

DATA-F

INVESTIGATION OF FLOOD DAMAGES AND RESIDENTS

DATA BOOK F: **Investigation of Flood Damages and Residents**

The data and information compiled here is a summary of the results of social survey conducted from August 16 to September 13, 2001.

Objective:

- (1) To collect information on living conditions of the residents of the study area
- (2) To investigate their perception on floods, including their past flood experiences

Methodology: *Questionnaire* (Annex F-1) was used in addition to the existing information/data of government and previous related study of the region were also utilized as a complementary information source. For this purpose, a local expert was subcontracted for assisting the Japanese Social Environmentalist. The expert was a university lecturer and has experience in working for other JICA studies in North Sulawesi as well as for CIDA in the LBB area. Four teams of two persons each, including the Counterparts of the study, were formed to carry out the survey. The questionnaire is composed of; (1) General Information on the resident's living conditions, (2) Past flood experiences, (3) Residents' perception on the flood, and (4) People's observation on natural environment (ref: Figure F-1).

Survey Location: Twenty (20) villages were selected and twenty (20) households were interviewed in each village (400 households in total). For details, see Table F-1, F-2 and Figure F-2.

Results: The data and information compiled here is summarized as follows:

- Executive summary of the findings of social survey
- General information of the sites (population, occupation, characteristics of the respondents, etc.)
- Results 1 : People's economic, social situations
- Results 2 : People's perception on floods and flood experience
- Results 3 : People's perception on water resources

Executive Summary of Socio-Economic Survey and Flood Perception

Study area for the survey covered 8 sub-districts (kecamatan) in Kabupaten Gorontalo and 3 sub-districts (kecamatan) in Kota Gorontalo. Total number of village samples is 20 villages, 16 rural villages (Desa: Labanu, Datahu, Isimu Selatan, Tahupo, Payunga, Pilolenga, Bulota, Biyonga, Kayu merah, Hunggaluwa, Tunggulu, Longalo, Tupa, Tilote, Lombongo and Pinogu) in Kabupaten and 4 urban villages (Kelurahan: Talumolo, Siendeng, Molosipat W, and Dulomo Selatan) in Kota. In each village (Kelurahan or Desa), 20 respondents were interviewed. Total 400 respondents consist of 219 men as a head of household and 181 women (housewife =92 % or woman as a head of household =8 %).

Profile of the respondents

The average age of respondents is about 45 years old, ranging from 19 up to 80 years old, however when classified by sex (man and woman), the men's average age is 48 years old and for women, 42 years old. For men the age ranges from 21 up to 80 years old, and for women, from 19 up to 75 years old.

The average number of household members (family size) of respondents are 5.6 which comprise of 2.81 men and 2.81 women. It means that an average household has 6 members, comprising of a married couple (father and mother or husband and wife), 2 sons and 2 daughters. The number of household members ranges from 1 to 15, and when classified by sex, the number of men ranges from 0 to 8 and that of women from 1 to 7. The most common size of household was 4-5 persons (55%).

The average number of household members with job is 2.32 which comprise of 1.50 men and 0.81 women. This shows that the number of men who have job is almost 2 times higher than women. Most of women are housewives.

This number ranges from 1 to 7 persons per household and when classified by sex, then it ranges from 1 to 5 men and from 0 to 2 women. Most frequently, the number of household members with job is between 1 and 2 persons per household (75%).

In terms of educational degree of respondents, most of them (69 %) have only a degree below elementary school (graduated or non graduated). Among the 20 surveyed desa (villages), those inhabitants who have never attended school were identified and when classified that by sex, it is shown that education level of women was left behind that of men. The number of women who have never attended school is higher than men. The number and percentage of inhabitants graduated from elementary school and holding only a lower degree at Kabupaten level (men 75% and women 72%) are higher than those at Kota level (men 67% and women 58%).

The occupation of respondents is different between men and women. It is found that occupation of man is dominantly in agricultural sector (54 %), and women are mostly housewives (55 %) and also occupied with trades (20 %) and home industry (10 %).

