#### 22.10 Preliminary Engineering Studies

#### 22.10.1 Preliminary Design of Port Facilities

(1) Design Vessel

The proposed container berth is designed to accommodate container ship with maximum capacity of about 5,000 DWT. The proposed design ship has the following dimensions:

Container Ship: 5,000 DWT,	Overall Length: 110 m
Breadth: 15.7 m,	Full loaded Draft: 5.5 m

As for the wharf depth, an additional depth is required for the keel clearance of the ship (10% of the full loaded draft). Then the wharf depth is calculated in the following equation; 5.5 m x 0.1+5.5m-0.2m(LWL) = 6.0m.

- (2) Design Conditions and Design Criteria
- 1) Codes and Standard

The design criteria of marine and civil works conform to the following design standards and references.

- "Standard Design Criteria for Ports in Indonesia, 1984"
- "Technical Standards for Port and Harbour Facilities in Japan, 1999"
- 2) Design Criteria

The details of major design criteria for Master Plan are summarized in Table 22.10.1

		Muara Sab	bak	
	Talang Duku Container Bert		General Cargo Berth	
Seismic coefficient	0.05	0.05	0.05	
Load on berth	$3t/m^2$	$3t/m^2$	$3t/m^2$	
Load on yard	$4t/m^2$	$4t/m^2$	$4t/m^2$	
Truck	T-20	T-20	T-20	
RTG on yard	Max.32t/wheel	Max.32t/wheel	-	
Gantry Crane on berth	Max 45t/wheel	Max 45t/wheel	-	
Berth top elevation	+1.5 to +8.5	+5.6	+5.6	
Berthing velocity of ship	15cm/sec	15cm/sec	15cm/sec	
Subsoil condition	SPT 25-53	Sandy silt	Sandy silt	
Assuming depth of hard strata	-	-20m	-20m	

Table 22 10 1	General Design	Criteria
1 auto 22.10.1	General Design	CIICIIa

#### 3) Tide

The water level fluctuations including tide and floodwater at both sites are as follows:

Talang Duku: HWL = +7.0m, LWL = +0.2mMuara Sabak: HWL = +3.8m, LWL = +0.2m

- (3) Layout
- 1) Talang Duku

As explained in the master plan, new floating pontoons are proposed in addition to the existing pontoon to complement the berthing facility for container vessels. The new pontoon will be of the same size as the existing one, connected by new movable access bridge between pontoon and land. The existing container-handling yard will be extended to the southern area near the existing IPC II office building. With this extension, the existing Warehouse will be demolished and a new workshop for the terminal will be constructed.

A pontoon with two movable access bridges and the yard extension with the related facilities is to be installed in the first development phase. Another pontoon with an access bridge is to be installed in the third development phase.

The major facilities and container handling equipment in the master plan for Talang Duke are summarized in Table 22.10.2. The general layout is shown in Figure 22.10.1.

Facility	Descriptions	Phase I	Phase II	Phase III
Pontoon	Steel, 60m x 17m	1 unit		1unit
Access Bridge	Steel,	2 units		1unit
Yard Pavement	T-20	31,200m <sup>2</sup>		
RTG Lane	1.5m width, RC beam	2,300 m <sup>2</sup>		
Container Sleeper	1.5m width, RC beam	$2,600 \text{ m}^2$		
CFS	54m x 30m	1,600 m <sup>2</sup>		
Workshop	40m x 30m	$1,200 \text{ m}^2$		
Utilities	Power, Water, Drainage	L.S		
Equipment	Capacity	Phase I	Phase II	Phase III
RTG	6 lanes, 1 over 4		2 units	2 units
Mobile Crane	50 t		1 units	1 units
Yard Tractors	20", 40"		4 units	4 units

 Table 22.10.2 Facilities and equipment for Talang Duku

2) Muara Sabak

The development of new container and general cargo terminal is planned at both sides of the existing concrete pier in Muara Sabak. Two alternatives are studied for the development: base case and high public case.

In the base case, three (3) container berths and one (1) general cargo berth are planned in the first four (4) construction phases. The container berths will be 375 m of the total length with 28 m width. The general cargo berth will be 125 m length with 17 m width. The western area of these berths is allocated for the container and open storage yard with related facilities. Each berth will be connected to the yard by an access bridge.

In the high public case, one(1) container berth of 125m long with an access bridge and connected container yard are planned in the fifth construction phase at the northern side along with the previous construction phase.

The major facilities and container handling equipment in the master plan for Muara

		a equipine				
Facility	Descriptions	Phase I	Phase II	Phase III	Phase IV	Phase V

Sabak are summarized in Table 22.10.3. The general layout is shown in Figure 22.10.2.

 Table 22.10.3 Facilities and equipment for Muara Sabak

- (3) Design of Port Facilities
- 1) Floating Berth (Pontoon) and Access Bridge for Talang Duku Port

The pontoon is proposed as the berthing facility in order to avoid the high initial cost of berth construction with quay handling equipment, taking it into consideration the future demand of the container and cargo handling volume. With respect to the large difference of annual water level (0m to +7m), the floating berth with ship gear is more economical than the fixed berth structure with handling equipment.

