USERS GUIDE: Contents of the Report

This report consisted of the following Chapters on environmental information of the country.

1. Keywords of the Environment

Various features and principal environmental issues and their related matters of the country are schematized within 1 page to easily understand the country's natural and social environmental issues on the whole.

2. Fact Sheet

Principal indices and natural and social environmental characteristics of the country such as economy, demographic statistics, socio-economic conditions, various important resources available in the country are described.

3. Institutional Context

3.1 Environmental Agency

Matrix table on governmental agencies related to the environmental issues in the Chapter 4 is described to grasp the role of the agencies easily. Responsibilities and organizational structure of the principal responsible agency for the environment, and responsibilities of related agencies are explained. Main activities of the various environmental non-governmental organizations are described in the table.

3.2 National Environmental Policy

Environmental policy of the country such as national environmental action plan is explained.

3.3 Environmental Laws and Regulations

Environmental laws and regulations of the country including their status of applications are described.

4. State of the Environment

In this Chapter, status of the various environmental issues as follows are covered with information on related agencies, related standards, laws and regulations, examples of the issue are explained. In the section 4.3, other kind of considerable environmental issues in the country are described based on the report which local consultant prepared.

4.1 Air Pollution	4.7 Waste Water Management
4.2 Water Pollution	4.8 Forest Conservation/Desertification
4.3 Other Pollution	4.9 Biodiversity
4.4 Waste Management	4.10 Natural Resource Management
4.5 Energy Conservation and Alternative Energy	4.11 Natural Disaster
4.6 Water Supply	4.12 Environmental Education

5. International Relationship

Status of the implementation of the economic and technical assistance projects in the country are outlined. International conventions and agreements on environment which the country agreed and ratified are listed up in section 5.1, and environmental projects which are funded and/or implemented in the country by donor countries and international organization in the section 5.2. In addition, location map of the project funded and implemented by using the Official Development Assistance (ODA) of Japanese government are showed.

6. Sources of Information

Governmental environmental agencies related institutions and NGOs are listed with the some information such as contact address and e-mail address.

7. References

References used in the report are listed.

2. FACT SHEET

2.1 Socio-economic Index

Index	Data	Data year	Reference
Population	3.42 million (annual average incremental rate : 2.4% (1990~95))	1995	b)
Race	Mixed blood with Caucasian 95%、black person 3%、aborigines 2%	no information	d)
Religion	Catholicism (national religion)	no information	d)
Literacy rate	Adult female : 89% Adult male : 94%	1990	b)
Urban Population rate	50% (1.7 million)	1995	b)
Life expectancy	76 (1990~1995 average)	1990-95	b)
Under-5 mortality rate	16 (per 1,000)	1993	b)
GNP ¹	\$7,031 million (\$2,150/person)	1993	b)
GDP ¹	\$7,577 million (\$2,317/person)	1993	b)
GDP structure	Agriculture : 15% Industry : 26% Service industry & others : 59%	1993	b)
Prime industry	Food processing, sugar, textiles, fertilizer, medicines, furniture	1996	d)
Prime resource	Gold, salt, ?, cryptomeria, mahogany, coffee, banana, sugar cane, cacao, corn, cotton, hemp, fish	1996	d)
Safe water (% of population with access) ²	Urban : 86% Rural : 99%	1980-1995	b)
% of sewerized population ³	Urban : 99% Rural : 98%	1980-1995	b)
Human Development Index (HDI)	0.889 (World rank 33, GDP per capita rank 60 in same year)	1994	c)

*1 : The estimated value of the GNP was exchanged and adjusted from local currency into US\$ by means of 3-year average of exchange rates. The estimated value of the GDP was presented in US\$ of 1993 based on the exchange rate.

*2 : "Safe water" includes treated surface water, and untreated water which is pumped up from protected spring / excavated well and sanitary well.