Economic situation and properties

At each of the 20 selected desa, 20 residents were selected to become respondent by the following three economic criteria: Successful or prosperous family class III plus (5 respondents at each desa), middle class or prosperous family class II (6 respondents) and unsuccessful (not

yet successful) or economically pre-prosperous family (9 respondents). The number of respondents of every criterion is valid as long as the situation is permitted. The total number of respondents selected from the study area accounted for 400. Every respondent interviewed represented for one (1) household without any consideration of their gender.

Source of income of respondents household dominantly from agriculture (in general terms) (52%) , private sector (21%) and a temporarily job (20%).

The lowest amount of **household Annual income**, was Rp. 70,000 of a corn field farmer and the highest was Rp. 450,950,000 of a head of household. The head of household is a trader, farmer (coconut and corn), and running a business and his wife is also running business of store.

The average annual income of respondent households mostly ranges from Rp. 1,000,000 up to Rp. 50 million (76%). When classified by prosperity level (rich, middle class and poor), it was found that the annual income of the poor household class ranges mainly from Rp. 500,000 to 10 million (81%), for the middle class, ranges mostly from 1,000,000 to 50 million (86%), and for the rich households, its majority is categorized in the range of Rp. 5,000,000 - 50 million (62%). Thirteen percent (13%) of this class are categorized even in Rp. 100 - 200 million range.

By introducing the **poverty line** of BPS, the number of households under the poverty line almost balances with the number of household over the poverty line. Comparing Kota to Kabupaten, the number and percentage of household under the poverty line in Kabupaten are slightly higher than those in Kota. The standard of living of the household in Kota can be better than in Kabupaten to some extent.

According to the 1998 standard (December 1998), the poverty line was set to the income level of 96,989 rupiahs per month and per capita for urban areas and 72,780 rupiahs for rural areas per month and per capita.

The respondent's house locates mostly along main roads (48%) and at riverside (34%). House located along main roads are concentrated in 2 kelurahan in Kota Gorontalo (Molosipat W and Dulomo Selatan) and in 10 desa in Kabupaten Gorontalo (Labanu, Datahu, Isimu Selatan, Biyonga, Kayu Merah, Tungulo, Longalo, Tupa, Lombongo and Pinogu).

And houses along riverside are mostly in 2 kelurahan in Kota Gorontalo (Talumolo and Siendeng) and 4 desa in Kabupaten Gorontalo (Tahupo, Pilolalenga, Bulota and Hunggaluwa). The Respondent's houses located along the lake side are identified in 2 desa of Kabupaten Gorontalo (Payunga and Tilote).

Conditions of the respondents' house are commonly permanent or made of concrete or bricks (56%) and temporary or bamboo construction (38%). Semi-permanent house or wood construction was 7% of the respondents.

Average area of agricultural land per household is 0.88 ha of which 0.58 ha (66%) is formally owned, 0.27 ha (31%) is illegal occupation (informally owned) and 0.04 ha is a rented land. The communities of the 20 surveyed villages tend to cultivate their own lands rather than the others' (rent or informally owned lands).

Average area of land for principal crops is 0.35 ha which comprises of 0.27 ha (75 %) owned, 0.07 ha (19 %) informally owned and 0.02 ha rented. As the lands for agricultural

production, the people tend to cultivate their own lands rather than the others'. The average area for main crops covers only 40 percents, in terms of spece, of the average area for agricultural production.

Size of premises is generally situated around the range of 51 - 500 square meters (51%) and 501 - 1000 square meters (33%).

In terms of **the status of premises**, most are "private" lands (84%), but only 7% of this percentage are certified premises. There are 11 % of premises that are not owned by the respondent which are usually in the status of borrowed and/or state land.

In terms of **the duration of occupation of their actual house**, most of them occupy for 1-10 years (44 % : its higher percentages are "occupied for 6 years" or since 1995 (16 %), "for 5 years" since 1996 (13 %) and "occupied for 3 years" or since 1998 (11 %)). As a whole, 65 % of the respondents live in the actual house for less than 20 years and the rest 35 % live at the place for more than 20 years. 4 households occupy the premises for a very long period, more than 60 years.

Perception on floods and environment

Most of the households (respondents) answered that they have been suffering from flood disaster "often" (45%) and 1 - 3 times (34%).

