Chapter INTRODUCTION 1

1. INTRODUCTION

1.1 Sector Development in the Philippines

The Government of the Philippines (GOP) has, over the last decade, with the assistance from external donors, made considerable progress in developing the water supply and sanitation sector. Development has covered physical and institutional framework nationwide.

Nevertheless, infrastructure service delivery including this sector during the period 1987 to 1997 has been insufficient to keep pace with the demand, which was magnified by natural calamities and economic status of the country.

About 68% (46.7 M) of the population nationwide enjoyed access to potable water supply in 1995 (66% in 1992). In urban areas outside Manila, 61% (11.6 M) had access to safe water supply services (47% in 1992), while in the rural areas, 70% (26.1 M) was covered by point water sources (80% in 1992). However, from the surveys conducted through the PW4SP, it was found out that about 20-30% of the existing water sources in the rural areas fall on the category of underserved or unserved in terms of safe or unsafe sources, damaged and non-functioning sources. Hence, of the rural population, it was estimated that only about 50-55% was served adequately by safe sources. This implies that around 60% of the total population enjoy water supply services at present.

Private sanitary toilets were available to 66% (45.3 M) of the total household nationwide in 1996 based on the DOH compiled reports. Communal toilet facilities are generally found only at schools, public markets and sometimes in bus terminals and town parks. For sewerage, only portions of the cities of Metro Manila, Cebu and Baguio have sewerage systems. Municipal refuse collection using service trucks is limited to urban areas. In 1996, majority of the households (55%) practiced individual disposal, mostly dumping, while the remaining 45% relied on municipal refuse collection and disposal services.

The policies and strategies on the sector are generally guided by the "Updated Medium-Term Philippine Development Plan (MTPDP: 1996-1998) in 1996" and the recently published "Philippine National Development Plan (PNDP: 1999-2025)". Activities in the sector have been directly guided by the "Water Supply, Sewerage and Sanitation Master Plan of the Philippines 1988-2000" since its issuance in 1988. The National Sector Master Plan (NSMP) sets ambitious targets to reach large segments of the population and to redress the imbalances between rural and urban areas. Meanwhile, the Updated MTPDP revised the targets for water

supply services based on updated conditions in 1996. The PNDP further modified the targets this year to suit current sector status.

Development in the sector had previously been directed to a high degree by central government agencies. However, the GOP has been instituting devolution and full decentralization of responsibilities for implementation of infrastructure projects to Local Government Units (LGUs), in line with the Local Government Code of 1991. Major initiatives towards this direction in the sector are the current projects being implemented such as the World Bank-assisted Local Government Unit-Urban Water Supply and Sanitation Project and the ADB-funded Rural Water Supply and Sanitation Project. Both projects aim at building/enhancing local level capacity in planning, implementation and management of water and sanitation services.

The GOP has also recently approved the Implementing Rules and Regulations (IRR) of Clause (g) of NEDA Board Resolution No. 4 (series 1994) providing detailed arrangements in accordance with broad reforms aimed at streamlining sectoral activities. The institutional framework therefore, presented in this provincial sector plan considers the direction of the central government agencies and LGUs in the sector.

1.2 Provincial Sector Planning

1.2.1 Objectives of Sector Planning

The main objectives of the provincial sector plan are:

- (1) To formulate a Long-Term Provincial Development Plan with a target year of 2010 for the water supply, sewerage and sanitation sector;
- (2) To propose a Medium-Term Sector Investment Plan covering the years 2001-2005 to form the basis for implementing foreign and locally funded projects;
- (3) To recommend arrangements and logistics for implementation; and
- (4) To provide measures to strengthen operational framework and institutional capabilities including community development and gender responsiveness.

1.2.2 Scope of Sector Planning of Medicine Act of Action 18 (1997) Section 1997 (1997)

The study covers the following major elements to achieve the objectives mentioned above.

Sea Mark 1.12 网络一次Maranes Maran [1] 1788年 (1912年) 1812年 (1912年) 1813年 (1914年) 1814年 (1914年) 1814年 [1914年]

- Investment needs ranking of municipalities
- Implementation arrangements
- Cost recovery

(4) Monitoring for Evaluation of Provincial Plan Implementation

1.2.3 Financing of Sector Plan

The First Water Supply, Sewerage and Sanitation Sector Project (FW4SP) was implemented with financial assistance from the World Bank (IBRD). With reference to the Project, the technical assistance to help Provincial Governments prepare 37 provincial sector plans in Luzon area was financed by various bilateral and multilateral agencies, such as the United Nations Development Program (UNDP), the Danish International Development Agency (DANIDA) and the Japan International Cooperation Agency (JICA).

In September 1996, the GOP requested the Government of Japan to finance the preparation of the Study for 21 provinces in Visayas and Mindanao areas. Among these was Iloilo province, which was assisted by the JICA. The PW4SP will be the basis to permit execution of the sector development from the proceeds of the sector loan by foreign donors, LGUs budget including internal revenue allotment from National Government and private sector investment.

1.3 The Provincial Plan for the Province of Iloilo

1.3.1 Preparation of the Plan

The PW4SP for the Province was prepared by a Provincial Sector Planning Team (PSPT) organized by the provincial government. The members consist of the Provincial Planning and Development Coordinator (PPDC), the planning and development officers from PPDO, and the staff members from Provincial Engineers Office (PEO), Provincial Health Office (PHO) and Provincial Local Government Operations Office (PLGOO-DILG). The preparation of the plan was assisted by the Department of the Interior and Local Government (DILG), the Department of Public Works and Highways (DPWH), the Department of Health (DOH), the Local Water Utilities Administration (LWUA), the National Economic and Development Authority (NEDA), other national line agencies and non-government organizations (NGOs) active in the sector. The PSPT was also assisted by the JICA Study Team through technical grant assistance from the Japanese Government (refer to Minutes of Discussions between

earla chail le creach Malantevi

DILG and JICA, and Figure 1.3.1 Organization Chart, 1.3.1 Preparation of the Plan, Supporting Report).

The PW4SP has been prepared at municipal level covering all sub-sectors for each municipality of the Province.

The report consists of three (3) volumes: I - Main Report, II - Supporting Report, III - Data Report.

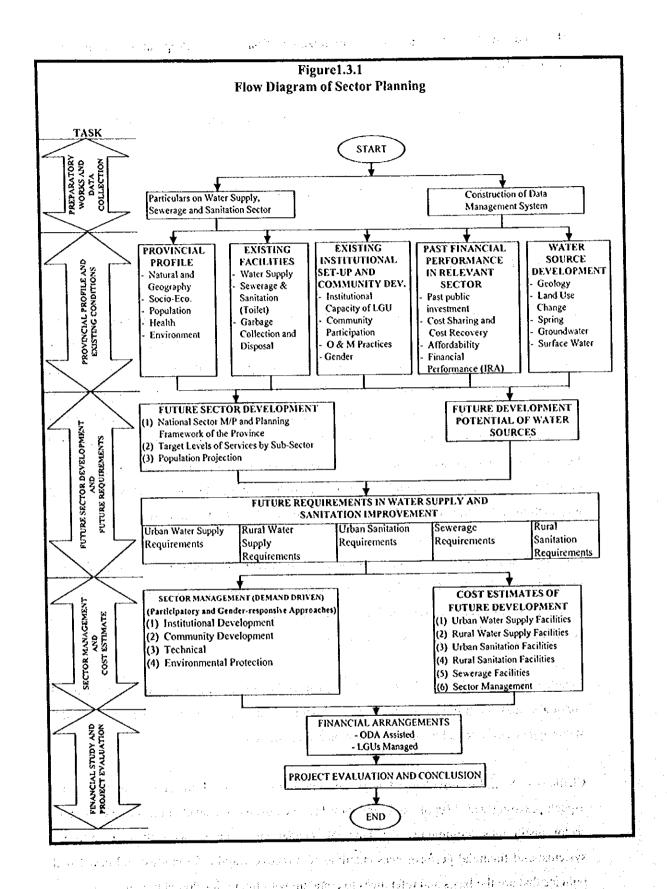

1.3.2 Outline of the Report

The PW4SP is a framework plan that would serve as the basis for the future implementation work in the sector. It will be carried out either as large-scale projects funded by international agencies or as a small size project carried out by local parties. It should be noted that the PW4SP is a sector development plan for the entire province and that it does not include detailed planning of individual projects. The individual projects will commonly cover selected sub-sector/s for limited areas and detailed planning/design work has to be conducted for the respective projects before start of construction work. The planning process is presented in Figure 1.3.1. The following are the contents of the Main Report (List of data and information collected is included in 1.3.2 Outline of the Report, Data Report).