A floating berth (pontoon) made of a steel structure of approx. 62 m length and 17 m width is determined, which is the similar scale and structure with that of the existing pontoon. The access bridge between the terminal yard and pontoon is also a steel structure as same as the existing movable bridges. The typical section of the pontoon and access bridge is shown in Figure 22.10.3

2) Container and General Cargo Berth for Muara Sabak Port

A detached pier type RC deck structure supported by the steel pile piles was proposed for the container berth. Steel pipe piles will be driven into sand stone layer (N value > 50). Vertical piles and coupled batter piles of the same diameter will be used for the foundation of the deck structure. Crane rails will be installed just above the concrete deck to support the gantry crane. The general cargo berth and the access bridges are also of the similar structure as the container berth, however, the diameter of the piles and scale of the RC deck are smaller than the container berth.

The typical section of the berths and Access Bridge are shown in Figure 22.10.4

- 3) Pavement (Road, container yard and general cargo open storage) Roads and areas subject to paving works are listed as follows:
  - Container storage areas and general cargo open storage
  - RTG runway beam (RTG Lane)
  - Container Sleeper
  - Roads and Other area of Container Terminal

Depending on the facilities and their uses, different pavement types are applied to suit to their function as described as follows:

- Container storage areas and general cargo open storage

80 mm thick of rectangular interlocking blocks, 50 mm of sand, 200 mm thick of cement bound material, a crushed aggregate sub base (300 mm) are layered on top of the compacted sub grade.

- RTG runway beams

Rubber Tired Gantry Crane (RTG) requires a long span passage with 1.5 m width, in order to stand its loading weight of more than 38 tons per wheel. The lanes are generally made of the reinforcing concrete slab (RC slab) having 300 mm thickness with sub- base (300 mm) on top of the compacted sub grade. The joint of the spans will be provided on the RC base in order to avoid unequal settlement and to allow for the smooth operation of the RTG.

- Container Sleeper

Since containers will be generally stacked and arranged in fixed positions in the yard slots, a base named Container Sleeper to bear the containers' concentration load will be provided. The Container Sleeper is 1.5 m width and similar structure as RTG lane.

- Roads and Other area of Container Terminal

The vehicle traffic lanes run parallel to the container stacking areas and access road to the terminal are planned to be paved with concrete. The pavement consists of concrete slab of 250 mm thick, on top of a crushed aggregate sub-base (300 mm) over the compacted sub-grade.

# 4) Buildings

The proposed port buildings are determined in accordance with the following principles.

- Rational and functional design for efficient port management and operation.
- Smooth flow line planning
- Flexibility to the future port expansion
- Utilization of local construction methods and materials
- Economical design

The proposed buildings are basically planned as RC column structure.

4

22-93

#### 22.10.2 Cost Estimation

- (1) Construction Procurement in Jambi
- Unit Cost of Labor and Materials in Jambi The unit costs of labor and materials in Jambi basically refer to "HARUGA SATUAN BAHAN BUNGUNAN" issued by the provincial office, "JURNAL BAHAN BANGUNAN, KONSTRUKSI DAN INTERIOR 2001" and the survey made by the study team in the study area. For details see Table 22.10.4.
- Unit Cost of Container Handling Equipment The unit costs of the procurement of the handling equipment were calculated from the local price of imported CIF plus installation fee. Indonesian import tax and duties are not included. For details see Table 22.10.5

3) Construction Firms in Jambi

The construction firms in Jambi basically work as the sub-contractors under the foreign or major domestic contractors in Indonesia.

(2) Assumptions for Cost Estimation

1) Basic Price and Exchange Rate

The basic prices are as of 2001 and the foreign exchange rate of;

#### 1 US\$ = 9,500 Rupiah (Rp) = 118 Yen

2) Currency Component

The each unit price was split into foreign currency and local currency portions, both indicated in Rupiah, estimated in the following classifications.

The foreign currency component consists of:

- Imported construction materials
- Foreign components of depreciation and operation /maintenance cost for construction equipment and plant
- Foreign component of domestic materials
- Salaries and costs of foreign personnel

The local currency component consists of:

- Local construction materials
- Local components of depreciation and operation /maintenance cost for construction equipment and plant
- Salaries and costs of local personnel
- Import duty on imported materials
- Indonesian taxes
- 3) Maintenance Cost (Facility, Equipment, Dredging)
  - The maintenance cost for facilities is set out as 2% of the construction cost based on the annual maintenance fee of the facilities. Also, 3% of the equipment cost is adopted as the maintenance cost for the equipment. The maintenance dredging cost is determined from the unit prices proposed by RUKINDO.

Unit Price of Maintenance dredging in navigation channel: Rp.13,000/m<sup>3</sup>

(3) Basic Cost of Construction Works

The combined cost for major construction works is estimated from the costs of labor, required materials, required construction equipment, and the site expense of labor and equipment. The estimation was verified by referring to the data of local construction cost data collected in the survey. The combined cost of major works is shown in Table 22.10.5.

