

## **APPENDIX 9**

### **HYDRAULIC ANALYSIS ON CROSS DRAINAGE**

## HYDRAULIC ANALYSIS ON CROSS DRAINAGE

### 1 Rainfall Discharge

#### (1) Probable Daily Rainfall

Table 1 and Table 2 show the maximum daily rainfall from year 1980 to 1997, and its incidence probability respectively. Figure 1 shows the maximum daily rainfall probability curve.

**TABLE 1 MAXIMUM DAILY RAINFALL**

Year	Maximum daily rainfall (mm)
1980	144
1981	142
1982	335
1983	122
1984	105
1985	166
1986	117
1987	107
1988	94
1989	101
1990	119
1991	124
1992	122
1993	150
1994	84
1995	91
1996	144
1997	85

**TABLE 2 MAXIMUM DAILY RAINFALL INCIDENCE PROBABILITY**

Maximum daily rainfall (mm)	Incidence probability
335	0.053
166	0.105
150	0.158
144	0.211
144	0.263
142	0.316
124	0.368
122	0.421
122	0.474
119	0.526
117	0.579
107	0.632
105	0.684
101	0.737
94	0.789
91	0.842
85	0.895
84	0.947

#### (2) Rainfall Intensity

Rainfall intensity for duration of "t" hours is estimated from the following equation:

$$\frac{R_t}{R_{24}} = \left( \frac{t}{24} \right)^{1/3}$$

where,

$R_t$  = rainfall intensity for duration of t hours (mm)

$R_{24}$  = daily rainfall (mm)

t = duration of the time of concentration (hour)

The rainfall intensity - duration curve is shown in Figure 2.

