 W &= 0.4 \times 0.4 \times 34.6 \times 1.5 = 8.3 \text{ t} \\
 Ra &= \frac{1}{3} \times (159.1 - 2.8) + 2.8 = 8.3 \text{ t}
 \end{aligned}$$

### (3) Allowable Tension Capacity

$$\begin{aligned}

 W &= 8.3 \text{ t} \\
 Pa &= \frac{1}{6} \times 88.3 + 8.3 = 23.0 \text{ t}
 \end{aligned}$$

### (4) Examination of Negative Skin Friction

 \end{aligned}$$

(5) Investigation of Pile Stress

$$P_0 = 46.6 \text{ t}$$

$$R_{nf} = 49.2 \text{ t}$$

$$W' = 0.4 \times 0.4 (17.60 + 12.40) \times 2.5 \\ = 12.0 \text{ t}$$

$$\sigma_y = 290 \text{ kg/cm}^2$$

$$A_p = 1584 \text{ cm}^2$$

$$1.2 \times (46.6 + 49.2 + 12) = 129.3 \text{ t}$$

$$2900 \times 0.158 = 458.8 \text{ t}$$

Pile stress is bigger than all the load affect to the pile head. OK

\* It is clear that the pile stress is quite bigger than the all the load affect to the pile head.  
Then calculation for another facilities omit.

#### *Road and Storm Water Discharge*

## Road design in WWTP

Base on result of settlement, pavement surface shoud better constructed after 1 year finish embankment, or improve soft soil by sand pile or wick drain.

### (5) Pavement structure

Use flexible pavement . Trafic volume suppose 100 vehicle H10/day.

Reference "Typical flexible pavement structure — TKM 02-80" approved by MOC There are two type:

- Type P1 : Use for access road (conveyance sewer road) portion 4 (see Table 9.4.3-1) , and inside road of WWTP.

+ Demand elastic modulus (young modulus) 1500 Kg/cm<sup>2</sup>

+ Layers thickness :

5 cm wearing course , asphalt concrete small size

Emulfies asphalt tack coat 0,2- 0.7 lit/m

8 cm binder course , asphalt concrete gross size

Emulfies asphalt prime coat 1.0 — 2.0 lit/m

10 cm base course, crushed aggregate

20 cm subbase course, aggregate (or red gravel grade)

Total : 43 cm

- Type P2 : Use for access road (conveyance sewer road) portions 1 , 3 (Table 9.4.3-1).

+ Demand elastic modulus 1300 Kg/cm<sup>2</sup>

+ Layers thickness :

9 cm asphalt concrete pavement

Emulfies asphalt prime coat 0,2- 0.7 lit/m

10 cm base course, crushed aggregate

20 cm subbase course , aggregate (or red gravel grade)

Total : 39 cm

Designing method following "Standard of flexible pavement design — 22 TCN 211-93" approved by MOT. According to this standard, flexible pavement design must be enough 3 condition:

- *Checking elastic settlement condition:* Elastic settlement of pavement structure must smaller than permitted elastic settlement  $I_{sp}$ . That mean elastic modulus of strucrure  $E_{ch}$  bigger than demand elastic modulus  $E_{yc}$

$$E_{ch} > E_{yc} = \frac{p \cdot D (1 - \mu^2)}{I_{sp}} = \frac{p \cdot D}{100 I_{sp}}$$

p - tier pressure of calculating vehicle, Kg/cm<sup>2</sup>

D - diamete of equivalent rounded circular of tier mark, cm

$\mu$  - Poisson coefficient , = 0.3

Value  $E_{yc}$  follow Table 3-3 of 22 TCN 211-93

Value p , D see Table 3-1 in 22 TCN 211-93

- *Checking slide condition:* carry out this codition with soil bed and material layer non cohesive (like gravel, aggregate..)

To have not elastic deformation zone in soil bed and material layer non cohesive, pavement structure must be enough following condition :

$$\tau_{as} + \tau_{ar} \leq K \cdot C$$

$\tau_{av}$  - maximum sheare strength make by vehicle

$\tau_{av}$  - shear strength make by loading of material layers on calculating point.

C - cohesive of soil or material non cohesive

K - coefficient of working condition

- *Checking tensile strength  $\sigma_{tu}$  in asphalt concrete layer when bending subjected:* Pavement structure is good when maximum tensile strength in asphalt concrete layer enough following condition :

$$\sigma_{tu} < R_u$$

$R_u$  - Permitted tensile strength of asphalt concrete layer when bending subjected  
( see appendix 3 in 22 TCN 211-93)

# Drainage design in WWTP

## 9-4-4. Storm Water Drainage

### (1) General

Storm Water Drainage in WWTP Phase (1 + 2) is about 25 ha, but in Phase 1 only 17 ha. Drainage System used U channel at curb (side ditchese) to concentrate water from every where to 8 Outfall (phase I have 5 Outfall).