(4) Construction Cost and Procurement Cost

The construction cost is estimated based on the combined cost of the construction works. The utilities cost of such as water, electric power and drainage, refers to the other projects in the equivalent scale. In addition to the construction cost and procurement cost, the engineering fee for the detail design and supervision, physical contingency and VAT are estimated in this study. The engineering fee for construction is about 10% to 15% for the construction cost, 3% for the equipment cost. The physical contingency is 8% for the construction cost, VAT is 10% of the whole cost.

The project cost for Talang Duku is shown in Tables 22.10.6 and 22.10.7. The equipment cost for Muara Sabak for is shown in Table 22.10.8. The construction cost for Muara Sabak is shown in Tables 22.10.9 and 22.10.10.

# Table 22.10.10 Construction Cost for General Cargo Terminal in Muara Sabak

#### (5) Project Cost

The total project cost for Jambi is **Rp 751,720 million** for the base case and **Rp 873,173 million** for high public case.

In addition to the above project costs, the initial dredging for the Batanghari River is required. The volume of the initial dredging is estimated as about  $5,190,000 \text{ m}^3$ . The initial cost is calculated as follows.

First Stage Dredging

Outer Bar:	890,000 m <sup>3</sup>	(N	ot included in this project)
Inner Channel:	570,000 m <sup>3</sup>	х	Rp 25,000/ $m^3 = Rp$ 14,250 million

#### Second Stage Dredging

Total	= Rp 146,293 million
VAT: 10% of Dredging and Engineering fee	= Rp 13,299million
Engineering Fee: 2.5% of Dredging fee	= Rp 3,244 million
Inner Channel: 1,930,000 m <sup>3</sup> x Rp 25,000/ m <sup>3</sup>	= Rp 48,250 million
Outer Bar: 2,690,000 m <sup>3</sup> x Rp 25,000/ m <sup>3</sup>	= Rp 67,250 million

The summary of the project cost is indicated in Table 22.10.11 and Table 22.10.12. For the economic analysis, the depreciation period of the constructed facilities and the procured equipment are determined as following Table 22.10.13.

#### 22.11 Phased Planning

#### 22.11.1 Base Case

#### (1) Talang Duku

The measures to be taken at Talang Duku up to 2025 are summarized below (Table 22.11.1). Talang Duku can deal with the projected cargo volume with these measures (Figure 22.11.1). In order to deal with the temporary increase of containers, port users will be requested to observe the ship schedule. The Team assumed a reduction of the berthing time by 30 % from 2004 on.

Year	Milestone	Procurement	Construction
2017			1 Pontoon, CFS, Shed and Open Storage Demolition of the Existing Warehouse
2018	1Container Berth becomes operational	1 Mobile Cranes, 4 Yard Tractors, 2 RTGs	
2022		1 Mobile Crane, 4 Yard Tractors, 2 RTGs	1 Pontoon
2023	1Container Berth becomes operational		

Table 22.11.	1 Milestone	at Talang Duku
--------------	-------------	----------------

 Table 22.11. 3 Milestone at Talang Duku

# (2) Muara Sabak

The measures to be taken at Muara Sabak up to 2025 are summarized below (Table 22.11.4). Muara Sabak can deal with the projected cargo volume with these measures (Figure 22.11.4).

Year	Milestone	Procurement	Construction
2006		1 Gantry, 2 RTG, 4 Tractors, 2 Mobile Cranes, 5 Forklifts	1 Container Wharf, CFS
2007	1 Container Wharf becomes operational, Existing Jetty dedicated to General Cargo		
2008		1 Mobile Cranes, 5 Forklifts	1 General Cargo Wharf, Shed
2009	1 General Cargo Wharf becomes operational		
2012		1 Gantry, 2 RTG, 4 Tractors	1 Container Wharf
2013	Another Container Wharf becomes operational		
2017		1 Gantry, 2 RTG, 4 Yard Tractors	1 Container Wharf, CFS
2018	Additional Container Wharf becomes operational		
2021		1 Gantry, 2 RTG, 4 Yard Tractors	1 Container Wharf
2022	Additional Container Wharf becomes operational

# 22.12 Capacity Evaluation

# 22.12.1 Simulation Model

Two scenarios have been drawn up for the Short Term Plan (target year 2007) and the Master Plan (target year 2025) of Jambi.

The purpose of this chapter is to carry out the "Vessel Traffic Simulation" for both scenarios and to examine their results.

A numerical simulation model "WITNESS 2000" was employed to evaluate whether the port capacity and the channel capacity would be sufficient to cope with the increasing cargo and vessel traffic throughout the planning period of this study.

The list of the data to be used in the simulation is shown in Table 22.12.1. The volume of cargoes and the number of calling vessels are in line with the traffic demand forecast for 2007 and 2025. The scenarios are "Case 1 (Base Case Scenario)" and "Case 2 (High Public Case Scenario)". Table 22.12.2 and Table 22.12.3 show the numbers of berths, berth productivity and working hours for Case 1 and Case 2.