*3 : "Sewered population" should be met conditions that the population in urban area can use public sewerage and indoor facility such as dug hole outdoor toilet, pouring water toilet, private sewerage system, public community toilet, and similar facilities, and that the population in rural area can use dug hole outdoor toilet, pouring water toilet, or other proper treatment methods.

2.2 Geographical Characteristics

Area : 51,000 km ² (about 1.4 times as Kyusyu in Japan)
Geographical features : (no information)
Highest place : Mt. Chirripo (3,819 m)

Source: a)

2.3 Meteorological Characteristics

Climate: (no information)
Season: (no information)
Average temperature: (no information)
Average annual rainfall: more than 2,000 mm/year in most of the country
Climatic classification: (no information)

Source: a)

2.4 Ecological Characteristics

Biogeographical feature: (no information)
Identified animals and plants: 5% of all the globe species
Protected area : National Park system started 25 years ago.

Source: a)

2.5 Hydrological Characteristics

Main river: (no information)
Lakes: (no information)

Source: a)

2.6 Other Characteristics

Tourist: about 800 thousand visitors/year

3.3 Environmental Laws & Regulations

Laws & Regulations	Status	Related Sections
1996 Law of Regulatory Authority of the Public Services (<i>Ley de la Autoridad Reguladora de los Servicios Públicos nº7593</i>). • Public services such as water supply, garbage collecting, electricity, etc.	(no information)	4.4. 4.5. 4.6
1996 Forest Law and its regulation (<i>Ley Forestal nº7575 del 14/4/96 y su reglamento</i>). • Forest conservation and rational exploitation, biodiversity conservation, water resources protection and water pollution.	(no information)	4.6 4.8 4.9
1995 Environmental Organic Law (<i>Ley Orgánica del Ambiente nº7554 del 13/11/95</i>). • Atmospheric, water and soil pollution, waste management, conservation of forests, biodiversity, natural resources, energetic resources, marine and coastal resources, environmental education, land use planning, environmental impact assessment, organic agriculture, participation of communities.	(no information)	4.1, 4.2, 4.3, 4.4, 4.5, 4.8, 4.9, 4.10, 4.12
1992 Wild Life Conservation Law and its regulation (<i>Ley de Conservación de la Vida Silvestre nº7317 del 7/12/92 y su reglamento</i>). • Forest and biodiversity conservation, water pollution, natural resources management.	(no information)	4.2, 4.8. 4.9. 4.10

Laws & Regulations	Status	Related Sections
1973 Health General Law, modified in 1975, 1980, 1982 and 1988 (<i>Ley General de la Salud nº5395 de 1973</i>) • Relates human health with water, air, noise and waste pollution and other environmental issues.	• no information	4.1, 4.2, 4.3, 4.4
1970 Municipal Code (<i>Código Municipal, ley nº4574 del 4/5/70</i>). • Sets municipal responsibilities regarding public services such as water supply, waste collecting, as well as natural resources conservation and natural disaster assistance.	• no information	4.4, 4.6, 4.10, 4.11
Penal Code (<i>Código Penal, ley nº4573 de 1970</i>). • Establishes penalties and fines to some injuries related with environmental aspects.	• no information	none

Source: a)

4. STATE OF THE ENVIRONMENT

4.1 Air Pollution

The Main Source of air pollution is transportation but there are some industries which pollute locally in different parts of the country. In particular, the three cement plants generate some particles but the situation has improved. The fertilizers factory in Puntarenas is generating some gases.

