Chapter
FUTURE REQUIREMENTS IN WATER
SUPPLY AND SANITATION IMPROVEMENT

8. FUTURE REQUIREMENTS IN WATER SUPPLY AND SANITATION IMPROVEMENT

8.1 General

Phased investments for provincial sector development, Medium-Term Investment (2001-2010) and Long-Term Development (2006-2010), are planned in almost the same manner as adopted in the 1998 Philippine National Development Plan (PNDP), the National Sector Master Plan (NSMP) and Updated Updated Medium-Term Philippine Development Plan.

Targets of provincial service coverage for the two phases are established as percentages of beneficiaries or utilities to be served by sub-sector. Service coverage in the base year (1998) and national sector targets indicated in the National Sector Master Plan (NSMP) and the updated Medium-Term Philippine Development Plan, 1996 - 1998 (MTPDP) are the bases of the study. Sector targets which are not prescribed in the national plan; school and public toilets as well as sewerage are assumed based on the current conditions. In addition, preliminary discussions on solid waste management are included as a vital component of sanitation sector.

Lead to the second

Projection of frame values by municipality is undertaken for respective sub-sectors; future population by urban and rural area, the number of student enrollment to public schools and the number of public utilities. Reference base figures for the study of framework are the 1995 Census of Population and Housing, the statistical data of the province and the information from relevant agencies. Provincial population by target year and the base year (1998) is estimated referring to the NSO population census results (past 3 census periods: 1980 - 1995), the 1995 Census-based Regional and Provincial Population projection prepared by NSO and the Provincial Physical Framework Plan/Comprehensive Provincial Land Use Plan. While, the population distribution to urban and rural areas prepared by NSO in 1995 is modified to meet actual conditions in the classification of the areas.

Types of required facilities and their implementation criteria according to service level standards are referred to the NSMP and the NEDA Board Resolution No. 12 (s. 1995). Some planning conditions and assumptions not prescribed in the national plan are conferred to the relevant standards of sector agencies and provincial government. For sewerage requirements, the deficit in sanitation must first be addressed. Partial upgrading of on-site disposal to a sewerage system (off-site disposal) is envisaged in the final target year.

In estimating future requirements by municipality, additional population (or number of stu-

dents/public utilities) to be served by sub-sector is first calculated as a shortfall at target years in comparison between each target and its base year service coverage. In this regard, planned/on-going projects to be completed by respective base years are considered as part of existing services for each target year. Required number of facilities by sector component is then estimated corresponding to the said additional population (or number of students/public utilities) to be served. Rehabilitation work for Level I facilities limited to new deep wells to be constructed under PW4SP is taken into account. Generally, rehabilitation of deep wells and shallow wells constructed by means of conventional method is difficult.

Logistic support is considered as a minimum requirement of LGUs for community development and training, and other relevant activities along with the implementation of PW4SP. The types and number of well drilling/rehabilitation equipment and supporting vehicle for Level I facilities are also suggested as reference information. Also, minimum requirements for setting up a provincial laboratory to support drinking water quality surveillance and monitoring are described. This will include building, instrument/equipment and reagent/chemical requirements. The 1993 Philippine National Standards for Drinking Water (PNSDW) requires that initial examinations of water from newly constructed sources should first be undertaken before operation for public use and henceforth periodic examinations of these water supply sources/facilities.

Project priority for medium-term development is discussed entailing general criteria to identify specific projects. However, at the provincial level master plan, it is suggested that municipal priority ranking be used for allocation of provincial fund.

8.2 Targets of Provincial Sector Plan

Provincial sector targets for the years 2005 and 2010 are determined as the provincial average of the desirable minimum level for each sub-sector. Table 8.2.1 summarizes the target percentages to be served by sub-sector. Details by sub-sector are discussed in this sub-section.

(1) Water supply a selection of the base of the first and the first and

The base year (1998) service coverage was calculated as a total of 1998 figures and expected by planned/on-going projects scheduled to be completed by 1999. Table 8.2.2 shows service coverage for the planning purpose (details are referred to Supporting Report).

The base year service coverage in urban area (80%) is higher than the updated MTPDP sector target (69%) for the year 1998, while rural area (68%) is behind the sector target of 79%. As identified in Chapter 4, lower service coverage in rural area is considered to arise because of the existence of high percentage of underserved population.

For Phase I development, targets of service coverage for water supply by urban and rural were set up considering the following conditions:

- i) at least the existing service coverage shall be secured to meet population increase;
- ii) physical targets of Level I facility for rural water supply under the on-going ADB-assisted project shall be incorporated into medium-term development plan; and
- iii) viable investment using available IRA to be allocated to water supply sector shall be considered.

With regard to rural water supply, population to be served under on-going ADB-assisted project was assumed as additional population to be served to meet increase of the population in rural area.

Thus, the existing service coverage of 80% for urban and 68% for rural area are assumed in the medium-term period.

Phase II targets are planned to increase urban and rural water supply coverage to 95% and 93%, respectively, as envisaged in the NSMP.

(2) Sanitation

1) Household toilets

As with water supply, the base year service coverage is calculated as shown in Table 8.2.3 reflecting any planned or on-going projects scheduled to be completed by 1999 (details are referred to Supporting Report).

The province has base year service coverage of 73%, which is well above the current national average coverage of 60%. Urban area registers a level of 80%, while rural area has 71%, both above the national average coverage. By type of sanitary toilet facility, the existing percentage composition to total households is as follows:

<u>Type</u>		<u>Urba</u>	ın (%)	Rural	(%)

To pursue sufficiency and equitable access to basic services, provincial target of Phase I for urban household toilets is planned at 90%, while, for rural household toilets, 85% is assumed. A higher increase in the urban service coverage is aimed for to lessen the gap of the coverage between the urban and rural areas and to achieve a balanced distribution of this basic facility as embodied in the PNDP. For Phase II, 93% as set by the NSMP is adopted for urban household toilets, while, 90% is arranged for rural household toilets.