The Years of flood occurrence that they experienced at their actual residence are in 2001 (58 %) and 2000 (48 %).

The perception about flood is not different by sex. The answers were "bad/not good" (men: 84 % and women: 85 %), "dangerous" (men: 69 % and women: 71 %) and "afraid" (men: 56 % and women: 56 %).

The two latest flood disasters occurred in 2000 (68%) and in 2001 (80%), according to the respondents.

One of the **financial losses** caused by the two latest floods was related to house damage. There were 15 houses totally destroyed (in Kelurahan Talumolo: 1 house; Desa Datahu: 1 house; Desa Payunga: 4 houses; in Desa Hunggaluwa: 2 houses and in Desa Tilote: 3 houses) and 75 houses were partly damaged, of which the most affected site was Desa Tilote (14 houses).

72 % of the respondents of 20 desa stated that **the water level of the two latest floods** was 0.1 – 0.5 m of height from the floor according to the respondents. The water level of more than 0.50 m is observed mostly by respondents in Kelurahan Siendeng, where water level was between 0.51-1.00 meter from the floor. In Desa Tilote, the water level was 1.00 – 1.50 meters of flood from the floor. Based on the survey team's observation, the elevation of house floor is about 0.10 – 1 meter from the earth. Therefore, the water level of inundation from the earth would be calculated by adding these figures.

Farms and plantation losses are 151 banana trees and animal loss of 2,057 poultry (chickens). These losses were recorded mostly in Desa Payunga and Desa Tilote.

In terms of **flood victims in the family of the respondents**, 3 persons were dead, of which 2 persons in Desa Bulota and 1 in Tilote. And the number of inhabitants who suffered injury were 8 persons, 5 persons of which in Desa Bulota, and 357 persons became sick. The villages with

higher incidence of sickness were Tilote (55 persons), Hunggaluwa (41) and Payunga (35). Types of diseases occurred were mostly a simple disease like fever, cough and diarrhea. The higher incidence of fever was observed in Desa Tilote (18 persons), Kelurahan Siendeng (15) and Desa Payunga (13).

Total financial losses amounts to Rp. 231,113,700 in total for 400 respondents, according to their self-estimation. There is a big difference from one desa/kelurahan to another. The most serious loss was in Desa Tilote (Rp. 36,770,000) and the smallest amount in Desa Lombongo Selatan (Rp. 1,100,000). In terms of the loss amount of a household, the smallest loss was Rp. 10,000 (chicks in Lombongo) and the highest loss was Rp. 25,000,000 (house completely destroyed in Bulota). The amount per one member of the respondent families ranges from the highest of Desa Tilote (Rp. 303,884) to the lowest for Desa Dulomo Selatan (Rp. 9,244).

Most of the respondents (59%) stated that **the most serious flood disaster** occurred in 2001, mainly in Kelurahan Siendeng, Kelurahan Molosipat W, Desa Payunga and Desa Tilote.

In most of the case, **inundation period** is 1–7 days (59%). The desa suffered from inundation for more than 1 week were Kelurahan Molosipat W and Desa Payunga (1-2 months) and Desa Tilote (2-7 months).

The height of flood water level was generally less than 0.5 meter from the floor (64%) even at the most disastrous flood in the past. The height of more than 0.5 meter was recorded in Kelurahan Molosipat W and Desa Payunga (0.5–1 meter) and Desa Tilote (1 –2 meters).

Asset damages/losses caused by flood disaster were claimed by 132 respondents (33%). They had damages mainly to farming lands (36%) and furniture (36%). The damages of farming land were claimed mostly in Desa Isimu Selatan, Tahupo and Bulota. On the other hand, furniture losses were claimed in Kelurahan Siendeng, Kelurahan Molosipat W, Desa Payunga and Desa Tilote where the most serious damage was done.

