the implementation of the project as well as payment of monthly dues are required to develop the beneficiaries' sense of ownership of the project and to ensure the proper operation and maintenance of the facilities.

As we go on in our intention of promoting the well-being of our constituents, I would like to enjoin everyone to continue to solidify and focus our efforts and resources towards a common direction and vision. The realization of our dreams is not impossible if all actors of development will work hand-in-hand and complement each other in the realization of our objectives. Where there is unity and commonality of purpose, progress and development are inevitable. Cohesiveness, unity and cooperation are the keys for lasting peace, for progress and development. Let us work as one family, for God, for Country, for Southern Leyte.

ROSETTE YÑIGUEZ-LERIAS
Provincial Governor

EXECUTIVE SUMMARY

ES

EXECUTIVE SUMMARY

1. Introduction

Background and Objectives

The Provincial Water Supply, Sewerage and Sanitation Sector Plan (PW4SP) for the province of Southern Leyte was prepared by the Provincial Sector Planning Team with technical assistance from Japan International Cooperation Agency (JICA). The PW4SP will be the basis for execution of sector development from proceeds of sector loan by foreign donors, LGU's budget including internal revenue allotment from the National Government and private sector investments.

The PW4SP covers a Long-Term Development Plan (2005-2010) and a Medium-Term Investment Plan (2000-2004) to achieve the provincial targets of water supply, sewerage and sanitation sector. The plan includes arrangements and logistics for implementation and measures to strengthen operational frameworks and institutional capabilities that embody community development and gender responsiveness. As an initial step towards capability building, the Study was designed with the end view of strengthening the LGU's capability in sector plan preparation through conduct of series of workshop and hands-on training.

Planning Approach for Future Sector Development

The primary bases of the PW4SP are national sector policies and strategies, as well as major legislation and regulations relevant to the sector. The guidelines for setting the provincial sector targets are the three national level plans: the Philippine National Development Plan (1999-2024), the Water Supply, Sewerage and Sanitation Master Plan of the Philippines (1988-2000) and the Updated Medium Term Philippine Development Plan (1996-1998). The GOP recently approved the IRR providing detailed arrangements on the devolution of WATSAN responsibilities and resources. Parallel to this are the current sector policies and strategies, to wit: i) self-reliance and local community management of services; ii) an integrated approach to water, sanitation and hygiene education; iii) cost sharing arrangement; iv) cost recovery of capital and O&M; v) private sector participation; and vi) an integrated water resources strategy.

The PW4SP will help ensure that sector investments are optimized in consideration of fund and water source availability constraints as well as planning capacity. It is envisaged that the Plan will be progressively updated as its implementation proceeds. Furthermore, future detailed studies and plans for project implementation shall be conducted in the context of the PW4SP.

A data management system was established as a tool to come up with the outputs commensurate to the objectives of the provincial plan and at the same time reflect the planning approach. It will provide a map of relative needs in the province allowing for adjustment and updating when further information becomes available. Different scenarios may be worked out by planners using the program by changing key parameters based on planning assumptions and conditions.

Report Composition

Three (3) study reports were prepared as follows: i) Main Report (Volume I) which presents the results of the whole study consisting of 12 chapters; ii) Supporting Report (Volume II); and iii) Data Report (Volume III). Supporting materials including alternative studies and detailed calculations, and data/information constitute the last 2 reports.

2. Provincial Profile

Southern Leyte is one of the six (6) provinces comprising Region VIII, the Eastern Visayas Region. The municipality of Maasin is the provincial capital. The province is composed of 19 municipalities. In 1998, there are 501 barangays, of which 60 are urban and 441 are rural. The province is classified as 3rd class. At the municipal level, 15 municipalities belong to 5th class, 1 municipality to 6th class, and the rest has higher classification. The population of the province was 317,565 in 1995 with an annual growth rate of a negative 0.26% between 1990 and 1995.

Physical Features

The province has two (2) types of climate: Type II which is characterized by an absence of dry season with very pronounced maximum rain period and Type IV which has a rainfall that is more or less evenly distributed throughout the year. The topography of the province is generally characterized by the rugged mountains of the Leyte Central Highlands Range that bisects the entire length of the main island of Leyte. Relatively flat areas can be found along alluvial plains and coastal areas.

Salog River is the largest of the six (6) major rivers in the province. It has a watershed of 208 km² and drains to Sogod Bay passing through Tomas Oppus and Bontoc. About 65% of the total land area of the province constitute agricultural land. Remaining forest cover is only 33%, while built-up area is a mere 2%.

Socio-economic Aspects

Agriculture and fishery are the major economic activities in the province. The average annual family income in 1994 was P45,503 which was well below the national average of P83,161. Moreover, about 60% of the total number of families lived within and below the established poverty threshold income of ₱ 37,053 in Region VIII.

All municipalities have electric supply service with a high 70% household coverage. Likewise, telecommunication service is available in all municipalities. Inter-municipal land transportation can be obtained by means of jeepneys, taxis and buses. There are 15 banking institutions, 300 industrial/commercial establishments and 20 tourism-related facilities. With regard to social services, there are 391 schools, 13 hospitals, and 118 health units and barangay health stations.

Provincial population growth rates had been declining for the last 6 censal years. The 1998 population was estimated to provide the planning base for this provincial plan. Considering the 1995 NSO classification of urban and rural barangays, rural population accounts for 73%, while the remaining 27% are urban.

An indicator of health problem related to water supply and sanitation is the high incidence of water-related diseases. The reported cases in the province were viral hepatitis, diarrhea, skin diseases, intestinal parasitism, typhoid, conjunctivities, dengue fever, gastro-enteritis and scabies.

Environmental problems related to wastewater discharge and unsanitary solid waste disposals are occurring in parts of the province. Major pollution sources in urban areas are domestic wastewater and dumped garbage. Only 15% of the total households in the province relied on the municipal refuse collection services.

3. Existing Facilities and Service Coverage

The service coverage of each sub-sector is estimated as percentages of served population/households/utilities against the total number. In water supply, safe classification of Level I facilities is introduced and further categorized into public or private. Aside from household toilets, school toilets and public toilets are included in the sanitation components in view of public hygiene improvement. Preliminary discussions on solid waste management are also considered.

Water Supply

The province has 36 Level III systems operating under different types of ownership (authority or association) together with their service coverage. These are two (2) Water Districts, thirteen (13) Municipal Waterworks and twenty-one (21) RWSAs operated systems. Some of these practice scheduled water supply due to insufficient water sources and/or inadequate capacity of existing facilities. Improvement/rehabilitation of transmission/distribution pipes together with augmentation of water source are the current issues for these systems. Water quality examination is also a common issue, since the current practice is very limited in terms of sampling frequencies and items to be examined. Collection efficiency of water charges is quite high at larger waterworks, which is in contrast with smaller waterworks that experienced very poor collection due to weak management practice.

There are 239 Level II systems operating in the municipalities. Majority utilizes spring sources (235 systems), while 4 systems use shallow/deep/dug wells. Most of these systems supply water for 24 hours with good water quality. About 30% of the waterworks impose a flat rate water charge of 5 to 20 Pesos/HH/month. The rest supplies water free of charge. Repair works are often done with the assistance of the MEO/PEO or DEO as required. It is also prevalent that water quality examination is not adequately conducted.

Level I facilities are common in rural barangays. Of the 3,690 operational Level I facilities, 71% are shallow wells. In the course of PW4SP preparation, 30 - 80% of the shallow wells were assumed as unsafe water source by municipality. All deep wells, covered/improved dug wells and developed springs are regarded as safe water sources. Most of these unsafe sources are located in nearby potential pollution sources, hence, for new construction of shallow wells, proper site selection and appropriate construction method shall be applied together with periodic water quality monitoring. Percentage shares between public and private Level I facilities for rural water supplies are 42% and 58%, respectively. The share of developed springs in public facilities is 17%.

About 73% or 229,500 of the present population (316,100 comprising 27% in urban area and 73% in rural area) are adequately served. Under area classification, 77% of urban population and 71% of rural population have access to safe water sources/facilities. Of the served population, 33% or 74,800 persons are served by Level III systems. About 28% or 64,500 persons depend on Level I facilities, while the rest relies on Level II systems.

Sanitation

The service coverage of sanitary toilets in the province is 82% or 53,230 of the total households, which is well above the national coverage of 60%. These toilets consist of 2% flush type and 98% pour-flush type. In municipalities that have high water service coverage (Hinundayan, Silago), high sanitation coverage occurs and adversely, in low water supply coverage (San Juan, Bontoc), low sanitation coverage also occurs. Urban area has service coverage of 76%, while rural area has 84%. In urban areas, problems arise from the unsatisfactory disposal of the effluent from the septic tanks or the direct discharge of wastewater to the local drains. Sullage management is unheard of. There is no sewerage system in any of the urban areas.

The province has a total of 1,875 toilets installed at 367 schools. Sanitary toilets adequately serve 81% of the students. The present average ratio of 43 students per sanitary toilet is almost equal the service level standard of 40 students per sanitary facility. Some of these facilities are not being used due to lack of water supply, destroyed plumbing fixtures and water tank seepage. There are 39 public toilets found in public markets, bus/jEEPney terminals, and parks or plazas in the province. All these public toilets are sanitary indicating 100% coverage. However, the manner of usage and maintenance are improper rendering the facilities unsanitary. At present, no specific arrangements are made for the operation and maintenance, as well as the collection of fees to cover such cost.

4. Existing Sector Arrangements and Institutional Capacity

Institutional Framework

The Local Government Code has essentially re-defined the roles, relationships, and linkages of central, provincial, municipal and barangay institutions in the provision of basic social services, including water and sanitation. The new direction mandates the LGUs to play a larger role in planning and implementing water supply and sanitation projects. However, this has raised serious institutional capacity and resource reallocation issues.

Drastic changes took place among the DPWH, DILG, DOH and LGUs after the government's decentralization and issuance of NEDA Board Resolution No.4 (1994). To ensure common interpretation of the Resolution, the Implementing Rules and Regulations (IRR) were prepared. The role of implementing water supply projects, which DPWH used to undertake, has been transferred to the LGUs. The functions of the then IPHO under the DOH have also been devolved to the LGUs. It is now the DILG, through the Water Supply and

Sanitation Program Management Office (WSS-PMO) which provides overall coordination over the implementation of WATSAN projects of LGUs.

At the provincial level, the PPDO is in charge of the formulating integrated and sectoral development plans and policies for the consideration of the Provincial Development Council, while the PEO undertakes survey, design of facilities, construction supervision and assistance in O&M of facilities. The PHO is responsible for health, hygiene and sanitary improvement in coordination with MHOs. The PSWDO together with the MSWDO are responsible in community organizing activities. Normally, projects of Level I/II systems are initiated by BCs, and LGUs implement the projects with funds made available for the purpose. The implementing capacity of LGUs is still limited and may require continued assistance from national government line-agencies, NGOs, etc. For this purpose Water Supply Project Task Forces have set up as needed. For the ADB-assisted RW3SP, a WATSAN team was organized. Larger water supply systems are managed by either municipalities or WDs, which have a higher level of management expertise.

The current major institutional issues are: managing the transition process and establishing the LGU's leadership for the sector. Major resource realignments and capacity building initiatives are needed. At the local level, the LGUs' capability to handle sector projects needs to be developed to enable them to address their expanded role sufficiently, and will require substantial input and support.

Community Development

There has been limited experience in planning or implementing community development processes for the WATSAN sector projects in the Province of Southern Leyte. The manner by which CD/CO work is done is how it was done in past sector projects, particularly the Barangay Water Program. While the PPDO and the PSWDO both have the structure to undertake or conduct CD work, this is done only as part of or as a component of other projects. As such, there is an apparent lack of the identified major responsible players on CD, particularly on the provincial level. These create a serious gap to the critical linkage and support of sector projects, from the provincial to the municipal and as far down as the barangay levels. The training programs that should update the knowledge and skills of LGUs on community development have also been very few and far between.