The navigation conditions of Batang Hari River such as the river sailing route are shown in Table 22.12.4. These conditions are based on the interview with IPC II offices and the documents issued by IPC II Jambi office.

Figure 22.12.1 exemplifies a simulation model.

Barth	Cargo Type		Car	go Volume	Vesse	el Calls
Dertii		(Year)	(for	one year)	(for or	ne year)
	General Cargo	2007	29,000 tons		60

## 22.12.2 Capacity Evaluation of Jambi Short Term Plan (2007)

Below is the result output of the simulation over a span of one year (2007).

The average BOR is given in Table 22.12.5. The BOR of Muara Sabak in the Base Case shows high value. The average numbers of berth waiting time for each case are given in Table 22.12.6. The berth waiting time of Muara Sabak in the Base Case general cargo and container both shows high value also.

Public	Scenario	Case 1 (B	ase Case)	Case 2 (High Public Case)

# 22.12.3 Capacity Evaluation of Jambi Master Plan (2025)

The output of the simulation over a span of one year is shown below.

The average BOR is given in Table 22.12.7. The average berth waiting times are given in Table 22.12.8.

The values of BOR in each case can be considered reasonable.

In case of the berth waiting time, the values of general cargo shows a little high.

### 22.13 Economics of Master Plan Port Development at Jambi

#### 22.13.1 General Introduction to Economic Evaluation

The purpose of economic evaluation is to provide a view of the feasibility of investment from the national, resource viewpoint. It differs from financial analysis, which provides information on the direct financial implications of investment including profitability.

Economic evaluation, therefore, considers only resource costs and excludes transfers such as taxes. It also takes into account the price of local (non-traded) inputs which may be overpriced or underpriced relative to market conditions.

Minimum wages may overprice labour relative to its market value and subsidies, say for fuel or water, may underprice inputs. Shadow pricing is the mechanism to overcome these market defects.

Economic evaluation also differs from financial analysis as it is based on 'with' and 'without' project scenarios and the costs and benefits quantified are the incremental costs and benefits (i.e., the difference between the two scenarios).

In this project, the 'without' scenario is defined as the existing port at Jambi having minimal development and very little change occurring in infrastructure, equipment and operational procedures.

In this project, under the 'without' case, the existing port facilities will be used to their maximum capacity with an increasing degree of congestion and delay at the berths and in the terminals. This would result in increased waiting time, lower port efficiency and increased transport costs. Container traffic would also be handled at the existing general cargo berths at lower handling rates than would be anticipated at specialized berths.

Ultimately, traffic would be increasingly diverted to other ports such as Palembang and this is already happening and sometimes to ports even further distant.

Under the 'with' project scenario the specialized and additional facilities will enable cargo to be handled more efficiently and cost effectively with ships experiencing less queuing and faster on berth turnaround times.

#### 22.13.2 Methodology

(1) General

Economic analysis is carried out by means of well-developed techniques and the EIRR (Economic Internal Rate of Return) and NPV (Net Present Value) are the two most often used. Both use discounting or discount rates (i.e., money has a time value and the same amount of money is worth more today than in any future year).

EIRR calculates the discount rate internally, hence its name and is the most widely used for the reason that one does not need to input a discount rate. The rate estimated within this procedure provides a proxy for the economic return on investment and is then compared to the target discount rate (15 % in Indonesia).

To calculate the NPV of a project, the discount rate is input and a discounted project value (i.e., the value of the project in today's values) is the output. If the output is greater than zero, the project is economically feasible.

In Indonesia, in recent years, the minimum rate required for projects has been 15 percent for non-social projects and 12 percent for social projects such as housing.

In undertaking the economic analysis, the project period is determined, and the costs and benefits of the investment, in each year of disbursement or receipt, are calculated.

Both local costs and all benefits are shadow priced. The foreign portion is regarded as already at market prices so no adjustment is made for imported (traded) inputs.

All costs and benefits are expressed in real terms (i.e., there is no allowance for inflation) although costs and benefits may be increased if there is expected to be an increase in real terms (i.e., above the general level of inflation). Costs and benefits are expressed in real or constant values in the base year of study which for this project is 2001.

The exchange rate used throughout is US\$1.0=Rp.9,500.

Clearly, economic analysis depends on quantification of costs and benefits. All projects have clearly quantifiable elements but also elements that are difficult or impossible to quantify.

(2) Specific Aspects of Jambi Development

At this stage of the project, the ToR specify that the Master Plan as a whole is to be evaluated (i.e., the total costs and benefits of all the Jambi port sub projects are to be compared together) to assess in broad terms the feasibility of the Master Plan.

This section relates to the economic evaluation of the Master Plan. The short term project, which forms the first set of sub-projects for implementation within the master plan framework, is evaluated in section 24.5.

This section deals with both the 'Base' and 'High' development scenarios as defined above.

Usually, the principal quantified benefits of each such project are reduction in ship time in port and/or queuing and avoided land transport and /or transshipment costs between the without and with scenarios. In this case, we have one existing small port and a proposed port, which are both complementary and competitive. Unlike Samarinda, the existing port is very small and is not handling many containers per year.