The existing composition of the 3 facility types serves as an indicator in the distribution for Phase I, while for Phase II, VIP and sanitary pit privy/latrine (dry-type) is phased-out.

2) School toilets

The base year service coverage of public school students is shown in Table 8.2.4 counting expected coverage of any planned or on-going projects scheduled to be completed by 1999 (details are referred to Supporting Report).

Base year service coverage is 54% applying the standard number of public school students to be served by one (1) unit of toilet facility. A relatively high level of coverage is observed in the province.

In the absence of national targets for school toilets, the existing level of service coverage is the base in setting up the targets. It is expected that all new construction of school-buildings will entail sanitary toilets enabling the coverage to increase on a high level. For Phase I and II, 80% and 90% are set, respectively.

3) Public toilets

The base year service coverage considering expected additional coverage by 1999 is shown in Table 8.2.4 (details are referred to Supporting Report).

Seventy one percent (71%) of public utilities are served with at least one sanitary toilet.

Without national targets as of now, considering the improvement of present situation.

90% and 100% coverage for Phase I and Phase II are assumed, respectively.

(3) Sewerage

Given the non-existence of sewerage systems in any municipality at the present time, this plan does not consider the service during Phase I. For Phase II, a target of 50% coverage was applied to urban population of municipalities with more than 10,000 urban population provided by Level III water supply systems.

(4) Solid waste

The municipal level data in 1998 on the number of households served by the municipal refuse collection revealed that the current practice is concentrated to urban areas. The base year service coverage for urban area by municipality is reflected in Table 8.2.5.

About 16% of the total households in the province relied on municipal refuse collection using trucks or 60% urban household coverage. These municipalities have a total of 13 units of collection truck.

No national targets have yet been set. However, considering the improvement of present coverage, 80% urban household coverage is applied for the medium-term period (2001-2005).

8.3 Projection of Frame Values

8.3.1 Population Projection

Future population for all municipalities by urban and rural areas was projected for the target years of 2005 and 2010 together with the present population in 1998 as a planning base year.

The future regional and provincial population has been projected by the NSO, while the projections at municipal levels were not available during the study. The future population of LGUs was therefore projected (details are included in the Supporting Report). Available information for the study at present is as follows:

NSO population census results from 1980 to 1995

1995 Census-based Regional and Provincial Population Projection prepared by the NSO Provincial Physical Framework Plan/Comprehensive Provincial Land Use Plan (1996-2005) prepared by the Provincial Office

(1) 1995 Census-Based Regional and Provincial Population Projections: NSO

The NSO conducted regional and provincial projections for the period 1995-2020. The assumptions take into account future trends in the demographic processes of fertility, mortality and migration required by the cohort-component method for projecting population. The 1995 Population Census was used as the basis for the projection.

In the regional population projection, the subject region for this study; Region VI is classified as the medium-size region (at least 5 million but less than 10 million by year 2000). The following are the result of projection for the region and the province of Antique in 2000, 2005 and 2010.

Table 8.3.1 Regional and Provincial Population Projection by NSO

Y	'ear	1980	1990	1995	2000	2005	2010
D : 121	Population	4,525,615	5,393,333	5,756,623	6,328,671	6,890,447	7,428,329
Region VI	Growth Rate		1.77%	1.31%	1.91%	1.72%	1.51%
	Population	344,879	406,361	430,363	471,514	512,755	554,797
Antique	Growth Rate	-	1.65%	1.15%	1.84%	1.69%	1.59%

Note: Average annual growth rates: geometric growth rate

Population of the province in 1995 as of September 1, 1995 was 431,713 (1995 Census)

In the past development, annual growth rates of the region and Province between 1990 and 1995 decreased compared with those of previous census period. The growth rates for respective census period (1980-1990 and 1990-1995) in regional and provincial population show almost same tendency of decreases (about 30%). For the population projection, however, the NSO considered the experiences in the previous development both for regional and province. Thus, the growth rates of the region with 5-year interval between 1995 and 2010 are assumed at 1.91%, 1.72% and 1.51%, respectively. Likewise, those of the province are assumed at 1.84%, 1.69% and 1.59%, respectively.

(2) The Land Use Plan: Province of Antique (Planning period 1996-2005)

The population projection on the provincial total and component municipalities together with the regional population was made with a base year 1990. The population for the year 2005 was projected using a uniform growth rate between 1990 and 2005 referring to the experience from 1980 to 1990 (census years).

In comparison between Land Use Plan and NSO's projection for year 2005, there is no significant difference both in regional and provincial population.

On the other hand, regarding the projected municipal population in 1995, that of eleven (11) out of 18 municipalities is higher than census results with a range of 1% to 16%, while that of remaining seven (7) municipalities is lower with a range of -2% to -13%.

Thus, future projection shall be made using 1995 census results as a base year. While, the regional and provincial population projected by the NSO may be adopted in this

PW4SP, since the differences between population projected for the medium-term by Land Use Plan and by the NSO is less than 3%.

(3) Population Projection of the Province

The following conditions are considered in the population projection.

Regional and Provincial Population

For the regional and provincial population in the study, the projection conducted by NSO shall be adopted. Table 8.3.2 shows the projected population of the region VI and component provinces.

Table 8.3.2 Projected Population by the NSO

<u></u>	Census		Pr	ojected Populat	tion/Growth Ra	ite

Municipal Population

1) The total population of the province in 1998, 2005 and 2010 was fixed.