Gender Consideration

For some time now, the Province has been implementing gender-sensitive projects. Those that relate to the WATSAN sector, however, have been limited to health and sanitation, as

well as hygiene projects. Gender and development, as a whole, has still to be fully integrated in the mainstream of projects planned and implemented for the province and its LGUs, including the WATSAN sector. Key informant surveys and group interviews were conducted to determine the degree of community participation on the sector of barangay officials and their constituents, with emphasis on gender-related issues. In general, there is no gender bias in the manner by which WATSAN activities are being practiced:

- water fetching responsibility – Most men claimed that they or their sons fetch water. But according to women, there is no designated gender responsible for fetching water. The responsibility lies on whoever is available.
- operation and maintenance activities – Men were more involved in WATSAN activities, particularly in repair and maintenance of the facilities. But some women claimed that they are also responsible for minor repairs. However, they expressed that both women and men can participate in operating and maintaining WATSAN facilities.
- barangay organizations - These are still male-dominated. Most chairpersons/heads are males, while women occupy the traditional roles, such as secretary or treasurer. This is due to being traditionally patriarchal especially for indigenous communities.
- consultation and project participation – Both women and men were consulted and briefed on their roles and responsibilities in the planning, design and construction of WATSAN facilities. Actual participation during construction came mostly from men.
- WATSAN training – Most men received sector-related training. Both women and men have access to training and are interested to learn new skills.
- Health and hygiene – Both women and men equally recognized the importance of good health and hygiene practices. But women mostly attend health and sanitation training.

5. Past Financial Performance in Water Supply and Sanitation

Since the devolution of the water supply and sanitation project to the LGUs in 1992, the LGUs have been dependent on the Internal Revenue Allotment (IRA) for their financial requirements. For the period 1995-1998, the IRA of the province represented about 95.1% of the total income. The provincial government has no economic enterprises, but it receives municipal income, not on a regular basis from fees and charges from small-scale mining as well as from sand and gravel operations.

On the other hand, actual expenditures for the same period were 91.3% of the total revenue. These expenditures are further broken down into personnel (68.3%), capital outlay (9.7%), and operation and maintenance expenses (13.4%).

The funds for the development are part of the capital outlay of the province. The amount of debt servicing capacity of the provincial government is computed to be P32.16 million for the year 1999, which represents the maximum loanable amount through the MDF.

Funds for the capital outlay is mainly derived from 20% DF of the IRA. For the period 1996-1997, the 20% DF of the province were not sufficient to cover the actual expenditures. For 1998, the province had surplus funds due to delays in the release of funds. For 1999, it is projected that the 20% DF will be adequate to cover the capital expenditures of the province, which is projected at P28.9 million.

During the period 1995 to 1998, the provincial government had allocated its budget to the relevant sector ranging from P200 thousand to P600 thousand. In 1998, the disbursed amount was minimal with 1.95% of 20% DF. There has been no fixed percentage of 20% DF being allotted to WATSAN sector, although its average share to IRA is about 1% for the same period of 1995-1998. Given priority in the WATSAN is Level II spring development. For 1999, the provincial government provided the prioritized WATSAN projects with funds under the social services sector.

The sector projects in previous years were implemented by the task force under the Provincial Engineering Office (PEO) and DILG (BWP – Institutional building, UNDP – WATSAN and CIDA – capability building). The PEO-Waterworks implements the provincial government funded projects under the General Fund. For sector implementation, the following are the local funding sources and corresponding implementing agencies: funding sources are provincial government, CDF (Congressmen) and the municipal government. The respective implementing agencies are the PEO, DPWH-District Office and the Municipal Governments.

With regard to the capital cost recovery for Level I water supply, it was free to the community in the past. For Level II systems, the capital cost is shouldered by the RWSAs through a loan or grant, while for Level III, the WDs or RWSAs bear the entire cost. Those for Level III are usually financed by the LWUA for a period of up to thirty (30) years with interests ranging from 8.5-12.5 %. For less capable WDs, soft loans without interest for the first 5 years of operations are available. Regarding sanitation sector, construction of the super-structure and the depository of household toilet is through self-help.

The O&M cost for Level I and II water supply systems is the responsibility of the users. It is mandatory that the community shall organize themselves into an association that handles collection of water charges as well as O&M of the facility. However, most of the RWSAs

and BWSAs reportedly face difficulty to manage the systems, since beneficiaries do not recognize the cost requirements. The monthly fee for Level I in the active associations ranges from P10.00 to P50.00 /III/month. For Level III systems, the O&M cost is basically covered by the user's fees.

The percentage of water fee to median monthly household income is about 1.4% for Level III, 0.9% for Level II and 0.3% for Level I. Thus, the current water rates in all service levels are within an affordable range. On the other hand, construction cost of household toilet seems to be expensive comparing with the family income.

6. Water Source Development

The study on water source development covers the entire province. It gives an emphasis on groundwater availability rather than surface water considering its economic advantages and current practices in potable water use.

In the island of Leyte, four broad lithologic classifications are made: (1) a schist body, (2) an igneous complex with serpentized facies of probable Cretaceous period to Oligocene epoch, (3) the sedimentary sequence equivalent to that of Samar Island during early Miocene to Pleistocene epoch, and (4) Quaternary volcanics.

The most extensive exposure of the schist body during Pre-Cretaceous period is found at the west-side of Saint Bernard, the northern Panaon Island, and the east-side of Malitbog and Padre Burugos. The layer that is unconformably overlying on the said rocks in the western side of the province is coralline limestone with marly facies. There are volcanic cones and associated flows distributed along a northwestern trending belt controlled by a major fault structure that runs parallel to the Philippine Rift Zone. The evolution of Mt. Hugpa is related to this period of volcanism. Recent deposits consist mostly of unconsolidated alluvium; fine sand, silt, clay with minor gravel. In the river mouth area facing Sogod Bay, the deposits are well sorted along the rivers forming varying thickness, width and length.

For planning purposes in the development of groundwater sources, the provincial area is divided into solo shallow well, deep well and difficult areas. The province has no solo shallow well area. Deep well area covers about 60% of Southern Leyte, while difficult area falls on the remaining area. Ironic and acidic water is observed in shallow and deep wells along the Leyte Central Highlands, where the municipalities of Hinunangan, Hinundayan, Saint Bernard, San Juan and Silago are located.

Based on the inventory of water sources prepared through the study, the province has 496 developed springs currently serving the province. Such spring sources are located in the high mountain areas in the western part, the range area in the eastern part and the southern island part of the province. A total of 90 untapped springs for future development is reported in the eastern peninsula of Leyte Central Highlands area. Other municipalities have few untapped springs. In addition to this, copper mining sites are located in Hinundayan and Pintuyan.

Based on the existing well inventory, the depth of potential aquifers occurs between 20 to 60 meters in the Recent alluvium and the Plio-Pleistocene rocks. The development of deep wells is more advantageous than shallow wells considering the safe quality and invariable yield of deeper aquifers. The trend of acid groundwater is examined in the Leyte Central Highlands area. This groundwater characteristic will be caused by pumped water with high iron concentration. In this case, deep well shall be designed with anti-corrosive materials such as PVC and SUS.

For the preparation of the medium-term development plan in terms of water source development, utilization of spring sources was given first priority, with special attention to the development of Level III systems. Groundwater source availability as second priority was presented by municipality with standard specifications of wells, including parameters such as well depth, static water level and specific capacity.

For the furtherance to design the concrete specifications of the planned wells, recommendations are made to conduct detailed groundwater investigations entailing the construction of test wells, prior to the detailed design or in the pre-construction stage. The municipalities that fall on this group are located in Anahawan, Hinunangan, Hinundayan, Pintuyan, Saint Bernard, San Francisco, San Juan, San Ricardo and Silago.

Untapped springs shall also be surveyed to confirm the development possibility in the detailed groundwater investigation. This will include items on the following: i) locations and type of spring sources; ii) fluctuation of discharge rates through the year; iii) distance from spring sources and proposed served areas; and iv) elevation differences between the two points.

7. Future Requirements in Water Supply and Sanitation Improvement

Physical Targets and Service Coverage

Phased requirements for the sector development in the province are assessed to meet the provincial targets established as percentages of beneficiaries or utilities to be served by sub-sector. Targets of service coverage for water supply in Phase I development were established in consideration of securing the existing service coverage, physical targets of Level I facility for rural water supply under the on-going ADB-assisted project and viable investment using available IRA both in urban and rural water supply as shown in Table 7.1. Sanitation sector target is applied in order to attain sufficiency and balanced distribution of the facilities in urban and rural area as embodied in the PNDP. Sewerage target is set for only part of urban centers in the long-term development, while solid waste management considered the medium-term household requirements. Logistic support is considered as a minimum requirement of LGUs for the implementation of PW4SP. The types and number of well drilling/rehabilitation equipment and supporting vehicle for Level I facilities are identified as reference information. Also, minimum requirements for setting up a provincial laboratory to support drinking water quality surveillance and monitoring activities are described.

Table 7.1 Present Service Coverage and Sector Targets

<i>Sub-Sector</i>	<i>Area/Type</i>	<i>Base Year Service Coverage</i>	<i>Provincial Sector Targets</i>	
			<i>Phase I</i>	<i>Phase II</i>
<i>Water Supply</i>	<i>Urban Area</i>	77	77	95
	<i>Rural Area</i>	71	83	93
<i>Sanitation</i>	<i>Urban HH Toilet</i>	77	90	95
	<i>Rural HH Toilet</i>	83	88	93
	<i>School Toilet</i>	84	90	95
	<i>Public Toilet</i>	100	100	100
<i>Sewerage</i>	<i>Urban Area</i>	0	Not applicable	50
<i>Solid Waste</i>	<i>Urban Area</i>	56	60	Not applicable

Frame values are projected by municipality for respective sub-sectors; future population by urban and rural area, the number of students in public schools and the number of public utilities.

Required Facilities to Meet Target Services

Types of required facilities and their implementation criteria are determined according to service level standards as adopted by the NSMP and NEDA Board Resolutions. Urban population is planned to be served by Level III systems, however, existing Level I and II facilities are to be used during Phase I period. For rural water supply, Level I facilities to be constructed under the on-going ADB-assisted project are adopted for Phase I requirements.

However, it does not exclude from being implemented Level I and II facilities in urban area as individual cases in the future as well as Level III systems in rural area. Rehabilitation work is planned only for new deep wells (Level I) to be constructed under PW4SP, considering the difficulty of rehabilitation for existing wells constructed by means of traditional methods. Facilities for the provincial laboratory are determined, taking into account existing facilities and the exigency to examine the water samples at the right time.

In sanitation sector, pour flush and/or flush type household toilets are planned, while VIP type household toilet and sanitary pit latrine are considered in rural area as an intermediate measure. Household toilets, school and public toilets to be provided under the on-going ADB-assisted project are taken into account for Phase I requirements. Sewerage program is planned in Phase II for limited urban area. The study on solid waste considered only the number of required trucks for the year 2000. Additional service coverage of the sector by phase is shown in Table 7.2.

