## **CENTRE DE DÉVELOPPEMENT DOCUMENTS TECHNIQUES**

Cette série de documents techniques a pour but de diffuser rapidement auprès des spécialistes dans les domaines concernés les résultats des travaux de recherche du Centre de Développement. Ces documents ne sont disponibles que dans leur langue originale, anglais ou français ; un résumé du document est rédigé dans l'autre langue.

Tout commentaire relatif à ce document peut être adressé au Centre de Développement de l'OCDE, 94 rue Chardon Lagache, 75016 Paris, France. Un certain nombre d'exemplaires supplémentaires sont disponibles sur demande.

## **DEVELOPMENT CENTRE TECHNICAL PAPERS**

This series of technical papers is intended to disseminate rapidly the Development Centre's research findings among specialists in the field concerned. These papers are generally available in the original English or French, with a summary in the other language.

Comments on this paper would be welcome and should be sent to the OECD Development Centre, 94 rue Chardon Lagache, 75016 Paris, France. A limited number of additional copies of this paper can be supplied on request.

## **ACKNOWLEDGEMENTS**

This report was prepared in collaboration with the Ministry of External Affairs, Morocco, and the World Bank. The views expressed here are those of the authors and should not be attributed to their affiliated institutions. Special thanks are due to Mr. Hassan Bernoussi, Mlle. Zahra Maafiri, and Ian Goldin, for their co-operation and helpful discussion. The results of this work are part of the Development Centre research theme on Sustainable Development: Environment, Resource Use, Technology, and Trade.

## RÉSUMÉ

Ce document décrit l'élaboration d'un tableau entrées/sorties de l'économie du Maroc. Basé sur une combinaison provenant d'un tableau plus général établi par le gouvernement marocain et sur des données détaillées issues de sources officielles, le tableau se réfère à l'année 1990 et montre les interactions se produisant dans 133 domaines répartis entre les secteurs primaires, industriels et des services. Ce tableau sera l'élément essentiel d'une matrice de comptabilité sociale (MCS) détaillée et actuellement en cours d'élaboration dans le cadre de ce programme de travail. Finalement, la MCS sera intégrée dans un modèle d'équilibre général, utilisé conjointement par le Centre de Développement, le gouvernement marocain et la Banque mondiale, pour l'analyse des politiques relatives aux échanges et aux ressources. Ce document présente le tableau dans son intégralité et fournit quelques estimations préliminaires des multiplicateurs qui éclairent les liens entre l'agriculture marocaine et le reste de l'économie.

## SUMMARY

This paper reports on the construction of an Input-Output table for the economy of Morocco. The table is calibrated to the year 1990 and details the interactions between 133 primary, manufacturing, and service sectors, relying on a combination of a more aggregate table estimated by the Moroccan government and detailed data from official sources. This table will form the core of a detailed social accounting matrix (SAM) currently under construction as part of the same work programme. Ultimately, the SAM will be incorporated into a general equilibrium model, to be used cooperatively by the Development Centre, the Moroccan government, and the World Bank for trade and resource policy analysis. This report describes in detail the construction of the Input-Output table, presents the table in its entirety, and provides some preliminary multiplier estimates elucidating the links between Moroccan agriculture and the rest of the economy.

(page en blanc)

## **PREFACE**

This Technical Paper, part of the research programme on "Sustainable Development: Environment, Resource Use, Technology, and Trade," presents a detailed Input-Output table for Morocco estimated for the year 1990.

Morocco is one of a large number of countries facing the possibility that water scarcity will attenuate their economic development within a few decades. In order to avert this possibility, a better understanding of the policies and economic incentives governing this essential renewable resource is necessary. Patterns of water use generally evolve as the product of complex interactions between private needs and policies towards agriculture, urban development, and external markets. In order to elucidate these linkages, a detailed general equilibrium model of the Moroccan economy is being constructed. The Input-Output table presented here represents the first and largest step toward calibrating this model for applied policy analysis.

This table represents a more detailed version of one already estimated by Moroccan economists in the Ministry of Industry, and the estimates of the former are fully consistent with those of the latter. In constructing the table, the authors have relied on the generous and timely co-operation of colleagues within the Moroccan Ministry of External Affairs and at the World Bank. This collaboration will continue throughout the design and calibration of the model, which will ultimately be used by all three institutions to analyse patterns of resource use in the country and their relationship to domestic and trade policies. Beyond immediate benefits of this trilateral cooperation to the participants, it is hoped that its example and results will be useful to other countries and institutions facing similar policy challenges.

## I. INTRODUCTION

As part of its research theme on sustainable development, the Development Centre has initiated collaboration with the Moroccan Ministry of External Affairs and the World Bank to evaluate the economy-wide implications of trade and resource policies in that country. The specific contribution this research will make to this collaboration will take the form of an analytical facility, a detailed calibrated general equilibrium (CGE) model, of Morocco, which can form the basis of empirical policy studies by all three parties, individually and in concert. The first phase in this model development programme is database construction, and this report describes how a detailed 1990 Input-Output table for Morocco was constructed from a variety of official information sources. This table will be the central component of a social accounting matrix (SAM) for the country which is being constructed to calibrate the CGE model.