Chapter 2 describes the planning approach for the sector development, which guides the preparation of the plan: the background and rationale for provincial planning; as well as the planning tool that relies heavily on local participation and gender responsiveness, and flexible enough to improve planning and implementation.

Chapter 3 provides the provincial profile with reference to current sector conditions: natural conditions and geographical features, socio-economic conditions, demographic trends, health status and environmental conditions as the planning environment.

Chapters 4, 5, and 6 provide existing sector conditions in physical, managerial and financial aspects: existing water supply and sanitation facilities by service level and service coverage; sector institutions, community development, gender and training, as well as monitoring systems; and financial performances entailing cost recovery and affordability and new fiscal policies that are the basis and references to come up with future development plan.

Chapter 7 analyzes the possibility of water source development for the water supply component: geological and hydrological conditions in the province, and future development potential of different water sources. Furthermore, water source availability by concerned municipality was presented with well specifications for the medium-term development.

Chapters 8, 9 and 10 develop the long-term Development Plan and the medium-term Investment Plan both for physical and sector management requirements. Emphasis is placed on the sector management for the medium-term development plan entailing institutional arrangements and operational framework, community development, gender and training and project implementation needs. Required costs for physical and institutional elements are also presented according to the implementation arrangements.

Chapter 11 presents the financial arrangements based on identified sources of funds. The financial shortfall is shown to meet provincial targets established for the Medium-Term Investment Plan. The manner of national budget allocation (IRA) to municipalities by subsector is illustrated and trial calculation is made for the target year considering the new cost sharing policy between the central government, the LGUs and the beneficiaries. Investment need ranking of municipalities as a factor of financial allotment is also considered based on synthetic evaluation of sector components. The financial viability study of Level I water supply and sanitation projects is highlighted with reference to ODA assisted projects for eligible municipalities. Finally, cost recovery by the beneficiaries and the LGUs is discussed.

Chapter 12 provides recommendations on monitoring of implemented projects covering procedures and responsibilities in different administrative levels. Periodic monitoring will allow for the updating of the PW4SP and modification of respective projects both in quality and quantity.

1.4 Acknowledgment

The Provincial Sector Planning Team (PSPT) which was responsible in the preparation of the PW4SP, acknowledges the extended cooperation, support and assistance of the Department of the Interior and Local Government (DILG), and other national, regional, provincial, municipal, city, and barangay institutions. These institutions had shared essential data and planning principles (List of individuals and their corresponding offices who directly participated in the preparation of the plan is included in 1.4 Acknowledgment, Data Report). The Japanese Government through JICA has generously provided technical assistance to the PSPT throughout the course of the planning work.

PLANNING APPROACH FOR FUTURE SECTOR DEVELOPMENT

2. PLANNING APPROACH FOR FUTURE SECTOR DEVELOPMENT

2.1 General

The primary basis of the PW4SP is summarized with reference to the national sector policy and strategies as well as the major legislation and regulations relevant to the sector. Planning framework is also discussed with reference to key measurable targets. Guiding principles for preparation of the plan are described in application of computer-aided planning approach.

2.2 Planning Framework

The GOP, through the Water Supply, Sewerage and Sanitation Master Plan of the Philippines: 1988-2000, the Philippine National Development Plan: 1999-2025, and the Updated Medium Term Philippine Development Plan (MTPDP): 1996-1998, has manifested its commitment to the development of safe and dependable water supply and sanitation facilities. Policies and investment programs are compiled in these documents which lay out the basis of a strategy to accelerate sector development through the equitable mobilization of resources between urban and rural areas and institutional reforms at all government levels. Guiding principles set in the aforementioned national development plans are sustained decentralization; private sector-led development; environmental protection; people participation; full cost recovery; social equity; accelerated information technology applications and macroeconomic stability.

According to the Updated MTPDP targets for the year 1998, the population served with potable water shall be increased up to 76.4% (52.4 M). This corresponds to 81.6% (9.9M) of the Metro Manila population, 68.8% (16.3 M) in other urban areas, and 79% (29.5 M) in the rural areas. Sewerage facilities in Metro Manila and other highly urbanized areas will be constructed. About 1.8 million toilets will be built nationwide.

Given these updated MTPDP targets, as well as the goals set in the 1988 NSMP, the current indications and the planning cycle adopted for this provincial sector planning, the national targets as shown in Table 2.2.1 will be used as the basis for setting the provincial targets.

in the transfer of the service of th

Constitution of the contract o

Table 2.2.1 National Sector Coverage Targets

Sub-Sector	Year 1995	Year 2003 1	Year 2010 ²
Urban Water Supply 3	61%	69%	95%
Rural Water Supply	70% 4	79%	93%
Sanitation	60% ⁵	68%	93%

Notes:

2.3 Sector Objectives

The objectives of the sector are:

- (1) To provide safe and adequate water supply and sanitation to meet basic needs;
- (2) To pursue proper O & M of facilities for sustainable water supply;
- (3) To undertake the phased construction and installation of sewerage facilities; and
- (4) To develop the capabilities of LGUs to implement water supply, sewerage and sanitation programs with the national government providing assistance in the areas of community participation, sub-sector planning, program management, regulation of development, selection of technologies, financial management, construction supervision, monitoring and reporting.

2.4 Current Sector Policies and Strategies

- (1) One clear policy shift has been towards the promotion of self-reliance and local community management of services. Since the seventies, formation of local water districts in provincial urban areas has been aggressively pursued. During the eighties, this shift was further induced with the establishment of community-run BWSAs and RWSAs to provide services in smaller rural and peri-urban areas. Recently, more comprehensive demand-driven participatory approach and gender sensitive participation initiatives are given impetus to ensure success and sustainability of the sector's projects especially in rather small rural and urban fringe areas.
- (2) An integrated approach to water, sanitation and hygiene education has been prescribed in order to achieve full health benefits of improved services. The GOP promotes intensified health education and information programs to improve hygiene practices at the household level.

¹Based on the Updated MTPDP targets for 1998.

² Based on the long-term targets set in the previous National Sector Master Plan (NSMP).

³Excluding Metro Manila and its outlying areas.

⁴Includes only point sources.

⁵Service coverage for 1996.