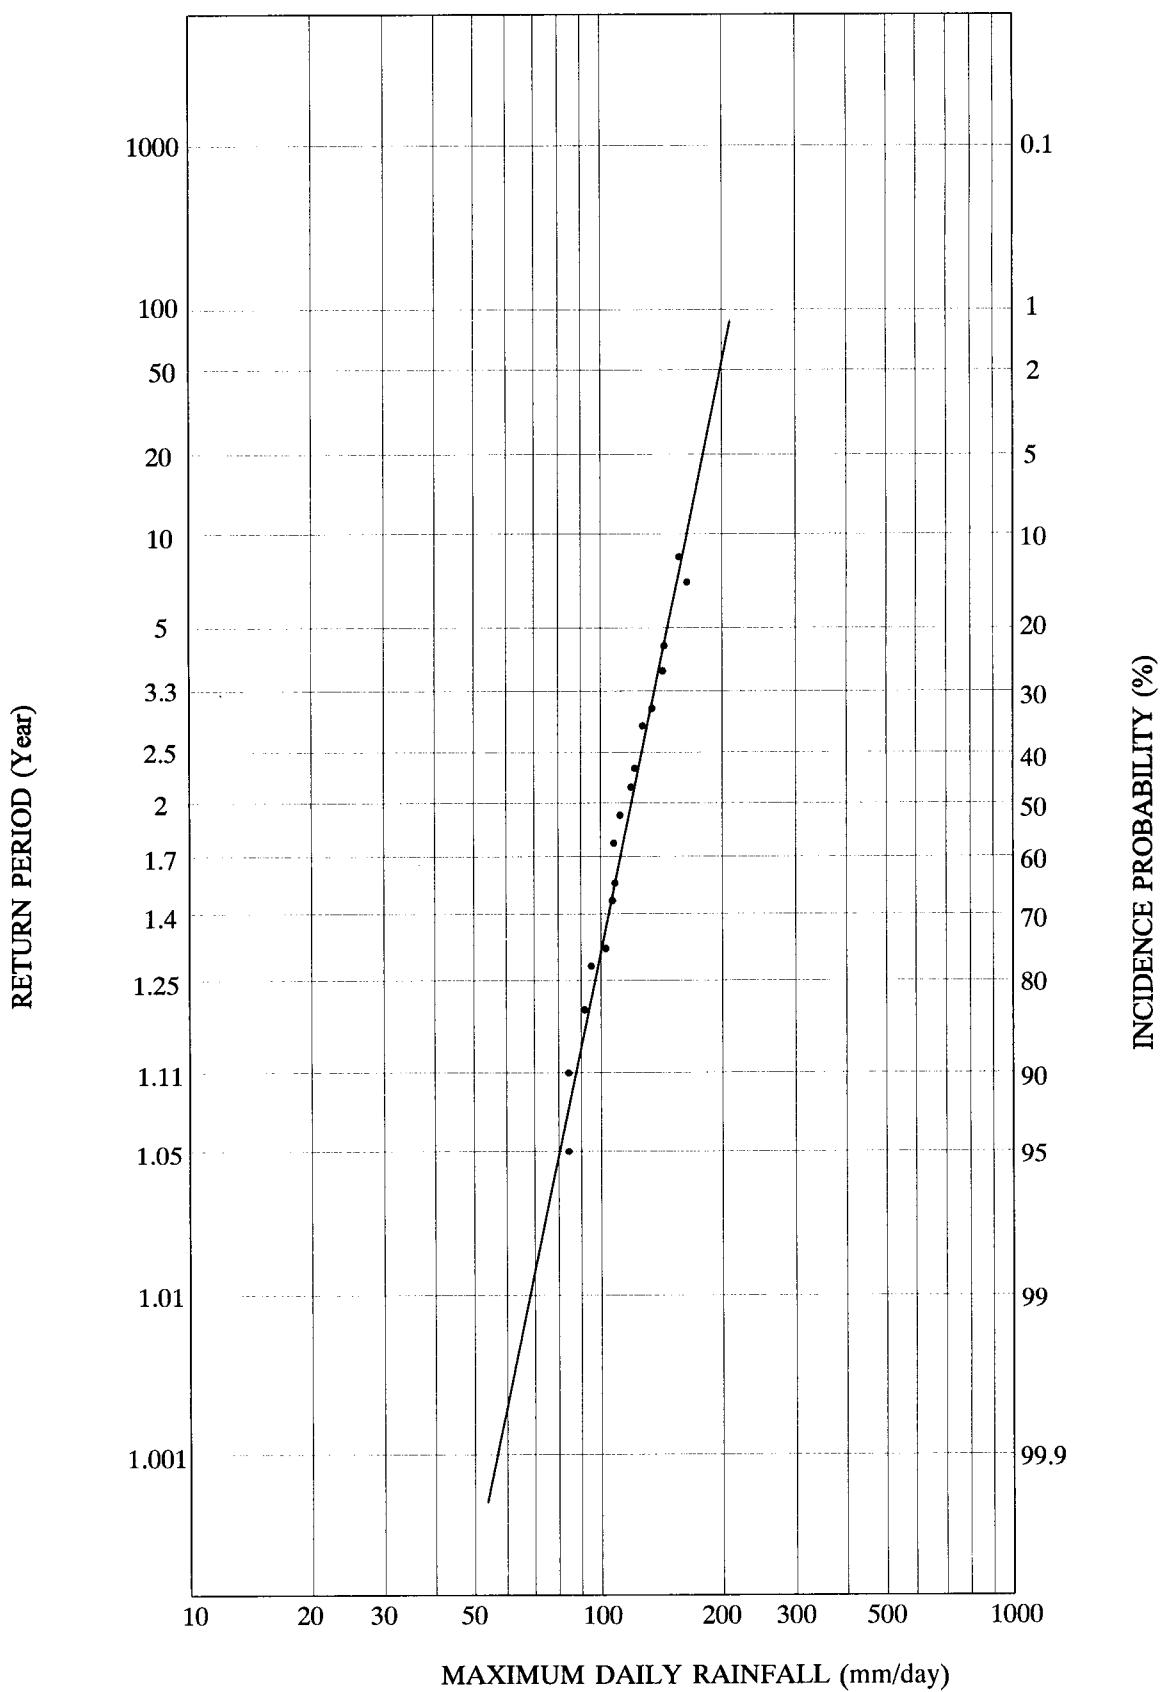

FIGURE 1 MAXIMUM DAILY RAINFALL PROBABILITY CURVE

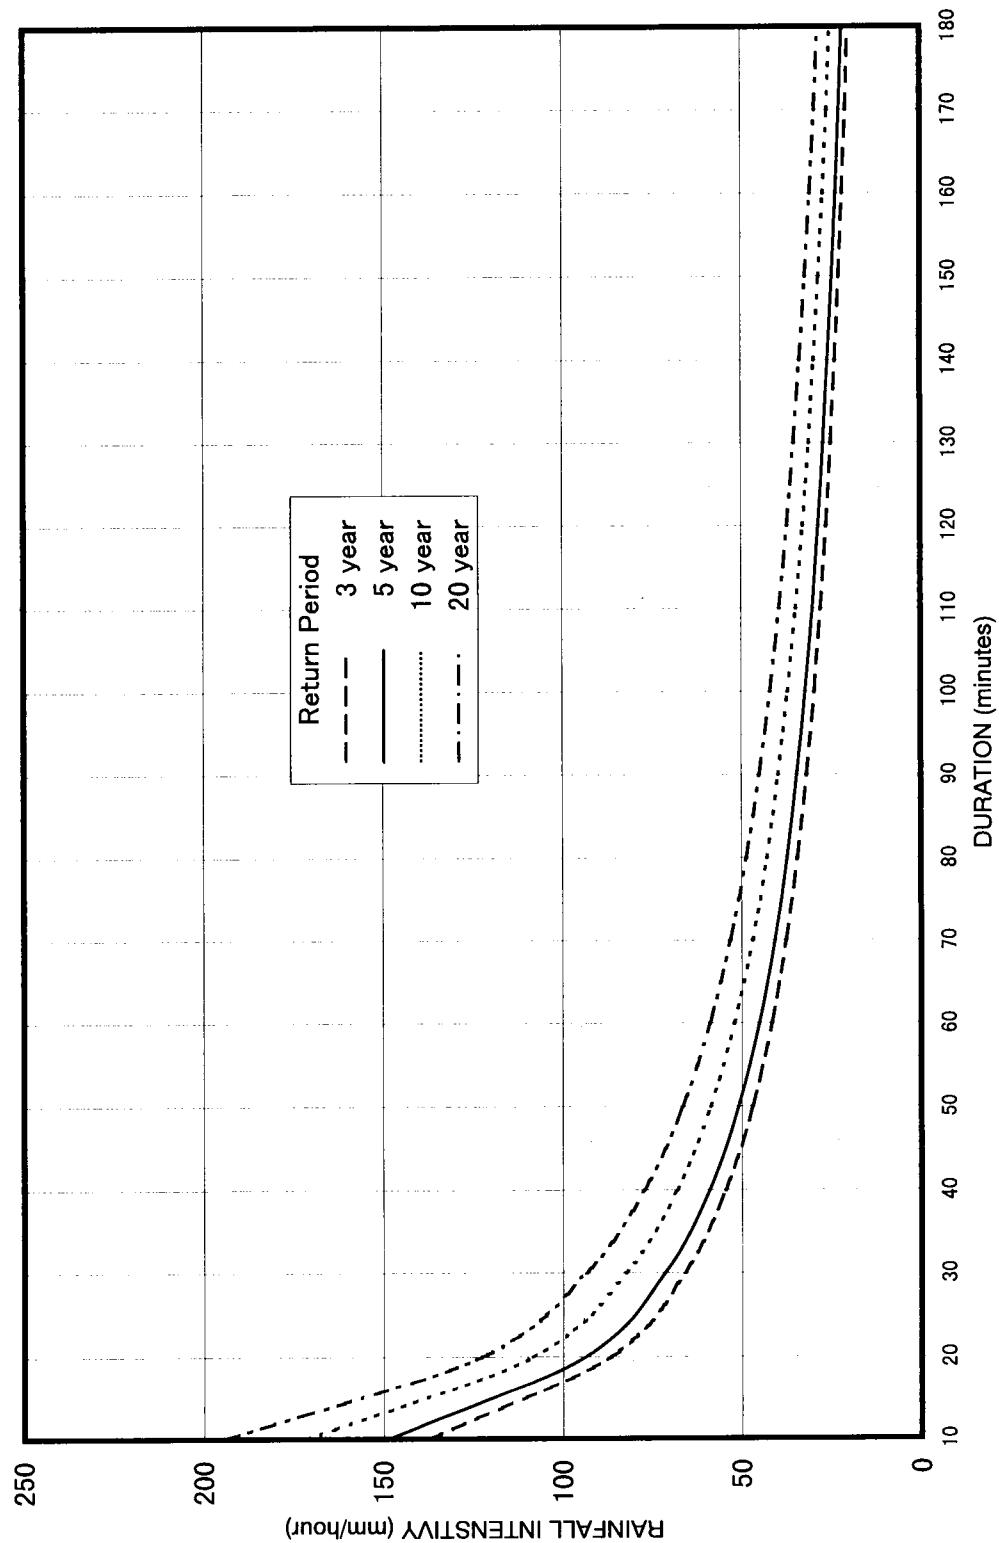

FIGURE 2 RAINFALL INTENSITY - DURATION CURVE

### (3) Rainfall Discharge

Rainfall discharge is calculated from the following rational formula:

$$Q = \frac{1}{3.6 \times 10^6} \bullet C \bullet r \bullet a$$

where      Q = Discharge ( $\text{m}^3/\text{sec}$ )

C = runoff coefficient

r = rainfall intensity (mm/hour)

a = catchment area ( $\text{m}^2$ )

The catchment basin is shown in Figure 3. Rainfall discharge calculation is shown in Table 3.