The 1990 Input-Output table details the intermediate deliveries, value added, and final demand of 133 Moroccan production activities. Particular emphasis was placed in disaggregating existing data for agriculture, and 23 such sectors are represented in the table. Also included are 102 other primary and manufacturing sectors and 8 service sectors. The table was constructed in a manner which renders it consistent with a 33-sector Input-Output table estimated for the same year by Moroccan Ministry of Industry and, when the former is aggregated, the two are essentially identical.

Section II of this report presents a detailed explanation of how the 133-sector table was constructed. This is followed in Section III by a listing of the table in its entirety, accompanied by some tables of share parameters which give an overview of Moroccan economic structure. Section IV presents a series of preliminary multiplier estimates to illustrate the immediate uses to which the table may be put, including a brief analysis of linkages between Moroccan agricultural and non-agricultural activities.

## II. CONSTRUCTION OF THE 1990 INPUT-OUTPUT TABLE

This section details the steps and estimation conventions which were followed to construct the 133-sector Input-Output table, including references to all the data sources which were incorporated. The general approach to assembling data for the table was hierarchical. When direct estimates were available from official sources, these were incorporated first. The second category of estimates are updates of data from previous years. Finally, when data were missing or considered extremely unreliable, indirect estimation methods, such as share imputation and matrix balancing, were used. The use of these conventions is made explicit at each stage below.

The main source of information on Moroccan industry structure and linkages was a 1990 Input-Output table estimates by the Ministry of Industry.<sup>1</sup> This table was in turn based on a combination of contemporaneous official data and an interindustry table sampled directly in 1980 by the National Statistical Office.<sup>2</sup> The later table appears to have updated the 1980 one, combining 1990 final demand and value added data with the earlier intermediate table and using a matrix balancing procedure to produce a consistent table. Since these represent the most detailed official estimate of Input-Output accounts for a recent year, we have chosen to make our more detailed table consistent (by aggregation) with this one.

The 1990 Ministry of Industry table contains 32 sectors. These include 7 sectors covering agriculture (an aggregate), mining (Phosphates, Non Metal Mineral, Metal Mineral, Crude Petroleum Products), and energy (Refined Petroleum Products, Electricity and Water). These are followed by 18 industries (Food Industry, Other Food Industry, Beverages and Tobacco, Textiles, Clothing, Leather and Shoes, Wood, Paper, Quarrying, Metal Industry, Metal Products, Machinery, Transport equipment, Electronic Products, Precision Instruments, Chemicals, Rubber, Other Manufactures). Service activities are decomposed into 8 activities (Construction, Commerce, Transport Services, Communication, Banking, Insurance, Other Services, Public Administration).<sup>3</sup>

To disaggregate this table to 133 activities, we relied on a variety of official domestic and international data sources for direct estimates. In the case of international sources, we used only official data which were reported by the Moroccan government. A special effort was made in the disaggregation to detail agricultural activities, which in the two previous tables had been represented only by

one aggregate sector.<sup>4</sup> The result is a group of 23 subsectors, whose disaggregation is described below.

#### **A. Disaggregation of Agriculture**

The following agricultural activities are detailed in the 133-sector Input-Output table:

1	Hard Wheat
2	Soft Wheat
3	Barley
4	Maize
5	Rice
6	Legumes
7	Sugar Beets
8	Sugar Cane
9	Oil Seeds
10	Raw Fiber
11	Vegetables
12	Alfalfa
13	Bersim
14	Citrus
15	Olives
16	Grapes
17	Dates
18	Almonds
19	Other Fruit
20	Other Agriculture
21	Livestock
22	Forestry
23	Fishing

These sectors aggregate consistently to the figures for Gross Output, Trade, Domestic Demand, and Value Added for the corresponding single agriculture sector in the Ministry of Industry table. Direct information was available for most of the final demand and value added components of the detailed agriculture sectors. This section describes how intermediate demands for the 23 sub-sectors was estimated.

For simplicity, it is useful to distinguish the 133 sectors of the IO table in two categories: 1. Agriculture (Ag, the first 23 sectors) and 2. Non-Agriculture (N-Ag, all remaining sectors). The data available in the Ministry of Industry IO table are (considering the column) total purchases of Ag from Ag (a scalar) and from N-Ag (a vector of 32 elements), and (considering the row) total deliveries of Ag to Ag (the

same scalar considered above) and deliveries of Ag to N-Ag. These data are clearly not sufficient to estimate the square (Ag x Ag) matrix of transactions within Agriculture and the two rectangular (Ag x N-Ag and N-Ag x Ag) matrices of transactions (deliveries and purchases) of agricultural sectors with the rest of the economy. We therefore relied upon, as an additional source of information, a special study commissioned from FAO by the Ministry of Agriculture.<sup>5</sup> This study considers the evolution of intermediate consumption for selected agricultural categories for the years 1969, 1975, 1980, 1985.<sup>6</sup> The relevant information and the estimation procedure we used are shown in the table below.