According to the respondents, men and women understand that **flood is causes by deforestation, river overflow and continuous rain**. But there is some difference in perception between men and women concerning flood causes. Man respondents stated that flood is caused by deforestation (26%), river overflow (26%) and rain (23%), meanwhile woman respondents stated that flood causes were mainly river overflow (36%) and then continuous rain (25%) and thirdly deforestation (16%). There are also different perceptions between Kota and Kabupaten. Kota respondents stated that flood was caused by rain (46%), broken dike (21%) and river overflow (17%), whereas kabupaten respondents answered that flood was caused by deforestation (28%), river overflow (27%) and rain (19%). For woman respondents in both Kabupaten and Kota, they have similar perception on flood causes, i.e. floods are caused mainly by river overflow (Kota=45%, Kabupaten=33%), continuous rain (Kota=24%, Kabupaten=25%) and deforestation (Kota=24%, Kabupaten=13%). Differences in perception of men and women (women ranked “deforestation as a cause of flood” lower than men) may imply a necessity for up-grading/increasing the **awareness of women on forest functions** (its water retention capacity, in particular), especially at the Kabupaten level. The people have to preserve forests in order to overcome/mitigate flood disaster. It is hoped that women’s better understanding on forest functions will be transmitted to the next generation (their children) so that forests are protected for a long time and therefore flood risks are reduced.

According to the respondents, **flood mitigation measures** are related to the river and lake dike/embankment, drainage and forest. There are different perceptions between man and

woman respondents concerning flood mitigation measures. There are three major flood mitigation measures, according to **man respondents**, which are reforestation (29%), construction/improvement/rehabilitation of drainage (25%) and construction/improvement of dike (22%). On the other hand, according to **woman respondents**, flood mitigation measures are firstly construction/improvement of dike (35%), and then construction/improvement/rehabilitation of drainage (25%) and river improvement/normalization/dredging (17%). A lot of man respondents stated that flood was caused by deforestation, and therefore, flood mitigation measures should be done by reforestation according to them.

Comparing between Kota and Kabupaten, the answers show deferent feature. **Kota respondents** stated that flood mitigation measures can be done by construction/improvement/rehabilitation of water drainage (30%), construction/ improvement of dike (26%) and reforestation or regreening (13%). Whereas the perception of **respondents of kabupaten** answered in the following order: firstly reforestation (32%), improvement of water drainage (24%), river dredging/ normalization (21%) and improvement/construction of dike (21%). The perception on flood mitigation measures of **woman respondents** both in Kota and Kabupaten has a similar tendency. They stated that flood mitigation measures were improvement/ construction of dike (women in Kota=56%, Kabupaten=28%), improvement/ construction of water drainage (Kota=26%, Kabupaten=25%), and river dredging/ improvement (Kota=18%, Kabupaten=17%). Woman respondents did not give priority to the issue of reforestation. This may be because they were not conscious yet about the important function of forest as a source of water whose water retaining capacity is closely relating to flood mitigation.

According to the respondents, **preventive actions** in order to avoid flood damage, are moving out (evacuation) to a higher and safer place, keeping their belongings/property safe, constructing/improving and rehabilitating water drainage, reforestation or regreening and construction of gabion. Perceptions on preventive action by man and woman respondents are similar: “evacuate to a higher and safer place” (men=45% and women=42%), “construct/improve and rehabilitate water drainage” (men=20%, women=18%) and reforestation or regreening (men=7%, women=9%). Yet, there was difference in “keep their belongings/property safe” (men=4% and women=13%).

Comparing Kabupaten to Kota, both of them seem to have a similar trend about preventive actions vis-à-vis flood damage: mainly two actions which are evacuation to a higher and safer place (Kota=56% and Kabupaten=43%) and construction/improvement and rehabilitation of water drainage (Kota=13 %, Kabupaten=21 %). And **woman respondents** both in Kota and Kabupaten have a similar perception: evacuate to a higher and safer place (Kota=50%, Kabupaten=38%), construct/improve and rehabilitate water drainage (Kota=15 %, Kabupaten=20 %) and keep their belongings safe (Kota=13 %, Kabupaten=11 %).

Most of the respondents (83%) stated that the latest flood disaster was in 2001. Total 93 **persons** (25%) **evacuated or took shelter** at that time and their destination was mainly the family's house (parents' house, place of parents in law, brother or brother in law, etc.)(74%), school building (10%) and neighbors' house (7%). **The period of evacuation** was generally for less than 1 week (49%), but there are the respondents who had evacuated for more than 1 week like 0.5–1 month and 1–3 months.