Related Agency
① Ministerio de Obras Públicas y Transportes (MOPT)
② Ministerio del Ambiente y Energía (MINAE)
③ Defensoría de los Habitantes
④ Autoridad Reguladora de los Servicios Públicos (ARESEP)

Source: a)

Some important facts
<ul style="list-style-type: none"> generation of air pollution is high but their impacts in the San Jose metropolitan area are relatively minor because the strong NE winds in the dry season and heavy rains during the rainy months take away the pollution. recent measurements in San Jose (1997) show the following levels of pollutants in micrograms per cubic meter: NO_x = 46.4; CO = 9.3; total particles in suspension 189.6; ozone = 52.0; PM10 = 38.5. (Mideplan/SIDES) quality of fuels is much lower than in developed countries. Sulfur contents in diesel was 10,000 PPM (parts per million) in 1997. It is expected to go to 5,000 PPM this year, and the target is 500 PPM by 2003; in the meantime, diesel in the European Community (EU) has 500 PPM of sulfur and will go to 350 PPM by the year 2000. In Costa Rican eco-gasoline sulfur content is 900 while in the EU will go to 150 PPM in 2000 (Financial Times, Automotive Environment Analyst, February 1998) fleet vehicles is very old: more than half of the vehicles are older than 10 years and many diesel vehicles are 20 years old (Jimenez, 1997)

Source: a)

Some Solutions
<ul style="list-style-type: none"> accelerate the process of improving fuels quality, in particular reduce the SOx content of diesel which can make possible to use vehicle catalyzer which will capture the NOx push for a renewal of the vehicle fleet, specially urban buses correct the environmentally perverse cross-subsidy in favor of diesel and put an environmental tax to diesel and regular gasoline sold in the main counties of the Great Metropolitan Region of San José make the pollution allowed limits stricter for every type of vehicle and reinforce vehicles testing on the road introduce natural gas vehicles for some routes of urban public transportation

Note: ○ : Issued, × : None, △ : Under planning, ? : Unknown

4.2 Water Pollution

The measurement of water pollution is not easy and requires systematic programs. Costa Rica does not have them. The regular measurements are done only in relation with water supply (AyA) and in some cases with hydroelectricity production (ICE). Recently the program of Bandera Ecológica of MINAE measured pollution levels in most Costa Rican beaches in order to give a "free of contamination banner". The measurements of underground water are also very few, and some relatively high levels of nitrates were detected (AyA, Senara).

Costa Rican society has not been very carefully cleaning its rivers because almost all the water consumed comes from aquifers and natural springs (in the higher parts of the watersheds and the river courses).

The main types of pollution in the Costa Rican rivers are untreated sewage, effluents from agriculture and agroindustry, erosion (both of fertile soils and clay), and some industrial effluents. The situation changes very much with different rivers. The Virilla that crosses the San José metropolitan area and discharges in the Grande de Tarcoles are probably the most polluted rivers in the country. Significant quantities of solid wastes are thrown in the rivers affecting seaboard communities and damaging hydroelectric turbines (140 million colones in september 1996, only in Ventanas).

There is not enough information about the state of different water courses and deposits both for river and sea water in different seasons. Similar problems exist for underground water deposits.

Note: ○ : Issued, × : None, △ : Under planning, ? : Unknown

4.3 Other Pollution

(1) Noise

Noise Pollution
<ul style="list-style-type: none"> San José and other Costa Rican cities have high levels of ambient noise, created mostly by the traffic, but also by airports location, certain industries, etc. Costa Rican construction, in particular new low cost design have very bad low noise damping properties Very few construction projects include significant noise control measures

Source: a)

Possible solutions
<ul style="list-style-type: none"> impose regulation both to construction and to noise generators educate people for a more silent life (specially due to vehicles horns)

Source: a)

(2) Soil Pollution

Soil pollution has occurred in a few documented cases, the most significant where the soils contaminated with copper components that were abandoned by the United Fruit Company in the south Pacific Region of Costa Rica.

There are suspicions that other contaminated soils in open dumps, and in places close to certain chemical plants as the Moín refinery. On the other hand, many of the gasoline expenders had leaky tanks that are polluting the soils nearby, but the MINAE started just a couple of years ago to correct that problem through tank substitution.