The first column contains the broad categories covered by the FAO study, and in the second column are estimates for intermediate consumption. The third and the fourth columns show the disaggregation of column 2 obtained using output shares for the 23 sectors of the last column.<sup>7</sup> The fifth column represents updated intermediate demands estimated by using the shares of column 4 and the total value of 17,524 million Dh for agricultural output recorded in the Ministry of Industry table. The assumption underlying these estimates is that intermediate demand is proportional to gross output and that the composition of the more aggregate (FAO) intermediate demands has not changed significantly since 1985.

The next step was to disaggregate the values in column 5 (the total expenditures of Ag) among the Ag and N-Ag delivering sectors. The information contained in the FAO study treated delivering sectors at a relatively aggregated level, so it was necessary to use the basic data of the Ministry of Industry IO table. Production shares were again used to disaggregate the Ag sectors and then obtain agricultural intermediate consumption shares for the N-Ag sectors. The industrial sectors of the N-Ag group were further disaggregated from the original 18 to 96. To do this, output shares were used within each group. As an example, Table 2 below shows this procedure for the (Ministry of Industry table) Chemical sector.

**Table 1**

<b>Total</b>	2767.10	17758.90	1.00	2767.10	0.15

In the first column there are the 8 subsectors belonging to the group Chemicals, column 2 shows the total value of deliveries of Chemicals to Ag, columns 3 and 4 are the production values and shares for this group, and the last two columns represent the values and the shares of intermediate demands to these

sectors. By combining the estimates described in Table 1 and those of Table 2 (for the complete set of sectors), it was possible to obtain both the square matrix Ag x Ag and the rectangular matrix Ag x N-Ag. Deliveries of Ag to N-Ag were obtained by disaggregating the row vector of the original IO table using Ag output shares.

The final result we obtained applying the methodology just described was not fully satisfactory for a number of reasons. Firstly, the Ag x Ag matrix presented some unrealistic linkages<sup>8</sup>. Secondly, the Input-Output technology implied by the above approach is very homogeneous across the Ag sectors. To overcome these problems two corrections were applied. Firstly, unrealistic linkages (e.g. Sugar to Wheat) were eliminated in the Ag x Ag matrix and, using FAO estimates of the feed/seed ratio, diagonal elements were corrected for the principal crops.<sup>9</sup> The second correction entailed modification of the Input-Output coefficients based on for the same agricultural activities in other countries. The best available information in terms of agriculture detail and comparability of technology, was found in IO tables estimated for Indonesia, Japan, and the United States.<sup>10</sup> To make these tables comparable to the Moroccan IO table, it was necessary to construct a correspondence from each of the other three sectoring schemes. The simple average of three columns of Input-Output coefficients was then applied to Moroccan total intermediate expenditures for each of the 23 agricultural sectors.

## **B. Gross Output and Related Data Sources**

This section describes the data sources and the estimation procedures applied to calculate Gross Output. Agricultural and non-agricultural sectors are considered separately. For gross production in Agriculture, basic data for quantities and producer prices were obtained from the official yearly survey of production and in a study conducted by the Ministry of Agriculture.<sup>11</sup> The first source reports data on areas, yield and quantities produced for all the crops in the new Input-Output table, the second document contains producer prices for Hard Wheat, Soft Wheat, Barley, Maize, Sugar Beets, Sugar Cane, Cotton (Raw Fibers) Oil Seeds. Since these data are not sufficient to estimate the production values for all 23 agricultural sub-sectors, it was necessary to obtain some additional information. In particular, prices for Vegetables, Fruits, Legumes and Forages are derived using farm gate prices from of a World Bank irrigation project and FAO price estimates.<sup>12</sup> Table 3 below shows how production values for agriculture were calculated.

**Table 3**  
**Production Data for Agriculture**

	Area Ha	Production million QT	Yield Ton/Ha	Price Dh/QT	Production Million Dh
HardWheat	1250.00	16.17		269.00	4348.92
SoftWheat	1470.00	19.97		225.00	4493.70

OilSands	193.00	1.74		439.92	766.34
RawFibre	18.00	0.29		480.98	138.52
Vegetables	213.00	38.73		131.40	4826.85
Alfalfa	92.22	51.92	56.30	0.04	1.87
Berdm	39.75	26.87	67.80	0.04	0.97
Citrus	72.00	14.44		140.00	2021.60
Olives	368.00	6.00		200.00	1200.00
Grapes	58.00	2.92		200.00	484.00
Dates	22.00	1.20		700.00	840.00
Almonds	36.00	0.58		2800.00	1615.80
OtherFruit	58.00	4.37		140.00	611.80
OthAgri	118.00	0.78		178.00	133.53

For the Fishery sector, production data were taken from the 1992 Statistical Yearbook.<sup>13</sup> The production values for Livestock and Forestry are estimated as the difference between total production of Agriculture (a value given by the Ministry of Industry IO table) and the sum of Fishery and Crops production. This residual value was then allocated among the two remaining sectors according to output shares calculated from the most recent figures available in the Moroccan National Accounts.<sup>14</sup>

The current estimates of gross production by the N-Ag sectors should be distinguished among between Industrial sectors, Mining and Energy sectors, and Service sectors. The main problem in calculating gross output for the Industrial sectors was to reconcile the disaggregate data (96 sectors) with that in the Ministry of Industry IO table (18 sectors). Furthermore, while estimates of informal production were available at an aggregate level and were included in the original IO table, there were no such data at the more disaggregate level. The informal activity estimates are derived from a study conducted by the *Direction de la Statistique* for the year 1988.<sup>15</sup> This study covers the urban informal activities of the Industrial sectors, Commerce and Services. The other sectors, mainly primary sectors and those linked to Public Administration, are excluded. It is interesting to note here that, in terms of production, the whole informal sector counted for 11.5 per cent of GDP for the year