#### 22.13.3 Project Period

Infrastructure projects are expensive but have long economic and physical lives. Hence, the evaluation period is usually at least 20 years, excluding construction, and often 30 years. Thirty years has been chosen for this project. Costs and benefits are specified for each of the project years. Discounting means that costs and benefits after about 20 years usually have relatively small impacts on the economic feasibility.

This means that if there is expenditure in 2004, as in the High scenario, the last year is 2036. However, if expenditure starts in 2005 as in the Base scenario, the last year is 2037.

#### 22.13.4 Project Costs

Costs for each scenario are divided into capital costs and annual costs. Capital costs are incurred both for the initial investment, and any subsequent, phase and for replacement of fully depreciated assets within the 30 year period (usually equipment has an economic life of less than 30 years).

Dredging at Jambi will be required on capital and annual basis.

The economic costs of implementing the projects have been estimated based on the financial cost including physical contingency. Price contingency, interest during construction and taxes and duties are then all excluded from the financial cost.

In order to shadow price the projects costs and benefits, a standard conversion factor (SCF) of 0.924 has been generally applied to non-traded (local portion) costs and benefits and a specific factor of 0.75 has been applied to unskilled labour. These factors are currently being applied in other Indonesian project evaluations.

Annual costs (i.e., operating and maintenance costs) are assumed to have a reasonably high local content and a SCF of 0.85 has been applied.

All traded costs (foreign portion) have been valued at their border price (i.e., the SCF is assumed as 1.0).

(1) Capital Costs and Maintenance Costs

These have been specified by year in Section 13.9.2 and the assumptions made detailed therein. The without scenario envisages minimal development and so the capital and maintenance costs are the incremental costs. Current maintenance expenditure is minimal.

(2) Operating Costs

These have been projected originally for the Jambi port branch based on 1999 and 2000 data and then converted to incremental costs for the project, based on incremental cargo volumes for each scenario.

These have been projected originally for the branch based on 1999 and 2000 data and then converted to incremental costs based on incremental cargo volumes for each scenario. The estimates involve a two-stage process. First a realistic assessment of the base year data is needed to establish the reliability of the data and then the future year costs must be estimated taking into account that some costs will directly vary with cargo growth and other costs are fixed or semi-fixed.

Base year costs were reviewed in relation to other Indonesian ports including on an IPC wide basis for the 4 IPCs. Secondly, cost data was disaggregated and an estimate made of the likely proportion of fixed sub-costs and variable sub-costs. Based upon a weighted average of these two, an estimate could be made of the link between cargo growth and operating cost growth. So for example, at Jambi, as cargo growth increases by 10 %, operating costs were estimated to increase by 4 % per year on the basis that per tonne throughput, Jambi operating costs are already high. Thus we can expect economies of scale.

Table 22.13.1 show the estimated incremental operating costs for the Base and High Scenarios.

(3) Dredging Costs

Dredging costs are subsidised in the RUKINDO contracts and we have allowed a substantially increased price. However, it is unclear as to whether any subsidy still remains in our estimates. Hence, we have not shadow priced dredging costs.

Table 22.13.5 at the end provides a summary of capital and annual costs, in economic prices, that are used in the analyses in this report.

Year	Cost Per tonne (000 Rp)	Annual Operating Costs (with-in Rp m)	Cargo (000 tonnes)	Cargo Growth Rate (% pa)	Costs without (Rp m.)	Incremental Costs
2000	29.8	4,802	161		4,802	0
2001	28.3	4,976	176	9%	4,976	0
2002	26.9	5,154	192	9%	5,154	0
2003	25.5	5,344	209	9%	5,344	0
2004	22.2	5,941	268	28%	5,941	0
2005	21.1	6,156	292	9%	6,156	0
2006	20.0	6,388	319	9%	6,388	0
2007	17.7	6,987	394	23%	6,987	0
2008	15.9	7,558	475	20%	6,987	571
2009	14.4	8,125	564	19%	6,987	1,138
2010	13.7	8,396	611	8%	6,987	1,409
2011	13.1	8,701	666	9%	6,987	1,714
2012	12.4	9,019	727	9%	6,987	2,032
2013	11.8	9,348	794	9%	6,987	2,361
2014	11.2	9,690	866	9%	6,987	2,703
2015	10.6	10,047	946	9%	6,987	3,060
2016	10.1	10,418	1,033	9%	6,987	3,431
2017	9.6	10,804	1,129	9%	6,987	3,817
2018	9.1	11,207	1,234	9%	6,987	4,220
2019	8.6	11,627	1,350	9%	6,987	4,640
2020	8.2	12,065	1,477	9%	6,987	5,078
2021	7.7	12,522	1,617	9%	6,987	5,535
2022	7.3	12,999	1,771	10%	6,987	6,012
2023	7.0	13,497	1,941	10%	6,987	6,510
2024	6.6	14,019	2,128	10%	6,987	7,032
2025	6.2	14,564	2,335	10%	6,987	7,577

These are for Master Plan; FS costs are constant after capacity year, estimated as 2015 Base, 2013 High

Capacity 397,000 tonnes

#### 22.13.5 Benefits-Quantifiable

(1) Ship Queuing and Savings to Ships

Ship waiting time with and without the project are estimated with a simulation model and this was described in section 20.11. The resulting time savings are then costed by applying the daily cost of the average vessel in key years, and interpolating between these years. We have established vessel cost per day by surveys with ship operators and charterers. These costs are increased in real terms in line with the increased size of vessel projected over time.