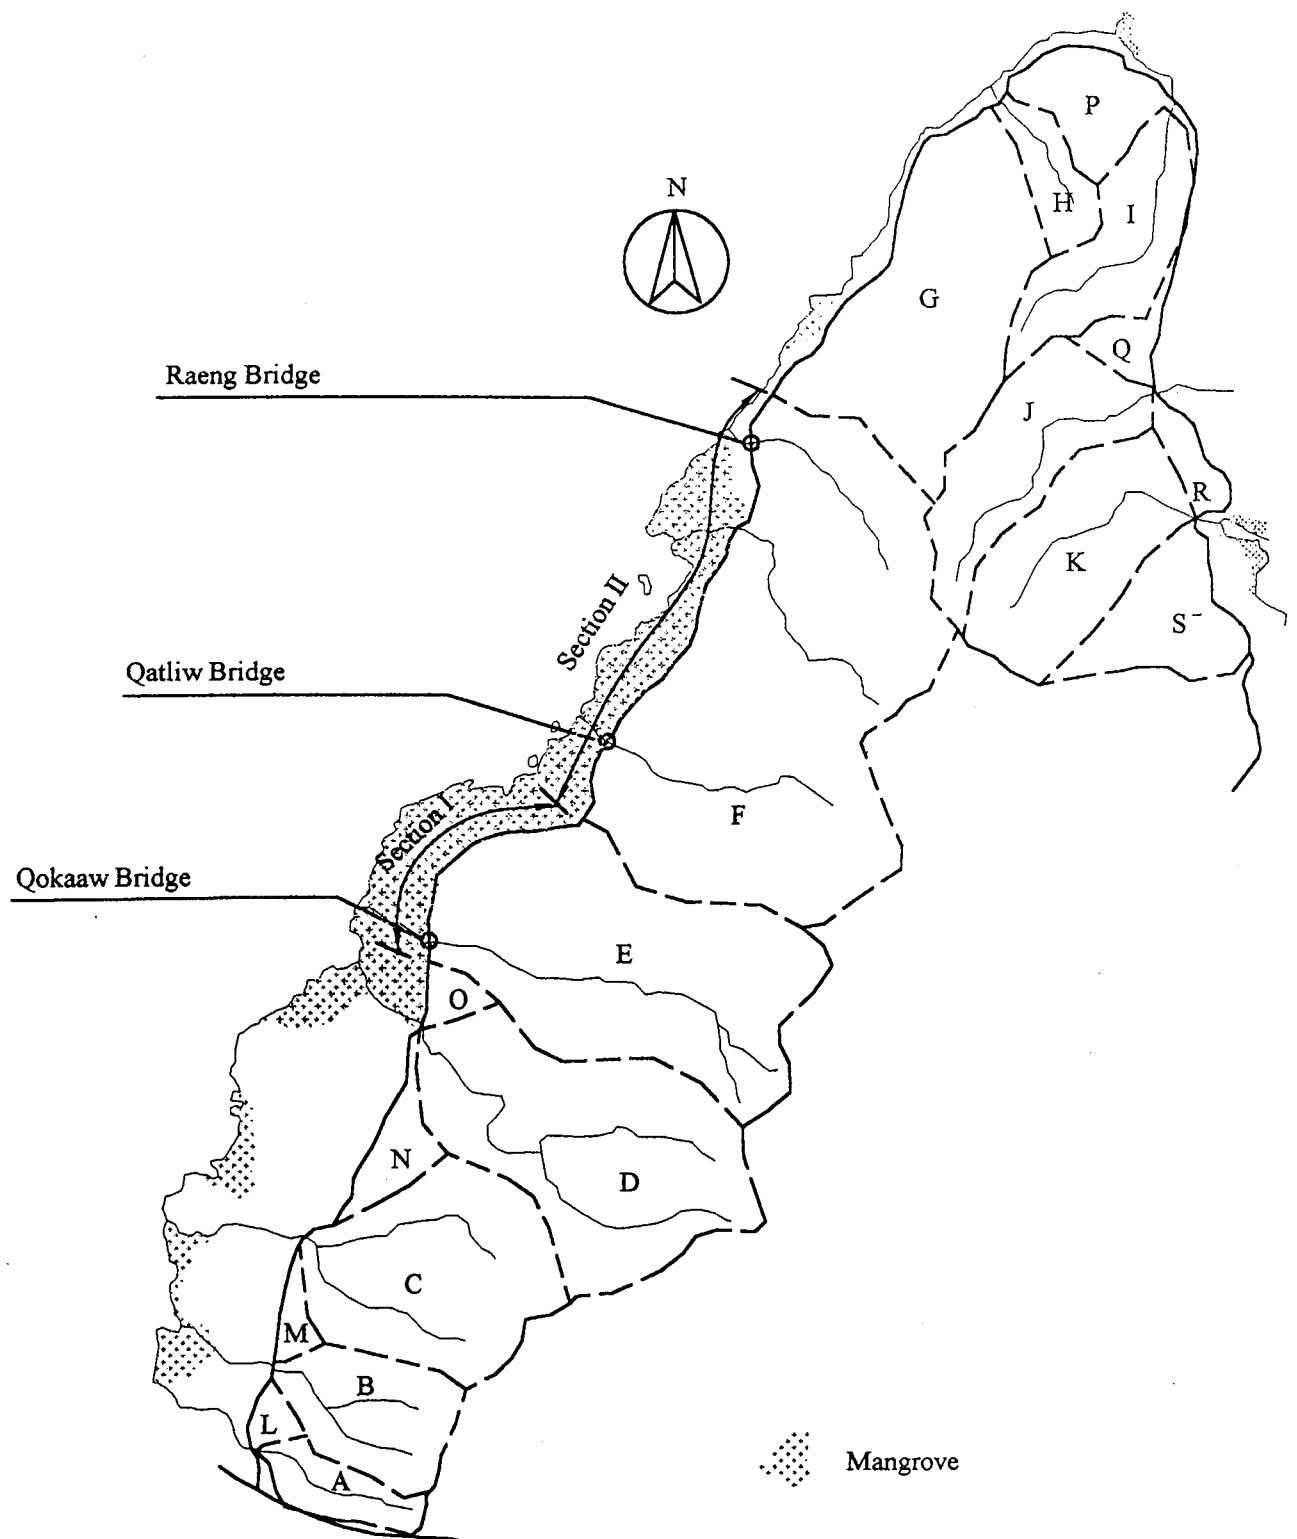

FIGURE 3 CATCHMENT BASIN RELATED TO CENTRAL YAP ROAD

TABLE 3 RAINFALL DISCHARGE CALCULATION

## 2. Analysis of Flood Sections (Present Situation)

Analysis is made on the following two sections:

Section I : 4.6 km to 5.64 km

Section II : 5.64 km to 8.42 km

Above two sections include the portions where the road elevation is lower than high tide level.

The analysis is made on the rainfall discharge crossing the road at the time of high tide.

### (1) Analysis Method

When the water levels of upstream and downstream sides of the road are assumed as certain values, the flow rates of the rivers, culverts and overflow sections can be estimated. Giving the water level of downstream side and total discharge volume, the water level of upstream side at which the sum of individual flow rates is equal to the given discharge is obtained by convergent calculation.

Individual flow rate is calculated as follows.

- Open Channels (rivers and culverts with free water surface)

The flow rate is calculated by the non-uniform flow analysis between downstream and upstream sides.

The following formula is used as velocity formula.

$$v = \frac{1}{n} \bullet R^{2/3} \bullet I^{1/2}$$

where,  $v$  = Mean velocity (m/sec)

$n$  = Coefficient of roughness

(river: 0.04, culvert : 0.03, PVC pipe: 0.01)

$R$  = Hydraulic radius (m)

$I$  = Gradient of water surface

- Culverts filled with water