医温度管 医精体系统 建氯磺胺苯酚 医皮肤炎 医克里特氏管 化二烷

2) Municipal population for short/medium-term target years (1998 and 2005) is estimated using the experienced growth rates between 1990 and 1995. The municipal population estimated initially is adjusted in proportion to the population size of each municipality to the total provincial population, to meet the above mentioned provincial population fixed for the years 1998 and 2005. In this adjustment, the population of Tibiao in 1995 was fixed to avoid negative population growth.

For the year 2010 in the long-term, it is assumed that the tendency of population growth of respective municipalities between 1980 and 1995 will not change drastically in the future. Thus, recorded growth rate between 1980 and 1995 by municipality is firstly applied to project 2010 population from the year 2005. Then, the municipal population estimated initially is adjusted in the same manner mentioned above.

Table 8.3.3 presents census results (1980, 1990 and 1995) and projected population of the municipalities.

Table 8.3.3 Census results and Projected Population of Municipalities

Note: Growth rates in 1998, 2005 and 2010 were calculated using geometric formula.

Population by Urban and Rural Area

1) Past population development

With regards to the ratios of the urban population of the province to the total population, the provincial averages in 1980 and 1990 were 20.7% and 28.9%, respectively. While it decreased to 26.1% in 1995. The provincial growth rate of 5.14% between 1980 and 1990 also decreased to -0.83% in 1995. On the contrary, the growth rates of rural population as the provincial average increased from 0.54% (1980 - 1990) to 2.01% (1990 - 1995).

The reason of the negative population growth of urban area between 1990 and 1995 is explained that classification of urban/rural barangays in the municipalities of Hamtic, Pandan, San Jose, etc. was considerably changed from that in 1990 Census time.

encontribution of a next to a treet of grant to

2) Projection of urban and rural population for the years 1998, 2005 and 2010 Urban population by municipality for the target years was at first projected and rural population was calculated to meet aforementioned total population fixing the urban population.

In the projection of municipal urban population, the followings are assumed by short/medium-term and long-term.

Short/Medium-term target: 1998 and 2005

નાં કોલ્પિક લાં લાં લાકુ તેમ કુલના પેલા તાંત્રો માટે કે મુખ્યા છે. જે જે છે છ

The share of urban population in 1995 in terms of the profile of urban population to total population by municipality were basically adopted, assuming that the latest profile will not change drastically in short/medium-term period.

Long-term target; 2010

For the long-term projection, the recorded growth rates of urban population between 1980 and 1995 may be applied for the municipal population in 2010, assuming that the tendency of urban population in the long-term period will be stable reflecting the experiences in the past long term.

Under the above assumptions, provincial average share of urban population for the year 2010 arrived at 26.1%, same as the share in 1995. Table 8.3.4 presents projected urban and rural population. The growth rates and shares on rural population are calculated using estimated rural population.

8.3.2 School Enrollment Projection

From the 1995 total population of the province, the number of children who would be enrolling in elementary and high school levels for all municipalities is derived.

School age population is extrapolated from the NSO age group classification of 5-9, 10-14 and 15-19 years old bracket by municipality. The age group for the elementary level is from 6 to 13 years, while that for the high school level is from 14 to 17 years. The percentages of school age population for the target years are based on the existing composition or structure of the 1995 population.

From the school age population, the number of children who would attend either private or public school, by target year is computed using the projected participation rate. Participation rate by target year varies depending on the socio-economic condition of the province. Generally, an improved economy will result to a higher participation rate. For the province, an increase in the participation rate in both private and public schools is foreseen by year 2010.

The number of public school students by target year is then derived from the projected number of children who will attend school. With regard to the participation rate for public school enrollment, the existing participation rate (88%) of public school students to the total school age

population is assumed to be kept both for year 2005 and 2010 (details are referred to Table 8.3.6, Supporting Report).

Table 8.3.5 shows the projected number of public school students by municipality, by target year. About 122,400 and 132,100 public school students are estimated to enroll for years 2005 and 2010, respectively.

8.3.3 Projection of the Number of Public Utilities

The number of public utilities (limited to public markets and bus/jeepney terminals) by target year is projected in urban areas for all municipalities. The provincial physical framework plan and the provincial comprehensive development plan serve as references in the projection. Bus or jeepney terminals are considered in major transport routes of the province.

Table 8.3.5 Projected Public School Enrollment and Number of Public Utilities by Municipality

Sibalom	11,883	14,126	15,443	2	3	4
Tibiao	4,581	4,559	5,054	2	3	3
Tobias Fornier	5,338	5,447	6,120	2	3	3
Valderrama	3,876	4,464	5,035	2	3	4
Provincial Total	109,070	122,357	132,055	40	58	70

A total of eighteen (18) public utilities are planned to be constructed by year 2005 and another 12 by year 2010. Presently, the on-going ADB assisted project is proposing 3 public toilets to be constructed by year 2002, hence this is included in Phase I development. Refer to Table 8.3.5 for the number of public utilities by municipality by target year (details are referred to Supporting Report).

8.3.4 Planning Area and its Projected Population for Sewerage

Urban areas with more than 10,000 population provided by Level III water supply systems in 2010 serve as the planning area. Population in the area is considered as the potential population to be served.

Three (3) municipalities with a total urban population of about 37,000 are considered (refer to Table 8.5.4).

8.3.5 Number of Households to be Served by Municipal Solid Waste Collection System

The number of urban households in 2004 is the potential households for the planning (refer to Table 8.3.5, Supporting Report).

ik kontikek financja libik njade politična ar in klasiana in

8.4 Types of Facilities and Implementation Criteria

In principle, the types of facilities and their implementation criteria as prescribed in the NSMP and the NEDA Board Resolution No. 12 (s. 1995) are adopted to this PW4SP.

8.4.1 Water Supply

The following are the major conditions and assumptions applied to urban and rural water supply, which are intended as a guide for the implementation of sector projects.