### (2) Applicable Codes and Standard

There are these Codes and Standard of Viet nam applying:

- 20 TCN 104-83 "Standard for Urban Highway Design" approved by Ministry of Construction , (MOC)
- TCVN 4054-98 "Standard for Rural Highway Design" approved by Ministry of Transportation, (MOT)

To calculating Storm water volume use formular of Doctor Tran Huu Uyen.

### (3) Design Condition and Parameters

#### a. Design condition

Live load	H30
Design Elevation of Embankment	2.20 m
Design Elevation of Pavement	2.05 (at curb) - 2.15 m (center line)
Elevation of foundation bottom of side ditchese	> 1.00 m
MWL (maximum water level) at outfall	1.51 m
Average ground level (GL)	0.60 m

#### b. Parameters

Wide of side ditchese in general B = 0.40m. There are some portion come to outfall B = 0.60 — 1.00 m.

Hight of side ditshese H allway from 0.20 — 0.70 m

Profile slop of side ditshese allway use 0.10%

### (4) Modification of System Concept

Phase 1, drainage water flows to 5 outfall O2 , O4 , O5 , O6 , O7. See drawing No PE-WWTP-223-03

Phase 2, drainage water will go on constructing to 3 outfall O1 , O3 , O8. See drawing No PE-WWTP-223-01

### (5) Hydraulic Analysis

Base on Rain Discharge Plan (Drawing No PE-WWTP-223-01) and Layout of Storm Water Drainage System, Phase 1, (Drawing No PE-WWTP-223-03), Hydraulic Analysis of side ditchese system was calculated as following:

#### a. Storm Intensive q (litre / s.ha)

Apply formular of Doctor Tran Huu Uyen:

$$q = \frac{A_s(1 + C_{lg}P)}{(1 + b_o P^m)^n} ; l/s.ha$$

Ho Chi Minh City has Coefficients following:

$A_o = 11650$ ,  $b_o = 32$ ,  $C = 0.58$ ,  $m = 0.18$ ,  $n = 0.72$   
In Ho Chi Minh City use storm sequence  $P = 1$ , so:

$$q = \frac{11650}{(t+32)^{0.95}} ; \text{ l/s.ha}$$

$t$  (s) — Calculating storm time ( $=$  Water Flow time from beginning point to calculating point)

b. Storm Water Volume (l/s)

$$Q = M \cdot Y \cdot F \cdot q ; \text{ l/s}$$

M — Storm distribution coefficient

$$M = \frac{1}{1 + 0.001 F}$$

F (ha) — Catching area

Y — Flow coefficient

$$Y = f_1 \cdot Y_1 + f_2 \cdot Y_2 + f_3 \cdot Y_3$$

$f_1, f_2, f_3$  — Flow coefficient for kind of ground surface

$f_1 = 0.95$  with hard pavement

$f_2 = 0.60$  with aggregate pavement

$f_3 = 0.10$  with glass

Water flow time calculated by formula:

$$t = t_0 + t_r + t_c = 5 + 1.25 l_r/v_r + r.l_c/v_c ; \text{ min}$$

Suppose:  $v_r = 1.5 \text{ m/s}$

$v_c = 1.7 \text{ m/s}$

$r = 2$

$l_r$  (m) - Length of gutter at curb

$l_c$  (m) - Length of side ditches

Calculating results as Tab. 9.4.4-1

Tab. 9.4.4-1

## CALCULATION FOR FERMENTING VESSEL

(The calculation based on Japanese standard)

### 1-Geometry datum for calculation

Ground level:	GL =	2.2
Ground water level:	GWL =	0.0
Bottom level of waste water tank: BL =		-2.4
Bottom level of blower room : BL =		0.6
Bottom level of compost zone : BL =		1.43
Thickness of bottom slab of w.w.tank :		0.50 m
Thickness of bottom slab of compost zone :		0.50 m
Thickness of bottom slab of blower room :		0.50 m
Thickness of outside wall :		0.50 m
Thickness of wall ( compost zone ) :		0.40 m
Thickness of wall of blower room :		0.50 m

### 2-Parameters for calculation:

Concrete: Grade 250,	Rn =	70 ( Kg/cm <sup>2</sup> )
	RS=	3.6 ( Kg/cm <sup>2</sup> )
Reinforcement type JIS:	Ra=	1600 ( Kg/cm <sup>2</sup> )
Back fill sand: $\gamma_s =$	1.80T/m <sup>3</sup>	; Coefficient of earth pressure at rest $K_o =$ 0.5
Internal friction	20deg	

### 3-Load calculation (Base on Japanese standard):

#### 3.1- Maximum loads from architect part to be taken in calculation as in analysis

#### 3.2- Soil and water load:

##### In case of ground water level at 0.00 (Permanent case):

-Horizontal triangle distributed load due to soil and water (outside waste water tank):

$$q_2 = (\gamma_s \cdot 1) \times (GWL - BL) \times K_o + (GWL - BL) \times 1.0 + \gamma_s h x K_o = \\ = 1.5 \times 1.8 \times 0.5 + 2.4 \times 0.8 \times 0.5 + 2.4 \times 1 = 4.71 T/m^2$$