- (3) Cost sharing arrangement is enforced. In line with devolving the central government's functions and responsibilities, particularly those that have social and/or environmental objectives, projects/activities are implemented through a cost sharing arrangement between the central government agency and LGUs. As for the sector, national (central) government's (NG's) grant is to be extended only to Level I systems for eligible municipalities, and its share is within a range of 0 to 50% of the total capital cost. The remaining are managed by LGUs, communities, or BWSAs/RWSAs. No subsidies from the central government are to be provided for Levels II and III systems. For public toilets in public markets, the share of the NG is within 50 to 70%.
- (4) Cost recovery of capital and O & M costs of all water supply service levels by beneficiaries is to be encouraged. This is a distinct switch from subsidies, which characterized previous strategies. Current priorities also stress the need to promote the collection of such costs, especially in Levels I and II.
- (5) Private sector participation is encouraged to bring into the sector business principles and practices and private capital to accelerate social and economic development; to improve sector efficiencies; and to ease the burden on the GOP's budget and foreign borrowing. Public-private partnership is to be pursued through any of these mechanisms: build-operate-transfer, concession arrangements, privatization of WDs, LGU-private sector MOA, LGU-WDs collaboration and others.
- (6) An integrated water resources strategy has been adopted in areas combining irrigation, power, flood control, and domestic and industrial water supply. Small and medium-scale water resources projects through the active participation of the people are encouraged. Watershed management; water conservation and erosion and sediment control are deemed critical.

2.5 Major Legislation and Regulations Affecting the Sector

(1) The Local Government Code of 1991 (RA 7160) provides for a more responsive and accountable local government structure. Local government units now exercise more authority and responsibilities and provide resources to accelerate the provision of basic services and facilities, including water supply, sanitation and sewerage. The Implementing Rules and Regulations (IRR) to effect the devolution of water and sanitation responsibilities and resources was recently approved. The IRR integrates the common

definition of terms for water supply and sanitation and defines the roles and functions of central government agencies and LGUs for the sector (details are referred to 5.2, Data Report).

- (2) The Water Code of the Philippines (PD 1067) consolidates legislation relating to the ownership, development, utilization, exploitation and conservation of water resources. The Code established the basic principles and framework on the appropriation, control and conservation of water resources to achieve their optimum economic efficiency and rational development. In addition, PD 424 declares that the National Water Resources Board (NWRB) shall be responsible for coordinating and integrating all activities related to water resources. PD 1067 also pertains to the grant of water right privileges (water permits) to appropriate and use water. Water permit applications are reviewed and granted by the NWRB.
- (3) The Provincial Water Utilities Act of 1973 (PD 198) authorizes the formation of local water districts in the provincial areas outside the Metropolitan Manila area, and provides for their administration and operation. It also created the Local Water Utilities Administration (LWUA) as a specialized lending institution for the promotion, development and financing of local water districts.
- (4) The Metropolitan Waterworks and Sewerage System (MWSS) Charter (RA 6234) was enacted in 1971. The utility was formed to take over the facilities of NAWASA in 1971. The Charter was amended by virtue of PD 1046 expanding further its territorial jurisdiction to include areas that may be included in the growing metropolis.
- (5) The Philippine Environmental Policy (PD 1151) requires all public and private entities to undertake an environmental impact assessment of all projects, which significantly affect the quality of the environment. The Philippine Environmental Code (PD 1152) established standards for air and water quality, and guidelines for land use management, natural resource management and conservation, utilization of surface and groundwater, and waste management.
- (6) The Sanitation Code (1975) was promulgated to deal with water supply, excreta disposal, sewerage and drainage issues. The Sanitation Code and the National Building Code (1977) require that new buildings be connected to a water-borne sewerage system. Where such systems do not exist, sewage must be disposed of onto Imhoff tanks or septic

tanks with a subsurface absorption field. In addition, the facilities are required to conform to the 1959 National Plumbing Code.

(7) The 1981 Rules and Regulations for Domestic Wastewater Disposal require all subdivisions and condominiums, etc. to have adequate sewage collection, conveyance, treatment and disposal facilities. A permit must be obtained prior to commissioning a new system.

2.6 Planning Principles and Data Management

2.6.1 Planning Principles

The PW4SP shall be prepared to ensure that the sector investments are optimized under the constraints of funds and water source availability as well as planning capability. Furthermore, the plan shall ensure its sustainability at the provincial level. The overviews of the plan will be progressively adjusted and refined at different detailed implementation stages. Accordingly, the demarcation is a prerequisite between a sector plan and succeeding detailed plan/s. Specifically, the following are required as planning principles.

- (1) The plan is conceived to be flexible, consistent and as simple as possible to respond to the changing socio-economic conditions of the province, accumulated technical information and updated policy of local governments allowing for periodic upgrading.
- (2) The plan is arranged to allow planners to run different scenarios for project implementation, especially with reference to the interface between the provincial plan and project proposals from municipalities (bottom-up).
- (3) The plan is conceived to be adaptable to the local planning capacity and to ensure its full "ownership" by LGUs.

Brang Bloom are built to

In addition, the following shall be taken into account to help the provincial planners perform their tasks.

ent of the contraction of the section and the section of the contract of the c

(1) The plan follows existing provincial and municipal planning routines to minimize duplicated planning activities. It is essential to maintain and extend the involvement of local officials for data collection.

mas Magazir 1968, an machipulat bhat that in bitific ear, magazir batana an mher iair

- (2) The plan, as a comprehensive tool, considers the consistency to derive the next level of planning.
- (3) The plan entails monitoring and evaluation of actual implementation progress, as investments are undertaken.

The guideline for preparation of the PW4SP is included in the Planning Approach for Future Sector Development, Data Report. It identifies all tables and figures with respective forms by main, supporting and data reports.

2.6.2 Data Management

The data management system was established to come up with the basic outputs commensurate to the objectives of the provincial plan and at the same time reflect the planning approach mentioned above. It will provide a map of relative needs in the province allowing for adjustment and updating when further information becomes available. Monitoring and evaluation are to be done using the tool, thereby serving as baseline information for the improvement of planning and implementation. Different scenarios maybe worked out by planners using the program in application of variable parameters.

The need for full and continuous involvement of local officials is indispensable to establish a reliable database.

(1) Computer-based system

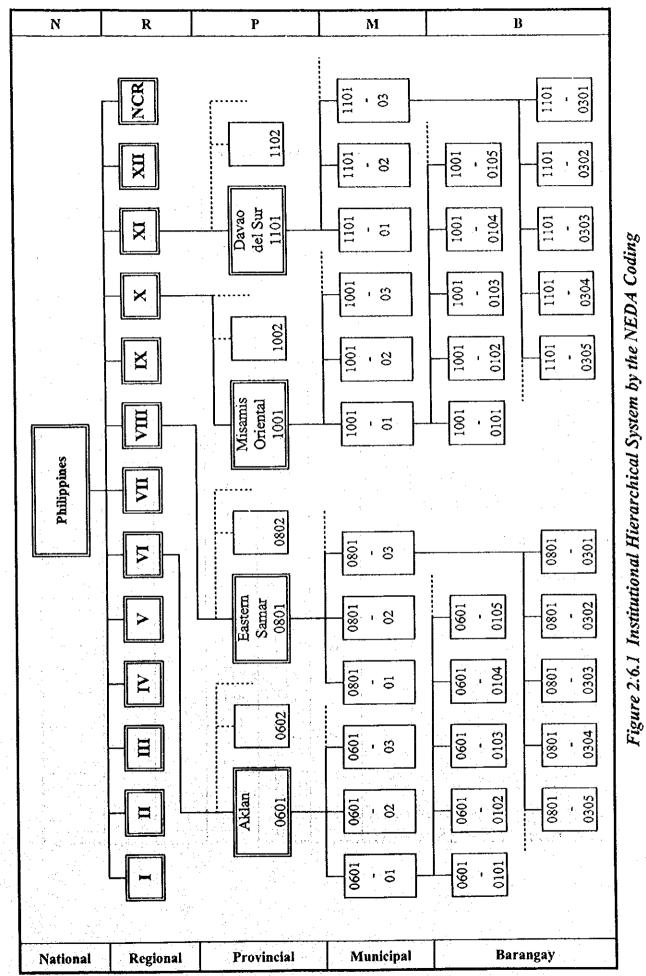

Data management system is designed to perform simple and direct interfaces in data processing. Since a limited number of municipalities is the planning level entailing data collection from the administrative units, EXCEL was selected to facilitate data storage, retrieval, updating and processing.