Flow rate,  $Q$  is calculated assuming the condition of submerged orifice.

$$Q = CA\sqrt{2gH}$$

where,  
 $Q$  = Flow rate ( $\text{m}^3/\text{sec}$ )  
 $C$  = Velocity-water head coefficient (0.62)  
 $A$  = Sectional area ( $\text{m}^2$ )  
 $g$  = Gravitational acceleration ( $\text{m/sec}^2$ )  
 $H$  = Difference in water level (m)

- Overflow

$$\begin{aligned} H_1/H_2 < 0.6 & : Q = C_o B H_1^{3/2} \quad (\text{complete overflow}) \\ 0.6 \leq H_1/H_2 \leq 0.7 & : Q = C B H_1^{3/2} \quad (\text{incomplete overflow}) \\ H_1/H_2 > 0.7 & : Q = C' B H_2 \sqrt{H_1 - H_2} \quad (\text{submerged overflow}) \end{aligned}$$

where,  $Q$  = Flow rate ( $\text{m}^3/\text{sec}$ )  
 $C_o, C, C'$  = Flow rate coefficient  
 $C_o = 1.4$   
 $C = (1.018 - 0.030 H_2/H_1) \cdot C_o$   
 $C' = 2.6 \cdot C_o$   
 $B$  = Overflow width (m)  
 $H_1$  = Upstream side overflow depth (m)  
 $H_2$  = Downstream side overflow depth (m)

## (2) Conditions in Analysis

### Downstream side water level

: High tide elevation is 0.70m when the influence of atmospheric pressure is not considered and the fluctuation of tide by atmospheric pressure is about  $\pm 0.23\text{m}$ . Based thereon, downstream side water level is assumed to be 0.93m.

### Rainfall discharge

: Rainfall discharge at the return period of 5 years (Section I :  $43.7 \text{ m}^3/\text{sec}$ , Section II :  $73.3 \text{ m}^3/\text{sec}$ ) is assumed.