There is considerable competition in shipping rates at present with the economic recession in Indonesia and elsewhere but the possible increase in real costs is difficult to estimate.

The three types of vessels handled at Jambi public port are container, general cargo and bulk/CPO vessels. Passenger vessels are not handled at Talang Duku nor proposed at Muara Sabak.

	1	1 0/	
Type of Vessel	GRT, Tonne (t) or TEU	Year	Cost per Day(Rp.m.)
	75 teu	In 2007	8.0
Container	125 teu	By 2025	19.0
	300 t	In 2007	6.7
General Cargo	650 t	By 2025	10.9
Bulk CDO Cargo	927 grt	In 2007	8.8
Buik CrO Calgo	1210 grt	By 2025	10.3

 Table 22.13.2 Estimated Ship Costs per Day, 2007 and 2025

Notes: Conversion of tonnes to GRT or v.v. based on Indonesian fleet data and load factors Sources: Research in Indonesia with shipping companies and charterers.

(2) Ship Service Time on Berth and Savings to Ships

Benefits are also generated by faster turnaround of vessels. The simulation model gives time on berth with and without project and annual savings are calculated and costed as in a) above.

Other benefits, albeit small in total, are generated because ships can save up to 36 hours per round trip by calling at Muara Sabak rather than Talang Duku. The saved time is valued as in a) above.

(3) Avoided Transport Costs

At the point at which the 'without' project capacity is reached, overflow cargo is assumed to be handled elsewhere. In accordance with this likely situation, the Consultants have assumed 100% will be handled at Palembang some 265 km. from Jambi. The avoided costs (benefits) are based on the economic cost and truck transport data used in Indonesia for highway planning. While these rates could vary from actual freight rates they represent a more realistic resource cost.

Road transport costs are based on cost models currently in use in Indonesia. These models are based on the World Bank Highway Development Manual and adapted over many years to Indonesian conditions. The main inputs are vehicle type, speed and road surface. We have assumed that these conditions will not be as favourable as in East Kalimantan (a new road or toll road is planned to link Samarinda the capital with Balikpapan the oil centre) and therefore, truck costs are somewhat more expensive in Sumatra than Kalimantan.

Heavy truck costs are estimated to amount to Rp 3,688 per truck/km assuming that each truck will carry 10 tonnes payload. As traffic will be imbalanced a load factor of 80% has been assumed within that figure bearing in mind probable overloads.

It is quite possible that in a regional port study, there would be justification of including some additional capital costs for 'overflow' ports and other infrastructure. In this study, we are assessing a specific Master Plan and we have not considered in detail the regional infrastructure requirements.

Therefore, as this benefit is quite substantial and there could be justification for assessing the impact of not including all of this benefit assessed in the sensitivity analysis.

(4) Transport Disbenefits

Muara Sabak is some 105 km from the existing Jambi port and there will be some disbenefit from the additional distance. However, companies are likely to move in the longer term nearer the port and industrial development areas are already planned in the Muara Sabak area at Parit Culum. Further, Jambi city will become increasingly congested and impose penalties on port users.

The disbenefit is assumed to be on the same cost basis as the avoided costs above.

However, for the reasons above, we have assumed that in year 1 of operation the disbenefit will be 100 % of the maximum. By 2025 this percentage is assumed to fall to 10 % with relocation of business.

Traffic is forecast only up to 2025 and therefore, by convention, all benefits are kept constant thereafter to avoid overestimation.

(5) Shadow Pricing of Benefits

The net benefits are shadow priced at a SCF of 0.923. Conventionally, only benefits to Indonesian shippers and other Indonesian parties are included. In Jambi, as in most river ports, this is made complex by the fact that say plywood is exported from Indonesia in

foreign ships but is barged to the sea in Indonesian vessels. Container exports often travel in Indonesian ships to the export port where they are exported in foreign ships.

This is further complicated by the fact that Indonesia is taking steps to carry more goods in Indonesian ships so that by 2025 the situation could be different.

In this case, unlike Samarinda, we have, therefore, assumed no benefits accrue directly to foreign entities.

# 22.13.6 Unquantified Costs and Benefits

Environmental and social impacts are usually impossible or very difficult to quantify in monetary terms. The loss of mangrove areas and the destruction of landscapes and cultures cannot be measured in these terms. Project screening at an early stage attempts to sieve out the most sensitive areas.