(1) Urban water supply

Prevailing situation of urban water supply in each municipality was first reviewed mainly focusing on existing water sources and magnitude of service coverage. Planned/on-going projects for concerned municipalities were also studied and reflected in the planning, with due attention to merging of municipalities into an integrated water supply system. Potential water source for future development was then evaluated based on the study results in Chapter 7, taking into account the possibility to utilize untapped spring sources. Recommendations arising from these studies were also incorporated as overall development strategy.

Aforementioned studies were carried out by the following sequence:

Review of existing water supply systems and water sources;

Review of planned/on-going projects;

Establishment of planning conditions covering service level, utilization of existing facilities, water sources, and number of systems; and

Recommendations for overall development strategy.

Table 8.4.1 presents a summary of the study results by municipality.

editorio, patrio della diferenzia. El prese protessa data giorio dell'editorio di considerati di

1) Review of existing water supply systems and water sources above the state.

The municipalities of Barbaza, Bugasong, Cilasi, Hamtic, Pandan, Patnongon, Sibalom and Tobias Fornier are served by WDs.

While the municipalities of Sebaste and Tibiao are served by Level III systems operated by the municipal government.

Bank to be at the ground and the rail of the gas and thinks to

Population served by existing Level III systems range from about 2,000 persons at Patnongon WD to 24,000 persons at Pandan WD. The average size of served population is about 5,000 persons/system. Majority of the existing Level III systems in urban areas is utilizing deep well/spring sources.

Table 8.4.1 Summary of Urban Water Supply Development by Municipality/City (Antique)

Municipality	Sylethos Candition	O Proposition and	The state of the s	
	Southern Strategy	Cargonia ramado region	Water Source Avanability	ruture Kequirements
Апілі-у	There is no Level III system:		DW; not sufficient discharge (acidic) SP; scattered & limited yield (potable) Future development; grouped springs	A new Level III system in use of spring sources is necessary.
Barbaza	There exists one WD, water source of which is the spring. This system serves two urban barangays for a total population of 3,306 and six rural barangays for 5,122 population.		DW; high yield & free flowing (slightly ironic). Expansion of existing system with either SP; sufficient but far from populated area (potable) Future development; priority to spring	Expansion of existing system with either spring or DW sources
Belison	There is no Level III. system.		development, but Dw. is also available DW; high yield & free flowing (slightly ironic). SP; sufficient but far from populated area (potable) Future development; priority to spring, but	A new Level III system in use of spring /deep well sources is necessary.
Bugasong	The WD serves three urban barangays (4,866 people) and four rural barangays (4,078 people) in use of deep well source.		DW: high yield & free flowing (potable), SP; sufficient but far from populated area (potable) Future development; priority to spring development, but DW is also available	Expansion of existing system using existing DW source
Caluya	There exists no Level III system.		DW; risky (only shallow well), SP; only potential source Future development; SP; then radial well and/or surface water with due consideration of water quality	A new Level III system is necessary, Water source may be spring, while radial well is secondary choice.
	There are one each of WD and WWs, both of which use spring sources. These systems serve three urban barangays (5,603 people) and six rural barangays (5,700 people).	*	DW; high yield (potable) SP; sufficient discharge but far from populated area (potable) Future development; select thr. cost comparison between DW and SP	Expansion of existing system with the augmentation of spring sources
Hamtic	There exist one each of WD and WWs, both of which use deep wells (free flowing). The WD serves five poblacion barangays (3,995-people) and the WWs one rural barangay (1,243 people).		DW; high yield & free flowing (slightly ironic locally) SP; limited yield & far from populated area Future development; DW	Expansion of existing system with augmentation of deep well wources.
Laua-an	There is no Level III system.		DW; high yield (high iron content in the hilly area) SP; sufficient but far from populated area (potable) Future development; SP	A new system is necessary. Water source shall be determined through cost companison between spring and deep well.
Libertad	There is no Level III system.		DW; not sufficient discharge (ironic locally) SP; scattered. & fimited yield (potable) Future development; grouped springs	A new system is necessary. A group of springs may be used.

Table 8.4.1 Summary of Urban Water Supply Development by Municipality/City (Antique) (Cont'd)

Municipality	Existing Condition	On-going/Planned Project	Water Source Availability	Future Requirements
Pandan	Newly constructed WD is servicing barangay poblacion, which utilizes spring source.		DW: low yield (ironic problem locally) SP: scattered, limited yield & far from populated area (potable) Future development, grouped springs together with deep wells	Expansion of existing system. A group of springs in combination of deep wells may be used.
Patnongon	One WD exists, water source of which is deep well. This system serves one urban barangay (4,699 people) and three rural barangays (3,226 people).		& free flowing (slightly ironic). It far from populated area nent; existing DW has enough ansion	Expansion of existing system. Existing deep well may be used for the purpose.
San Jose (capital)	San Jose (capital) The WWs utilizing spring source serves for nine urban barangays (19,285 people).		DW; high yield (salinity in the coast area), SP; sufficient but far from populated area (potable) Future development; DW	Expansion of existing system, water source of which shall be augmented by deep well.
San Remigio	There is no Level III system.		DW: high yield & free flowing (slightly ironic) SP; sufficient (potable) Future development; SP	A new system in use of spring source is necessarry.
Sebaste	There is one WWs which utilizes spring source. This system serves the barangay poblacion (2,885 people).		DW: high yield (slinity in the coast) SP: sufficient but far from populated area (pomble) Future development; SP	Expansion of existing system entailing the augmentation of spring sources.
Sibalom	There is one WD, water source of which is deep well. This system serves two urban barangays (7,297 people) and four rural barangays (4,614 people).		DW; high yield & free flowing (ironic) SP; sufficient & near populated area (potable) Future development; SP	Expansion of existing system using DW/spring sources.
Tibiao	There exists one WWs, water source of which is the spring. This system serves two urban barangays (5.39) people) and one rural barangay (192 people).		DW; high yield (potable) SP; sufficient but far from populated area (potable) Future development; select thr. cost comparison between spring and DW	Expansion of existing system in either use of spring or deep well.
Tobias-Fomicr.	There exists one .WD, water sources of which are the spring and DW. This system serves three urban barangays (3,683 people) and one rural barangay (394 people).		DW; not sufficient (ironic locally) SP; scattered & limited yield (potable) Future development; grouped springs	Expansion of existing system with the augmentation of spring sources.
Valderrama	There is no Level III system.		DW; risky SP; only potential source (potable) Future development; SP	A new system is necessarry using spring source.