人名意西尔姓氏 医髓膜 医二氏试验

The data storage system was arranged to parallel the structure of questionnaires and contain the same system of logical categories under institutional hierarchical system of the Philippines as shown in Figures 2.6.1 and 2.6.2. Data are encoded by hierarchical level.

A series of EXCEL routines was established to allow summaries and consolidation of data into the forms required for analysis and presentation. Details together with User's Guide for computer-aided planning are included in 2.6.2 Data Management, Supporting Report.

(2) Key Parameters

Establishment of criteria and assumptions are requisites in the planning process. In this connection, key parameters are identified to allow for preparation of alternative plans and updating in accordance with sector improvement policy in the future. The parameters for relevant sub-sectors are assumed on an urban and rural basis for respective municipalities referring to current conditions and practices on national and provincial levels. The following are the selected parameters.

- 1) Number of households to be served by a Level I facility
- 2) Safe and unsafe percentages of Level I facilities
- 3) Standard number of students to be served by a unit of sanitary toilet
- 4) Standard number of toilets for a public utility
- 5) Provincial sector targets by sub-sector
- 6) Composition of different types of toilets
- 7) Per capita water consumption for Level III system
- 8) Composition of different types of well sources and their specifications
- 9) Percentage of Level I wells to be rehabilitated
- 10) Unit construction cost of different facilities per person/household/facility/system
- 11) Percentage of sector management cost to construction cost
- 12) Physical and price contingencies
- 13) Unit recurrent cost of different systems/facilities
- 14) Allocation factors/percentages of IRA
- 15) Share of public investment
- 16) Funding levels/percentages for different financing scenarios
- 17) Scoring factors for municipal investment ranking
- 18) Annual distribution of investment cost (medium-term development)

The above-mentioned parameters are not included in the database program, since they are to be established through sensitivity analysis. Assumed figures are directly entered into a separate spreadsheet that is linked to the output files.

(3) Data Processing

Collected data are entered into the forms constructed in EXCEL database. The data are consolidated into final forms in application of small programs prepared for this planning. Linked outputs in tables and graphics are prepared in EXCEL spreadsheets for final

Chapter PROVINCIAL PROFILE 3

3. PROVINCIAL PROFILE

3.1 General

Iloilo Province occupies the southern and northeastern portion of Panay Island and belongs to Region VI, the Western Visayas Region. Iloilo City, a highly urbanized independent city is the provincial capital as well as the designated regional center. The province is bounded by Capiz and Jintotolo Channel in the north, by Panay Gulf and Iloilo Strait in the east, Antique in the west and Guimaras Strait in the south as shown in the Location Map.

The province is classified as 1st class and has a total land area of 4,663.42km² (excluding Iloilo City) that is almost 1.55% of the Philippine total land area of about 300,000km². It is composed of 42 municipalities and 1 component city, Passi City. From the 1995 NSO records, the province has 1,721 barangays, of which 266 are urban and 1,455 are rural. Provincial total population was 1,415,022 in 1995. About 79% of the population reside in rural areas, while the remaining 21% are in urban areas. At present, there are 15 water districts and 14 LGU/association managed Level III water supply systems that are operating in the province. Table 3.1.1 presents the breakdown per municipality of land area, population and density, as well as administrative composition.

3.2 Natural Conditions and Geographical Features

3.2.1 Meteorology

The province has 2 types of climate under the Coronas classification: Type I, which is experienced in the southern part and Type III, in the northern part. Type I is characterized by two pronounced seasons, dry from December to May and wet from June to November, while Type III has no very pronounced maximum rain period, with a short dry season lasting only from one to three months as reflected in the Location Map. From the 5 years average (1994-1998) rainfall record of PAGASA, the average annual rainfall was registered at 2,290.3mm. The northern monsoon prevails during the dry season, while the southern monsoon dominates during the rainy season.

3.2.2 Land Use

Remaining forest area constitutes a mere 15% of the total land area of the province located mostly in the western cordillera mountain ranges. Agricultural land occupies 74%, including

the built-up area. Primary settlements are concentrated along the major transport routes and coastal areas.

Provincial Total	≠ 1st :	4,663.42	1,415,022	303	266	1,455	1,721

Note: Iloilo City, a highly urbanized independent city, is excluded from the PW4SP study area.

The existing land use pattern as presented in Table 3.2.1 must be enhanced by rehabilitation of watersheds in order to pursue a sustainable growth of the province. The remaining forest cover must be conserved to primarily serve as watershed rather than as source of timber. An efficiently managed watershed collects and regulates flow of water, controls soil erosion and minimizes water pollution. Conversion of the remaining forestland to other uses will restrict its function as a watershed. Correspondingly, a significant increase in agricultural area will result in a high demand of water use.

3.2.3 Topography and Drainage

The relief of the province varies from level plains to rolling lands in the eastern part and hills to mountain peaks in the western part. Level areas are not extensive and are found mostly in the southeastern part as broad level bottoms along the rivers. On the west are rugged high-lands commonly known as the western cordillera, while on the east are rolling hills along the coast dotted by small basins which discharge into the Guimaras Strait. In the eastern edge of the province, there are several volcanic islets. Of these islets, Bacot Island and Bulobadiangan Island with their peaks of 574m and 235m, respectively are classified as inactive volcances.

In general, the whole province is dotted with long and narrow meandering rivers and is well drained. Some of the large rivers are dammed either for irrigation purposes or for domestic water supplies. Destructive floods oftentimes occur on the lower plains whenever there is heavy rain over the watershed of these rivers. Major drainage systems are Jalaur, Jaro and Sibalom Rivers and their tributaries located in the central Iloilo plain.

Figure 3.2.1 shows the natural drainage systems of the province. Table 3.2.2 is a list of the main rivers and their corresponding drainage areas with recorded flow rates at the site of the gauging station.

Table 3.2.2 Drainage Areas & Flow Rates of Major Rivers

Maximum - Maximum Daily Discharge of Weighted Daily Discharge Minimum - Minimum Daily Discharge of Weighted Daily Discharge

Suage river was selected for water quality examination. Analyzed river water was turbid and colored. According to the Regional DENR, river waters in the province were classified into the Class B or C limitation of "DENR Fresh Water Quality Criteria". The examination result is referred to 7.5, Data Report.

3.3 Socio-economic Conditions

3.3.1 Economic Activities and Household Income

Just like most of the provinces in the country, Iloilo is basically an agricultural province, although the establishment of the Regional Agro-Industrial Center will serve as another stimulus to the economic growth of the province. The major economic activity is still farming. Principal crops cultivated are palay, corn, coconut and sugarcane. Agri-based industries are the production of refined sugar, feeds and processing of marine products.

The NSO Family Income and Expenditures Survey in 1994 showed that the average annual family income of the province was P 58,883 while the expenditure was at P 53,057 or a net saving of P 5,826. Distribution of households by income class in the region and province is shown in Figure 3.3.1 (refer to Table 3.3.1, Supporting Report). Percentages of households of lower income levels were less than the average figures in the region. Based on the established poverty threshold income of P 47,133 in Region VI for 1994, about 46.50% of the total number of families lived within and below the poverty threshold.