Without water outside :  $q_2 = 3.9 \times 1.8 \times 0.5 = 3.51 T/m^2$

-Horizontal triangle distributed load due to compost zone and gravel zone :

$$q_3 = 3.5 \times 0.8 \times 0.5 + 0.4 \times 2 \times 0.5 = 1.80 T/m^2$$

-Horizontal triangle distributed load due to water inside waste water tank

$$q_4 = 2.5 \times 1 = 2.50 T/m^2$$

-Vertical uniform load due to compost zone and gravel zone :

$$q_1 = 0.8 \times 3.5 + 0.4 \times 2 = 3.60 T/m^2$$

-Uplift pressure to bottom of waste water tank :

$$q_5 = (H_{\text{ground water}}) \times 1.0 = 2.40 T/m^2$$

#### 3.3-Live load:

-Live load for all operating floor and walking way :  $q_{\text{live}} = 0.50 T/m^2$

-Live load for blower room :  $q_{\text{live}} = 0.50 T/m^2$

#### 3.3-Load for mixing machine:

Load from a set of machine : 35 T

When machine near blower room :  $P_2 = 33 T$ ,  $P_1 = 2 T$

When machine near outside wall :  $P_2 = 7.5 T$ ,  $P_1 = 27.5 T$

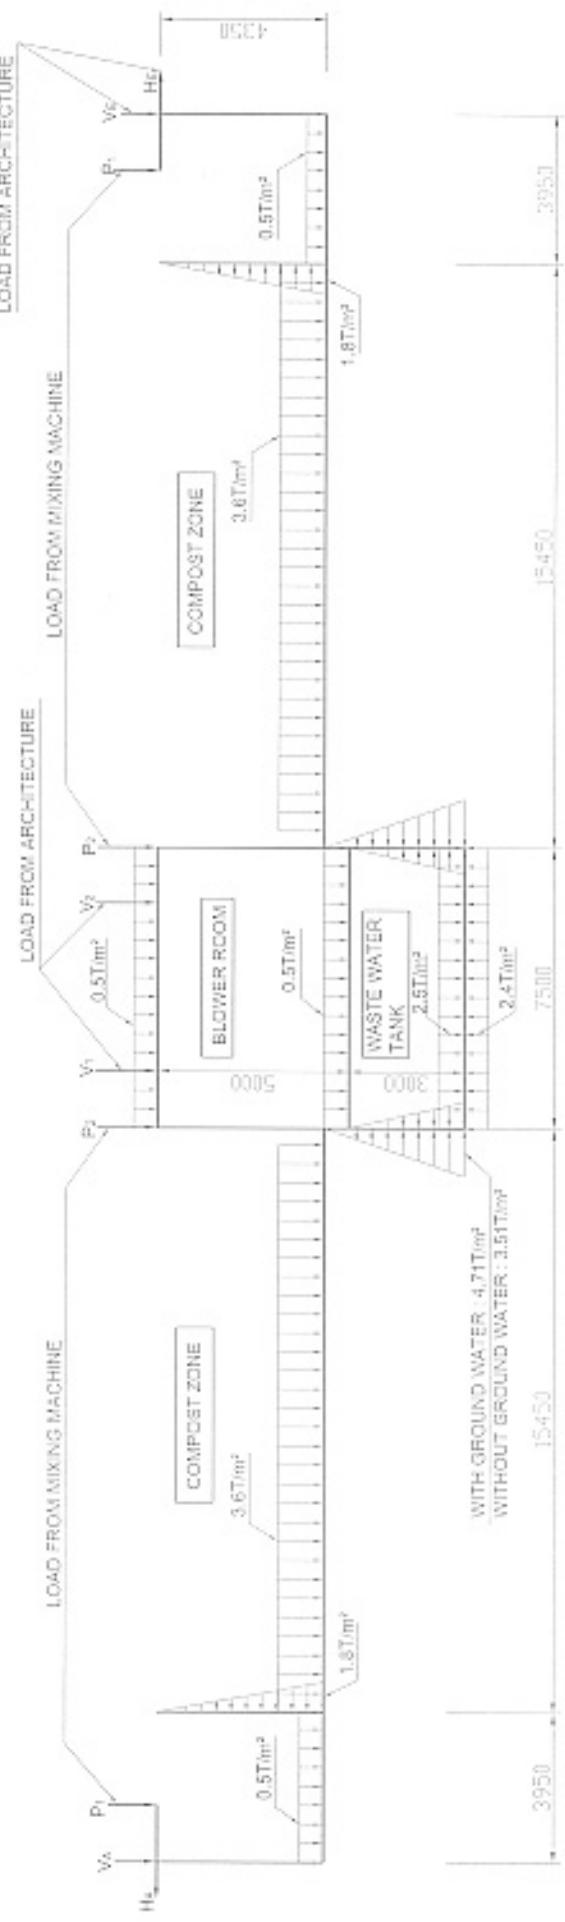

( All loads are shown on the drawing attached )