Table 7.2 Additional Service Coverage by Phase

<i>Sub-Sector</i>	<i>Area/Type</i>	<i>Unit</i>	<i>Additional Service Coverage</i>	
			<i>Phase I</i>	<i>Phase II</i>
<i>Water Supply</i>	<i>Urban Area</i>	<i>Persons</i>	<i>15,331</i>	<i>48,453</i>
	<i>Rural Area</i>	<i>Persons</i>	<i>24,300</i>	<i>25,753</i>
<i>Sanitation</i>	<i>Urban HH Toilet</i>	<i>No. of Households</i>	<i>1,297</i>	<i>10,503</i>
	<i>Rural HH Toilet</i>	<i>No. of Households</i>	<i>1,968</i>	<i>8,754</i>
	<i>School Toilet</i>	<i>No. of Students</i>	<i>6,131</i>	<i>5,224</i>
	<i>Public Toilet</i>	<i>No. of Utilities</i>	<i>7</i>	<i>2</i>
<i>Sewerage</i>	<i>Urban Area</i>	<i>Persons</i>	<i>Not applicable</i>	<i>26,847</i>
<i>Solid Waste</i>	<i>Urban Area</i>	<i>No. of Households</i>	<i>3,529</i>	<i>Not applicable</i>

The necessary water supply facilities for Phase I include 13 deep wells/springs for 3,170 house connections in urban area and 270 Level I wells/springs for rural area. These Level I facilities will be constructed under the on-going ADB assisted project. For Phase II, 20 deep wells/springs for additional 12,100 connections and 437 Level I wells/springs are required for urban and rural water supplies, respectively. Rehabilitation requirements are assumed to be 10% of the total number of deep wells to be constructed under PW4SP. The on-going ADB assisted project will provide three (3) water quality laboratories and four (4) portable water test kits that are considered sufficient for the medium-term requirement.

For urban water supply, one Level III system is, in principle, considered for urban area of every municipality. In the municipalities with existing Level III system/s, the expansion of the existing system/s was first considered. In case there are no Level III system, a new sys-

tem was recommended. Existing plan/s on the development of Level III/WD are also taken into account to determine respective system of the municipalities.

Merging of municipal systems (physical arrangement) in long-term is considered. Integrated management systems shall also be sought. Conditions to be studied include; water source availability, willingness by concerned municipalities and technical study on cost recovery/economic construction.

The following municipalities may be studied for the integration both in physical and management systems.

- Bontoc and Sogod
- Saint Bernard and San Juan

Integration of small Level III systems for operation and management shall be sought, although these systems are currently managed individually.

Moreover, Phase I sanitation will require 6,128 household toilets, 10 public school toilets and 7 public toilets for urban area. In rural area, 1,968 household toilets and 17 public school toilets are necessary. Solid waste disposal will need 14 refuse collection trucks. For Phase II, urban area will require 10,503 household toilets, 6 public school toilets and 2 public toilets. In rural area a total of 8,754 household toilets and 237 public school toilets are necessary. It is assumed that half of the requirements of school toilets may be converted to classroom toilets from standard toilet building depending on technical conditions and adjustment with DECS.

8. Sector Management for Medium-Term Development Plan

Institutional Framework

To effectively manage the water and sanitation sector, the provincial and municipal governments need to adjust their current policies and structures to achieve closer coordination with the overall policies, institutional and regulatory frameworks, and resource-sharing systems of the water sector.

The adjustments would enable the LGUs to avail of opportunities in the sector, specifically:

- To immediately improve the physical infrastructure for water, sanitation, and related environmental services; and
- To acquire permanent capabilities for planning, management, and development of sustainable institutions in the sector.

In line with the proposed adjustments, the Province will adopt the following policies and strategies in relation to the development of the water sector:

- Facilities will be managed with emphasis on sustainability;
- Project selection and prioritization based on beneficiaries' commitment and willingness to pay, on the current water, sanitation and health conditions, and on potential for growth;
- Technology appropriate to local conditions and resources shall be adopted. Facilities will be selected and designed for economy, while construction costs should not compromise quality, reliability, useful life, and provisions for upgrading and expansion;
- An integrated approach shall be used in the provision of potable water supply, sanitation, and hygiene education;
- Water supply and sanitation services shall be made available equally to rural and urban areas, and to wealthy and depressed areas;
- Cost recovery measures consistent with national policies on subsidies and loans to the sector shall be implemented at the local level;
- Private sector participation will be preferred whenever practical in the design, construction, operation, and maintenance of the facilities;
- The province will consider and, if practical, tap potential sources of local and external funds (loans and grants) to finance the capital requirements of the sector;
- Environmental protection and management measures will be integrated in all sector development plans and activities;
- Provisions shall be made to ensure water supply and sanitation services under emergency conditions.

To be successfully implemented, these policies and strategies require a common vision to be shared by its officials and by a critical mass of its citizens, that can focus their efforts and resources to achieve sectoral goals. For this purpose, the LGU should give priority to an "Information, Education and Communication Program" aimed at creating safe water and sanitation values in communities throughout the province.

Also to be given priority by the LGU are the following:

- Measures to set up, in coordination with appropriate national and local agencies, a coordinated regulatory framework considering, among others, the following: policies on water allocation and water rights (resolution of priorities and conflicts); setting and review of water rates; registration of water associations; water quality assurance; and the protection of water resources and enhancement of watersheds.

- Measures to avail of national and external funds that, although diminishing, are assumed to continue in the medium-term to be channeled through local offices of central agencies.
- Adoption of this PW4SP as a basis for the Annual Sector Plan which, together with the budgets, will be reviewed by the Governor and passed upon by the legislation as part of the annual provincial budget approval process.

In the medium-term, a full-time Provincial Water Supply and Sanitation Unit (PWSU) shall be set up by the Province, supported by adequate logistics and incentives. The PWSU will implement, assist and monitor all water supply and sanitation services in cooperation with the Municipalities which, for their part, will establish a Municipal Sector Liaison Team (MSLT). The DILG WSS-PMO shall continue to provide technical and managerial assistance in the formative years of the PWSU and MSLT.

For institutional arrangements, the formation of community-based associations to decide on and participate in the establishment, operation and maintenance of water systems shall be a prerequisite to availment of project support. These may be in the form of BWSAs for Level I systems and RWSAs for Level II and III systems. To provide the members with the necessary skills, training programs will be implemented by concerned national agencies and by the provincial and municipal governments. In all cases, women shall have equal opportunities to be trained and involved in all phases of project management (planning, construction and O&M) and in undertaking health and hygiene education programs.

Community Development

To ensure that the full participation of the beneficiary community in sustaining sector projects is realized, it is recommended that the LGUs provide the needed human, financial and other material resources for community development work to take-off. To institute the linkage among all the actors in sector development, a CD Unit should be established within the proposed Provincial Water Supply and Sanitation Unit. A permanent CD Specialist shall be appointed to take charge of promoting, developing and coordinating CD and IEC programs of the province, even looking into how it can harness the participation of the private sector and train project beneficiaries. It is also recommended that a CD Specialist be assigned to the existing Municipal WATSAN Liaison Task Force to coordinate and implement all CD/CO and IEC work at the municipal level. At the barangay level, it is recommended that each Barangay Development Council (BDC) establish a WATSAN Committee that will coordinate all sector projects in the barangay as well as designate one person who can be trained on CD work.

The power of information, education and communication as a necessary foundation activity for CD has not been fully realized and maximized. It is, therefore, recommended that a comprehensive IEC program be conceptualized and implemented on the national, provincial and municipal levels. The program will promote a better awareness and understanding of the responsibilities of sector planners as well as the benefits due to the project beneficiaries so that the gains of the sector can be sustained on a long term basis.

It shall be the DILG who shall retain the central role as the national government agency that promotes and develops the capacities of the province and the municipalities in participatory CD approaches and IEC programs for the sector. It shall also encourage and institutionalize the participation of national NGOs, with local networks or offices that specialize in community management program and utilize these to enhance and assist the LGUs in organizing project beneficiaries. Another national agency, the LWUA, shall on the other hand, continue to promote community participation in the formation of LGU-WS into water districts and to provide regular CD assistance particularly in consultation with the community on projects, loans, and water rates adjustments.

The LGUs and the intended beneficiaries can both participate in sector development: Level I – for the planning and implementation of sector projects and in the formation and management of a water supply and sanitation association/cooperative; Level II – for the formation of a water supply and sanitation association/cooperative or a waterworks; while Level III – for the formation of water districts or LGU-operated waterworks. Thus, it is important that the LGUs make the decision on the projects it can afford to implement.

To achieve this, the LGU must encourage active community participation and involvement through four approaches. These are: (1) sharing relevant information on the project with the beneficiaries, (2) consulting with users on all phases of project development; (3) giving ample room to the beneficiaries to make project-related decisions; and (4) providing opportunities to the community to initiate actions for their own benefit.

On the other hand, recommended are four ways that beneficiaries themselves can participate in sector projects, some of which have been tried in the province. These are: (1) the provision of free labor and/or materials by community members; (2) the sharing of costs between project proponent and the users; (3) expressed participation of all parties through MOAs and, (4) the participation through a firm involvement and commitment of the community in the management, operation, maintenance of the system itself.

For Levels I and II, the WATSAN Unit should utilize the recommended Community Development Framework (modified from the UNDP-WATSAN Project) consisting of three phases of activities: Phase 1 is Formation of Organization; Phase 2 is Development of Organization; and, Phase 3 is Consolidation of Organization.

Gender Consideration

Since sustainability of WATSAN services depends on responding to the demands of men and women in the community, the LGUs must recognize and give vital emphasis on the role of gender sensitive participation because the use, maintenance and financing of WATSAN systems require the participation of both the men and women. Thus, they should be given equal voice and opportunities in serving the community as well as in the planning, implementation and monitoring and evaluation of sector projects. To ensure gender responsiveness of WATSAN projects, the LGUs should be trained through a Trainor's Training Program on Gender Responsive Planning as envisioned by the Philippine Plan for Gender Responsive Development (1995-2025).

9. Cost Estimates for Future Sector Development

The investment cost includes direct cost for construction/rehabilitation of required facilities, procurement of vehicle/equipment, construction/upgrading of laboratory, sector management, physical and price contingencies, and value-added tax. Among others, the required cost for Level I facilities and sanitation facilities under the on-going ADB assisted project was excluded from medium-term development plan. The recurrent cost is incurred for operation and maintenance of facilities. Unit construction cost per person/household/ facility was first prepared under contract-out basis in 1998 price level. Investment cost required by phase for the province is summarized in Table 9.1.

Total investment cost for Phase I is estimated at about P119.0 million. A total of P68.3 million is required as the construction/rehabilitation cost (including cost for disinfection of well) in Phase I, of which urban water supply and sanitation share 91.5% and 8.5%, respectively.

Required equipment and vehicle for construction/rehabilitation of Level I facilities and solid waste management are roughly estimated: 1 set/unit each of well drilling equipment and service truck with crane; 1 set/unit each of well rehabilitation equipment and support vehicle; and 14 units of refuse collection truck. The total procurement cost is estimated at approximately P56.45 million. The works for Level I facilities and the supporting vehicle/equipment will be managed through ADB-assisted project. However, those for maintenance of facilities

will be required through the future. In this connection, one set/unit each of well rehabilitation equipment, support vehicle and maintenance tools/water quality testing kits is incorporated in the medium-term investment plan.

Likewise, annual recurrent cost in 1998 price level is estimated at P20.4 to P23.0 million/year during Phase I period.