1988.<sup>16</sup> Since, at the 96-sector level of detail, the only data available were official figures of gross production,<sup>17</sup> the solution adopted for estimation of informal production was to assume that subsectors belonging to each of the 18 aggregate groups had informal activity proportional to their gross outputs, summing to the informal estimate for the whole subgroup. This assumption maintains consistency with the more aggregate table. The methodology used is illustrated in Table 4.

**Table 4**

<b>TOTAL</b>	<b>142422.2</b>	<b>101083.8</b>		<b>41338.4</b>	<b>14157.0</b>	<b>9.94</b>

The first column contains values from the Ministry of Industry table. The second column lists aggregate official production values calculated from the 96-sector data.<sup>18</sup> Column 3 gives the estimated informal sector imputation factors, followed in the fourth column by the implied level of informal activity. Column 5 gives the available official estimates of the informal sector. These data are taken from the study on the urban informal sector production for the year 1988.<sup>19</sup> The values shown in the table are updated to the year 1990 using official quantity and price indices for the industrial sectors.<sup>20</sup> Column 6 is the percentage difference between the values in column 1 and those of column 5. The final figures contained in the disaggregate Input-Output table are obtained by multiplying the 96-sector official production values by the adjustment ratios in column 3.

**Table 5**  
**Production Data for Services**  
**(millions of Dh)**

	1	3	5
	IO table Production	AdjRatio [(1-5)]	Informal Production
Construction	29315.1	1	0
Commerce	37803.1	1.49	12488.7
Transport Ser	14646.8	1.25	2884.1
Communicat	3945.8	1	0
Banking	12636	1	0
Insurance	1811.9	1	0
Other Services	66555.9	1.11	8547.8
<b>Total</b>	<b>166814.6</b>		<b>22021.4</b>

Finally, for sectors 24 - 29 (Mining and Energy) and 126 - 133 (Services), data were obtained from the Ministry of Industry table.<sup>21</sup> Table 5 contains the same information as Table 3 with two differences. First, columns 2, 4 and 6 are omitted since the data needed to calculate them were not available. Secondly, the adjustment ratio is obtained in a different way.

### C. International Trade

All the trade data used for constructing the disaggregate table come from trade statistics of the Ministry of Foreign Trade of Morocco.<sup>22</sup> The data were contained in text files and are organized by product. The available information includes:

- values (in local currency, FOB for imports, CIF for exports)
- country of origin/destination
- import tariffs
- import tariff exemptions

The Ministry of Foreign Trade arranged these data following the same scheme as the Foreign Trade Yearbook published by the *Office des Changes*, so that there is exact correspondence between the two sources. This scheme consists of a six-digit product classification with 89 merchandise groups.<sup>23</sup>

The trade data were first aggregated into three regions: EEC, Europe non-EEC (ROEU), Rest of the World (ROW). Then they were further aggregated into

the Ag/N-Ag sectoring scheme described above. The first two regional groups were constituted as follows:

EEC

- 1 France
- 2 U.E.B.L (Belgium and Luxembourg)
- 3 Netherlands
- 4 Germany (RFA)
- 5 Italy
- 6 United Kingdom
- 7 Ireland
- 8 Denmark
- 9 Portugal
- 10 Spain
- 11 Greece

Rest of Europe - Non-EEC

- 1 Iceland
- 2 Norway
- 3 Sweden
- 4 Finland
- 5 Switzerland
- 6 Austria
- 7 Gibraltar
- 8 Malta
- 9 Yugoslavia
- 10 Turkey
- 11 Andorra
- 12 USSR
- 13 Germany (RDA)
- 14 Poland
- 15 Czechoslovakia
- 16 Hungary
- 17 Romania
- 18 Bulgaria
- 19 Albania

N.B. EEC is composed of 11 countries only, because Belgium and Luxembourg are aggregated.

West Germany is considered separately from East Germany which is part of the ROEU region.

USSR is part of ROEU.

The raw trade data were classified into almost 8,000 different products, and a correspondence between the six digit product classification and the new table's sectoring scheme was devised to aggregate them. For the N-Ag sectors, this function was already available in a correspondence table prepared by the Moroccan sources.<sup>24</sup>

For agriculture, it was necessary to build an original correspondence between products and sectors. The first step was to find a correspondence between the broad category (01) Agriculture, Livestock, Forestry and Fishing (used in the National Accounts and Input-Output table by the Moroccan sources) and the detailed traded products. Within this category, it was then necessary to allocate the various traded goods in the 23 described sectors. Each product is identified by a 6 digit number: the first 2 digits correspond to a large group (among 99 groups of products), the next 2 digits correspond to a smaller sub-group and the last 2 identify the single product. For example 03 02 30 is *anchois sales* and 03 correspond to *poisson, crustaces et mollusques*, 02 to processed fish and 30 to the type of fish. Of the 99 large groups of products, only 13 contain products belonging to the category "01" and therefore to one of the 23 sub-sectors in the new table. The aggregation rules for each of these groups are shown in Table 6.