Source: a)

(3) Radioactive Substances

Hospitals and other institutions use radioactive substances. The residues are now being returned to the provider. There is medical use of radioactive substances and recently (1997) there was an accident in the San Juan de Dios Hospital with the "cobalt machine" which affected 115 patients many of them have died already, the victims have received a relatively small economic compensation.

Source: a)

Related Agency
<ul style="list-style-type: none"> Comisión de Energía Atómica

Source: a)

(4) Offensive Odor

There are some complaints about offensive odors in different parts of the country, the strongest ones are: sewage treatment plants (Puntarenas), solid waste collection trucks, open dumps, some sanitary landfills, and chicken and pig farming. In one exceptional occasion, several years ago, a group of citizens burnt down a "fish treatment factory" in an urban area, because of reiterative non-compliance and failure of the legal system to close it down.

Note: ○ : Issued, × : None, Δ : Under planning, ? : Unknown

4.4 Waste Management

The generation of solid waste at the households is of approximately 600 g/person/day; most Costa Rica have twice a week collection service, in many areas of the country is disposed in open dumps. Some industrial residues are being reused within the factories (plastics) or send to recycling plants (cardboard), a lot of hazardous waste remains within the industrial facility.

Source: a)

Related Agency
① Municipal governments
② Autoridad Reguladora de los Servicios Públicos (ARESEP)
③ Ministry of Health
④ Secretaría Técnica Nacional Ambiental (SETENA)

Source: a)

Most of the Agriculture and food Processing Residues are composed or used as fuel
• Composting has increased dramatically in the last five years, however for most processors it is a form to eliminate a waste and not a form to produce organic conditioner and fertilizer, the best results are in Ingenio Juan Viñas where the nitrogen content of the product is much higher (personal communication Ronald Arrieta)
• Recuperation levels are high specially for paper and cardboard, it is estimated that more than 130 tons of cardboard and paper are recycled daily;
• There are recycling plants for paper, paperboard, glass, and there are small smelters for aluminum, copper, etc. There are some efforts to recycle the plastic generated in the banana plantations
• The steel scrap is being exported to El Salvador to be processed there
• Some recovered aluminum is being recycled in small shops, and some is exported to the United States, other metals are also recycled in the country
• Old tires, old motor oil and some plastics are being used as fuel at the two cement plants of the country.
• The equipment for traditional solid waste collection is relatively new, but there are no specialized vehicles for recycling materials

Source: a)

Disposal of Solid Waste
• Most of the household solid waste is being deposit in "engineered land fills" which however do not show adequate international standards (impermeabilization, leachate treatment), the rest is thrown into open dumps
• There is not enough funds for an adequate solid waste management, but there is a danger that the private only private firm the WPP gets monopoly power and can start raising its prices with no adequate control

Source: a)

Economic and Institutional issues
• Many people are paying very little or nothing for their solid waste service
• The municipal governments in charge of solid waste management are very weak

Source: a)

Some Solutions
• proceed with a diagnostic of the situation with recommendations for each type of productive activity
• reinforced and accelerate the correction efforts currently done in the CCSS, in particular the creation of "a security landfill of secure landfill cells"
• promote the recycling and neutralization of hazardous residues
• establish a register system for every firm or institution that uses, transports, disposed, process hazardous materials and quantify the different wastes at every stage
• improve the technologies for their handling and transport

Source: a)

② Laws on hazardous waste	<input type="radio"/>	

Note: O : Issued, X : None, Δ : Under planning, ? : Unknown

4.5 Energy Conservation and Alternative Energy

The energy consumption per unit of national product or energy intensity of the Costa Rican National Product has decreased slightly. In 1996 was 74.6% of the intensity in 1970. However the remain almost constant during the period (1994-96). It seems evident that there are many opportunities for additional energy efficiency. However, this process will be negatively compensated by the rapid grow of energy consumption in the transportation sector (more cars) and by changes in the structure of the Costa Rican economy away from agriculture and toward manufacturing, more intensive in energy consumption (electronics components, apparel, paper, printing). Some important facts are:

- The energy consumption per capita increased in the period 1993 to 1996 by 12.4% to reach 26.3 terajules per 1,000 people
- The recent increases in energy consumption are due mainly to the duplication of energy consumption in the transportation sector in the period 1987-1996 to 40,389 terajules (12 terajules per 1,000 persons)
- The industrial sector has increased its overall energy consumption to 23,063 terajules in 1996, i.e an 33.9% increase since 1987 (Mideplan, SIDES)

Most people have access to electricity, 93.2% in 1997 (almost 100% in the urban areas). Much of the Costa Rican electricity come from hydroelectric plants (now represents close to 85% of the total generation). Hydro projects are located in different watersheds, and have a significant water storage capacity to support dry weather for several years. Another important energy source is geothermal that in 1997 represented close to 10% of the electricity production.

Energy - saving efforts: The low prices of electricity for the residential sector (4 cents of US dollars per kW-hour up to 250Kw-hour) do not motivate savings. The industrial and commercial sector were extremely slow in improving their energy efficiency despite relatively expensive electricity starting in 1990 (due to cross-subsidies to the residential sector). The Law for the Rational Consumption of Energy (No 7447) of 1994, was used later to force every big electricity consumers to do energy audits to discover ways to improve its electricity efficiency. There are several educational efforts by NGOs and electric companies.

The country produces wind energy in the Guanacaste highlands (1.4% of all the electricity in 1997). There is a map with the wind-energy potential of the country (ICE). There is a big potential for Solar Energy which is rarely used, in part due to relative low rates for the residential sectors. There is a plan by ICE to provide electricity by alternative sources and systems, specially solar to approximately 6% of the household that are very expensive to reach by the national interconnected grid (which is also connected to the nearby countries)

Biomass Energy contribution is a very rapidly changing reality with a dual phenomena: (a) reduction of the household fuelwood use and (b) increases in industrial use of biomass fuels in particular in coffee processing plants, Kraft paper mills, food outlets, etc. Most of the residues of other productive activities are being used in energy production and will end helping in the production of electricity through co-generation specially in sugar cane mills

4.6 Water Supply

The enormous physical diversity of Costa Rica presents with many different hydrogeological conditions within its territory (see the National Hydrogeological Map produced by SENARA at 1/500.000 scale). The diversity is related to variations of precipitation regimes, topography, different infiltration coefficients, and the structure of the underground geologic system and its water enclosing capabilities.

Enormous water availability in most of the country with the exception of Guanacaste with significant vulnerabilities to serious dry seasons and lack of underground water in many areas. The coastal area has very small aquifers very vulnerable and incapable of supporting the big tourist developments being built there.

Very good Coverage of the water supply systems in particular in urban areas. Some limitations in the service, in the rural areas the spring water is not treated, and in some urban areas water is not available continuously, specially in the dry season (January to April)

Big technological differences between different institutions: Acueductos y Alcantarillados (AyA) is a national decentralized institution in charge of providing running water to most of the metropolitan area of San José and many other cities. There are several municipal owned or controlled services in medium size cities some of them within the Metropolitan Region of San José (Alajuela, Heredia, Cartago). There are hundreds of local water councils that provide water to rural communities.

Inadequate and unfair fare structure does not promote conservation because cost does not increase with the level of consumption and for private wells the extraction rights decrease considerably with higher volumes.