Comparing Kabupaten to Kota, the number of people in Kota who experienced an evacuation (34 persons) was less than that of Kabupaten (159 person), however the figures in percentage of

Kota respondents (52%) is higher than those of Kabupaten (19%). The first choice for destination for evacuation was the family's house (Kota=71 % and Kabupaten=76 %). The second choice was school building which was observed especially in Kelurahan Talumolo, Desa Kayu merah and Tilote. The period of evacuation was generally less than 7 days in Kota (46%) and in Kabupaten (51%). But there were the residents of some desa/kelurahan who evacuated for more than 1 week. This was the case in Kelurahan Siendeng and Molosipat W in Kota where the evacuation lasted 0.5–1.0 month (7 of 13 evacuated respondents of Siendeng and 6 out of 9 of Molosipat W), and there were Desa where people evacuated for about 1–3 months in Kabupaten, which were Desa Payunga (4 out of 7 evacuated respondents) and Desa Tilote (10 persons out of 11 evacuated respondents).

The actions undertaken by the respondents at the latest flood disaster (answered by 70 % from total 198 respondents) in both Kota and Kabupaten. The respondents stated that they kept their belongings/property to a higher/safer place or prepared for evacuation. This action accounted for 88% in Kota (especially in Kelurahan Siendeng and Molosipat W) and 65% in Kabupaten (especially in Desa Tilote and Payunga).

The availability of assistance by organization. Only 19% from total 400 respondents stated that there were organizations which provided assistance at the time of flood disaster. The types of organization are divided into government organizations, private sector, community/social organizations, religious groups, family/neighbor/local community. Government organizations are such as local government (Camat - head of Kecamatan (Sub District), Kelurahan/Desa), Village – Health Centre (Puskesmas), Dinas Sosial, Posko Banjir (Flood Coordination Centre) and IKIP (Institute). Private sector consists of Bank (Bank Mandiri) and Naga Manis (sugar company). Social/community organizations comprise of NGO, Political Party, Indonesian Red Cross, GM TriDa, Prime Ministry of South Korea, Karang Taruna (Youth Organization), Wiraga Mulya.

Form of assistance. The inhabitants who suffered from flood disaster received assistance from government, family/neighbor/local community and others social organizations (mainly in Kelurahan Siendeng in Kota and in Desa Tilote in Kabupaten). The assistance were provided in the form of health services, assistance/help at the time of evacuation and subsidy.

In total 50 respondents answered that they got assistance at the time of flood disaster, mainly in the form of health services (56%), and then assistance/help at time of evacuation (30%) and subsidy (26%). The answer “health service” was mainly mentioned by the respondents of Kelurahan Siendeng and Desa Tilote.

The availability of **warning sign** was answered only by 46 respondents and 330 respondents (88%) stated that there was no warning sign. This indicates a lack of warning system at the inhabitant level. Warning was done primarily by Government 47%, Mosque (35%), PMII - Indonesian Red Cross (15%) according to 34 respondents answered. Warning signs were announced by loudspeaker and drum from Mosque.

The Desa/kelurahan which received warning of flood disaster were primarily Kelurahan Talumolo and Siendeng, and Desa Tilote. There are some desa or kelurahan which most of the respondents have not received any warning sign, but in fact they suffered a big loss by flood. This was the case of Kelurahan Siendeng and Desa Bulota and Longalo. Some respondents stated that they got warning by radio “Poliamma”. This could be a good alternative for warning system because of its wide range of network, and it had better to involve Local Indonesian Public Radio (RI).

Regarding the perception on **relocation with an appropriate compensation**, only 25% answered “agree”, and then “depend on situation” (24%), “do not know” (4%) and the majority answered “not agree” (55%) of total 323 respondents. The number of respondents who answered “agree” on relocation, in reality, could be lower, because 10% answered “agree” because of unsuitable or bad conditions of their present house. Therefore, it can be said that the percentage of respondents answered “agree” and “agree under conditions” is 39% (=25-10+24%). The conditions for relocation suggested were an appropriate amount of compensation (beneficial/profitable) and that new location should be in a strategic place, i.e. close to their work or business place (79%), which was mostly answered by the respondents of Kelurahan Siendeng and Desa Isimu Selatan, Bulota and Hunggaluwa.