The first column in the Table 6 refers to the 23 sectors in the new Input-Output table, the second column is the name of the sector, the third column refers to the group numbering in the *Office des Changes* documentation, the fourth column is the name of those groups (in French), the fifth column contains notes on the aggregation rules.

The correspondence described above was used to aggregate imports, export, and tariff data. The latter were calculated by applying the basic tariff rate against c.i.f. import values and subtracting exemptions.<sup>25</sup> These Tariff collections have been further adjusted so that they are consistent with those in the Ministry of Industry Input-Output table. This correction consisted simply of calculating an adjustment ratio at the aggregate level and applying this to the figures of every sector (the methodology is similar to that of the informal sector considered above).

Service sectors are not considered in the statistics of the *Office des Changes* (see footnote 21) and the trade and tariffs data for them are taken from the Ministry of Trade table.

#### D. Investment by Origin

The basic source for data on investment is the table of the National Accounts, reproduced below.<sup>27</sup>

**Table 7**  
**Formation brute de capital fixe par nature (1990)**  
**(million Dh)**

Matériel et outillage	24302
Bâtiment	15542.6
Travaux publics	9599.6
Aménagement et plantations	896.4
<b>Total</b>	<b>682.2</b>
Total	51004.7

In constructing its 1990 Input-Output table, the Moroccan Ministry of Industry used these values in the following way: First, values for Plantations and Livestock are aggregated and allocated to Agriculture. Second, the values concerning Construction (*Bâtiment and Travaux Publics*) are again aggregated and allocated to the corresponding sector. Finally, the remaining 24,302 million Dhs are disaggregated among the 18 Industrial sectors. The disaggregation takes place in 2 steps. First, imports of capital goods are distinguished by sector. Second, the residual value is supposed to be supplied by domestic production. Relevant data on domestic production of capital goods are taken from the official yearly survey of the industrial sector.<sup>28</sup> For the new Input-Output table, this procedure was replicated at the 96-sector level, and Table 8 below synthesizes the result at the aggregate level.

Columns 1, 2 and 3 contain values calculated from files of the Ministry of Foreign Trade. In particular, column 3 represents the actual market price of imported capital goods. To obtain these values, it was necessary to apply the correspondence, from the six digit classification to the sectoring scheme of the new table, to the capital goods subset of imports.<sup>29</sup> This subset was obtained by using another mapping function based on the following classification of traded goods: 1. *Alimentation, Boisson et Tabac*, 2. *Energie et Lubrifiants*, 3. *Matières Premières*, 4. *Produits Manufacturés* distinguished in 4a. *Demi-Products*, 4b. *Biens d'Équipement* and 4c. *Produits Finis de Consommation*.<sup>30</sup>

**Table 8**  
**Investment: Aggregated Values - Industrial sectors**  
(millions of Dh)

	1 Values of Imports	2 Custom Duties	3 Total [1+2]	4 Investment (IO tab)	5 Implied Dom Supply [4-3]	6 Pere Dom Supply [5/3]

Equipm	6081.01	366.73	6447.74	7931.50	1483.75	18.71
TranspMat	4538.67	434.14	4972.81	6452.20	1479.39	22.93
ElectMat	2516.78	373.19	2895.96	4923.00	2027.04	41.17
Proclnat	1243.75	215.80	1459.35	1958.70	499.35	25.49
Chemicals				0.00		
Rubber	164.29	54.02	218.30	1087.90	869.30	79.93
OtherInd	7.35	2.79	10.13	483.40	473.27	97.90
<b>TOTAL</b>	<b>15235.11</b>	<b>1661.73</b>	<b>16796.84</b>	<b>24301.90</b>	<b>7504.98</b>	<b>30.88</b>

Column 4 is the reproduction of the vector of Investment demand in the Ministry of Industry table. Columns 5 and 6 are self explanatory. Note that, on average, less than 31 per cent of the value of Moroccan capital goods is supplied domestically. The disaggregation of the data in column 3 does not pose a serious problem since trade data are sufficiently detailed. For the residual domestic supply, the data in column 5 were allocated to sub-sectors according to output shares.

For Agriculture, Investment was allocated to Livestock according to the value in the National accounts (*Bétail* 662.2) and to Other agriculture and Forestry according to output shares. The remaining values (*Travaux publics and Bâtiment*) were allocated to Construction.

#### E. Variation of Stocks

Estimation of the Variation of stocks is based on a variety of sources of information. For the Industrial sectors, basic data are found in the yearly survey.<sup>31</sup> For Agriculture, estimates are given by the *Office National Interprofessionnel des Céréales et des Légumineuses* (O.N.I.C.L.).<sup>32</sup> For Mining and the remaining

sectors, relevant information is available from the Statistical Yearbook and the Input-Output study of the Ministry of Industry<sup>33</sup>.

The estimates of variation of stocks for Agriculture are based on the same assumptions employed by the Ministry of Industry in constructing their table, namely that the Cereals and Legumes are the only sectors that keep stocks. The total Variation of stocks in Agriculture is then allocated among the Cereals and Legumes subsectors according to output shares.