Similarly, the generation of employment and employment opportunities, development of the economy and the facilitation of agriculture, trade and industry are all aspects which this project will help develop in a very important manner. However, their quantification is rarely attempted. This is because either no data exists to help quantify the impact of improved transport, and even where some data does exist, its further translation into monetary terms depends on often-speculative assumptions. However, this is not to say that the economic development aspects are not important. On the contrary, while we attempt to quantify benefits through cost savings, the goal is expansion of the regional economy, more and better quality employment opportunities and economic and social development in its wider sense.

The basis of the provincial economy and its maritime transport constraints were discussed in section 9, on demand forecasts.

However, it is worth emphasizing again, albeit briefly, that Jambi province is poorly served by river/sea transport with Talang Duku a long way upstream and providing public services through only small vessels on a semi-scheduled basis. The current difficulties and limitations of the existing services are described above.

Conversely, as described in the sections above, Jambi province is resource rich and, while possibly not on the same level as Riau or East Kalimantan, urgently requires improved river/sea transport to provide much needed support to exploit these resources. The Jambi Port Master plan sets out to significantly support economic development through the phased implementation of infrastructure and equipment, together with associated operational and related improvements.

#### 22.13.7 Residual Values

Land values have not been included as no expenditure has been made on land in the cost estimates.

Infrastructure implemented after 2020 has been valued at 50 percent of its initial cost and all equipment is assumed fully depreciated by 2036. After 30 years, the impact of residual values is very small.

## 22.13.8 Results of the Economic Evaluation

The EIRR for the proposed Master Plan was estimated as shown in Table 22.13.3 which also shows the sensitivity analysis.

JAMBI Port Master Plan	Base Scenario	Cost Plus 10%	Benefits Minus 10%	Combining (2) and (3)
	(1)	(2)	(3)	(4)
EIRR (%)	19.2	17.3	17.1	15.3

 Table 22.13.3
 EIRR Analysis for Jambi Port Master Plan-Base Scenario

The EIRR analysis shows that the Master Plan is economically viable. Even with two unfavourable factors combined the EIRR falls to about 15 percent.

At 15 % discount rate, the Net Present Value (NPV) is Rp. 70,468 million. Any positive value of NPV means the project is viable.

 Table 22.13.4
 EIRR Analysis for Jambi Port Master Plan-High Scenario

JAMBI Port Master Plan	High Scenario	Cost Plus 10%	Benefits Minus 10%	Combining (2) and (3)
	(1)	(2)	(3)	(4)
EIRR (%)	18.1	16.4	16.6	15.0

The EIRR analysis shows that the Master Plan is economically viable. If either costs or benefits change by 10 percent the project is still approximately viable. However, with two unfavourable factors combined the EIRR falls to 15 percent.

At 15 % discount rate, the Net Present Value (NPV) is Rp. 70,465 million. Any positive value of NPV means the project is viable.

## 22.14 Preliminary Financial Analysis

#### 22.14.1 Objective and Methodology of the Financial Analysis

## (1) **Objective**

The purpose of the financial analysis is to evaluate the financial feasibility of the project. The analysis focuses on the viability of the project itself and the financial soundness of the new terminal management entity during the project life.

#### (2) Methodology

#### 1) Viability of the Project

The viability of the project is analyzed using the Discount Cash Flow Method and appraised by the Financial Internal Rate of Return (FIRR). The FIRR is the discount rate that makes the discounted costs and revenues over the project life equal, i.e., the rate "r" that satisfies the following formula:

n		Bi - Ci
		$(1+r)^{i-1} = 0$
i=1		
Where,	n	: Project life,
	Bi	: Revenue in the i-th year: the first year is the base year,
	Ci	: Cost in the i-th year
	r	: Discount rate.

The revenues and costs which are taken into account for the FIRR calculation are summarized in Table 22.14.1.

Tuble 2211 HT Revenues and Costs Employed in First Calculation			
Revenues	Costs		
1) Operating Revenues by the Project	1) Investment for the Project		
	(Installation of Handling Equipment and		
	Replacement/Overhaul of Equipment)		
	2) Operating Expenses such as Maintenance,		
	Repair, Rental, Personnel and Other Cost		

#### Table 22.14.1 Revenues and Costs Employed in FIRR Calculation

The revenue and cost items excluded from the FIRR calculation are summarized in Table 22.14.2.

Revenues	Costs
1) Fund Management Income	1) Depreciation Cost
	2) Repayment of the Loan Principal
	3) Interest on Loan

# Table 22.14.2 Revenues and Costs Exempted from FIRR Calculation

When the FIRR exceeds a certain threshold, the project is assessed to be financially feasible: the weighted average of the interest rates of various funds generated for the project is used as the threshold.

# 22.14.2 Assumption for Financial Analysis

## (1) Scope of Analysis

The viability of the project was assessed using the revenues and costs related to the project.

## 1) Base Year

Price as of year 2001 is used in this financial analysis. Price escalation due to inflation for the future is not considered.

## 2) Project Life

Taking account of conditions of the long-term loans and service lives of port facilities, the project life for the financial analysis is determined as 33 years including 3-year design and construction period.