### Cross-Section

: Cross-sections for analysis are shown in Figure 4 (upstream side and downstream side sections are assumed as the same).

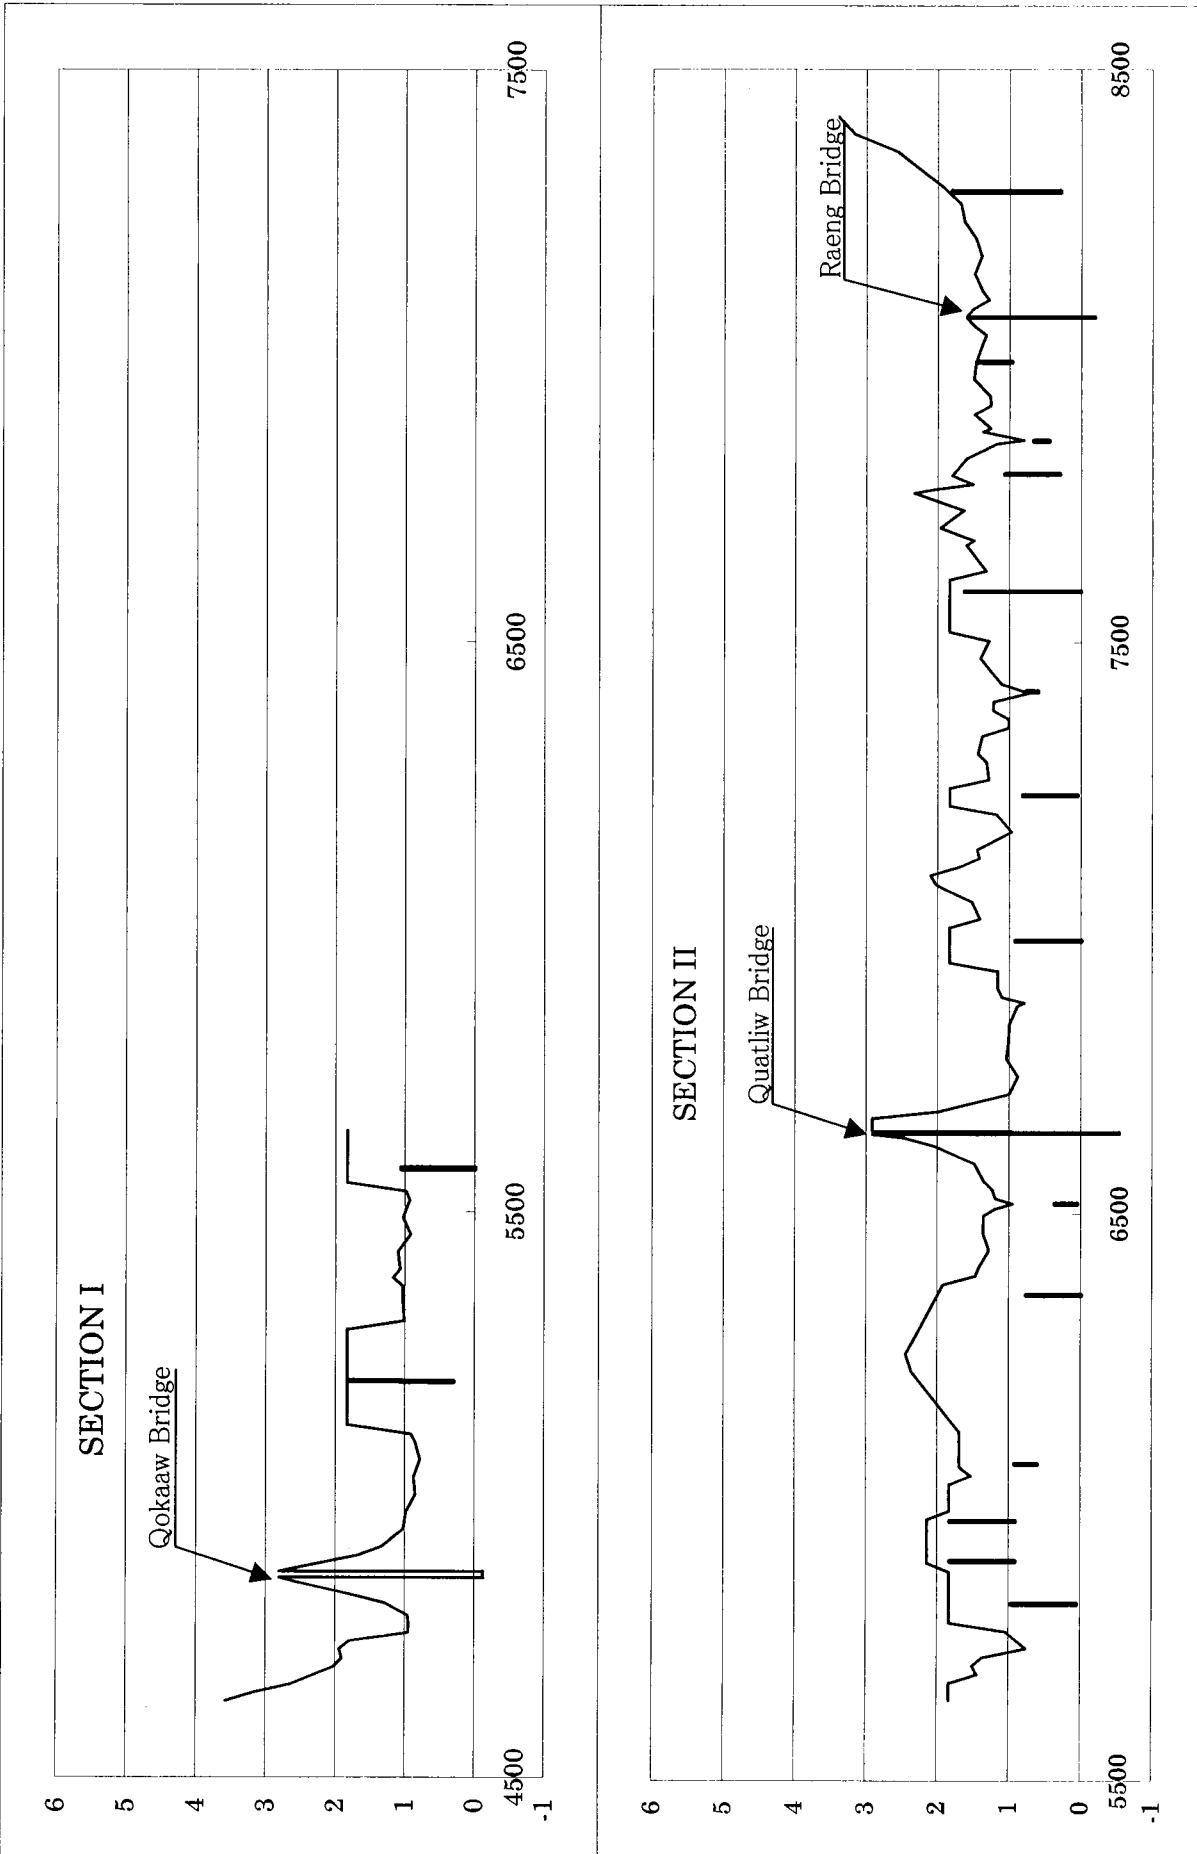

FIGURE 4 LONGITUDINAL PROFILE OF THE ROAD (PRESENT)

(3) Result of Analysis (Section I)

Upstream side water level : 1.037 m  
 Downstream side water level : 0.930 m

Flow Rate and Velocity (upstream side)

	Flow rate (m <sup>3</sup> /sec)	Velocity (m/sec)	Length of overflow section (m)	Maximum water depth (m)
Qokaaw Bridge (4.862km)	21.961	1.863		
Overflow section (4.756~4.794km)	1.219	0.406	37	0.097

Pipe culvert No.12 (2-cell)	2.406	1.393		
Total	43.700		437	

(4) Result of Analysis (Section II)

Upstream side water level : 1.154 m  
 Downstream side water level : 0.930 m

Flow Rate and Velocity (upstream side)

	Flow rate (m <sup>3</sup> /sec)	Velocity (m/sec)	Length of overflow section (m)	Maximum water depth (m)
Quatliw Bridge (6.643km)	13.272	2.105		
Raeng Bridge (8.068km)	7.466	1.984		