#### 4-Analysing by sap 2000: There are 4 combos for analysing as attached hereafter:

All the loads, factors, and other input datum to be taken in analysis and calculated by SAP 2000

#### 5-Calculation for bar arrangement:

## COMPOST PLANT - FERMENTING VESSEL

NOTE:  $\Rightarrow$  THIS FOR VALUES OF LOADS ONLY  
 COMBOS ARE TO BE CONSIDERED  
 $\Rightarrow$  IN ANALYSIS BY SAP2000

Base on attached results of shell forces analised by SAP2000, choosing the most dangerous forces for calculation:

$$A_o = M/R_{n}bh_o^2$$

Where,  $M$ : Maximum bending moment(T.m)

$h_o$ : Effective depth of bearing area(cm)

$b_o$ = (Element thickness-Cover thickness)

$b$ : Width of calculated area(cm)

Required area of reinforcement:

$$F_a = M/\gamma R_{n}b h_o^2$$

Where:  $\gamma = 0.5 + ((1.2A_o)^{1/2})/2$

**6-Calculation for pile number ( as attached sheet) :**

Pile number to be decided by pile calculation sheet, please refer to pile calculation sheet for more information.

### Pile numbers calculation (Fermenting Vessel)

#### (1) Architecture Loads

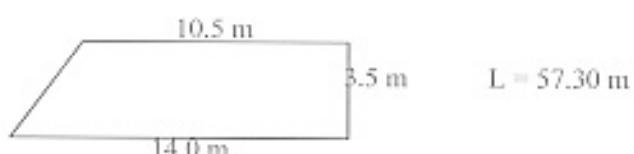

$$\text{Architecture Loads} = (8.25 \times 2 + 8.21 \times 2) \times 11 = 362.12 \text{ t}$$

#### (2) Concrete

$$3678.91 \text{ m}^3 \times 2.50 \text{ t/m}^3 = 9197.28 \text{ t}$$

#### (3) Compost Cake

$$(14.0 + 10.5) \times 1/2 \times 3.50 \times 57.30 \times 0.80 \text{ t/m}^3 \times 2 = 3930.78 \text{ t}$$

#### (4) Gravel

$$(0.40 \times 14.50 \times 57.30 \times 2.00 \text{ t/m}^3 \times 2 = 1329.36 \text{ t})$$