#### 3) Revenues and Port Tariff

The Study Team took the following assumptions for the container wharves of Jambi Port.

- a. Talang Duku will remain a conventional terminal throughout the study period.
- b. Talang Duku will raise the tariff by 20 % in 2005 to become on a par with other conventional terminals. The tariff in Talang Duku will be raised in 2018 again to pay for the new investment.
- c. Muara Sabak will be declared as a container terminal in 2007/2008. Most of the containers handled at Muara Sabak will be destined for Singapore. Accordingly, Muara Sabak will charge the tariff for a FCT.
- d. As for general cargo handling and marine charge, the existing tariff will be applied.
- e. To avoid a drastic increase of the container tariff, an exchange rate of US\$1= Rp.6, 000 is applied (This rate of convenience is adopted at Palembang).

Terminal	Type of Container	-2004	2005-2017	2018-
	ECI	Rp.94,800(20')	Rp.120,000 (20')	Rp.200,000 (20')
	ICL	Rp.142,200 (40')	Rp.180,000 (40')	Rp.300,000 (40')
Talang Duku	ICI	Rp.195,600 (20')	Rp.240,000 (20')	Rp.400,000 (20')
	LCL	Rp.293,400 (40')	Rp.360,000 (40')	Rp.600,000 (40')
	Empty	Rp.85,320 (20')	Rp.110,000 (20')	Rp.180,000 (20')
	Empty	Rp.127,980 (40')	Rp.165,000 (40')	Rp.270,000 (40')
	FCL	-	US\$ 81 (20')	US\$ 81 (20')
Muara Sabak			US\$121 (40')	US\$121 (40')
	LCL		US\$135 (20')	US\$135 (20')
		-	US\$ 203 (40')	US\$ 203 (40')
	Emetry		US\$ 73 (20')	US\$ 73 (20')
	Empty	-	US\$109 (40')	US\$109 (40')

Table 22.14.3 Future Container Tariff at Jambi Port

#### 4) Costs

Capital cost and annual cost for the project are summarized in Table 22.14.4 and Table 22.14.5. Capital dredging costs were divided to two parts, inside the river and outside the river. Since IPC2 is responsible for the dredging inside the river, the capital dredging cost for the channel inside the river was counted as the project cost. The Study Team also assumed IPC2 would pay a half of the maintenance dredging costs outside the river mouth. The dredging costs born by IPC 2 are included in the financial analysis.

Table 22.14.6 Proposed Dredging Cost Sharing

Area	Capital Dredging	Maintenance Dredging
Inside the River Mouth	IPC 2	IPC 2
Outside the River Mouth	Central Government	Central Government (50%) IPC2 (50%)

#### 5) Fund Raising

It is assumed that 85 % of the total project cost is financed by foreign funds. The remaining 15 % of the total cost is assumed to be raised by domestic funds. The following conditions are employed for each fund in this financial analysis.

#### a. Foreign Fund

The foreign loan conditions are assumed as follows:

- Loan period	: 30 years
- Grace period	: 10 years
- Interest rate	: 1.0 % per annum
- Repayment	: Fixed amount repayment of principal
- Ratio of investment	: Less than 85 % of the project cost

#### b. Domestic Fund

	S1\$=Rp.	6,000						FIRR	8.7%		

22-130

The domestic loan conditions are assumed as follows:

- Loan period	: 10 years
- Interest rate	: 18.0 % per annum
	( The real interest rate excluding inflation rate )
- Repayment	: Fixed amount repayment of principal

#### c. Weighted Average Interest Rate

The weighted average interest rate of the funds for investments is 3.55 % per annum under the loan conditions stated above. ( $1.0 \ge 0.85 + 18.0 \ge 0.15 = 3.55$ )

#### 22.14.3 Evaluation of Project

#### (1) Viability

FIRR of the project is shown in Table 22.14.5 and Table 22.14.6 FIIRR of each project is exceeding the weighted average interest rate of loan of 3.55 %.

#### (2) Sensitivity Analysis

Sensitivity analysis is carried out to examine the impact of unexpected future changes such as cargo volume, construction cost, inflation or exchange rate. The following cases were analyzed.

- Case 1 : Investment costs increase by 10 %.
- Case 2 : Revenues decrease by 10 %.
- Case 3 : Investment costs increase by 10 %, and revenues decrease by 10 %.

Results of the sensitivity analysis is shown in Table 22.14.7. In all cases except Case 3 of the base case, FIRR exceeds the weighted average interest rate of loan (3.55 % per annum). For this case, the exchange rate of convenience should be Rp. 6,500, which results in a FIRR of 4.5%.

	(Exchange fate	of convenience at US15-Kp0,000
Case	Jambi Base Case	Jambi High Public Case
Original case	6.0%	8.7%
Case 1	5.1%	7.8%
Case 2	4.4%	7.3%
Case 3	3.4% (4.5%)	6.4%

#### Table 22.14.7 Results of Sensitivity Analysis

(Exchange rate of convenience at US1\$=Rp6,000)

Judging from the above analysis, the project is regarded as financially feasible.