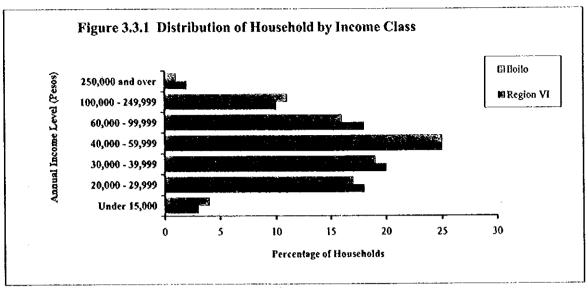

As to the number of workers by major industry group, agriculture, fishery and forestry had the dominant share followed by (refer to Table 3.3.2, Supporting Report). By class of worker, those who worked for private business, enterprise or farm had the highest share of 34% as reflected in Figure 3.3.2.

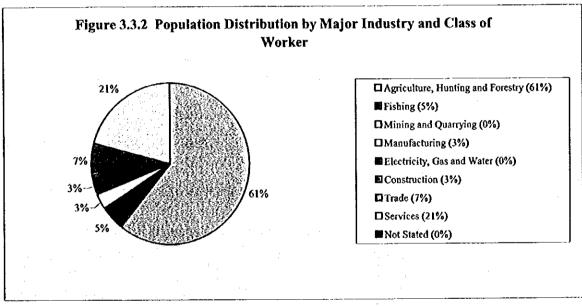

3.3.2 Basic Infrastructure

All municipalities have electric supply, but the service coverage at household level is quite low at 52%. Telephone service is also available in all municipalities. Land transportation is available by means of bus, jeepney, taxi and tricycle. Industrial/business and commercial establishments in the province total to 2,474, while tourism-related facilities total to 47. Table 3.3.1 presents a provincial outline of public services and Table 3.3.2 reflects the number of public facilities and services by municipality (refer to Table 3.3.1, Data Report).

3.3.3 Education

The province has a total of 1,149 schools consisting of 981 elementary schools, 140 high schools and 28 tertiary/technical schools. A large part of the population had attained elementary or high school levels of education as reflected in Figure 3.3.3 (refer to Table 3.3.3 Supporting Report).

3.4 Population

3.4.1 Previous Population Development

A declining provincial population growth rate had been experienced since the last six (6) census years (1960-1995). From an average annual growth rate of 1.57% during the period 1960 to 1970, it decreased to 1.22% (1990-1995). A summary of the average annual growth rates of the province is as follows:

Year	Population	Ave. Annual Growth Rate (%)	<u>Period</u>	
1970	885,221	1.57	1960 - 1970	
1975	1,001,507	3.50	1970 - 1975	
1980	1,096,432	1.57	1975 - 1980	
1990	1,337,961	1.58	1980 - 1990	
1995	1,415,022	1.22 pm. 1.4 february	1990 - 1995	

A consideration on how the population growth behaved in the past and how it is likely to behave in the future is important because of the issue of resource allocation including the water supply and sanitation sector requirements.

The 1998 population was estimated to provide the planning base for this Master Plan (refer to Section 8.3.1 Population Projection, Main Report). Figure 3.4.1 and Table 3.4.1 show how the past population development by municipality behaved from 1948 to 1995.

3.4.2 Classification of Urban and Rural Areas

NSO classifies a barangay as urban when it satisfies any of the following conditions on the economic and social functions.

- (1) In their entirety, all cities and municipal jurisdictions having a population density of at least 500 persons per square kilometer.
- (2) Poblaciones or central districts of municipalities and cities, which have a population density of at least 500 persons per square kilometer.
- (3) Poblaciones or central districts (not included in nos. 1 and 2) regardless of population size, which have the following:
 - 1) Street pattern, i.e., network of streets either at parallel or in right angle orientation;
 - 2) At least six establishments (commercial, manufacturing, recreational and/or personal services); and
 - 3) At least three of the following:
 - a) a town hall, church or chapel with religious services at least once a month;
 - b) a public plaza, park or cemetery;
 - a market place or building where trading activities are carried on at least once a week; and
 - d) a public building like school, hospital, health center or library.
- (4) Barangays having at least 1,000 inhabitants, that meet the condition set forth in no. 3 above, and in which the occupation of the inhabitants is predominantly non-farming/fishing.

All areas not falling under the urban classification are defined as rural area. Distribution of the classified areas is shown in Figure 3.4.1, Supporting Report. Considering the 1995 NSO classification of urban and rural barangay, there are 266 urban barangays and 1,455 rural barangays for a total of 1,721 barangays in 1998.

3.4.3 Present Population Distribution

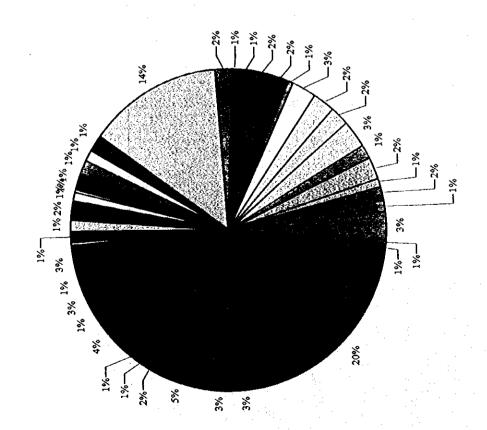

From the 1995 NSO census, the 1998 urban-rural population was estimated for the study area. Rural population accounts for 79% of the provincial total, while 21% is urban as reflected in Figure 3.4.2. Table 3.4.2 presents the breakdown of the number of urban and rural barangays by municipality and its corresponding present population distribution.

There are 280,683 households with 221,563 residing in rural areas and 59,120 households in urban areas. The average provincial household size is 5.31 persons/household. Table 3.4.3 presents a breakdown per municipality on the number of households and household sizes by urban and rural area.

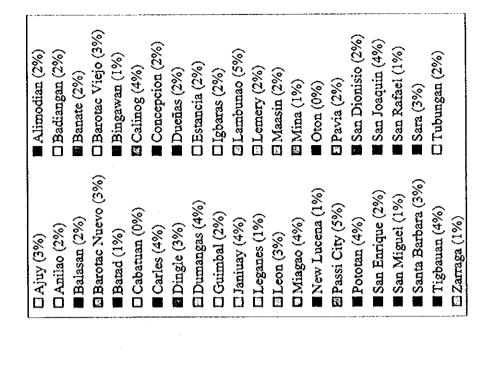

Urban Population (20.9%)

Rural Population (79.1%)

3.5 Health Status

3.5.1 Morbidity, Mortality and Infant Mortality

The number one cause of morbidity in Iloilo was ARI, followed by diarrhea and skin diseases, both water-related diseases. Pneumonia and influenza ranked 4th and 5th, respectively.

Regarding mortality, the number one cause was pneumonia, followed by diarrhea. Tuberculosis and heart diseases ranked third and fourth, respectively. Diarrhea, prematurity and pneumonia were the 3 leading causes of infant mortality in the province (refer to Table 3.5.1, Data Report).

The general health status of the populace of the province in 1998 was relatively better compared with the national condition. The incidence of diseases was lower in Iloilo than the country as a whole. Table 3.5.1 presents a comparative statistics on the ten leading causes of morbidity, mortality and infant mortality of the province as well as of the Philippines.

Water-related diseases in the ten leading causes of morbidity include diarrhea (rank 2nd), skin diseases (rank 3rd), intestinal parasitism (8th), scabies (9th) and dengue fever (10th). Diarrhea also ranked 2nd as the leading causes of mortality. Diarrhea (rank 1st) is also among the ten leading causes of infant mortality.

3.5.2 Water Related Diseases

An indicator of health problems related to water supply and sanitation is the incidence of water-related diseases. The World Health Organization (WHO) has classified diseases related to water into four (4) categories: 1) water-borne diseases e.g., cholera, typhoid, hepatitis A, diarrhea and dysentery; 2) water-based diseases e.g., schistosomiasis; 3) water-washed diseases e.g., diarrhea, intestinal parasitism, scabies, conjunctivitis (sore eyes), and skin diseases; and 4) water-vector related diseases e.g., malaria, filariasis and dengue or H-fever. As with malaria, the control of filariasis is beyond this Master Plan. A safe water supply, sanitary toilet and proper hygiene practices are conditions necessary for the control and prevention of these diseases.