The remaining 7 municipalities, out of the total 18 municipalities have no Level III system in their urban areas and are presently served by Level II systems and/or Level I facilities.

2) Review of planned/on-going projects

There is no available information on planned/on-going projects during the course of PW4SP preparation.

3) Establishment of planning conditions

a. Service level

It shall be noted that a national policy for urban water supply is a Level III system, as the most suitable measure. Therefore, for the investment needs of the sector development, it is assumed in this PW4SP that underserved or unserved urban population at present and in the future will be provided with individual house connections. However, it does not intend in the future to exclude, as individual cases, Level I and II facilities from being implemented in urban area.

b. Utilization of existing facilities

The existing Level I and II facilities are considered to be utilized during the Phase I period. However, the population served by these facilities is to be absorbed by Level III service in Phase II.

c. Water sources

Possibility/availability to utilize surface water and groundwater (spring and deep well) is evaluated as potential water sources for water supply development.

From the viewpoints of cost effectiveness and easy O&M of water supply system, utilization of spring sources is given due priority in the course of urban water supply planning. Application of deep wells for water source is regarded as the second priority in principle. Surface water is, on the other hand, not adopted at this moment, because of large capital investment requirements and complexity of surface water treatment.

d. Number of systems

In principle, one (1) Level III system is considered for urban area of every municipality. In the municipalities with an existing Level III system/s, the expansion of the system was first considered. In case of no existence of Level III system/s, a new system was recommended. Existing plan/s on the development of Level III/WD are also taken into account to determine the respective systems of

High ox bechieber was the made in the

the municipalities.

Possibility and necessity to merge service area of some neighboring municipalities to an urban water supply system were also studied from the viewpoint of:

water source constraints, and

economical development/scale merit of water supply system by cost reduction of water source development and other common facilities as well as O&M cost/minimized number of technical staff.

Any rural barangay/s being served by an existing urban Level III system are considered to continue throughout the future.

e. Rehabilitation

Rehabilitation of existing and future facilities is assumed to be undertaken by the operating bodies.

4) Overall development strategy

Expansion of the existing system/s was planned for those with WD/Level III, while creation of the system is considered for those without systems at present.

Merging of municipal systems (physical arrangement) in the long-term is considered. Integrated management systems shall also be sought. Conditions to be studied include; water source availability, willingness by concerned municipalities and technical study on cost recovery/economic construction.

Integration of small Level III systems for operation and management shall be sought, although these systems are currently managed individually.

Some municipalities may have high potential for spring development, however, a detailed survey to ensure appropriate development of spring sources shall be conducted in the implementation of the projects.

(2) Rural water supply

1) Service level

allow the more than the common to

Level I systems (deep well/shallow well/developed spring) are generally planned for rural areas where houses are scattered. In the PW4SP, all of the required Level I facilities will be implemented under the on-going ADB-assisted project.

ที่สี สิวกระทั่งให้ที่ของตองสองที่ เลยใหม่เห็นที่สี เปลาสมัย และสามารถใหม่เลยใส่เลยใส่เปลาสาร์สัส ใหม่เมื่อสร้

Tata o traje gripaja procesisti derbeikirinasirin gregorijasi ja virtus kolonia. Tara o naj naj rominasiri sa tatili sa delaktrikina ette naj 1820 til 1814 ili 1824. Level II systems are considered where houses are clustered and suitable untapped spring is available.

Service level standards are set forth as 15 households per source for Level I and 5 households per communal faucet for Level II, as defined in the national plan.

Application of Level III systems in rural areas may be considered in a case to case basis during actual implementation.

2) Utilization of existing facilities

The existing facilities/systems in all service levels are considered to be utilized throughout the future.

3) Water source

For Level I facilities, deep well construction is given priority wherever applicable considering safety against possible contamination and stable water supply. Standard specifications of shallow and deep wells are summarized in Table 8.4.2 based on the water source evaluation results presented in Chapter 7. Conventional construction method (driven well) may be employed under favorable substrata or hydrogeological conditions. The standard structure of wells in application of "open-hole drilling and gravel pack" is presented in Figure 8.4.1, Supporting Report. In addition to this, for deep well with high iron content, application of iron removal facility is recommended. The standard structure of iron removal facility is presented in Figures 8.4.2 (a) and 8.4.2 (b), Supporting Report.

Table 8.4.2 Standard Specifications of Level I Wells

Specification	Shallow Well	Deep Well
Construction Method	Open-hol	e drilling and gravel pack
Casing Diameter	் <i>முர்க்</i> 50mm் விவர்	data the sale 100mm
Borehole Diameter	150mm	200nun
Ranges of Well Depth		Standard Depth
0 - 20m	20m	Not Applicable
21 - 50m	Not Applicable	40m
51 - 100m	Not Applicable	80m
101 - 150m	Not Applicable	120m

Spring development is also included in Level I planning by adopting ADB-assisted

entrum or allumber 10 f

For Level II systems, only untapped springs suitable for water supply purpose are considered. However, there was no information available for untapped springs during the course of PW4SP preparation.