Source: a)

Possible actions and solutions
<ul style="list-style-type: none"> Reduce the losses of water in the Metropolitan Area of San José that some people estimate in 30% due to leaky conduction and distribution lines Increase the redundancy in the system through interconnections main piles, increase the number of tanks and water deposits Increase the water fares to include the "environmental payments" to protect the water sources from degradation Reinforce the main line Orosi - San José against landslides and earthquakes Promote the protection of recharge areas, water springs and other areas important to the water supply of urban and rural communities. Increase considerably the research and the protection measures to the natural systems providing the raw water Reduce the illegal connections to the water systems Improve the treatment of water in the rural systems

Source: a)

4.7 Waste Water Management

Big Improvements in the coffee processing industry in the last four years thanks to a combination of actions: stiffer regulation (Wildlife Law article 132), agreements for improvements along several years, pressure by the Health ministry, the Environmental Controllers (MINAE), and the Defensoría de los Habitantes (Ombudsman). The results have been excellent: the consumption of water was reduced by one order of magnitude (now is of approximately .5 cubic meters per 50 kilograms of "coffee ready to toast".

Geotécnica, a Brazilian company employing mostly Costa Rican engineers is developing the predesign of sewage treatment plants for most of the major cities of Costa Rica. Later it will proceed to the design of sewage treatment plants for the Metropolitan Area of San José and a five smaller cities. There are possibilities that the Interamerican Development Bank will finance part of the investment.

4.8 Forest Conservation/Desertification

Most of the hardwoods of the country are not available any more, they were wasted under a regime of perverse incentives for deforestation and lack of knowledge and long term thinking. Among the many very valuable species not available any more are: caoba, cristobal, etc.

The biggest impact of this deforestation has been the destruction of many natural habitats with very different elevations, rainfall patterns, temperature, humidity. Too late to correct it, maybe would be possible to protect what is left.

The deforestation has slowed down dramatically but still affects very valuable forest, including private property areas within national parks. In the seventies the deforestation rate was around 50,000 ha/year, that lower to 30,000 ha/year during the eighties. Mideplan indicates that in 1994 only 8 000 hectares were deforested but many Costa Ricans remain doubtful about the figures.

There are significant reforestation efforts, mostly homogeneous plantation, with two non-native species: melina and teak. In the period 1979-1995, 139 thousand hectares were reforested with the help of government incentives. During that period MINAE estimates that 844 thousand tons of CO₂ were captured (Mideplan/SIDES)

Unfortunately not all the reforestation efforts are positive, in some case land owners have deforested (even with very low use of the raw material) and immediately claim for reforestation tax breaks. Many firms took reforestation as gimmick to lower their taxes, but with no adequate knowledge, appropriate technology, and financial commitment to the long term horizons of wood plantations and they have abandon many of the reforested areas once the law was changed.

In some critical areas (Guanacaste, or highlands El General county) peasant cooperatives or organizations have promote reforestation with external aid with some success.

There are many efforts to let the natural forest to recover and grow up again from pasture land, coffee plantation or abandoned bushes. This is a relatively rapid process in Costa Rica (from 10 to 20 years). This process has occurred with many different land tenures: national parks, the surrounding of the Arenal Reservoir (ICE land), private areas which are being plan as tourist spots, or local and foreign conservationists .

Selective extraction. Pórtico is a firm that does selective extraction of "caobilla" within primary and secondary forest in approximately 6,000 hectares that owns in the Atlantic Coastal Zone. This wood is used to make "fine doors" exported to developed countries.

Forest Products. Recent data from MINAE indicate wood consumption of 35,814 tons during 1992 and 31,289 during 1993. Approximately three fourths of the wood was used in the production of plywood and similar products (partially coming from the area of the Tortuguero National Park) (Mideplan/SIDES, 1998).

Source: a)

Possible solutions
<ul style="list-style-type: none"> • Use tax exceptions, in particular the one over property value and the recognition as value of natural capital protection to compensate private owners of environmentally valuable land • Increase the use of remote sensing and satellite images to discover violations to the existing regulations and improve the control over corrupted officials • Promote reforestation with slow growth valuable tropical species, as a long term investment • increase the control in the construction materials and furniture markets for the use of scarce species • Promote additional reforestation with fast growth species, preferably local • Permit controlled extraction of valuable species preserving the essential elements of the tropical forest • Transform primary and secondary forest into tourist attractions

4.9 Biodiversity

Many of these problems are related to the issues of their habitats. It is clear from the experts opinions that every habitat that is not explicitly protected, and even some that have some protection, are being abused (Cortes, Solis, and others). These problems are partially the result of the Costa Rican success, too many tourists, too many people without sensibility or knowledge interacting with very fragile environments, too many poor or abusive people ready to produce biodiversity for exports.