Some reasons of disagreement were answered by 174 respondents and the majority answered “because they already know very well the environment of present location and close to their work or business place” (61%). This was stated mainly by the respondents of Kelurahan Talumolo (55%) and Desa Hunggaluwa (60%) and Tilote (75%).

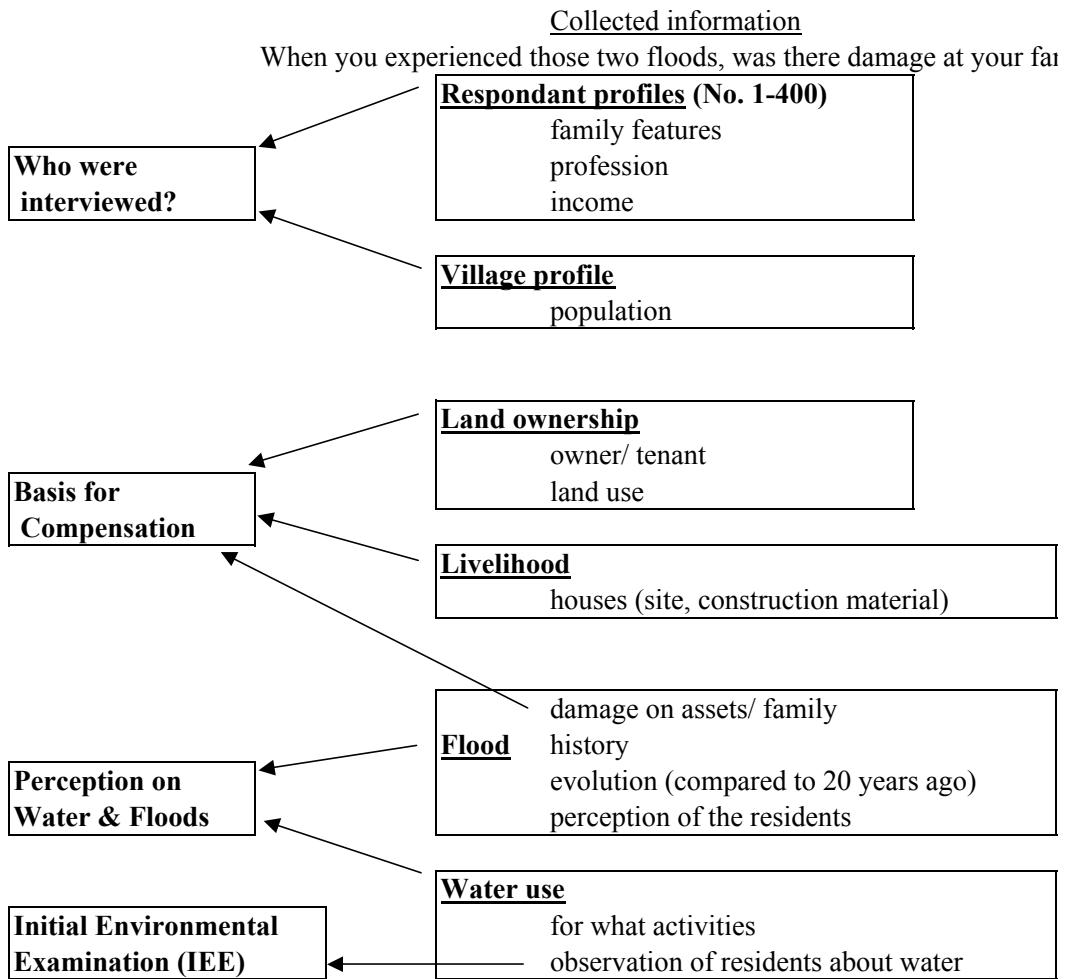

River and Lake Water Utilization. Of the total 353 respondent who answered this question, 40% stated that they used river as a source of water for laundry (62%), bath (62%) and privies (58%).