For the Industrial sectors, the variation of stocks was estimated at the detailed level, again applying a method employed by the Ministry of Industry, i.e. subtracting sales from production. This did not, however, result in estimates consistent with the data contained in the 32-sector Input-Output table. In order to reconcile the two different estimates, the detailed subsector estimates were normalized using the 18-sector values as control totals. For the informal sector, it was assumed that no stocks are kept. For the remaining primary and service sectors, data on Variation of stocks were taken directly from the Ministry of Industry table.

#### **F. Trade Margins, Private Consumption and Government Demand**

The Moroccan Ministry of Industry estimated trade margins for its Input-Output table from value added in the Commerce sector. For formal activities, value added was calculated from statistics of the *Direction de la Statistique* and then corrected to take into account informal activity by using estimates of a *Direction de la Statistique* study.<sup>34</sup> For the new table, gross output shares were used to disaggregate the margin values in the Ministry of Industry Table.

Once Production, Imports, Custom Duties, Commercial Margins and Investment, Exports, Variation of Stocks are estimated, a residual value can be computed as the sum of Private Consumption, Government Consumption and Intermediate Consumption. In all Moroccan Input-Output tables, Government Consumption is not sectorally disaggregated, and in the absence of additional information the new table follows the same convention. Subtracting this from the residual value gives the sum of Private Consumption and Intermediate Consumption. Detailed data on Private Consumption are available from two sources: a survey on Household Consumption<sup>35</sup> and detailed official data for imports of consumer goods. Unfortunately, the information in these sources is not quite

sufficient to estimate sectorally detailed Private Consumption.<sup>36</sup> For both Private Consumption and total Intermediate Demand, different methods were applied to the Agricultural sectors, the Industrial sectors and the remaining sectors.

For Agriculture, data from the Household survey are quite detailed and allow Private Consumption and Intermediates to be estimated separately. The Survey on household consumption is the second extensive attempt of Moroccan authorities to measure domestic living standards, the first was undertaken in 1984-85. It contains data on rural and urban consumption patterns, size of households, head of household employment and other factors affecting consumption. The following expenditure categories are considered in detail: 1. Food and Beverages, 2. Clothes, 3. Housing and Energy, 4. Durable Goods, 5. Health Care, 6. Transport and Communication, 7. Education and Leisure, 8. Other Expenditures. To aggregate the products considered in the survey in a manner consistent with the sectoring scheme, it was necessary to build another correspondence. The estimates for private consumption and intermediate demand that are obtained in this way, however, are not consistent with the values contained in the Input-Output table. To reconcile the two, the RAS technique was used with control totals given by the sum of the values of intermediates demand and private consumption.<sup>37</sup>

For the Industrial sectors, the 18-sector values for Intermediates and Private Consumption were used as control totals and further disaggregation was undertaken using the shares from the residual values as subsectoral weights and the shares between Intermediates and Consumption as weights to discriminate between these. For the remaining sectors - Mining, Energy, Services, and Government Services - the data were taken directly from the Ministry of Industry table.

## G. Value Added

The main source of Value Added data was the Ministry of Industry Input-Output table. The Value Added component of this table is reproduced in Table 9 in its original format.<sup>38</sup>

**Table 9**  
**Composantes de la valeur ajoutée**  
**(million Dh)**

<i>Serv n. march des admin</i>	25341.0	25279.0	14.0	48.0
<b>TOTAL</b>	<b>201761.2</b>	<b>97497.2</b>	<b>32773.7</b>	<b>71480.6</b>

The values of this table are taken from the Moroccan National Accounts published by the *Direction de la Statistique*. Due to lack of detailed data on production subsidies and social costs, these were included in Indirect Taxes and Wages, respectively.<sup>39</sup> Various adjustments were made to the values of this table. Since in the new Input-Output table Agriculture is composed by 23 sub-sectors, it was necessary to disaggregate the values in the above table. Value added was allocated to the agricultural subsectors according to output shares. This was then

decomposed into Labor and Capital payments and Taxes according to their respective shares for total Agriculture. But this was not entirely satisfactory, since it implied the same factor intensities throughout agriculture. Once again we overcame this inconvenience by borrowing data from other countries. In practice we adopted for Morocco a simple average of factors payments and indirect taxes shares of US, Japan and Indonesia. To correct the excessive capital intense technology we ended up with, we normalized that simple average using the Moroccan shares of aggregate agriculture. The data we used and the method applied are shown in the following table.

**Table 10**  
**Value Added Estimation - Agriculture**

For the Industrial sectors, the adjustment rules are shown in Table 11 above. The starting point is Table 9. The data contained in columns 1 and 2 of Table 10 are derived from electronic files of the Ministry of Industry<sup>40</sup> and they reproduce the results of the official yearly industrial survey. Column 3 is the simple sum of the values of Indirect Taxes and Capital payments from Table 9. From these data the adjustment ratios of columns 4,5 and 6 were calculated, which were then applied at the 96-sector disaggregate level. Column 4, in Table 11, is the ratio of column 1 to the relevant data from column 1 in Table 9 and is used to reconcile Value Added from the Industrial Survey with the control totals in the Ministry of Industry table. Column 5 is calculated similarly and Column 6 considers the proportion that should be attributed to Capital of the residual value in Column 3. In fact this proportion is calculated as the ratio of Column 3 to Column EBE in Table 9. The values for Indirect taxes are calculated as a residual. For the remaining sectors (Mining and Energy and Services), the value added estimates and its decomposition are taken from the Ministry of Industry Input-Output table.