Table 9.1 Investment Cost Required by Phase(Change)

Unit: 1,000 Pesos

<i>Item</i>	<i>Component</i>	<i>Phase I</i>	<i>Phase II</i>
Construction/ Rehabilitation	Water Supply		
	Urban Area	62,350	305,002
	Rural Area	0	110,792
	Sanitation		
	Household Toilet	1,095	631
	School Toilet	4,670	56,741
	Public Toilet	0	737
	Disinfection of Well	201	2,118
	Urban Sewerage	N/A	195,983
	Sub-Total	68,344	659,931
Procurement of Vehicle/ Equipment/Maintenance Tools	Well Drilling Rig & Service Truck	0	26,782
	Support Vehicle	590	0
	Well Rehabilitation Equipment	280	0
	Maintenance Tools	190	0
	Water Quality Testing Kits	15	0
	Sub-Total	1,075	26,782
Water quality Laboratory		0	0
Sector Management	Engineering Studies	8,764	60,231
	Community Development and Training	2,431	41,699
	Sub-Total	11,195	101,930
Total Direct Cost		83,358	790,129
Contingencies	Physical Contingency	8,056	78,864
	Price Contingency	22,520	N/A
	Value-Added Tax (VAT)	7,813	N/A
Total Investment Cost		119,005	867,507
Total Investment Cost (excluding Price Contingency)		96,433	867,507

Note: Institutional development includes;
1. Capacity enhancement program, 2. Community management program, 3. Health and hygiene education, 4. Water quality surveillance, and 5. Administrative support.

10. Financial Arrangements for Medium-Term Development Plan

Financial arrangements to attain medium-term (Phase I) targets were sought focusing on available Internal Revenue Allotment (IRA). The financial shortfall was first identified for this sector and recommendations were made to seek comprehensive logistics in terms of acquisition of various funds, augmentation of current practices in Government assistance to this sector, and effective investments and cost recovery.

The on-going ADB-assisted project for rural water supply (Level I) and sanitation improvement (implementation period: 1999-2001) was fully considered for the financial study as part of the Medium Term Development Plan. In this regard, financial arrangements required are those excluding the components scheduled by ADB-assisted project. Furthermore, sector IRA allocation was discounted (less than 3%) to ensure LGU's contribution (10% of construction cost) to the ADB-assisted project (overlapping period with the project is from 1999 to 2001).

The projection of IRA to the relevant sector for Phase I period was made covering different administrative levels. Provincial allocation to the relevant sector is assumed to be about 2%. This means that approximately 10% of "20% Development Fund" from national IRA are counted on sector projects. The same percentage is applied for the allocation of municipal IRA to the sector. The fund available for this sector for 5-year implementation period from 2000 to 2004 was calculated as a sum of municipal and provincial allotments.

The combined provincial and municipal IRA to the sector was estimated at P49.7 million (provincial IRA is 1.58% of the total IRA). In the overall IRA allocation to the sub-sectors, urban water supply has the largest allotment of 90.4% or P44.9 million. While the share of urban and rural sanitation are 4.0% (P2.0 million) and 5.6% (P2.8 million), respectively.

The shortfall in funding on the current price level was figured out comparing with available fund for the relevant sector (IRA) in the province over the Phase I requirements. IRA can fund only 52% of the requirements as a provincial average. Hence, there is a shortfall of P46.7 million in funding. It will become P69.3 million in consideration of contingencies and VAT. In the municipal level, more than half of the municipalities of the province will achieve the target needs including Hinunangan, Limasawa, Macrohon, Padre Burgos, Pintuyan, San Francisco and San Ricardo. Maasin is only 19% in achievement. The provincial average is 52% (42% in consideration of contingencies and VAT).

Under the above situation, different levels of funding availability are discussed with reference to service coverage. Alternative countermeasures are also discussed in view of: i) acquisition of external funds; ii) augmentation of sector finance under current arrangements (IRA and others); iii) introduction of private sector participation to mitigate public investment needs; and iv) effective and economical investments. It is common to all sub-sectors except for rural water supply that the service coverage in the year 2004 would not sustain even the present levels in the provision of only projected IRA. Using computer-based pro-

grams, these scenarios may be modified by policy makers according to the updated information and policy on available fund and sector targets.

In the synthetic investment need ranking of municipalities covering four sub-sectors, the top ranking municipalities are Pintuyan, Limasawa, Bontoc and San Juan (Cabalian), which indicates that they are given priority for investments in all sub-sectors. The municipality of Silago is the least priority in terms of investment ranking.

Potential ODA assisted project was additionally studied, to which central government will extend grant. In this connection, Level I rural water supply component was excluded, since the on-going ADB assisted project will cover the requirements for medium-term development target. While some sanitation components beyond the scope of the said ADB assisted project were studied for limited classes of the municipality to meet the established provincial target in 2004.

For the Project, the DILG is assumed to be the Executing Agency and the province, the Implementing Agency in the meantime. The project may be merged together with those of the 4th batch provinces in the preparation of the PW4SP. The implementation of a packaged project may be realized in the near future.

Project components including school toilet facilities were identified to meet the conditions in provision of GOP-assisted project. There are four (4) eligible municipalities in terms of 5th and 6th municipalities for GOP-assisted projects (limited to 3rd to 6th municipalities) in sanitation sub-sector. The sanitation component 12 school toilets to the rural communities. The works for Level I facilities and its supporting vehicle/equipment will be managed through ADB-assisted project.

Two alternatives for the financial arrangements were studied, these are: i) Case 1-Utilization of IRA only; and ii) Case 2-Utilization of IRA and MDF.

For Case 1, GOP shall share 50% of the overall project cost in combination of the foreign assisted loan of 26% (P2.2 million) and government counterpart fund (24% or P2.0 million). The remaining 50% of the overall cost shall be shared between the LGUs by 47% or P3.9 million and BWSAs (beneficiaries) by 3% or P0.3 million. Under this case, the IRA to be

used by the LGU will increase to P5.0 million from P3.9 million (1998 price level) considering contingencies and VAT. As a result of cost comparison between the estimated project cost to be shared by the LGUs and available IRA of LGUs (P2.6million), it was identified that there is a shortage of about P2.4 million, achieving about 50% of the proposed requirements. As an option to solve this financial shortage, the provincial government may utilize sector IRA allotted (concerned municipalities and province) to urban water supply or other sub-sectors without limiting to the available IRA for rural water supply sub-sector, as the possible financial source.

For Case 2, the utilization of the MDF is considered in case the LGUs will fail to furnish IRA for the cost to be shared. The foreign loan may be availed of at the maximum financing limit of 75% of the overall project cost. GOP is possibly to finance up to P6.3 million or 75% of the total project cost in the portion of loan. Out of GOP finance through the loan, P2.2million or 26% of the total project cost shall be granted to the LGUs, aside from 24% GOP counterpart fund. The remaining P4.1million or 49% of the total project cost shall be utilized for financing the LGUs to secure their budgetary capacity through MDF. Under this case, the total required cost for the proposed project will be covered without financing from the available IRA.

Cost recovery and cost sharing shall be promoted to attain the planned target based on the principle that adequate water, sewerage and sanitation facilities should be paid for. For Level I water supply systems, LGUs and beneficiaries are required to share the capital cost. While users need to pay water charge up to 2% of their monthly income to sustain the system (maximum P98/HH/month in 2004). For Level II water supply systems, full cost recovery is required for all capital and recurrent cost (P114HH/month in 2004, 2.3% of monthly income). For Level III water supply systems, a full recovery of capital and O&M cost is required (P205/HH/month in 2004, 4.2% of monthly income). Based on the experience that water fee must not exceed 5% of income, the monthly rate seems to be affordable.

For sanitation, LGU's support is limited to the provision of toilet bowl for pour-flush toilets as an incentive to increase the distribution of water-sealed toilets. To expedite the sanitation sector improvement, introduction of specific loans with low interest rate and longer repayment period may be effective. For urban sanitation, to cover the construction cost of sanitary toilets, a linkage with existing housing loan may be established.

11. Monitoring of the Medium-Term Development Plan

The sector monitoring system must support a well-defined and accepted sector development process-model. This will include information collection, tracing the flow of raw data from the field to the central level, information analysis, and data feedback. With the sector monitoring system in place, planners should be able to take a fresh objective view of the way current strategies are implemented. It should be followed through with effective feedback.

The sector monitoring system should reinforce the linkage between water, sanitation and health. It should be reliable and practical, and should involve the beneficiaries and be accepted by all sectors.

A three-phased monitoring system is proposed with each phase progressively increasing the number and complexity of indicators to be used. Detailed implementation of the first phase requirements is presented in this PW4SP, including institutional arrangements. It is envisaged that this will be linked with the national sector monitoring system being developed.

Chapter

INTRODUCTION

1

I. INTRODUCTION

I.1 Sector Development in the Philippines

The Government of the Philippines (GOP) has, over the last decade, with the assistance from external donors, made considerable progress in developing the water supply and sanitation sector. Development has covered physical and institutional framework nationwide.

Nevertheless, infrastructure service delivery including this sector during the period 1987 to 1997 has been insufficient to keep pace with the demand, which was magnified by natural calamities and economic status of the country.

About 68% (46.7 M) of the population nationwide enjoyed access to potable water supply in 1995 (66% in 1992). In urban areas outside Manila, 61% (11.6 M) had access to safe water supply services (47% in 1992), while in the rural areas, 70% (26.1 M) was covered by point water sources (80% in 1992). However, from the surveys conducted through the PW4SP, it was found out that about 20-30% of the existing water sources in the rural areas fall on the category of underserved or unserved in terms of safe or unsafe sources, damaged and non-functioning sources. Hence, of the rural population, it was estimated that only about 50-55% was served adequately by safe sources. This implies that around 60% of the total population enjoy water supply services at present.

Private sanitary toilets were available to 66% (45.3 M) of the total household nationwide in 1996 based on the DOH compiled reports. Communal toilet facilities are generally found only at schools, public markets and sometimes in bus terminals and town parks. For sewerage, only portions of the cities of Metro Manila, Cebu and Baguio have sewerage systems. Municipal refuse collection using service trucks is limited to urban areas. In 1996, majority of the households (55%) practiced individual disposal, mostly dumping, while the remaining 45% relied on municipal refuse collection and disposal services.

The policies and strategies on the sector are generally guided by the "Updated Medium-Term Philippine Development Plan (MTPDP: 1996-1998) in 1996" and the recently published "Philippine National Development Plan (PNDP: 1999-2025)". Activities in the sector have been directly guided by the "Water Supply, Sewerage and Sanitation Master Plan of the Philippines 1988-2000" since its issuance in 1988. The National Sector Master Plan (NSMP) sets ambitious targets to reach large segments of the population and to redress the imbalances between rural and urban areas. Meanwhile, the Updated MTPDP revised the targets for water

supply services based on updated conditions in 1996. The PNDP further modified the targets this year to suit current sector status.

Development in the sector had previously been directed to a high degree by central government agencies. However, the GOP has been instituting devolution and full decentralization of responsibilities for implementation of infrastructure projects to Local Government Units (LGUs), in line with the Local Government Code of 1991. Major initiatives towards this direction in the sector are the current projects being implemented such as the World Bank-assisted Local Government Unit-Urban Water Supply and Sanitation Project and the ADB-funded Rural Water Supply and Sanitation Project. Both projects aim at building/enhancing local level capacity in planning, implementation and management of water and sanitation services.

The GOP has also recently approved the Implementing Rules and Regulations (IRR) of Clause (g) of NEDA Board Resolution No. 4 (series 1994) providing detailed arrangements in accordance with broad reforms aimed at streamlining sectoral activities. The institutional framework therefore, presented in this provincial sector plan considers the direction of the central government agencies and LGUs in the sector.

1.2 Provincial Sector Planning

1.2.1 Objectives of Sector Planning

The main objectives of the provincial sector plan are:

- (1) To formulate a Long-Term Provincial Development Plan with a target year of 2010 for the water supply, sewerage and sanitation sector;
- (2) To propose a Medium-Term Sector Investment Plan covering the years 2000-2004 to form the basis for implementing foreign and locally funded projects;
- (3) To recommend arrangements and logistics for implementation; and
- (4) To provide measures to strengthen operational framework and institutional capabilities including community development and gender responsiveness.