Water-related diseases reported in the province in 1998 were diarrhea, typhoid, dysentery, intestinal parasitism, conjunctivities, viral hepatitis, gastroenteritis, skin disease, scabies and dengue fever. Table 3.5.2 presents the reported cases and deaths of notifiable water-related diseases in the province.

3.5.3 Health Facilities and Practitioners

Present facilities serving the health care of the populace are 13 hospitals, 43 rural health units and 363 barangay health stations. The ratio of the population to these facilities and to the health practitioners are relatively lower as compared to the national average figures (refer to Table 3.5.1 number and ratio of population to health facilities and/or medical practitioners, Supporting Report).

3.6 Environmental Conditions

3.6.1 General

Environmental issues and problems directly affecting the sector and/or how the sector affects these environmental concerns are dealt with in this sub-section. Specifically, the problems of water pollution and solid waste disposal spawned by rapid population growth and increasing industrial and economic activities are discussed. These problems put a strain on the provincial water resources and hinder their optimum utilization.

3,6.2 Water Pollution

There are no existing sanitary sewerage systems in the province. Most of the drainage facilities in all municipalities are open canals or ditches. The rivers and streams function as the drainage system. These rivers receive the domestic wastewater and storm water collected by the segmented drainage facilities in urban centers or poblacions.

A major water pollution source in urban areas is domestic wastewater. Graywater generated by households is simply allowed to discharge into nearby channels. Effluent from septic tanks or cesspools is also flowing into the streams. The other major pollutant is dumped refuse that finds its way to the river systems during rain or is thrown indiscriminately into the rivers. In rural areas, natural assimilation of the river may be expected to purify organic substances. However, pollution or contamination is anticipated caused by agricultural activities especially with reference to fertilizers and pesticides.

Heavy industries and agro-industrial establishments are identified as potential pollution sources in the province if no control measures are in place. The rivers must be protected and conserved for their intended or beneficial use. However, as of now, the rivers in the province have not been classified as to their usage by the Department of Environment and Natural Resources (refer to general information in Table 3.6.1 DENR Water Quality Criteria/Water Usage and Classification, Supporting Report).

3.6.3 Solid Waste Disposal

Of the 43 municipalities/city, 33 have municipal refuse collection and disposal services as of 1998 (details are referred to Table 3.6.1, Data Report). These municipalities/city have a total of 47 units of open dump truck. Balasan, Calinog and Leon have one (1) unit each of closed type truck, while Passi City has two (2) units. In the province, 21% of the households is served, while 79% is unserved. Table 3.6.1 reflects the manner of solid waste collection and disposal, and service coverage by municipality in 1998.

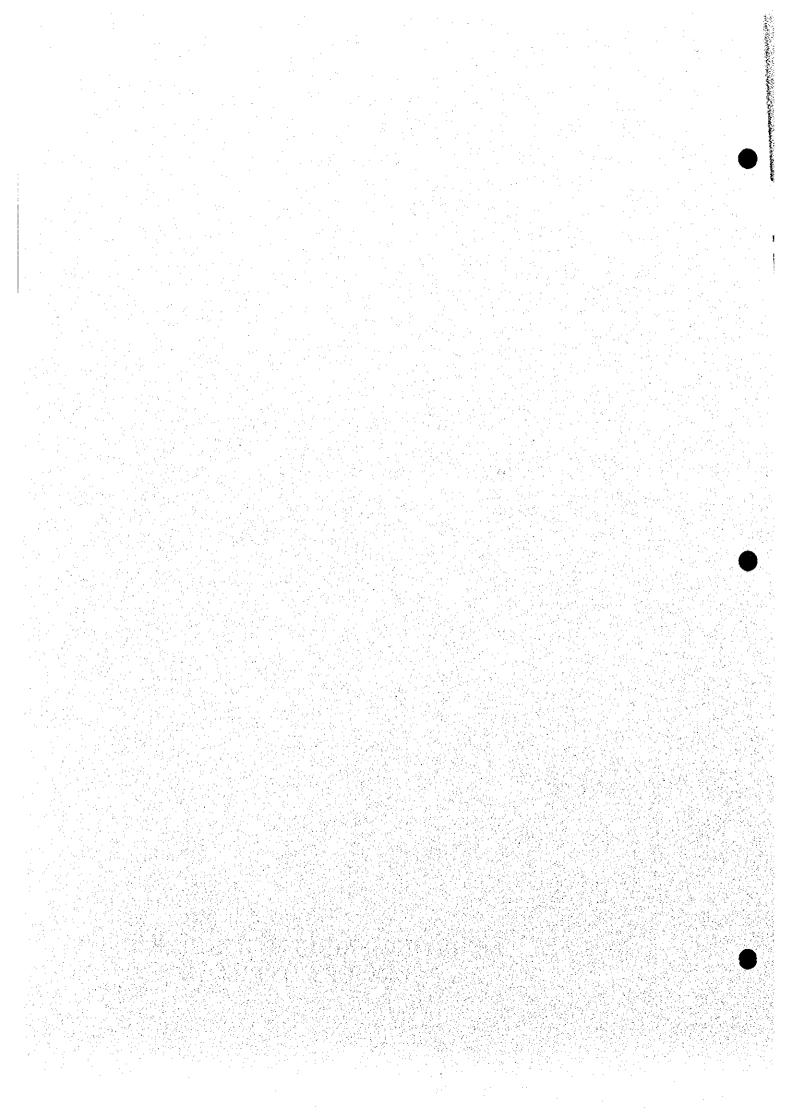

Open dumping is commonly practiced by the LGUs as disposal of solid wastes. The dumped refuse is usually burned or left unattended. Some significant negative effects associated with this unsanitary method are surface and groundwater pollution, air pollution, scattered solid waste, breeding grounds for insects, rodents and other disease vectors and fire hazard. At the household level, unserved households by the LGUs primarily depend on individual waste disposal such as dumping in vacant lots or body of water, burying and composting.

EXISTING FACILITIES AND
SERVICE COVERAGE

4. EXISTING FACILITIES AND SERVICE COVERAGE

4.1 Water Supply

4.1.1 General

Existing water supply facilities and conditions were surveyed by municipality under the category of urban and rural areas (as of October 1999 and regarded as a figure in 1998). Facilities are classified into three service levels, of which Level I facilities are further classified into safe and unsafe for drinking purpose.

The percentages of service coverage by different service level were estimated covering urban and rural areas by municipality. The served population is defined as "population served adequately with access to safe water sources/facilities." The rest of the population with unsafe sources/facilities and without access to water supply facilities was then defined as "underserved population" and "unserved population," respectively. The service coverage was figured out using estimated population in 1998.

Service profile and operating conditions of existing facilities are summarized by service level to come up with problem areas and need of rehabilitation to reflect in the development plan.

As a provincial total, approximately 63% of the present population (of which 21% in urban area and 79% in rural area) is considered as adequately served (refer to 4.1, Supporting Report for the detailed study). Under the area classification, 69% of urban population and 62% of rural population have access to safe water sources/facilities, while the rest is underserved or unserved. About 806,400 persons or 85% of the served population depend on Level I facilities, while about 138,600 persons or 15% are served by Level III and/or Level II systems.

4.1.2 Types of Facilities and Definition of Service Level Standard

(1) Composition of water supply system/facility

The NSMP defines service level and system components of the water supply systems/facilities as shown in Table 4.1.1. NEDA Board Resolution No. 12 (s. 1995) also provides the approved definition of terms relative to water supply including levels of service (refer to 4.1.2 Data Report). These terms are to be adopted by all government agencies including LGUs.