Overflow section (5.724~5.767km)	6.776	0.690	43	0.394
Overflow section (6.510~6.526km)	0.755	0.475	16	0.204
Overflow section (6.705~6.892km)	18.888	0.592	186	0.364
Overflow section (7.156~7.194km)	1.598	0.451	38	0.184
Overflow section (7.345~7.376km)	1.607	0.479	31	0.144
Overflow section (7.398~7.434km)	4.298	0.658	35	0.424
Overflow section (7.848~7.863km)	1.676	0.625	15	0.354
Pipe culvert No.13	1.202	1.889		
Pipe culvert No.14	0.000	0.003		
Pipe culvert No.15 (3-cell)	0.000	0.003		
Pipe culvert No.16	0.092	1.300		
Pipe culvert No.18	0.092	1.300		
Pipe culvert No.19 (2-cell)	1.690	1.300		
Pipe culvert No.20	0.574	1.300		
Pipe culvert No.21 (2-cell)	0.052	1.300		
Box culvert No.22 (2-cell)	10.828	2.048		
Pipe culvert No.23	0.380	1.300		
Pipe culvert No.24	0.041	1.300		
Pipe culvert No.25	0.000	0.000		
Box culvert No.26	2.010	1.568		
Total	73.300		364	

The above calculated results are close to the information gotten from PW & T and inhabitants.