1.2.2 Scope of Sector Planning

The study covers the following major elements to achieve the objectives mentioned above.

- (1) Collection and Review of Previous Studies and Existing Data, and Establishment of Data Base: Inventories on existing conditions and facilities

- 1) Natural conditions and geographical features
- 2) Socio-economic conditions
- 3) Population
- 4) Health status
- 5) Environmental conditions
- 6) Existing facilities and service coverage
 - Water Supply
 - Sanitation and Sewerage
- 7) Existing sector arrangements and institutional capacity
 - Sector institution
 - Current community development, gender and training approaches
 - Existing sector monitoring systems
- 8) Past financial performance in the sector development

(2) Long-Term Development Plan

- 1) Projection and assumption of planning framework: projection of population and relevant frame values, and targets of the sector plan
- 2) Service coverage by target year
 - Water Supply
 - Sanitation and Sewerage
- 3) Water source development
- 4) Service expansion plan
- 5) Estimation of project cost
- 6) Investment program

(3) Medium-Term Investment Plan (5-year)

- 1) Facilities and equipment, and rehabilitation required meeting target services
- 2) Identification of priority projects
- 3) Sector management plan
 - Institutional arrangements
 - Community development, gender and training
 - Procurement, construction and operation and maintenance
 - Sector coordination
- 4) Estimation of project cost
- 5) Financial arrangements
 - Sources of fund
 - Additional funding requirements

- Investment needs ranking of municipalities
- Implementation arrangements
- Cost recovery

(4) Monitoring for Evaluation of Provincial Plan Implementation

1.2.3 Financing of Sector Plan

The First Water Supply, Sewerage and Sanitation Sector Project (FW4SP) was implemented with financial assistance from the World Bank (IBRD). With reference to the Project, the technical assistance to help Provincial Governments prepare 37 provincial sector plans in Luzon area was financed by various bilateral and multilateral agencies, such as the United Nations Development Program (UNDP), the Danish International Development Agency (DANIDA) and the Japan International Cooperation Agency (JICA).

In September 1996, the GOP requested the Government of Japan to finance the preparation of the Study for 21 provinces in Visayas and Mindanao areas. Among these was Southern Leyte province, which was assisted by the JICA. The PW4SP will be the basis to permit execution of the sector development from the proceeds of the sector loan by foreign donors, LGUs budget including internal revenue allotment from National Government and private sector investment.

1.3 The Provincial Plan for the Province of Southern Leyte

1.3.1 Preparation of the Plan

The PW4SP for the Province was prepared by a Provincial Sector Planning Team (PSPT) organized by the provincial government. The members consist of the Provincial Planning and Development Coordinator (PPDC), the planning and development officers from PPDO, and the staff members from Provincial Engineers Office (PEO), Provincial Health Office (PHO) and Provincial Local Government Operations Office (PLGOO-DILG). The preparation of the plan was assisted by the Department of the Interior and Local Government (DILG), the Department of Public Works and Highways (DPWH), the Department of Health (DOH), the Local Water Utilities Administration (LWUA), the National Economic and Development Authority (NEDA), other national line agencies and non-government organizations (NGOs) active in the sector. The PSPT was also assisted by the JICA Study Team through technical grant assistance from the Japanese Government (refer to Minutes of Discussions between

DHLG and JICA, and Figure 1.3.1 Organization Chart, 1.3.1 Preparation of the Plan, Supporting Report).

The PW4SP has been prepared at municipal level covering all sub-sectors for each municipality of the Province.

The report consists of three (3) volumes: I - Main Report, II - Supporting Report, III - Data Report.

1.3.2 Outline of the Report

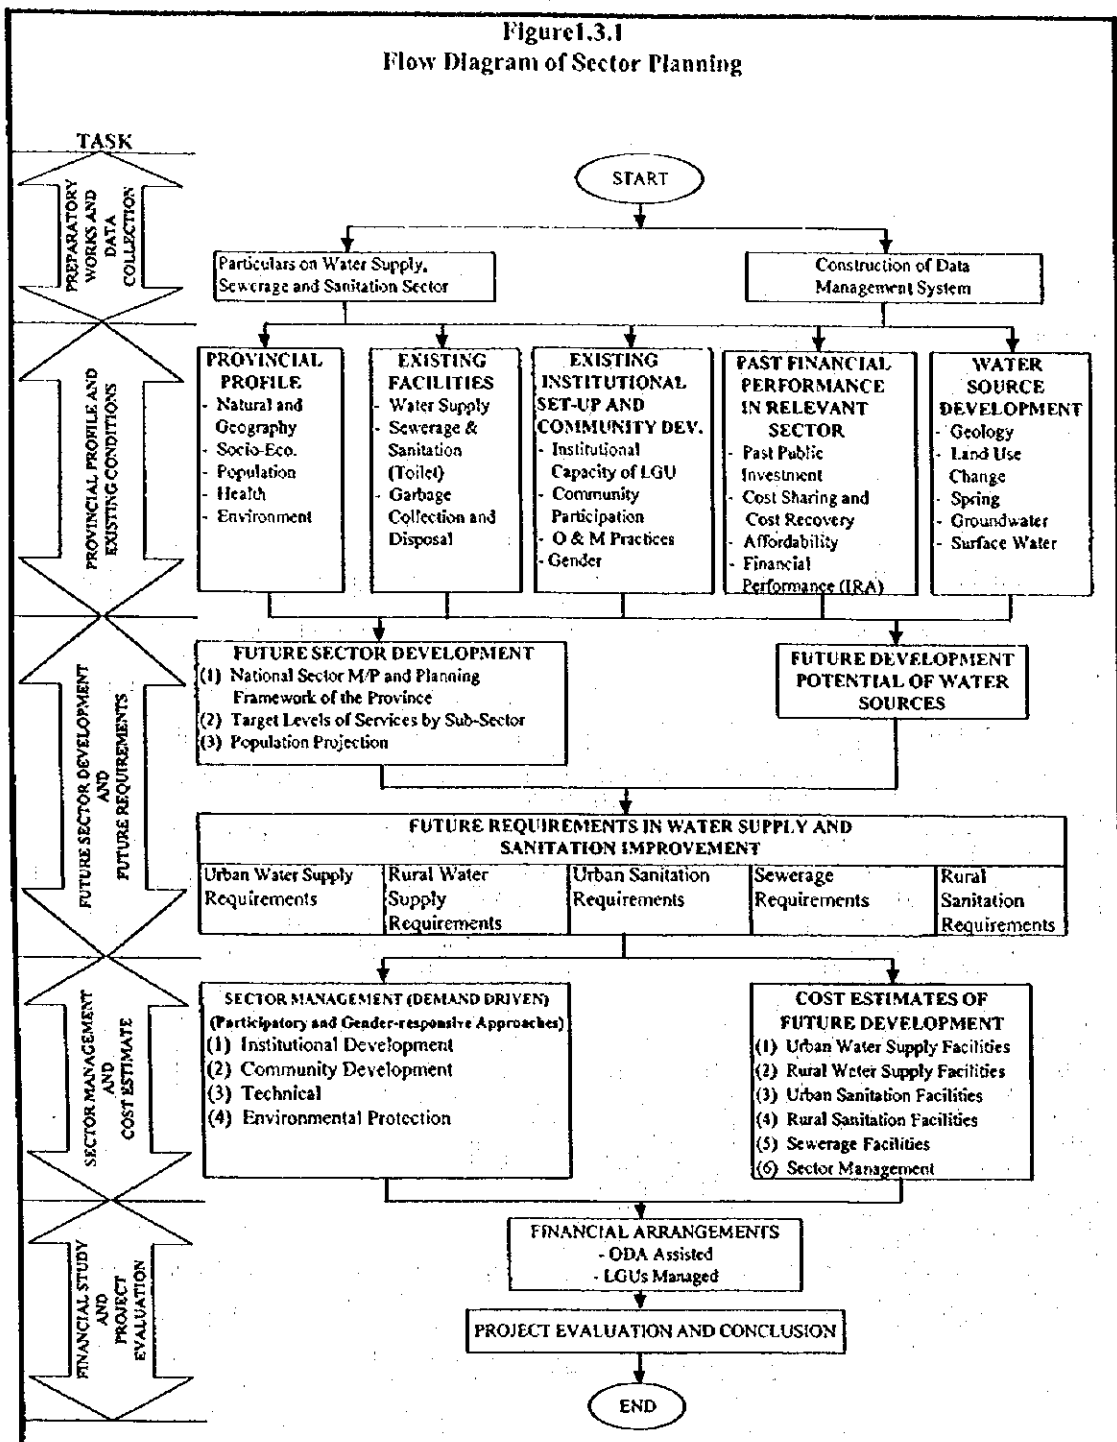

The PW4SP is a framework plan that would serve as the basis for the future implementation work in the sector. It will be carried out either as large-scale projects funded by international agencies or as a small size project carried out by local parties. It should be noted that the PW4SP is a sector development plan for the entire province and that it does not include detailed planning of individual projects. The individual projects will commonly cover selected sub-sector/s for limited areas and detailed planning/design work has to be conducted for the respective projects before start of construction work. The planning process is presented in Figure 1.3.1. The following are the contents of the Main Report (List of data and information collected is included in 1.3.2 Outline of the Report, Data Report).

Chapter 2 describes the planning approach for the sector development, which guides the preparation of the plan: the background and rationale for provincial planning; as well as the planning tool that relies heavily on local participation and gender responsiveness, and flexible enough to improve planning and implementation.

Chapter 3 provides the provincial profile with reference to current sector conditions: natural conditions and geographical features, socio-economic conditions, demographic trends, health status and environmental conditions as the planning environment.

Chapters 4, 5, and 6 provide existing sector conditions in physical, managerial and financial aspects: existing water supply and sanitation facilities by service level and service coverage; sector institutions, community development, gender and training, as well as monitoring systems; and financial performances entailing cost recovery and affordability and new fiscal policies that are the basis and references to come up with future development plan.

Figure 1.3.1
Flow Diagram of Sector Planning

Chapter 7 analyzes the possibility of water source development for the water supply component: geological and hydrological conditions in the province, and future development potential of different water sources. Furthermore, water source availability by concerned municipality was presented with well specifications for the medium-term development.

Chapters 8, 9 and 10 develop the long-term Development Plan and the medium-term Investment Plan both for physical and sector management requirements. Emphasis is placed on the sector management for the medium-term development plan entailing institutional arrangements and operational framework, community development, gender and training and project implementation needs. Required costs for physical and institutional elements are also presented according to the implementation arrangements.

Chapter 11 presents the financial arrangements based on identified sources of fund. The financial shortfall is shown to meet provincial targets established for the Medium-Term Investment Plan. The manner of national budget allocation (IRA) to municipalities by sub-sector is illustrated and trial calculation is made for the target year considering the new cost sharing policy between the central government, the LGUs and the beneficiaries. Investment need ranking of municipalities as a factor of financial allotment is also considered based on synthetic evaluation of sector components. The financial viability study of Level I water supply and sanitation projects is highlighted with reference to ODA assisted projects for eligible municipalities. Finally, cost recovery by the beneficiaries and the LGUs is discussed.

Chapter 12 provides recommendations on monitoring of implemented projects covering procedures and responsibilities in different administrative levels. Periodic monitoring will allow for the updating of the PW4SP and modification of respective projects both in quality and quantity.

1.4 Acknowledgment

The Provincial Sector Planning Team (PSPT) which was responsible in the preparation of the PW4SP, acknowledges the extended cooperation, support and assistance of the Department of the Interior and Local Government (DILG), and other national, regional, provincial, municipal, city, and barangay institutions. These institutions had shared essential data and planning principles (List of individuals and their corresponding offices who directly participated in the preparation of the plan is included in 1.4 Acknowledgment, Data Report). The Japanese Government through JICA has generously provided technical assistance to the PSPT throughout the course of the planning work.