#### (5) Others

$$A = 89.80 \times 46.80 = 4202.64 \text{ m}^2$$

$$4202.64 \times 0.50 \text{ t/m}^2 = 2101.32 \text{ t}$$

#### (6) Pile numbers

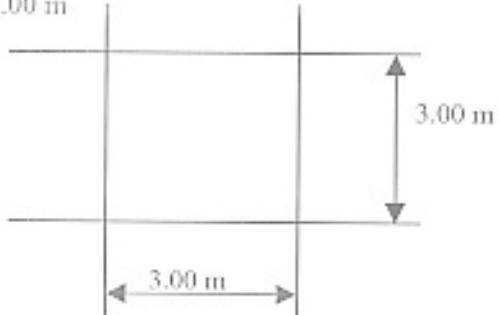

$$\text{Total Load} = 16920.86 \text{ t}$$

$$16920.86 \text{ t} \div 4202.64 \text{ m}^2 = 4.030 \text{ t/m}^2$$

Allowable bearing capacity of pile = 40 t/pile

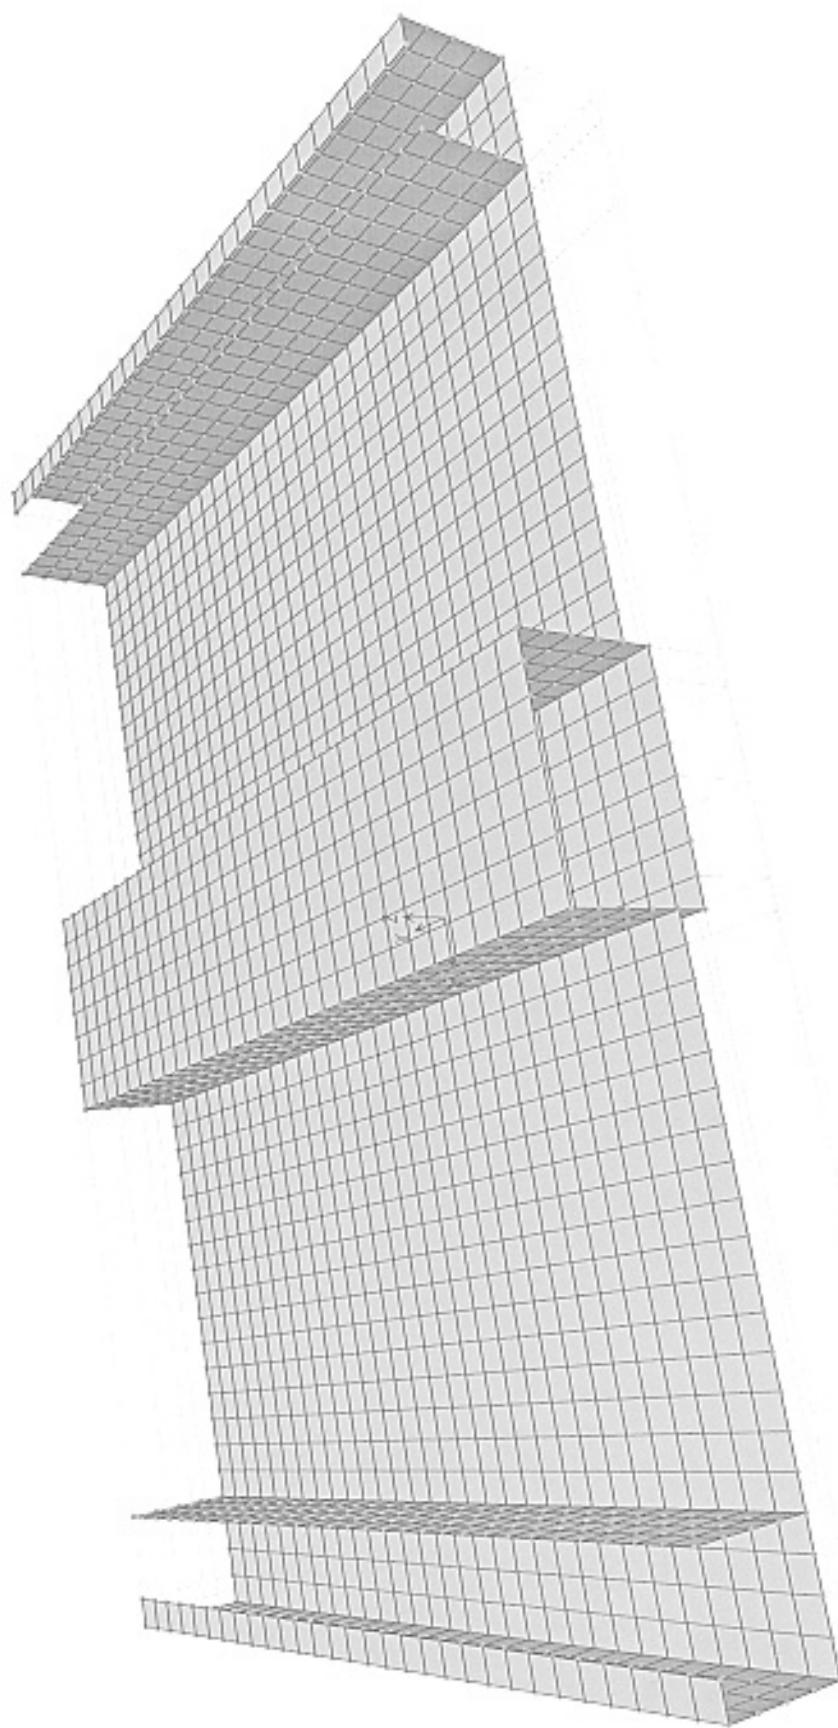

$$40 \text{ t/pile} \div 4.03 \text{ t/m}^2 = 9.93 \text{ m}^2 \text{ (for each pile)}$$