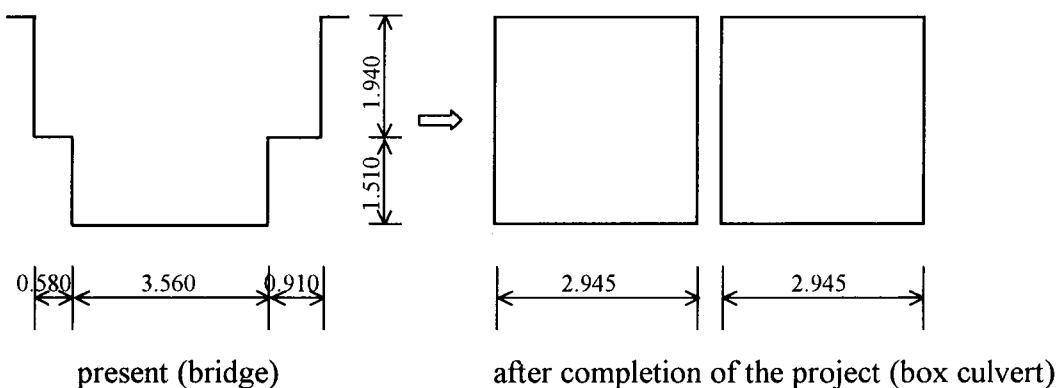

### 3. Analysis of Flood Sections (after Completion of the Project)

The same analysis method as used in the analysis of present situation is used. The cross-section for analysis is changed as follows (see Figure 5):

#### Profile of the road

- : raise of the sections with an elevation blow 1.0m up to 1.0m.
- : change of longitudinal profile resulting from laying of culverts under the FEMA project.

Bridge : change of the section of the Quatliw Bridge.

Culvert : Replacement/Addition under the FEMA project

No.	Diameter (m)	Replacement/Addition	Remarks
16	0.30→0.90	Replacement	PVC pipe
17	0.75	Addition	RC pipe
18	0.30→0.90	Replacement	PVC pipe
21	2 x 0.16→0.60	Replacement	PVC pipe
24	0.20→0.60	Replacement	PVC pipe

#### (1) Result of Analysis (Section I)

Upstream side water level : 1.092 m  
Downstream side water level : 0.930 m

#### Flow Rate and Velocity (upstream side)

## 4. Analysis for Other Sections

### (1) Analysis Method

Rainfall discharge of 5-year return period in each catchment basin is allocated to individual culverts. Discharge of individual culvert is calculated as follows:

- Culverts not affected by high tide (with free water surface)  
The following equation for uniform flow is used:

$$Q = Av$$

$$v = \frac{1}{n} R^{2/3} I^{1/2}$$

where, Q: Flow rate ( $\text{m}^3/\text{sec}$ )

A: Sectional area of flow ( $\text{m}^2$ )

v: Mean velocity ( $\text{m/sec}$ )

n: Coefficient of roughness (culvert: 0.03, PVC pipe: 0.01)

R: Hydraulic radius (m)

I: Bottom gradient

- Culverts affected by high tide (with free water surface)

The downstream side water level is assumed to be 0.93m. The following equation for no-uniform flow is used:

$$\Delta H = \frac{\alpha}{2g} \left( \frac{Q^2}{A_2^2} - \frac{Q^2}{A_1^2} \right) + \frac{n^2}{2} \left( \frac{Q^2}{R_1^{4/3} A_1^2} + \frac{Q^2}{R_2^{4/3} A_2^2} \right) \Delta x$$

where,  $\Delta H$  : Difference in water level between upstream and downstream sides (m)

$\alpha$  : 1.0

g : 9.8 ( $\text{m/sec}^2$ )

Q : Flow rate ( $\text{m}^3/\text{sec}$ )

$A_1, A_2$  : Sectional areas of flow at upstream and downstream sides ( $\text{m}^2$ )

$R_1, R_2$  : Hydraulic radii of upstream and downstream sides (m)

$\Delta x$  : Length of culvert (m)

- Culvert filled with water

The following equation for submerged orifice is used:

$$Q = CA\sqrt{2gH}$$

Q: Flow rate ( $\text{m}^3/\text{sec}$ )

- C: Velocity-water head coefficient (0.62)  
A: Sectional area ( $m^2$ )  
g: 9.8 ( $m/sec^2$ )  
H: Difference in water level (m)