Chapter

2

**PLANNING APPROACH FOR
FUTURE SECTOR DEVELOPMENT**

2. PLANNING APPROACH FOR FUTURE SECTOR DEVELOPMENT

2.1 General

The primary basis of the PW4SP is summarized with reference to the national sector policy and strategies as well as the major legislation and regulations relevant to the sector. Planning framework is also discussed with reference to key measurable targets. Guiding principles for preparation of the plan are described in application of computer-aided planning approach.

2.2 Planning Framework

The GOP, through the Water Supply, Sewerage and Sanitation Master Plan of the Philippines: 1988-2000, the Philippine National Development Plan: 1999-2025, and the Updated Medium Term Philippine Development Plan (MTPDP): 1996-1998, has manifested its commitment to the development of safe and dependable water supply and sanitation facilities. Policies and investment programs are compiled in these documents which lay out the basis of a strategy to accelerate sector development through the equitable mobilization of resources between urban and rural areas and institutional reforms at all government levels. Guiding principles set in the aforementioned national development plans are sustained decentralization; private sector-led development; environmental protection; people participation; full cost recovery; social equity; accelerated information technology applications and macro-economic stability.

According to the Updated MTPDP targets for the year 1998, the population served with potable water shall be increased up to 76.4% (52.4 M). This corresponds to 81.6% (9.9M) of the Metro Manila population, 68.8% (16.3 M) in other urban areas, and 79% (29.5 M) in the rural areas. Sewerage facilities in Metro Manila and other highly urbanized areas will be constructed. About 1.8 million toilets will be built nationwide.

Given these updated MTPDP targets, as well as the goals set in the 1988 NSMP, the current indications and the planning cycle adopted for this provincial sector planning, the national targets as shown in Table 2.2.1 will be used as the basis for setting the provincial targets.

Table 2.2.1 National Sector Coverage Targets

Sub-Sector	Year 1995	Year 2003 ¹	Year 2010 ²
Urban Water Supply ³	61%	69%	95%
Rural Water Supply	70% ⁴	79%	93%
Sanitation	60% ⁵	68%	93%

Notes:

¹ Based on the Updated MTPDP targets for 1998.

² Based on the long-term targets set in the previous National Sector Master Plan (NSMP).

³ Excluding Metro Manila and its outlying areas.

⁴ Includes only point sources.

⁵ Service coverage for 1996.

2.3 Sector Objectives

The objectives of the sector are:

- (1) To provide safe and adequate water supply and sanitation to meet basic needs;
- (2) To pursue proper O & M of facilities for sustainable water supply;
- (3) To undertake the phased construction and installation of sewerage facilities; and
- (4) To develop the capabilities of LGUs to implement water supply, sewerage and sanitation programs with the national government providing assistance in the areas of community participation, sub-sector planning, program management, regulation of development, selection of technologies, financial management, construction supervision, monitoring and reporting.

2.4 Current Sector Policies and Strategies

- (1) One clear policy shift has been towards the **promotion of self-reliance and local community management** of services. Since the seventies, formation of local water districts in provincial urban areas has been aggressively pursued. During the eighties, this shift was further induced with the establishment of community-run BWSAs and RWSAs to provide services in smaller rural and peri-urban areas. Recently, more comprehensive **demand-driven** participatory approach and **gender sensitive** participation initiatives are given impetus to ensure success and sustainability of the sector's projects especially in rather small rural and urban fringe areas.
- (2) An **integrated approach to water, sanitation and hygiene education** has been prescribed in order to achieve full health benefits of improved services. The GOP promotes intensified health education and information programs to improve hygiene practices at the household level.

- (3) **Cost sharing arrangement** is enforced. In line with devolving the central government's functions and responsibilities, particularly those that have social and/or environmental objectives, projects/activities are implemented through a cost sharing arrangement between the central government agency and LGUs. As for the sector, national (central) government's (NG's) grant is to be extended only to Level I systems for eligible municipalities, and its share is within a range of 0 to 50% of the total capital cost. The remaining are managed by LGUs, communities, or BWSAs/RWSAs. No subsidies from the central government are to be provided for Levels II and III systems. For public toilets in public markets, the share of the NG is within 50 to 70%.
- (4) **Cost recovery of capital and O & M costs** of all water supply service levels by beneficiaries is to be encouraged. This is a distinct switch from subsidies, which characterized previous strategies. Current priorities also stress the need to promote the collection of such costs, especially in Levels I and II.
- (5) **Private sector participation** is encouraged to bring into the sector business principles and practices and private capital to accelerate social and economic development; to improve sector efficiencies; and to ease the burden on the GOP's budget and foreign borrowing. Public-private partnership is to be pursued through any of these mechanisms: build-operate-transfer, concession arrangements, privatization of WDs, LGU-private sector MOA, LGU-WDs collaboration and others.
- (6) **An integrated water resources strategy** has been adopted in areas combining irrigation, power, flood control, and domestic and industrial water supply. Small and medium-scale water resources projects through the active participation of the people are encouraged. **Watershed management**; water conservation and erosion and sediment control are deemed critical.

2.5 Major Legislation and Regulations Affecting the Sector

- (1) The **Local Government Code of 1991 (RA 7160)** provides for a more responsive and accountable local government structure. Local government units now exercise more authority and responsibilities and provide resources to accelerate the provision of basic services and facilities, including water supply, sanitation and sewerage. The **Implementing Rules and Regulations (IRR)** to effect the devolution of water and sanitation responsibilities and resources was recently approved. The IRR integrates the common

definition of terms for water supply and sanitation and defines the roles and functions of central government agencies and LGUs for the sector (details are referred to 5.2, Data Report).

- (2) **The Water Code of the Philippines (PD 1067)** consolidates legislation relating to the ownership, development, utilization, exploitation and conservation of water resources. The Code established the basic principles and framework on the appropriation, control and conservation of water resources to achieve their optimum economic efficiency and rational development. In addition, PD 424 declares that the National Water Resources Board (NWRB) shall be responsible for coordinating and integrating all activities related to water resources. PD 1067 also pertains to the grant of water right privileges (water permits) to appropriate and use water. Water permit applications are reviewed and granted by the NWRB.
- (3) **The Provincial Water Utilities Act of 1973 (PD 198)** authorizes the formation of local water districts in the provincial areas outside the Metropolitan Manila area, and provides for their administration and operation. It also created the Local Water Utilities Administration (LWUA) as a specialized lending institution for the promotion, development and financing of local water districts.
- (4) **The Metropolitan Waterworks and Sewerage System (MWSS) Charter (RA 6234)** was enacted in 1971. The utility was formed to take over the facilities of NAWASA in 1971. The Charter was amended by virtue of PD 1046 expanding further its territorial jurisdiction to include areas that may be included in the growing metropolis.
- (5) **The Philippine Environmental Policy (PD 1151)** requires all public and private entities to undertake an environmental impact assessment of all projects, which significantly affect the quality of the environment. **The Philippine Environmental Code (PD 1152)** established standards for air and water quality, and guidelines for land use management, natural resource management and conservation, utilization of surface and groundwater, and waste management.
- (6) **The Sanitation Code (1975)** was promulgated to deal with water supply, excreta disposal, sewerage and drainage issues. **The Sanitation Code and the National Building Code (1977)** require that new buildings be connected to a water-borne sewerage system. Where such systems do not exist, sewage must be disposed of onto Imhoff tanks or septic

tanks with a subsurface absorption field. In addition, the facilities are required to conform to the 1959 National Plumbing Code.

- (7) The 1981 Rules and Regulations for Domestic Wastewater Disposal require all subdivisions and condominiums, etc. to have adequate sewage collection, conveyance, treatment and disposal facilities. A permit must be obtained prior to commissioning a new system.

2.6 Planning Principles and Data Management

2.6.1 Planning Principles

The PW4SP shall be prepared to ensure that the sector investments are optimized under the constraints of funds and water source availability as well as planning capability. Furthermore, the plan shall ensure its sustainability at the provincial level. The overviews of the plan will be progressively adjusted and refined at different detailed implementation stages. Accordingly, the demarcation is a prerequisite between a sector plan and succeeding detailed plan/s. Specifically, the following are required as planning principles.

- (1) The plan is conceived to be flexible, consistent and as simple as possible to respond to the changing socio-economic conditions of the province, accumulated technical information and updated policy of local governments allowing for periodic upgrading.
- (2) The plan is arranged to allow planners to run different scenarios for project implementation, especially with reference to the interface between the provincial plan and project proposals from municipalities (bottom-up).
- (3) The plan is conceived to be adaptable to the local planning capacity and to ensure its full "ownership" by LGUs.

In addition, the following shall be taken into account to help the provincial planners perform their tasks.

- (1) The plan follows existing provincial and municipal planning routines to minimize duplicated planning activities. It is essential to maintain and extend the involvement of local officials for data collection.

- (2) The plan, as a comprehensive tool, considers the consistency to derive the next level of planning.
- (3) The plan entails monitoring and evaluation of actual implementation progress, as investments are undertaken.

The guideline for preparation of the PW4SP is included in the Planning Approach for Future Sector Development, Data Report. It identifies all tables and figures with respective forms by main, supporting and data reports.

2.6.2 Data Management

The data management system was established to come up with the basic outputs commensurate to the objectives of the provincial plan and at the same time reflect the planning approach mentioned above. It will provide a map of relative needs in the province allowing for adjustment and updating when further information becomes available. Monitoring and evaluation are to be done using the tool, thereby serving as baseline information for the improvement of planning and implementation. Different scenarios may be worked out by planners using the program in application of variable parameters.

The need for full and continuous involvement of local officials is indispensable to establish a reliable database.

(1) Computer-based system

Data management system is designed to perform simple and direct interfaces in data processing. Since a limited number of municipalities is the planning level entailing data collection from the administrative units, EXCEL was selected to facilitate data storage, retrieval, updating and processing.

The data storage system was arranged to parallel the structure of questionnaires and contain the same system of logical categories under institutional hierarchical system of the Philippines as shown in Figures 2.6.1 and 2.6.2. Data are encoded by hierarchical level.

A series of EXCEL routines was established to allow summaries and consolidation of data into the forms required for analysis and presentation. Details together with User's Guide for computer-aided planning are included in 2.6.2 Data Management, Supporting Report.