So the challenges ahead are complicated and diverse. Each habitat, each park has its own weak points, vulnerabilities, and tensions. They require management designs that confront successfully these new challenges.

② Universidad de Costa Rica (UCR)
③ Universidad Nacional (UNA)
④ Ministerio del Ambiente y Energía (MINAE)
⑤ Sistema Nacional de Áreas de Conservación (SINAC)
⑥ Fundación de Parques Nacionales

Source: a)

Some Critical Problems
• the natural habitat areas are being reduced by the intrusion of direct and indirect human activity
• there is over-exploitation of wildlife resources through a non sustainable use and illegal trade of wild life species
• many of the National Parks nearby areas have not compatible uses with the preservation effort
• many of the lands within National Parks are still in private hands
• some of the protected areas are too small for an effective protection of fauna, and there lack of enough environmental corridors which will protect their seasonal migration patterns
• some wetlands were transformed into banana plantations
• many of the coastal wetlands are being destroyed by pollution and deforestation

Source: a)

Some Solutions
• increase the research about the real damage level of different habitats in particular, coastal wetlands very fragile and subjected to big pressures coming not only from the nearby activities but also by developments far away
• educate the Costa Rican people in general, for example, the Commercial Television Program "Sin Fronteras" which is very popular is a good example of the tasks ahead.
• improve the effectiveness of existing laws (Wildlife, public coastal areas)
• reinforce the purchase of critical lands from private owners
• develop regional planning tools that would protect this areas from impacts coming from nearby regions

4.10 Natural Resource Management

Costa Rica is a country with enormous natural resources. However these resources do not include oil or minerals (except for some small gold mines). The Costa Rican natural resources are related to big fish banks in the Pacific Coast, tropical forests, abundant water in most of the country and relatively fertile soils in parts of the country.

In general, the greatest problem with natural resources management in Costa Rica is the lack of an appropriate accounting system which could give official value to its different parts. Even more important is to charge for "the natural resources use" to every one in order to pay for the conservation of this natural capital for future generations. Some of the natural resources are underused (fisheries, in particular by Costa Ricans), others are being overused (forest, fisheries in the Nicoya Gulf), and many are being misused (most of the Costa Rican aquifers, erosion of fertile agricultural soils).

There are several critical cases: the destruction of natural resources (soils and water) due to urbanization in the Great Metropolitan Region of San José, the potential destruction of small coastal aquifers in Guanacaste because of over-exploitation by big hotel facilities, the destruction of primary forests and the overused of many natural resources by different economic activities (including tourism).

The monitoring is very limited. The public electricity company ICE has a very good hydrology department that keep track of many water resources, but there are many opportunities for improvement in this area.

Note: O : Issued, X : None, Δ : Under planning, ? : Unknown

4.11 Natural Disasters

There are many natural hazards in Costa Rica, some of them specially flooding and landslides are transform into disasters by human activities.

Flooding occurs mainly in the lowlands, both in the Pacific and Atlantic coastal areas, but also in the northern plains and in some rivers in the urban areas of San José, Turrialba. Some of the towns in the coastal areas are in the flood plains (Villa Neilly, Ciudad Cortes). Some of the cities have used the highest places very inefficiently and the poor people invade with their (ranchos) low land areas.