Table 4.1.1 Composition of Water Supply System/Facility by Service Level

	Description	Level I (Point Source Facility)	Level II (Communal Faucet System)	Level III (Individual House Connection)
1.	Water Source	Drilled/driven shallow well Drilled/driven deep well Dug well Spring Rain collector	Drilled shallow/deep well Spring Infiltration gallery	Drifted deep well Spring Infiltration gallery Surface water intake
2.	Water Treatment	Generally none. Disinfection of wells is conducted periodically by local health authorities. Iron removal facilities are provided in problem areas.	Generally none	Disinfection is provided. Systems with surface water source have series of water treatment facilities.
3.	Distribution	None	Piped system provided with reservoir/s	Piped system provided with reservoir/s and pumping facilities.
4.	Delivery & Service Level	At point (within 250m radius)	Communal faucet (within 25m radius)	Individual house connec- tion/household tap
5.	Consumption Rate (Adequately Served)	At least 20 lpcd	At least 60 lpcd	At least 100 lpcd

(2) Safe and unsafe classification of water sources

DOH has classified Level I water source facilities as safe (reliable water source) and unsafe sources/facilities based on the National Standard for Drinking Water (NSDW).

Safe source:

Protected deep well, protected shallow well, improved/covered dug well

and developed spring

Unsafe source: Unprotected deep well, unprotected shallow well, open dug well, unde-

veloped/unprotected spring and rainwater collector

Water sources other than the above, such as untreated surface water of rivers, lakes and ponds are also considered unsafe sources. On the other hand, Levels II and III water supply systems are regarded to have safe/reliable sources with provision of adequate treatment.

(3) Service level standard

The NSMP and NEDA Resolution No. 12 define "adequate service level" by different Improvement in the number of households per water water supply system. source/facility may be expected for Level I service in the future. On the contrary, the number of households served by a unit of private/public source is sometimes beyond the standard on a current basis.

Level III:

1 household/connection

Level II:

5 (4 to 6) households/communal faucet

Level I:

15 households/point source

1 household/private well

4.1.3 Level III Systems

Level III (individual house connection) systems at municipal level are usually established and operated by WD under the technical and financial assistance of LWUA. Some LGUs also implement and operate Level III systems commonly at barangay level.

There are 29 Level III systems in the province operated under different kinds of ownership (authority or association) as shown in Table 4.1.2 together with their service coverage in 1998 (details are referred to in Table 4.1.1, Supporting Report).

These are:

- 15 Water Districts covering 22 municipalities/city of Ajuy, Alimodian, Anilao, Barotac Nuevo, Barotac Viejo, Cabatuan, Calinog, Dingle, Duenas, Dumangas, Estancia, Janiuay, Leganes, Leon, Maasin, Miagao, Oton, Passi City, Pavia, Pototan, San Miguel and Sta. Barbara;
- 5 Municipal waterworks in the municipalities of Badiangan, New Lucena, San Dinisio, San Joaquin and Sara;
- 9 systems operated by RWSA in the municipalities of Batad, Dingle, Guimbal, Leon,
 Passi (2 systems), Pavia (2 systems) and San Joaquin.

The Metro Iloilo Water District (MIWD) is the largest system in the province, covering urban barangays in six (6) adjacent municipalities of Iloilo City; Cabatuan, Maasin, Oton, Pavia, San Miguel and Sta. Barbara. Total served population of the concerned municipalities excluding Iloilo City is about 22,500 at present. Water source of MIWD is surface water from Tigum River (Maasin weir, 8,700 cu.m/d), and eight wells and two infiltration galleries (14,700 cu.m/d). MIWD has an expansion plan to meet future needs in the service area applying BOT scheme.

Following MIWD is Dingle-Pototan WD, the second largest system in the province. The WD covers 6 urban and 11 rural barangays of Dingle and Pototan with the total served population of 14,800 in provision of spring water located in the municipality of Dingle.

Dumangas-Barotac Nuevo WD is the third largest system in the province. The WD supplies water to 7 urban and 26 rural barangays of Barotac Nuevo and Dumangas with a total served population of about 11,000 in provision of deep well source.

Passi City has a water district and two (2) RWSAs. The WD covers two (2) urban barangays with served population of about 8,600 in use of combination of infiltration gallery and spring source. While, 2 RWSAs serve for 2 rural barangays with total served population of about 2.500.

In the municipality of Ajuy, the WD supplies to one urban and four (4) rural barangays with served population of 7,400. Its water source is surface water.

Some other municipalities have Level III systems managed by WDs/LGUs/RWSAs with their served population ranging from about 300 to 3,700 in provision of deep well or spring sources.

Generally, waterworks with spring sources are simply managed without higher expertise needed and in provision of lower water charges.

Some Level-III systems, among the above, practice scheduled water supply (intermittent water supply) due to insufficient water source capacity. Even in case of enough water sources, intermittent water supply is forced due to insufficient capacity of the facilities (distribution pipe) against current water demand. Concerned municipalities relevant to the problem are Sara, San Dionisio, Concepcion, Balotac Viejo, Alimodian, Miagao, San Joaquin, Estancia and Guimbal. Lack of due consideration in D/D stage for expansion of the system was also observed.

All waterworks have O&M staff (engineer/technician/plumber/water fee collector) and practice chlorination. They have ensured budget for O&M cost, but the income is insufficient for expansion of the system.

The other 15 municipalities have no Level III system both in urban and rural area at present.

4.1.4 Level II Systems

Level II (communal faucet) systems are designed to cater for barangay level water supply with limited service coverage and supply capacity. These systems have been implemented by different agencies (DPWH, LWUA, DILG, LGUs) encouraging the use of spring sources and are operated by LGUs or RWSAs.

There are total of 163 Level II systems in 24 municipalities/city in the province. The majority is utilizing spring sources (140 systems), while 23 systems use shallow/deep wells (details are referred to in Table 4.1.2, Supporting Report). The municipality of San Joaquin has the largest number, 42 systems or 26% of the total as shown in Table 4.1.4 together with service coverage in 1998.

Problem areas, both in managerial and technical aspects, identified on existing Level II systems and necessary countermeasures for the improvements are discussed hereunder.

(1) Management practice

Level II systems using deep/shallow wells impose water rates ranging from \$\text{P10}\$ to 75/HH/month as flat rate, while the rest using spring sources supply with flat rate (\$\text{P5}\$ to 10/HH/month) or free of charge. Regarding repair works, some waterworks collects required money from beneficiaries and hire local contractor. Others request to barangay officials for assistance. This fact shows that current management practices will lead to any one of these systems to become non-operational sooner or later. This is because the financial savings to cope with future repair and depreciation of existing facilities are not duly considered under the current management practice, while cost recovery by the operating bodies is a prerequisite in sector management.

To attain financial and managerial sustainability, reinforcement of RWSA or other operating body shall be promoted with reference to institutional development.

(2) Technical skill for O&M of facilities

Most of the Level II systems using electric pump practice scheduled water supply (2 to 8 hours a day) due to insufficient water source/capacity of the facilities. Such problems are mainly caused by order-less expansion or tapping of communal faucets without due considerations, resulted in insufficient water flow/ reduction of water pressure.

Utilization of spring source usually leads to less attention to the daily O&M practice, owing to gravity flow of water to the service area. However, inappropriate care of spring box and pipeline results to various problems, e.g. turbid water, less water flow by

clogging at spring box and pipeline, etc. Some of them were constructed neglecting design standards. Indigenous materials are usually used (in some cases made of bamboo tubes).

Physical damage may also happen to the transmission line exposed on the ground in the mountainous area due to landslide, etc. associated with heavy rainfall, when proper protection of pipeline is not taken up.