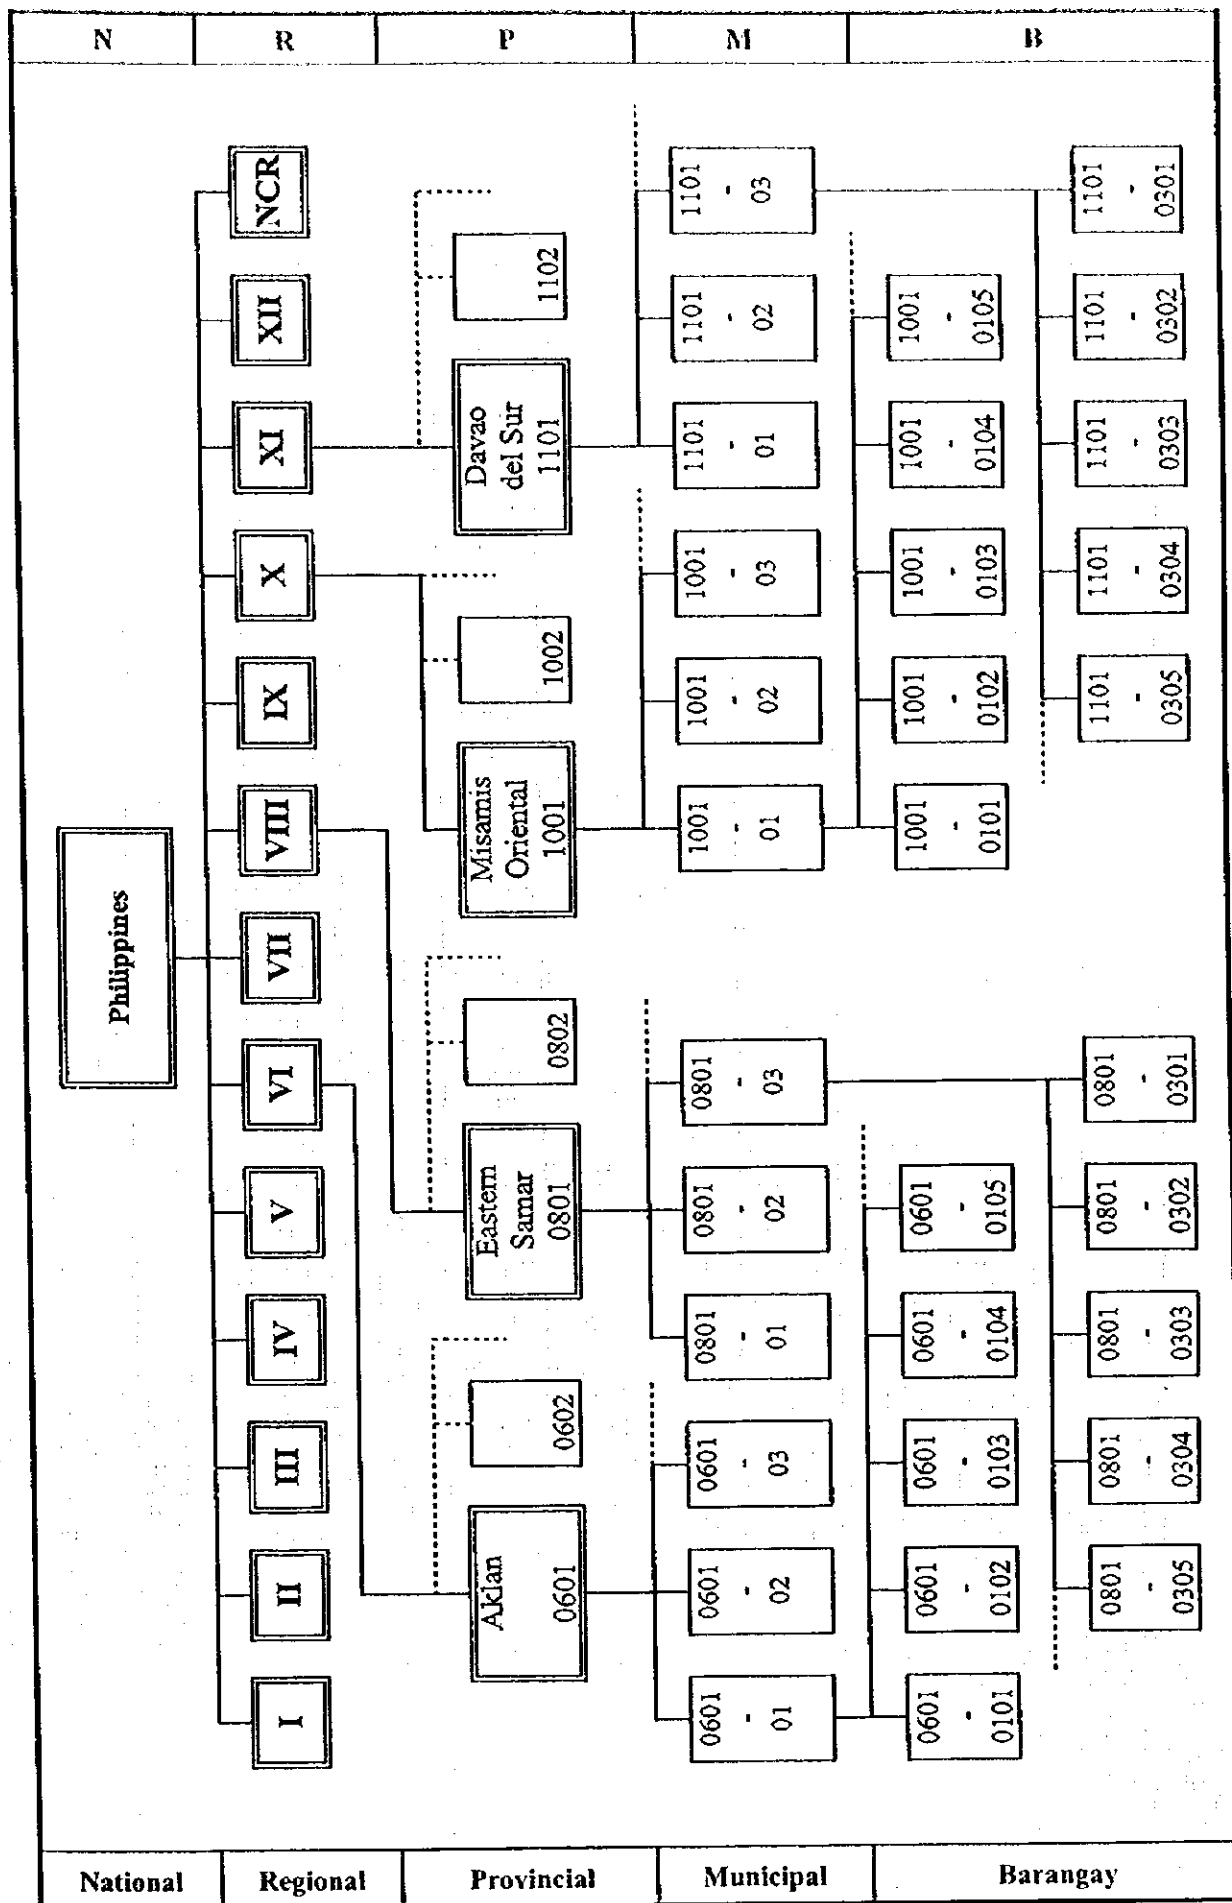

Table 2.6.2 Structure of Questionnaire

Grouping of Questionnaire	Questionnaire to be addressed

(2) Key Parameters

Establishment of criteria and assumptions are requisites in the planning process. In this connection, key parameters are identified to allow for preparation of alternative plans and updating in accordance with sector improvement policy in the future. The parameters for relevant sub-sectors are assumed on an urban and rural basis for respective municipalities referring to current conditions and practices on national and provincial levels. The following are the selected parameters.

- 1) Number of households to be served by a Level I facility
- 2) Safe and unsafe percentages of Level I facilities
- 3) Standard number of students to be served by a unit of sanitary toilet
- 4) Standard number of toilets for a public utility
- 5) Provincial sector targets by sub-sector
- 6) Composition of different types of toilets
- 7) Per capita water consumption for Level III system
- 8) Composition of different types of well sources and their specifications
- 9) Percentage of Level I wells to be rehabilitated
- 10) Unit construction cost of different facilities per person/household/facility/system
- 11) Percentage of sector management cost to construction cost
- 12) Physical and price contingencies
- 13) Unit recurrent cost of different systems/facilities
- 14) Allocation factors/percentages of IRA
- 15) Share of public investment
- 16) Funding levels/percentages for different financing scenarios
- 17) Scoring factors for municipal investment ranking
- 18) Annual distribution of investment cost (medium-term development)

The above-mentioned parameters are not included in the database program, since they are to be established through sensitivity analysis. Assumed figures are directly entered into a separate spreadsheet that is linked to the output files.

(3) Data Processing

Collected data are entered into the forms constructed in EXCEL database. The data are consolidated into final forms in application of small programs prepared for this planning. Linked outputs in tables and graphics are prepared in EXCEL spreadsheets for final

analysis and presentation. Key parameters are entered in a key parameter table linked to the output tables (refer to 2.6.2 Data Management, Supporting Report).

Data in the questionnaire forms (database) are transferred to the output tables for final calculations. Adjustments are made through manipulation of the key parameter table.

Chapter
PROVINCIAL PROFILE

3

3. PROVINCIAL PROFILE

3.1 General

Southern Leyte is one of the 6 provinces comprising the Eastern Visayas Region (Region VIII), with Maasin as the provincial capital. The province is composed of the mainland, the islands of Panaon (with 4 municipalities) and Limasawa (1), and two (2) islet barangays off the coast of Hinunangan. The province of Southern Leyte bounds the Leyte province on the north, the Pacific Ocean on the east, Leyte and Canigao Channel on the west, and Bohol Sea/Surigao Strait on the south as shown in the Location Map.

The province is classified as 3rd class and has a total land area of 1,734.80km² that is less than 1% of the Philippine total land area of about 300,000km². It is composed of 19 municipalities. Based on the 1995 NSO records, the province has 500 barangays, of which 58 are urban and 442 rural. Provincial total population was 317,565 in 1995. About 70% of the population reside in rural areas, while the remaining 30% in urban areas. At present, there are 2 water districts and 17 LGU/association managed Level III water supply systems operating in the province. Table 3.1.1 presents the breakdown per municipality of land area, population and density, as well as administrative composition.

Table 3.1.1 Outline of Municipalities

Municipality		Land Area (km ²)	1995 Population		Number of Barangay		
Name	Class		Number	Density (person/km ²)	Urban	Rural	Total
Anahawan	5th	56.00	6,471	116	3	11	14
Bontoc	5th	102.10	24,047	236	2	39	41
Hinunangan	4th	155.90	22,170	142	2	38	40
Hinundayan	5th	59.90	10,617	177	2	14	16
Libagon	5th	90.40	10,754	119	2	12	14
Liloan	5th	96.30	17,160	178	2	22	24
Limasawa	6th	6.40	4,927	770	1	5	6
Maasin (Capital)	2nd	197.80	63,746	322	5	65	70
Macrohon	5th	74.70	20,093	269	13	17	30
Malitbog	5th	93.40	17,976	192	4	33	37
Padre Burgos	5th	48.50	7,593	157	2	9	11
Pintuyan	5th	56.60	8,388	148	3	20	23
Saint Bernard	5th	100.20	21,363	213	1	29	30
San Francisco	5th	52.10	9,543	183	3	19	22
San Juan (Cabalian)	5th	26.00	11,392	438	3	15	18
San Ricardo	5th	45.00	7,869	175	1	14	15
Silago	5th	195.80	9,785	50	2	13	15
Sogod	4th	192.70	31,062	161	5	40	45
Tomas Oppus	5th	85.00	12,609	148	2	27	29
Provincial Total	3rd	1,734.80	317,565	183	58	442	500

3.2 Natural Conditions and Geographical Features

3.2.1 Meteorology

The province has 2 types of climate under the Coronas classification: Type II, which is experienced in the eastern part and Type IV, in the western part. Type II is characterized by the absence of dry seasons with very pronounced maximum rain period occurring in the months of December and January, while Type IV has a rainfall that is more or less evenly distributed throughout the year as reflected in the Location Map. Using the 20 year (1971-1990) rainfall records of PAGASA, the average annual rainfall was registered at 1,531.20mm. Average number of rainy days is placed at 128 a year.

The mean temperature is 27.00°C with a range of 23.0°C to 30.9°C. Prevailing wind direction is southwest and the province is located within the typhoon belt.

3.2.2 Land Use

Remaining forest area constitutes a mere 33% of the total area of the province located mostly in Mt. Nacolod and Leyte Central Highlands range. Agricultural land occupies 65%, while Built-up area is limited to only 2%. Primary settlements are concentrated along the coasts. The existing land use pattern as presented in Table 3.2.1 must be enhanced by rehabilitation of watersheds in order to pursue a sustainable growth of the province. The remaining forest cover must be conserved to primarily serve as watershed rather than as source of timber. An efficiently managed watershed collects and regulates flow of water, controls soil erosion and minimizes water pollution. Conversion of the remaining forestland to other uses will restrict its function as a watershed. Correspondingly, a significant increase in agricultural area will result in a high demand of water use.