Profile between gravel packed well and natural gravel packed well for Level I water supply:

The open-hole drilling method is employed for well construction to ensure yield of ground water from adequate aquifer in provision of proper screen location and specifications. The conventional "cased-hole driven well" shall be used only in cases where well specifications are established in the specified area with sufficient information on the hydrogeological condition including existence of natural gravel at the expected aquifer.

It is important to study the potential areas to adopt natural gravel method, which can perform the same level of function as gravel-packed wells. Such areas are usually limited to the upper stream of larger rivers in alluvial fans and alluvial plains. The arial proportion between those in application of gravel-packed and natural gravel pack wells will be worked out referring to the condition of the province.

Modification needs of riser pipe diameter according to the water level of deep wells: The standard specification of riser pipe of deep well hand pump is set with a diameter of 2-1/2 inch in the plan. However, water level of the deep wells may range between 20m and around 40m, depending on the aquifer conditions.

Although the Malawi type deep well pump with a cylinder that is currently used in the Philippines has operation experience of up to 40m in pumping water level, the diameter of riser pipe must be adjusted between 1" to 2-1/2" in order to lower required power at the pump handle (calculating required power under the specific pumping water level).

For Level II systems, only untapped springs suitable for water supply purpose are considered. Identified untapped springs are presented in the Supporting Report.

4) Number of systems/facilities

The number of Level I wells and spring development is estimated based on the service level standard; while the number of Level II systems coincides with the number of untapped springs.

5) Rehabilitation

Rehabilitation of existing Level I wells is not considered, since most of the wells constructed by driving method are not suitable for rehabilitation to recover their functions. Still, minor repair work for hand-pump and concrete apron is a requisite.

8.4.2 Sanitation

The conditions and assumptions are established for the different sanitation components to serve as guides in the implementation of projects.

(1) Household toilets

Three types of sanitary toilet facilities for individual houses are considered for Phase I; flush, pour-flush and VIP/sanitary pit privy (dry-type). While for Phase II, flush and pour-flush are planned considering the improvement of living standard.

The type of toilet facilities is dependent on the existing or planned service level of water supply in the community. In urban and rural areas with Level I or II water supply facilities, only pour-flush and/or VIP are considered, while in urban areas with Level III water supply systems, flush type toilets requiring a piped water connection are included. Isolated rural areas where there is dearth of water supply, sanitary pit privy (dry type) is taken into account.

(2) School toilets

Standard service level currently used by DECS (40 students per unit facility) is employed for both phases.

The standard toilet facility (1 building) with 5 units of toilet bowl to serve for 200 students is adopted for the planning purpose, which is modified from FW4SP design to provide a shallow well as a water source. Since DECS is currently promoting the "one classroom-one toilet" concept, the PW4SP also adopts this concept on a 50-50 basis, that is 50% of the school toilet requirements will be allocated using the JICA-RESP design and the other 50% will be adopting the new concept.

(3) Public toilets in a section was a mail and a real and a section of the

As a minimum requirement, at least 1 sanitary toilet facility is assumed to be provided for respective utilities: public market bus/jeepney terminal and parks/playground.

The standard design of DOH with 6-units of toilet bowl for the market is adopted. In this design, it is assumed that water supply will be tapped from the existing system, hence an elevated water tank is provided.

8.4.3 Urban Sewerage

The commencement of staged implementation of the sewerage program is planned in Phase II for the limited urban area (50% of urban population served by Level III system for the municipalities with urban population of more than 10,000). It is practical to start the program fully using the existing facilities to allow for lower initial investment cost than starting at once a conventional sewerage system (refer to Figure 8.4.2 Staged Improvement in Sewage Collection Method, Supporting Report).

Low cost off-site technologies such as small-bore sewer for collection of effluent from septic tank are to be adopted. Improvement of sewage collection method may be gradually achieved from combined sewer to separate sewerage system.

Sewage treatment facilities may range from community scale septic tank or Imhoff tank to aerated lagoon systems and to a more advanced treatment process such as oxidation ditch. For this PW4SP, aerated lagoons are assumed as a representative treatment facility for planning purpose. Daily average wastewater quantity is assumed at 100 liters per capita per day.

8.4.4 Solid Waste

In terms of facility requirements, this PW4SP only studied the number of refuse collection trucks required for the year 2005. A rated capacity of 5 cu.m truck/vehicle is considered for calculation of required units of truck. Disposal of solid waste shall be studied in detail through investigations, F/S and D/D. Unit solid waste generation for urban area is assumed to be 0.418 kg. per capita per day.

na serva v sa trib MS at the serva bullet disconner experie

construints of all partially of high star command bank

8.5 Service Coverage by Target Year

8.5.1 Water Supply

The service coverage in terms of population to be served by target year was estimated by urban and rural area by municipality. The service coverage in rural area was further subdivided by service level (Level I & II) to finally come up with physical requirements.

Base figures applied to estimate the future service coverage and the additional population to be served are:

provincial sector targets;
physical targets under on-going ADB-assisted project;
population projection by target year; and

base year service coverage (served population) by existing facilities.

Future requirements in terms of additional population to be served were then estimated by urban (Level III) and rural (Level I & II) area by municipality as a shortfall to meet the population to be served in each target year. The population served in base year is adopted as the population served in target year, when the former population exceeds the population to be served in the target year/s. Manner of calculation is specifically presented by phase.

(1) Phase I requirements

Additional service coverage was estimated as a shortfall of the population to be served in Phase I comparing with the population served in base year. In this connection, existing facilities both in urban and rural areas are assumed to be utilized during the Phase I period.

With regard to development of rural water supply, the on-going ADB-assisted Rural Water Supply and Sanitation Sector Project (RW3SP) is considered as a major role in the medium-term plan of PW4SP.

The physical targets of the province under the ADB-assisted project are construction of shallow well (195 units), deep well (113 units) and developed spring (28units). Although a total of 336 units were allocated to the recipient municipalities, the actual construction has not yet started to date. Accordingly, these physical targets may be included in the Phase I requirements of this plan (details are referred to Supporting Report).