### III. THE 1990 MOROCCAN INPUT-OUTPUT TABLE

Table 12 below presents the complete Input-Output table, the construction of which was described in the previous section. The units of account are millions of 1990 Moroccan Dirhams. Accounting groups for the table are described in greater detail in annex 1 of this report. The table itself is available on electronic media (diskette) by written application to the OECD Development Centre.

Table 12: Input-output Table for Morocco, 1990

	(Millions of Moroccan Dirhams)														
	HardWood	SoftWood	Bery	Males	Fee	Legumes	Superbees	SuperCere	OilSeeds	RawFibre	Vegetables	Hops	Berries	Olives	Others

#### IV. AN OVERVIEW OF MOROCCAN ECONOMIC STRUCTURE AND LINKAGES

##### A. General Economic Structure

This section presents a survey of the sectoral structure of the 1990 Moroccan economy, with special attention to the composition of production, demand, factor income, and trade. In order to summarize the information contained in the detailed Input-Output table, a more aggregated table was constructed. This partial aggregation details all 23 agriculture sectors while the remaining 32 sectors correspond to the Ministry of Industry table.

The basic structural information is presented in Table 13 below. Columns 1, 2, 3, 4 and 5 cover Gross Output, Value Added, Domestic Demand, Import and Export shares respectively. At a more aggregate level, note that Agriculture provides 12 per cent of total Gross Production and almost 20 per cent of total Value Added, while for Industrial sectors the corresponding figures are 33 per cent and 20 per cent and for Services, 47 per cent and 52 per cent respectively. Domestic Demand almost 20 per cent Agricultural products, 37 per cent for Industrial goods (note that the highest shares are for food processed products) and 40 per cent for services. As far as trade is concerned, Morocco is much more export-dependent than import-dependent in Agriculture, with particularly high dependence on tree crops like Citrus (3.4 per cent) and on Fishing (6.7 per cent). Note the high export share of Phosphates (8.8 per cent), and that export shares for the first 6 industries (Food, Textiles, Leather, etc.) are higher than their import shares, while the reverse is true for the heavy industries and equipment. As one would expect for a country in the intermediate stages of industrialization, overall import shares are highest in Manufactures.

The next column captures the ratios of labor to capital Value Added in percentage terms. These ratios grow, although not smoothly, from 57 per cent for Agriculture<sup>41</sup> to 152 per cent for Industry to 291 per cent for Services. Note that the capital component of value added dominates in the Refined petroleum sector and while that of labor predominates in the Public Administration sector.<sup>42</sup>

Columns 7 and 8 measure trade dependence: exports as a share of gross output and imports as a share of demand, respectively. Import dependence is generally higher than export dependence. As expected, for Agriculture the most export-intensive sectors are Citrus (69 per cent) and Fishing (75 per cent) which together account for almost three quarters of total agricultural exports. More import

dependence is recorded for Cereals. The highest import dependence rates are for minerals (excluding Phosphates) crude oil and Metal Industry.

The last six columns show the regional pattern of Moroccan imports and exports.<sup>43</sup> It is interesting to note that for Agriculture, Morocco relies on import supply (4.8 per cent of total import) mainly from the ROW region, whereas its main export market is the European Community. A liberalization of agricultural trade with the latter region might thus entail substantial gains for Morocco. For Industry, Moroccan dependence upon the EEC is at almost the same level for imports and exports. Note, finally, that the third region (non-EEC European countries) currently accounts for a relatively small proportion of Moroccan trade, except for imports of industrial sectors (11 per cent).

**Table 13: Sectoral Structure of Output, Demand, and Income**

## B. Some Preliminary Multiplier Estimates

As economies go through the transition from predominately agrarian activities to greater diversification and increased reliance on income from manufacturing and modern tertiary sectors, extensive structural adjustments take place. When this kind of development transition proceeds smoothly, it is largely mediated by direct and indirect linkages between agricultural and non-agricultural activities. The new Moroccan Input-Output table reveals the structure of the economy's agricultural production, as well as direct links to other sectors, at an unprecedented level of detail. In this section, multiplier decomposition methods will be applied to look behind the direct linkages at the myriad of transmission mechanisms which relate rural and urban incomes to one another. These linkages can be expected to play a key role in the course of Morocco's development during the next decade.