Table 3.2.1 Current Land Use

Land Use	Area (km ²)	Percentage over Total Land Area
Forest Land	563.22	33
Built-up	30.92	2
Agricultural	1,133.80	65
Fishponds, Mangrove, Inland Water Area	6.86	Nil
Provincial Total	1,734.80	100

3.2.3 Topography and Drainage

The province of Southern Leyte lies on the southern extension of a mountain range and system that are the major geomorphic features. A range of rugged mountains, the Leyte Central Highlands Range with a maximum height of 948 masl, bisects the entire length of Leyte Island. This range occupies the eastern peninsula and Panaon Island. Young volcanic rocks cover the top of the southern mountain range and Panaon Island, namely: Mt. Cabalian and Mt. Nelangcapan. These are classified as inactive volcanoes. A smaller mountain system is found on the western peninsula of Southern Leyte. Relatively flat coastal areas and mountainous interior regions characterize this province.

There are six (6) major rivers, namely: Das-ay, Lawigan, Buac, Salog, Amparo and Canturing Rivers. The Bonbon River is a tributary of the Salog River. The Salog River is the largest in the province with a watershed of 208 km² and drains to Sogod Bay passing through the municipalities of Tomas Oppus and Bontoc. These major rivers and numerous small rivers forming a somewhat dendritic drainage pattern serve as basin of excess water from the land.

Figure 3.2.1 shows the natural drainage systems of the province. Table 3.2.2 is a list of the main rivers and their corresponding drainage areas with recorded flow rates at the site of gauging station.

Table 3.2.2 Drainage Areas & Flow Rates of Major Rivers

Major Rivers	Drainage Area (km ²)	Flow Rate (m ³ /sec)			Water District (using river water)
		Peak	Maximum	Minimum	
Das-ay	62	86.09	83.58	1.68	None
Lawigan	85	100.42	71.53	0.83	None
Buac	-	No gauging station			None
Salog	-	No gauging station			None
Amparo	-	No gauging station			None
Canturing	-	No gauging station			None

Source: Philippine Water Resources Summary Data, established January 1980 by NWRC

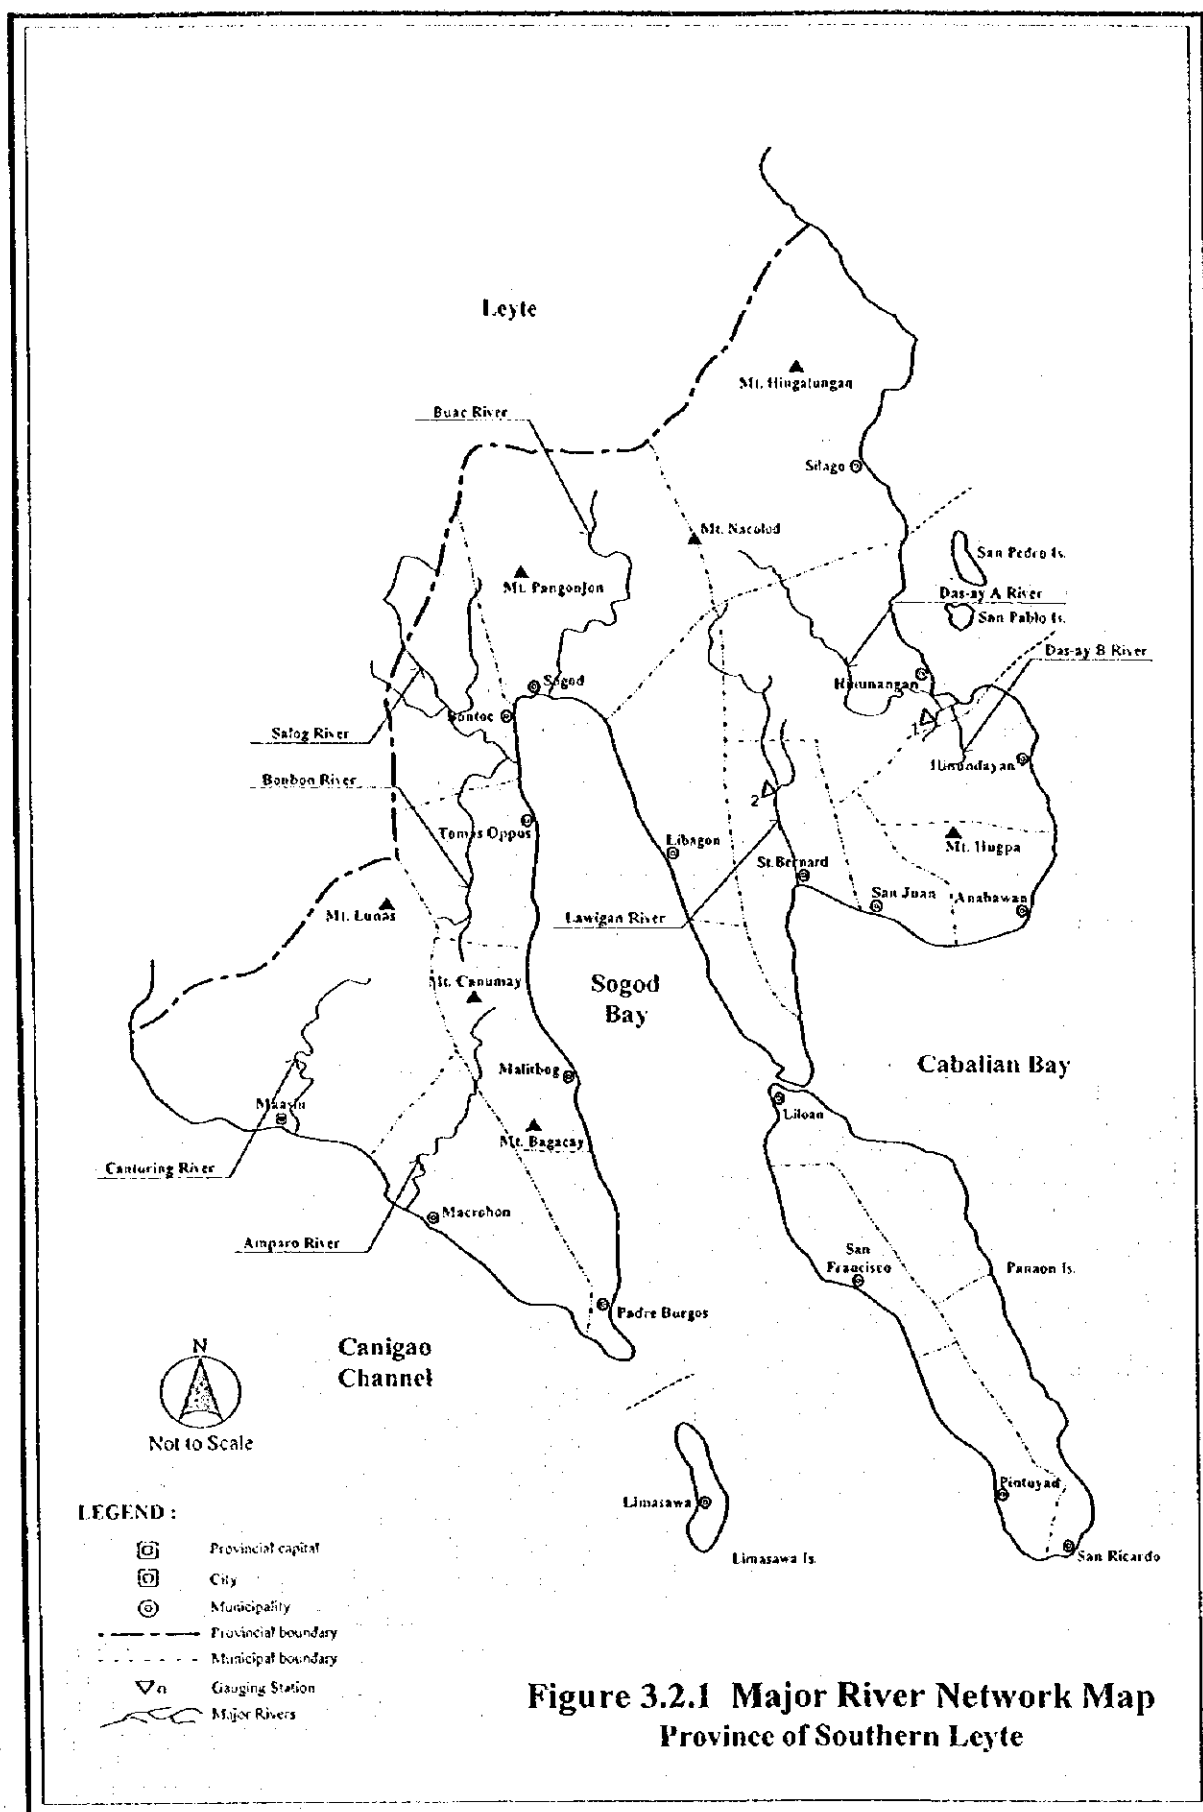

Notes: Peak - Peak discharge of Daily Maximum Discharge

Maximum - Maximum Daily Discharge of Weighted Daily Discharge

Minimum - Minimum Daily Discharge of Weighted Daily Discharge

Inc. - Incomplete/Lacks record

Six (6) typical rivers in the province were selected for water quality examination, namely: Das-ay, Lawigan, Buac, Salog, Amparo and Canturing. Analyzed river waters were turbid. The examination result shows high Fe and Mg contents from the Das-ay River probably due to the mineral rich rocks of the volcanoes (refer to 7.5, Data Report).

3.3 Socio-economic Conditions

3.3.1 Economic Activities and Household Income

Southern Leyte is basically an agricultural province. The major economic activities are farming and fishing. Principal crops cultivated are coconut and palay. Commercial crops such as abaca, corn, rootcrops, vegetables and bananas the other important agricultural commodities. Considering its valuable historical significance, being the site of the first mass in the country, the province is promoting tourism along with potential natural spots.

The NSO Family Income and Expenditures Survey in 1994 showed that the average annual family income of the province was P 45,503 while the expenditure was at P 33,354 or a net saving of P 12,149. Distribution of households by income class in the region and province is shown in Figure 3.3.1 (refer to Table 3.3.1, Supporting Report). Percentages of households of lower income levels were greater than the average figures in the region. Based on the established poverty threshold income of P 37,053 in Region VIII for 1994, about 60% of the total number of families lived within and below the poverty threshold.

As to the number of workers by major industry group, agriculture, fishery and forestry had the dominant share followed by social and personal services (refer to Table 3.3.2, Supporting Report). By class of worker, those who were self-employed without any paid employee had the highest share of 41% as shown in Figure 3.3.2.

3.3.2 Basic Infrastructure

All of the 19 municipalities have electric supply, while the service coverage at household level is 70%. Telephone service is also available in all municipalities. There are 19 post office service stations in the province. Land transportation is available by means of jeepney, bus, rent-a car and tricycle. There are 300 business establishments. Table 3.3.1 presents a provincial outline of public services and Table 3.3.2 reflects the number of public facilities and services by municipality (refer to Table 3.3.1, Data Report).

3.3.3 Education

The province has a total of 391 schools consisting of 321 elementary schools, 54 high schools and 16 tertiary/technical schools. The 1990 NSO census indicated that the province had 93% literacy rate of household population 5 years old and over. A large part of the population had attained elementary or high school levels of education as reflected in Figure 3.3.3 (refer to Table 3.3.3, Supporting Report).