Although utilization of untapped springs for Level II systems is given priority for rural water supply in this plan, Level I facilities under the ADB-assisted project are solely considered for rural water supply (Level II systems are excluded from proposed project).

Table 8.5.1 presents the service coverage by target year and by level of service as well as the additional population to be served (details are referred to Supporting Report).

Through Phase I development, approximately 41,400 persons in the province will be served by additional water supply services, of which 11,200 persons or 27% of the total will be urban population and 30,200 persons or 73% will be rural population.

Table 8.5.1 Population to be Served by Target Year (Water Supply)

egel les difiels,

For Phase II period, a total of 210,800 persons, of which 87,600 persons or 42% in urban area and 123,200 persons or 58% in rural area, will be further benefited by water supply services. This additional service coverage in urban area includes the upgrade of service level for 56,000 persons served by Level I and II facilities in 1998.

8.5.2 Sanitation

(1) Household toilets

The service coverage (number of households to be served) by different types of sanitary facility is estimated by urban and rural area by municipality for the years 2005 and 2010. The future service coverage and additional households to be served are estimated to meet the provincial targets using the number of household served in the base year and the number of households in target years.

Phase I service coverage will include the proposed household toilets of the on-going ADB assisted project in the province with a total of 2,550 units of pour-flush toilets. Construction/installation is expected to complete in 2002.

Additional number of households to be served by different type of facility by urban and rural area by municipality is the shortfall of the number of households to be served in target years comparing with either the base year or in Phase I (details are referred to Supporting Report).

In the determination of the number of households to be served by flush type toilet, when the number of households to be served in the target year is higher than in base year, the target coverage is applied with conditions. When the target coverage is higher than Level III water

supply coverage, the latter coverage is adopted, while in the other case, the target coverage is applied. In cases where the target coverage is less than that in base year, the base year coverage is adopted.

For Phase I, any type of existing sanitary facilities both in urban and rural areas is to be utilized during Phase I period. For Phase II, water-sealed toilet facilities in Phase I both in urban and rural areas are to be utilized.

The projected number of served households at the end of the Phase I period is 86,315. Additional households to be served totaled to 21,437 of which 23% is urban households

and 77% is rural households. Of this requirement, a total of 2,250 units of pour flush toilets will be absorbed by the on-going ADB assisted project. While at the end of Phase II period, the number of served households are 125,922 with additional households to be served at 42,656. Table 8.5.2 provides the number of households to be served by target year for urban and rural areas by municipality.

(2) School toilets

The service coverage or the number of public school students to be served is estimated by municipality for the years 2005 and 2010.

The future service coverage and additional number of students to be served are estimated using the number of students served in the base year, the number of students in target years and the provincial sector targets.

Phase I development will include the proposed school toilets under the on-going ADB assisted project in the province with a total of 4 units of school toilets to be situated in each classroom.

Additional number of students to be served by municipality is the shortfall of the number of students to be served in targets comparing with either that in base year or in Phase I (details are referred to Supporting Report

The existing facilities are to be utilized during Phase I period, while the facilities in Phase I are to be utilized during Phase II period.

The projected number of served students at the end of Phase I period is 97,886. The additional students to be served are 38,985 inclusive of about 960 students to be covered by the on-going ADB assisted project. While at the end of Phase II period, the projected number of served students are 118,853 with additional students to be served at 21,637. Table 8.5.3 summarizes the number of public school students to be served by target year.

(3) Public toilets

The service coverage of public utilities with sanitary toilet facility by municipality is estimated for the years 2005 and 2010.

The future service coverage and additional coverage are estimated using the existing number of public utilities with sanitary toilets in the base year, the number of public utilities in target years, and provincial sector targets.

The additional number of public utilities with sanitary toilets needed by municipality is the shortfall of the number of public utilities in target year comparing with either the existing coverage or Phase I coverage (details are referred to Supporting Report).

The existing sanitary facilities are to be utilized during Phase I period. The facilities in Phase I are to be utilized during Phase II period.

There are 32 public utilities to be constructed for the medium-term plan. Among them, the ADB assisted project proposes 3 units of public toilets in the province to be constructed within the Phase I period. Twelve (12) public toilets to be located in public

markets/bus terminals/parks are to be constructed by year 2010. Table 8.5.4 reflects the distribution of these public toilets by municipality.

8.5.3 Urban Sewerage

The service coverage in 2010 (Phase II) is estimated for the municipalities with population of more than 10,000 in urban area provided by Level III water supply. It is assumed that half of the population in the area/s is to be served by the sewerage systems. Table 8.5.5 shows the population to be served in Phase II.

Table 8.5.5 Population to be Served by Urban Sewerage in Phase II

Name of Municipality	Urban Population in 2010	Level III Water Supply Coverage	Population to be Served
San Jose de Buenavista	52,523	49,897	26,262
Sebaste	11,144	10,587	· 5,572
Sibatom	10,488	9,964	5,244
Provincial Total	144,813	137,575	37,078

8.5.4 Solid Waste

Future requirements in the sub-sector are studied giving priority to urban area for the Phase I. Staged improvement for the rural area shall be studied in the future.

Service coverage in Phase I was assumed at 80% with reference to the present service coverage of 60% in urban area. Additional service coverage in Phase I is calculated as a shortfall of target coverage in Phase I comparing with current service coverage. Table 8.5.6 presents additional service coverage for Phase I in the urban area.