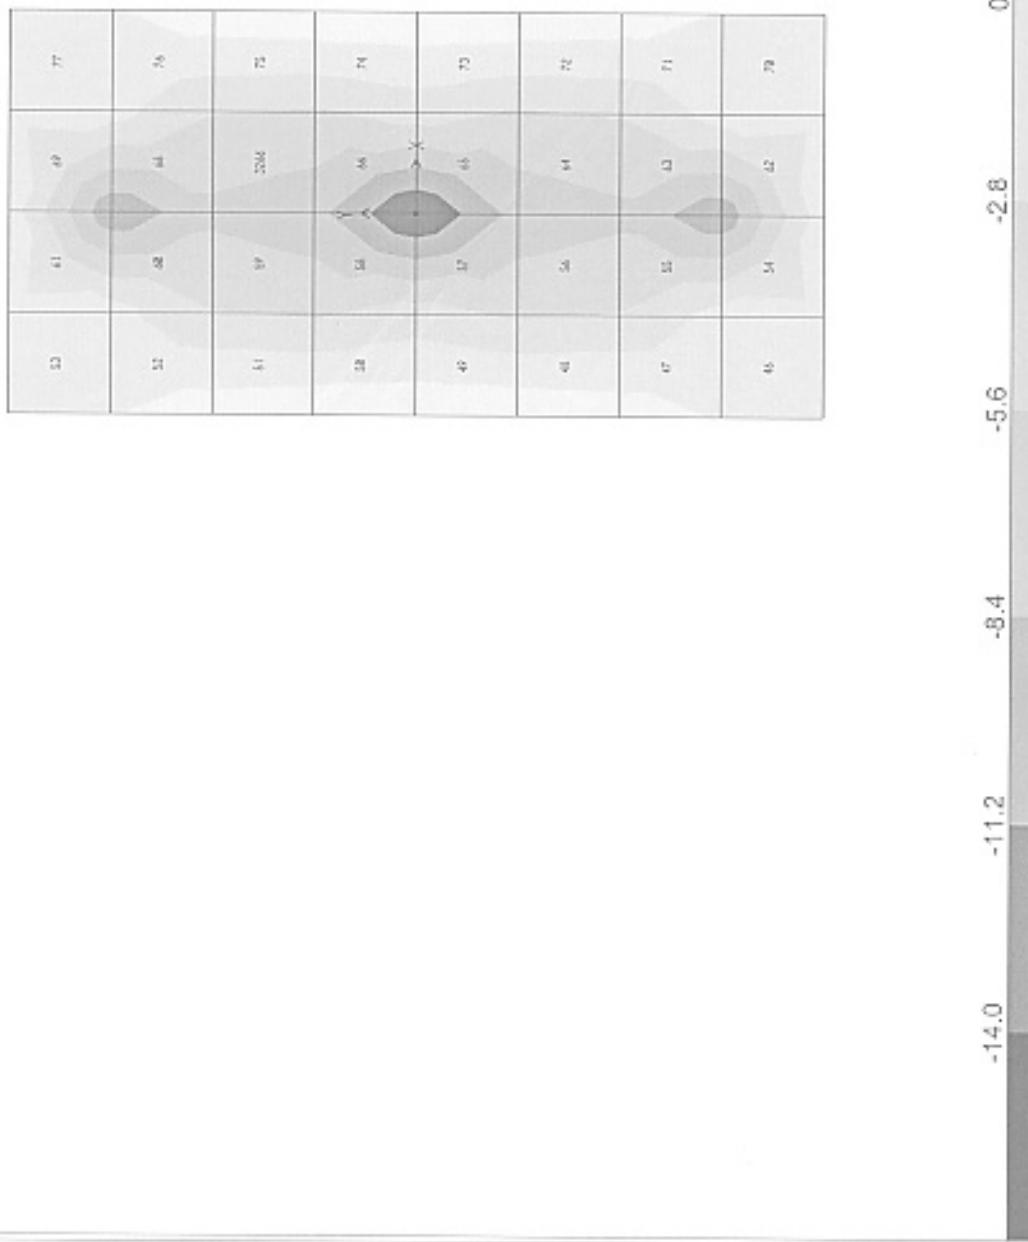

Pile pitch = 3.00 m

$$3.00 \text{ m} \times 3.00 \text{ m} = 9.00 \text{ m}^2 < 9.93 \text{ m}^2$$

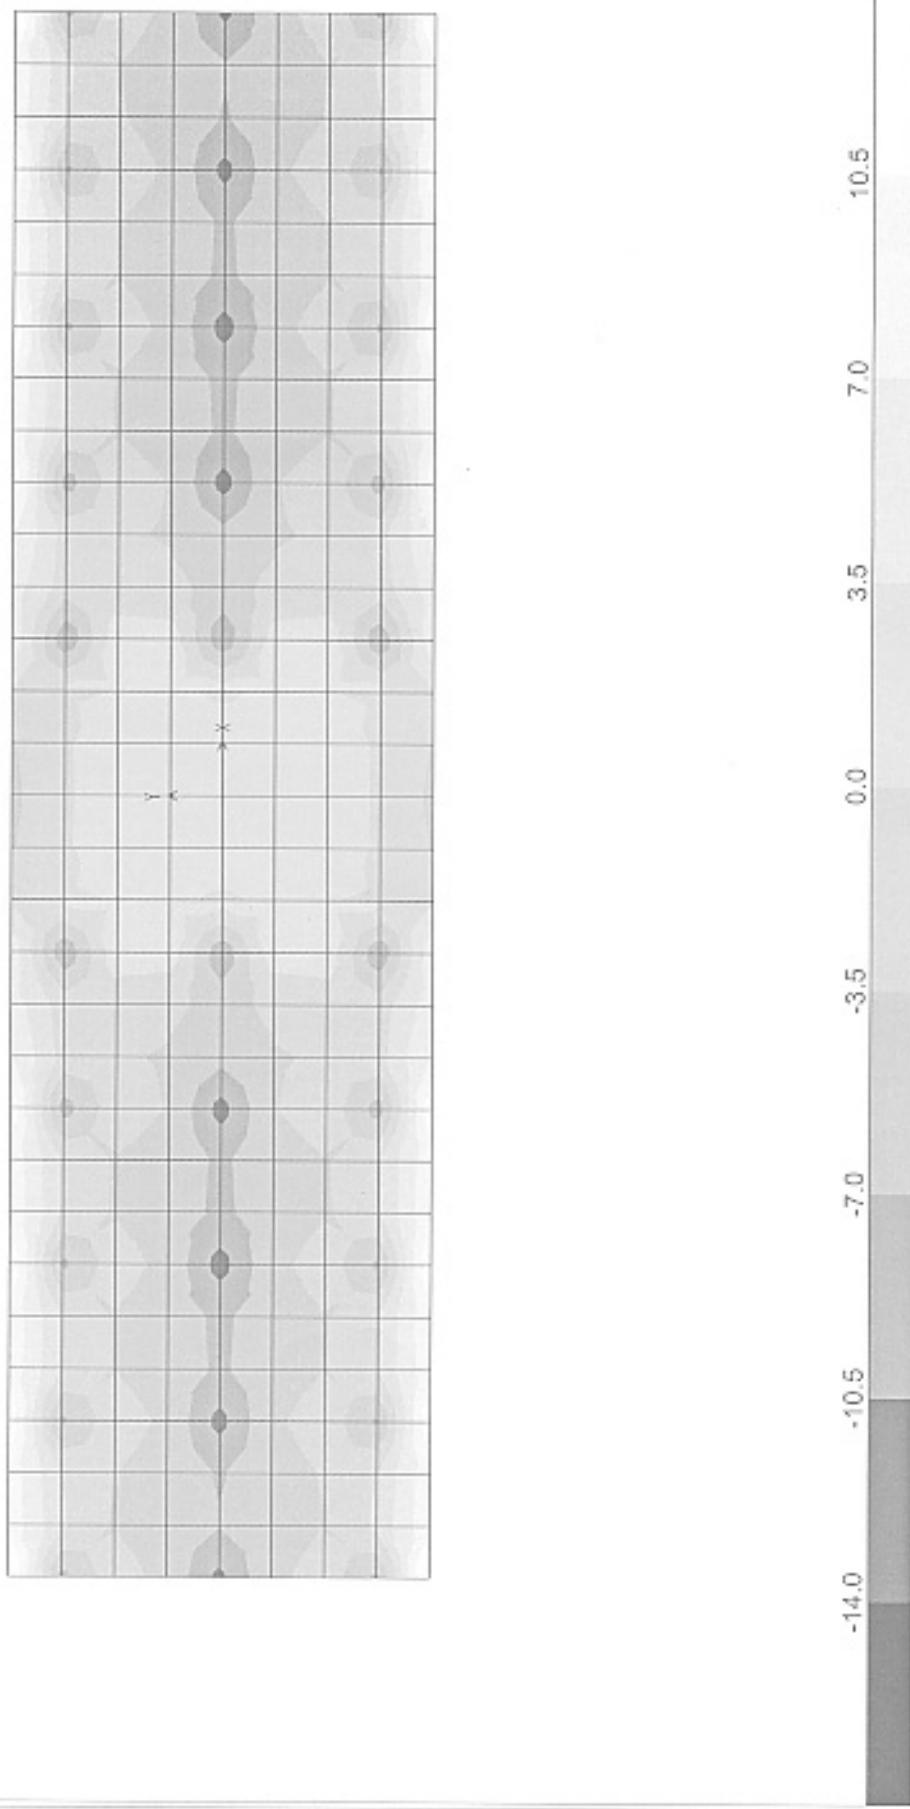

$$4202.64 \text{ m}^2 \div 9.00 \text{ m}^2 = 467 \text{ piles}$$

## CALCULATION FOR DEODORIZATION TANK PLAN

1-Geometry dimensions for calculation :

2-Material properties and soil conditions:

Ground water level:	GWL =	±0.00
Concrete: Grade 210,	Rn =	70 kg/cm <sup>2</sup>
	RS =	3.6 kg/cm <sup>2</sup>
Reinforcement type JIS:	Ra =	1600 kg/cm <sup>2</sup>
Back fill sand:	$\gamma_s = 1.8T/m^3$	Coeficient of earth pressure at rest $K_o = 0.5$
Internal friction	=	20deg

3-Loading and calculation scheme:

3.1 Horizontal triangle load due to filter material from both side of the deodorization soil filter

$$P_m = 2.0 \times 1.75 \times 0.5 = 1.75T/m^2$$

3.2 Vertical load due to filter material from bottom slab of the deodorization soil filter

$$P_v = 2.0 \times 1.75 = 3.5T/m^2$$

3.3 Surcharge load : =1T/m<sup>2</sup>

Horizontal distributed uniform load due to surcharge load from both side of the recirculation tank

$$P_s = 1T/m^2 \times 0.5 = 0.5T/m^2$$

3.4 Horizontal triangle load due to earth from both side of the recirculation tank

$$P_e = 3.35 \times 1.8 \times 0.5 = 3.01T/m^2$$

3.5 Live load for cover of the recirculation tank

$$P_{live} = 0.5T/m^2$$

4. Calculation for stresses and force

Refer to attached result sheet for calcution value of stress steel area for scheet elements