To sharpen the focus on Ag/N-Ag linkages, a method of regional multiplier analysis developed by Round (1982) will be applied to the table. Consider the aggregated Input-Output table of the last section, partitioned into  $n$  agricultural activities,  $m$  non-agricultural activities,  $k$  value added categories, and  $f$  final demand components. This table takes the form

$$T = \begin{bmatrix} T_{nn} & T_{nm} & T_{nf} \\ T_{mn} & T_{mm} & T_{mf} \\ T_{vn} & T_{vm} & 0 \end{bmatrix} \quad (1)$$

When this transactions table is column normalized, the following accounting identity holds:

$$\begin{aligned}
y = \begin{bmatrix} y_n \\ y_m \end{bmatrix} &= Ay + x = \begin{bmatrix} A_{nn} & A_{nm} \\ A_{mn} & A_{mm} \end{bmatrix} \begin{bmatrix} y_n \\ y_m \end{bmatrix} + \begin{bmatrix} A_{nn}e_n \\ A_{mn}e_m \end{bmatrix} \\
&= (B+C)y + x = \left( \begin{bmatrix} A_{nn} & 0 \\ 0 & A_{mm} \end{bmatrix} + \begin{bmatrix} 0 & A_{nm} \\ A_{mn} & 0 \end{bmatrix} \right) y + x \\
&= (I-B)^{-1}Cy + (I-B)^{-1}x \\
&= (I - (I-B)^{-1}C)^{-1}(I-B)^{-1}x \\
&= (I-D)^{-1}(I-B)^{-1}x \\
&= (I-D^2)^{-1}(I+D)(I-B)^{-1}x \\
&= M_3M_2M_1x \\
&= M \tag{2}
\end{aligned}$$

In this multiplicative decomposition of the matrix  $M$ , the three factor matrices each represent different components of the economywide income generation process. The first matrix,

$$M_1 = (I-B)^{-1} = \begin{bmatrix} M1_{nn} & 0 \\ 0 & M1_{mm} \end{bmatrix} \tag{3}$$

gives the so-called own-effect multipliers. This matrix details linkages within the agricultural and non-agricultural groups. The second matrix represents the first order indirect effects, i.e.

$$M_2 = (I+D) = I + (I-B)^{-1}C = \begin{bmatrix} I & M1_{nn}A_{nm} \\ M1_{mn}A_{mn} & I \end{bmatrix} \tag{4}$$

These are composed of open-loops or direct transfers from outside the economy (represented by the identity matrix  $I$ , and first round indirect transfers given by the off-diagonal expenditure coefficients in  $B$ , plus their cumulative within-group effects, represented by the multiplier matrix  $(I-B)^{-1}$ . Finally, the third factor matrix is composed of so-called closed loops, i.e.

$$M_3 = (I - D^2)^{-1} = \begin{bmatrix} I - D_{12}D_{21} & 0 \\ 0 & I - D_{21}D_{12} \end{bmatrix}^{-1} \quad (5)$$

This matrix traces the income linkages which originate within each group, are transmitted to the second group by first order links and, after running their course in the second group, return to the first to complete a closed loop. Taken together, the three factor matrices account for all the income linkages endogenous to the economy in question, decomposing them according to origin and destination in agriculture and non-agriculture.

The product factorization in equation (2) is mathematically intuitive, but the role numerical estimates in a matrix product are quite difficult to interpret. For this reason, the Moroccan Input-Output table will be decomposed in an additive manner which, subtracting the identity matrix to evaluate only endogenously generated income, takes the form

$$\begin{aligned} M - I &= M_3 M_2 M_1 - I \\ &= (M_3 - I)M_2 M_1 + (M_2 - I)M_1 + M_1 - I \\ &= N_3 + N_2 + N_1 - I \end{aligned} \quad (6)$$

The following six tables summarize the decomposition results. Noting that all three factor matrices are either block diagonal or block off-diagonal, each can be more succinctly represented by two submatrices. Tables 14 and 15 correspond to the two diagonal blocks of the own effects matrix  $N_1$ , Table 16 and 17 to the off-diagonal blocks of  $N_2$ , and Tables 18 and 19 to the diagonal blocks of  $N_3$ , respectively. The units of the tables are percentages of any initial injection from exogenous sources.

EA-62

As is apparent from the own agriculture effects in Table 15, linkages between agricultural activities in Morocco are relatively weak, the sole exception's being Livestock's demand for its own output for breeding purposes. Non-Agricultural own linkages, by contrast, are quite strong in many cases.

Open loop linkages from Non-Agriculture to Agriculture (Table 16) show only food processing (sectors 30 and 31) as having significant downstream links. By contrast, Agriculture's demand for Non-Agricultural inputs generates larger and more extensive open loop links (Table 17).

Finally, closed loop effects (Tables 18 and 19) are almost uniformly negligible for the two-sector groups. This further emphasizes the relative isolation of agricultural activities within the Moroccan economy, both with respect to Non-Agriculture and with respect to one another. Although Agriculture has significant requirements of Non-Agricultural inputs, there is little domestic demand for its output as an intermediate product. This is consistent with the subsistence and export emphasis of current Moroccan agriculture, but it implies that significant value-added in processing agricultural outputs, in terms of textile and other light industries, is not being realized. Only the food processing industries have strong backward linkages to agriculture. The fact that these multipliers are drawn from an Input-Output table does bias them downward, however, since income-expenditure links to consumption and other domestic demand are not endogenous. When this table is integrated into a complete social accounting matrix, it will be possible to follow the more extensive triangular linkages between Non-Agricultural activities, factor incomes, and demand for Agriculture in final consumption. This will undoubtedly reveal large income transmission links between the two groups of activities.<sup>44</sup>