8.6 Facilities, Equipment and Rehabilitation to Meet the Target Services

8.6.1 Water Supply

(1) Required facilities

Water supply facilities required by service level were estimated by urban and rural area by municipality based on the additional service coverage by target year and summarized in Table 8.6.1 (details are referred to Supporting Report).

			ents	Water Supply Level 1	is No. of Total No.		_	1001		108	111		22 87 109	135		111 47 158	15		138 205 343	45		13 108 121	850 1.213 2.063					4

Urban water supply:

Physical requirements of Level III systems were estimated as the number of required house connections. Mode of project indicates whether future urban water supply will be implemented as expansion of existing system or construction of a new system. The number of water sources was also estimated based on the water source evaluation results in Chapter 7.

Rural water supply:

Physical requirements of Level II systems were estimated as the number of systems and number of communal faucets, while that of Level I facilities were first estimated as the number of wells with classification of deep and shallow wells. Deep wells were further subdivided in terms of three different standard depths based on the water source evaluation results.

As for Level I facilities, the required facilities for Phase I will be implemented by public (LGUs) under ADB-assisted project. For Phase II, 50% of the total required facilities will be implemented by public (LGUs).

(2) Rehabilitation

Rehabilitation requirements were estimated as 10% of the total number of deep wells to be constructed under PW4SP. Rehabilitation work will be mainly redevelopment of wells by means of air surging, while minor repair of concrete apron and hand-pump will be undertaken by respective beneficiary organizations.

(3) Equipment

Logistic support:

For rural water supply development, 1 unit each or set of the following equipment was considered necessary for the provincial government to conduct various activities of PW4SP implementation;

Transportation- service vehicle

Office equipment- computer with printer, typewriter, mimeo machine. scanning machine and copier

Field equipment- sound system, tape recorder and tools for maintenance

aliful yeltaligi düllikleriye kuluk besak badabada kita ilkan alanza, , yanga bitti bili keliful yeltali kelif

For urban water supply, no hardware was considered.

Well drilling and rehabilitation equipment:

As a reference information, necessary types and number of well drilling and rehabilitation equipment were studied considering the existing equipment of sector agencies in the province.

During Phase I, a total of 113 Level I deep wells shall be newly constructed under ADB-assisted project and 10% of these deep wells shall be rehabilitated annually. The DEO-DPHW (in San Jose Buenavista) has one unit of rotary type drilling rig procured in 1982. but it is not operational at present.

Therefore, at least 3 sets of drilling rigs (medium size percussion type) together with 3 units of service truck for deep well construction shall be mobilized by private sector to implement ADB-assisted project. Aside from this, one set of well rehabilitation equipment and one unit of support vehicle for well rehabilitation shall be procured by the province (details are referred to Supporting Report).

Selection of well drilling machine

An appropriate type of well drilling machine with its specifications shall be selected after comprehensive study on the technical requirements, local capability in O&M of the machine and cost effectiveness.

From the technical viewpoint, geological conditions in the province allow for the use of either rotary or percussion type drilling machine (no rock drilling is expected). While, in view of economical and O&M experience on the machine in the local area, a percussion type is recommendable. Although, the rotary type machine is quite effective to reduce construction period under soft soil condition, special training on mud-circulation, handling manner, etc. are required together with additional equipment and materials as compared with percussion type. The drilling speed of the percussion type is rather slow, but has advantages in drilling boulder and cobble formations.

One unit of truck mounted percussion drilling machine was considered to be procured in the long-term development period.

(4) Laboratory

The provincial government is a recipient of the on-going ADB-assisted project. This project will provide 3 water quality laboratories for the municipalities of Bugasong, Culasi and T. Fornier.. Aside from this, the province has a plan to establish another laboratories.

8.6.2 Sanitation

This sub-section refers to physical requirements by target year covering household, school and public toilet facilities. Table 8.6.2 presents the required sanitation facilities by target year. Rehabilitation for the sanitation facilities is considered as part of recurrent cost.

(1) Household toilets

Future requirements in the number of household toilets by different type for urban and rural areas were estimated based on the additional households to be served by type of facility both for urban and rural areas by target year (refer to Supporting Report).

(2) School toilets

The future requirements in the number of toilet facilities were estimated based on the standard number of students to be served by a 5-unit standard facility or a toilet in every classroom (50-50 sharing) and the additional students to be served by target (details are referred to Supporting Report).

Total required facilities were further broken down into urban and rural areas by applying the percentage share of urban and rural population.

8.6.3 Urban Sewerage and Solid Waste

Physical requirements for the sewerage facilities are not discussed in this sub-section. Further study shall be conducted in the future.

As reference information, the number of refuse collection trucks is estimated for the urban area in Phase I. Thirteen (13) additional units of truck are required to meet assumed service coverage as reflected in Table 8.6.3.

Table 8.6.3 Number of Refuse Collection Trucks Required in Phase I

8.7 Identification of Priority Projects for Medium-Term Development Plan

In general, the present service coverage by municipality with reference to the target coverage indicates the direction of development effort for implementing PW4SP with municipal priorities.

Specific projects shall be selected subject to detailed studies and will not be discussed in the provincial master plan. In addition, pertinent information to identify priority projects is not available both at provincial and municipal level during this PW4SP preparation, except some future expansion work for WDs.

The general criteria for identifying priority projects as guide for implementing the PW4SP are summarized below.

The first level of priority should be given to projects with positive feasibility studies and identified funding. Next level of priority should be given to projects with positive feasibility studies, although no funding source has been identified. The third level should be for which feasibility study has been conducted. Within each level, if funds were insufficient, a ranking could be carried out applying some factors, such as willingness to pay, water-related diseases status and per capita cost. Under the above-mentioned conditions, the implementors should prepare a list of projects.

Due attention shall be paid on the importance of integrated development of relevant subsectors to maximize the effects and benefits through simultaneous implementation of water supply and sanitation projects. On a municipal level priority, synthetic evaluation of sector components for concerned municipalities (which is studied in the financial arrangements. Chapter 11) may be used for implementation arrangements.