## Calculation for bar arrangement for deodorization tank plan

Base on attached results of shell forces analised by SAP2000, choosing the most dangerous forces for calculation:

$$A_o = M/R_n b h_o^2$$

Where,  $M$ : Maximum bending moment(T.m)

$h_o$ : Effective depth of bearing area(cm)

$h_o$  = (Element thickness-Cover thickness)

$b$ : Width of calculated area(cm)

Required area of reinforcement:

$$F_a = M/\gamma R_{n0}$$

Where:  $\gamma = 0.5 + ((1-2A_o)^{1/2})/2$

Pile numbers calculation (Deodrizing Soil Filter)

(1) Concrete

$$261.20 \text{ m}^3 \times 2.50 \text{ t/m}^3 = 653.00 \text{ t}$$

(2) Zcolite

$$42.00 \times 10.00 \times 1.00 \times 1.60 \text{ t/m}^3 = 672.00 \text{ t}$$

(3) Crushed Stone

$$42.00 \times 10.00 \times 0.75 \times 2.00 \text{ t/m}^3 = 630.00 \text{ t}$$

(4) Re-circulation Water

$$4.00 \times 3.00 \times 2.50 = 107.50 \text{ t}$$

(5) Others

$$42.60 \times 10.60 \times 0.50 \text{ t/m}^2 = 225.78 \text{ t}$$

(6) Pile numbers

$$\Lambda = 42.60 \times 10.60 + 3.30 \times 4.60 = 466.64 \text{ m}^2$$

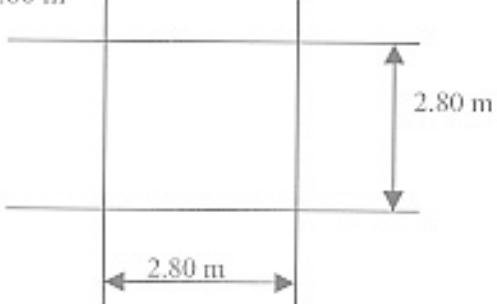

$$\text{Total Load} = 2288.28 \text{ t}$$

$$2288.28 \text{ t} \div 466.64 \text{ m}^2 = 4.90 \text{ t/m}^2$$

Allowable bearing capacity of pile = 40 t/pile

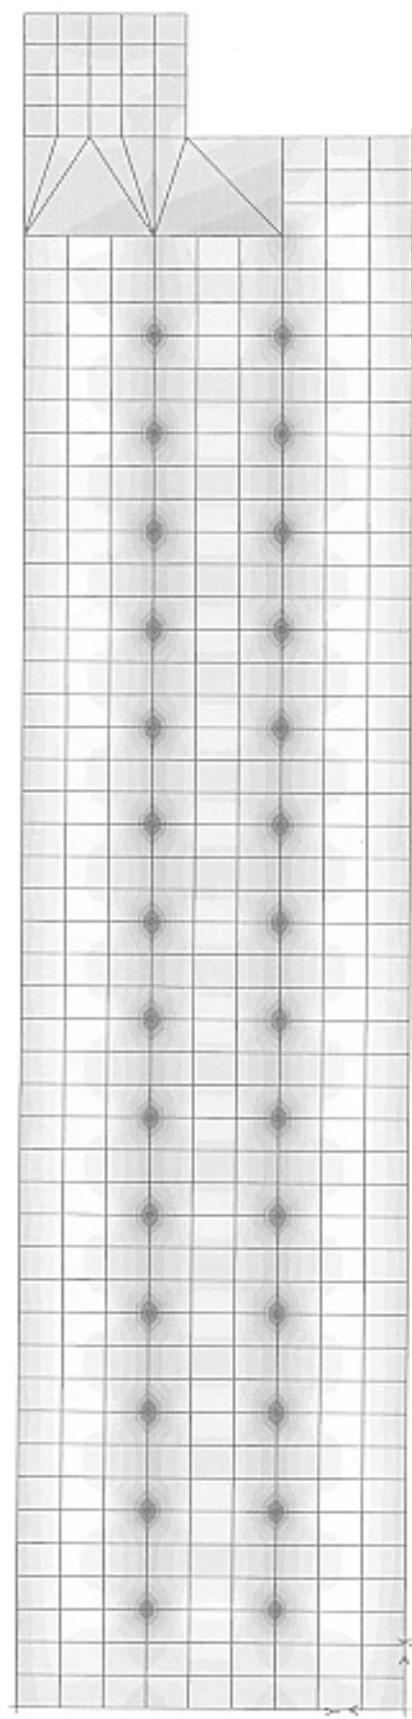

$$40 \text{ t/pile} \div 4.90 \text{ t/m}^2 = 8.16 \text{ m}^2 \text{ (for each pile)}$$

Pile pitch = 2.80 m

$$2.80 \text{ m} \times 2.80 \text{ m} = 7.84 \text{ m}^2 < 8.16 \text{ m}^2$$

$466.64 \text{ m}^2 \div 7.84 \text{ m}^2 = 60 \text{ piles}$