Landslides occur continuously in the country specially because the mountainous terrain and the heavy rains (more than 4 m/year) weaken many areas affected by human intervention: roads, constructions

Earthquakes are frequent in most of Costa Rica, their magnitude rarely goes over 7 in the Richter Scale, however some of the most destructive ones have been small and superficial (Cartago 1841, 1910) and Orotina (1924). The Limón - Telire earthquake occurred in April of 1991 had a Richter magnitude of 7.6 and created many damages, a big proportion of them were in protected areas. The magnitude of this earthquake seems very high for Costa Rican standards. The standards of Seismic Engineering practices in Costa Rica are very high, that has meant relatively small damages for relatively significant earthquakes. However, new cheap construction systems, not tested adequately could bring bad surprises in the next one.

Volcanic Eruptions there are several active volcanoes in Costa Rica (Arenal, Poás e Irazú). There are many agricultural and tourist activities nearby that are permanently under threat.

4.12 Environmental Education

There are environmental components in the curriculum of primary and secondary education. There are numerous, but mostly isolated efforts, all over the country for additional environmental education, mostly directed to children. However, many teachers lack knowledge to teach effectively about the complex environmental realities and sustainability issues of Costa Rica, tropical regions, or specific topics. Many teachers promote emotional slogans, but provide little hard information and knowledge to promote critical thinking.

The Public Universities in particular the University of Costa Rica and Universidad Nacional develop numerous programs of social extension with their students, including significant environmental components. Many NGOs develop informal education programs centered in their local o substantive interest. Many environmental research and extension programs have significant components for education.

However, the main educational problem is to provide producers and the rest of the adult population with knowledge about instruments, technologies, potential policies including economic tools that can improve the production processes and other human activities to make them environmentally more sustainable.

Source: a)

Related Agency
University of Costa Rica and Universidad Nacional

Source: a)

Possible Actions
• reinforce the creation of networks of people interested in environmental and sustainability education
• promote permanent environmental education for every adult centered in the opportunities for improvement as producer, decision maker and consumer
• systematize, integrate and adapt to kids and teenagers all the knowledge about the system
• broaden the perspective of young people about sustainable development and environmental problems.
• develop educational tools for adults

5. INTERNATIONAL RELATIONSHIP

(1) Trans-boundary Issues

There have been very few cases of trans-boundary problems. Maybe the most significant was the construction of the Arenal Dam which move water going north to Nicaragua to the Pacific Coast. Nicaragua protested because the navigability of the Rio San Juan could decrease. However nothing has been documented after the construction.

Precedents and status of international environmental cooperation that can provide further environmental projects funded by donor agencies or implemented with the cooperation/collaboration of other countries

The international cooperation in the environmental area has been very big, relatively diverse and coming from many countries. However, most of it has been to preserve biodiversity and not to control and moderate the impacts of human activities and settlements.

Among the many cases of international cooperation, it is possible to highlight the following:

- purchases of land for the National Parks system
- debt for nature swaps (Costa Rica was in the early 90's one of the first countries to implement it)
- there has been broad support for training short and long term (academic) from many countries: USA, Spain, Germany (DAAD), Japan, The Netherlands
- funds for biological research specially from the USA organizations
- support for different activities in particular implementation of more sustainable practices with the bilateral agreement with the Dutch government on sustainable development
- support for solid waste management by the German GTZ, for sanitary landfills construction by the Spanish and Dutch governments
- support for water supply and other related matters by (CAPRE-GTZ)
- support for seismological research by the Norwegian Government
- support of the European Community on cleaner production in general
- GEF has some small projects on energy efficiency
- PNUD support for the program Sustainable Human Development which produces an annual report about the Costa Rican reality
- selling of CO₂ absorption capacity of Costa Rican forest to Norway (1997)

In general, foreign aid to Costa Rica has been reduced drastically in the last few years, because the country has reached a threshold of development which is consider too high for some governments. However, there are many critical activities that cannot be implemented for the moment with local resources, this include both research and infrastructure. On the other hand, some foreign donors are discovering that it is possible to create projects with Central American scope based and including Costa Rica (for example, French, Canadian and Dutch assistance programs).