Expansion of distribution line and installation of additional public faucets are usually undertaken without appropriate technical study on the capacities of water sources and distribution facilities, resulting to decrease of supply pressure and quantity.

It is also common that water quality examination is not adequately conducted.

To attain technical sustainability of existing facilities, an appropriate technical guidance and skills training for operating bodies shall be arranged by concerned agencies/LGUs.

4.1.5 Level I Facilities

Level I facilities (point source) are common in rural barangays. Major facilities are different types of wells equipped with hand-pumps or developed spring with transmission line and one communal faucet. Rain collector is also used in some areas.

Level I facilities are classified in terms of safe and unsafe sources referring to the definition of DOH and the data from PHO as presented in Table 4.1.5 (details are referred to in Supporting Report). Served population in 1998 is also estimated as shown in the same table.

Of the 60,980 operational Level I facilities, 57% are shallow wells. According to the study on safe/unsafe percentage for shallow well, 30% of the shallow wells are estimated to be unsafe as the provincial average (detailed are referred to in Supporting Report 4.1.5). All deep wells, covered/improved dug wells and developed springs are regarded as safe water sources. In application of the unsafe percentage to shallow wells for each municipality, 39,467 Level I facilities are classified as safe sources, while 21,513 facilities are under unsafe sources.

Percentage shares between public and private Level I facilities for rural water supply is 39% and 61%, respectively. The share of developed springs in public facilities is 4% (details are referred to Supporting Report).

Problem areas observed on Level I facilities and necessary countermeasures for the improvement are summarized in terms of potable condition and functioning.

Most of the beneficiaries are not aware of the manner for O&M of the facilities. A considerable number of public wells are abandoned/non-functional due to lack of O&M, dried-up of wells and other reasons. In most cases, operating bodies for the facilities are not organized or non-functioning. Order-less private tapping to transmission line (spring water source) are also found at some Level I facilities, which caused insufficient water supply/water pressure.

Beneficiaries still rely on LGUs even for a simple replacement of parts (such as gasket). As for existing public Level-I, barangay council takes care of O&M using IRA allotted to barangay. In cases that major repair is required (replacement of hand pump unit/major parts), the barangay council submits barangay resolution of request for referral to the municipal

government. The municipal government assists them in case that financial sources are secured. Beneficiaries contribute free labor,

Considering the current situation of beneficiaries, LGUs shall lead them to recognize the need of formation of association and participation for sound O&M of the facilities. Information dissemination to beneficiaries is a requisite.

(1) Unsafe water sources

Most of the cases declared as unsafe sources are driven shallow wells which are unprotected against seepage of surface water and usually located in nearby potential pollution sources, such as septic tank and piggery. (The Code on Sanitation requires a minimum distance of 25m between water source and pollution sources.)

These shallow wells shall be provided with concrete apron on the ground surface and proper drainage facility at the surrounding area. Relocation of wells or pollution sources may be another countermeasure. For new construction of shallow wells, proper site selection and appropriate construction method shall be applied together with periodic monitoring of water quality.

(2) Non-functioning/abandoned wells

There are a lot of non-functioning public wells in the province as shown in Table 4.1.6.

For Level I facilities, the BWSAs or beneficiaries have responsibility on O&M, however, it is almost negligible. This can be gleaned from the presence of numerous non-functioning/abandoned wells constructed by DPWH. These conditions arise from lack of spare parts, drying up of water source and water quality problems such as colored water.

Table 4.1.6 Operating Status of Existing Wells in the Province

Operating Status	Unit	Public	Facility	Private	Facility	
operating cluttes	Ollit	Deep Well	Shallow Well	Deep Well	Shallow Well	Total
Functioning	No.	2,857	11,876	6,114	22.962	43,809
runctioning	Percent	97	97	98	98	98
Non-Functioning	No.	77	405	94	404	980
Non-Functioning	Pércent	3	3	2	2 .	2
Total Nun	1ber	2,934	12,281	6,208	23,366	44.789

Note: Number of non-functioning wells includes abandoned wells, but details in number and reasons are not available.

Among others, deep wells usually necessitate repair/replacement of mechanical parts and redevelopment of the well itself. Apart from the same problems as deep wells, shallow wells have primary disadvantages such as the use of shallow aquifer which is easily af-

feeted by surrounding environmental conditions and the simple construction method applied (driving well point) that makes rehabilitation works difficult.

To prolong the service life of public deep wells, periodic check-up entailing preventive maintenance and redevelopment of wells are to be performed. Meanwhile, proper site selection and protection of well sources are requisites for shallow wells.

4.1.6 Water Supply Service Coverage

According to the definition of DOH in terms of safe and unsafe sources, service coverage was studied under "served", "underserved" and "unserved" categories.

The present population of the municipalities as of 1998, base year for planning purpose, was estimated referring to NSO population census results (1980, 1990 and 1995) and 1995 Census-based Regional and Provincial Population projection prepared by NSO. Details are referred to Section 8.3.1 Population Projection.

Water supply service coverage by service level is estimated for urban and rural areas covering all municipalities under the following conditions and assumptions:

- Service percentage/population by Level III and Level II systems was estimated based on the questionnaire survey results.
- Unserved population was estimated using the percentages of unserved households to the total number of households by urban and rural area based on the 1990 population census data; "Households by Main Source of Drinking Water and City/Municipality", with modification of maximum 20% referring to the previous results.
- The rest of the population was considered served by Level I facilities assuming that 50% of private facilities was shared by neighbors to supplement insufficiency of public facilities.

Average number of households sharing at each Level I public/private facility was calculated at an average of 11 households/facility under the above assumptions (details are referred to in Supporting Report).

Table 4.1.7 presents the profile of the service coverage in terms of served, underserved and unserved. As a provincial total, 63% of the population is adequately served (69% of urban population and 62% of rural population).

The percentage of underserved population is estimated at 26% of the total population (23% of urban population and 27% of rural population) who are depending on unsafe sources/facilities.

The provincial service coverage at present is exhibited in Figure 4.1.1 (details are referred to Supporting Report).

Among different service levels, Level I water supply facilities have predominant service coverage in most of the municipalities in the province.

Percentage shares of population coverage by Level I public and private facilities in rural water supply are estimated at 73% and 27%, respectively (details are referred to in Supporting Report).

Level III systems take a major part of service coverage in urban water supply in limited municipalities/city, such as Ajuy (93%), Anilao (61%), Barotac Nuevo (52%), Batad (67%), Dumangas (62%), Guimbal (52%), Passi City (99%), Pavia (70%), and San Dionisio (58%).

With regard to Level II system in rural areas, 1 to 11% of service coverage were observed in some municipalities. Presently, piped system including Level III systems have not been fully developed in the entire province (2% for Level II and 7% for Level III systems).

Taking into account the municipal service coverage, of the 43 municipalities/city of the province, 22 are above the average provincial service coverage of 63% in terms of served population. The highest coverage is seen in San Miguel at 99% both for urban and rural area, followed by Barotac Nuevo at 97% both for urban and rural area, Badiangan at 95% (88% for urban and 96% for rural area), Sara at 95% (88% for urban and 96% for rural area), Pavia at 90% (94% for urban and 89% for rural area), Dingle at 87% (80% for urban and 88% for rural area), Santa Barbara at 81% (77% for urban and 82% for rural area) and Passi City at 78% (100% for urban and 74% for rural area).

In contrast to the above, 19 municipalities are below the provincial average. The lowest is Carles at 31%, Calinog at 34%, Oton at 40%, Lambunao at 41%, Anilao at 45%, Dumangas at 45% and Tigbauan at 48%. The low coverage of these municipalities is considered to arise from a large number of underserved population (40 to 60%) using unsafe water sources.