There are differences in utilization between Kabupaten and Kota. In Kota, the utilization of river water is mainly for privies (50%), and then bath (32%) and laundry (29%). Whereas in Kabupaten, firstly for laundry (69%), then bath (68%) and privies (59%). Higher percentage of river water utilization in Kota for privies may be due to the limited number of MCK (public bath, laundry and toilet facility) and turbidity of river water (bad color) may contribute to a trend of utilizing river for privies, and fewer people use river water for bath and laundry in Kota. But there are still some people in Kota who use river water for washing dishes, meanwhile other people use river for privies.

Conditions of River and Lake water. According to more than half (52%) of total 370 respondents who answered the question, by their observation, the quality of river water became degraded (contaminated), that is mainly identified by turbid color of water (84%) and putrefied situation (32%). The results show the same observation/perception of the respondents both in Kota and Kabupaten. Those who observed that the condition of water became more degraded were mainly the respondents of Kelurahan Siendeng and Desa Tilote, Payunga, Bulota and Biyonga.

Frequency of Flood. Based on 358 respondents who answered the questionnaire, half of them (50%) stated that recently flood occurs more frequently, and especially identified by condition of river shallower and increased volume of sediment deposition (71%). In comparison of Kota and Kabupaten, the results show the same perception that there is increase of flood occurrence, shallower rivers and sediment deposit. This observation was mostly stated by the respondents of Kelurahan Siendeng and Desa Tilote, Datahu, Payunga and Biyonga.

DATA COLLECTION BY SOCIAL SURVEY

LOCATION OF VILLAGES SELECTED FOR SOCIAL SURVEY

SUMMARY OF QUESTIONNAIRE (ENGLISH) (1/2)

QUESTIONNAIRE FOR THE LOCAL RESIDENTS OF THE STUDY AREAS ON SITUATION AND I

Respondent _____ **Sample No.** _____
(Name of Respondent)

Provinsi _____	<i>tanggal</i>	<i>bulan</i>	<i>tahun</i>
Kota/ City _____	Survey date /	/	/ 2001
Kecamatan _____	Name of Interviewer		
Kelurahan/ Desa _____			

This is a questionnaire for the Study on Flood Control and Water Management in Limboto-Bolango Bone Basin in the Republic of Indonesia. The objective of this questionnaire is to understand the residents' socio-economic situation and their perception on the flood in order to formulate an appropriate flood mitigation plan in the region.

Please answer the following questions as fully as possible. Your cooperation is greatly appreciated

Q1 Jenis kelamin/ Sex: **Q2 Umur/ Age:**

Q3-1 How many persons live together in your house? (dependents):

Q3-2 How many persons work?:

Q3-3 Household members in the same house including the respondent and those living together.

Q4 Major income sources of the family (with order of importance: 1,2,3...) in _____ (tahun)

	Annual Income (Rupiah)
Selling agricultural products	
Selling fishery products	
Selling livestock products	
Salary & wage from permanent job	
Remittance from family member	
Private business	

Q5 About the house where the respondent lives (circle the alphabets)

- 5-1 Place of the house (Multiple choice)
5-2 Structure of the house (Multiple choice)

Q6 Ownership of the land where the house is built and economic activities are in practice

- a. Owned (Total area): agriculture, major crops, non-agriculture (ha & activity)
b. Rented (Total area): same as above
c. Illegal occupation: same as above
d. Others (Specify):

Q7 History and background of the dwelling in present place concerning floods

- 7-1 Since when do you live in the actual house?
7-2 Have you experienced flood here? how many times?, in which year?
7-3 How do you think about floods? (Multiple choice/ good, bad, etc.)
7-4 When were the latest two floods?

SUMMARY OF QUESTIONNAIRE (ENGLISH) (2/2)

- Q7 (continued) History and background of the dwelling in present place concerning floods**
- 7-5 When you experienced those two floods, was there damage at your family and a such as house? (Yes/ No)
- If Yes,
- a.&b. House totally/partially destroyed (how many times?)
 - c. Flooded above the floor level (how many times?, how high cm?)
 - d. Flooded below the floor level (how many times?)
 - e.&f. Crops / livestock totally/partially lost (Specify: _____)
 - g.&h. Family members died/injured (how many persons?)
 - i. Family members became sick (how many members?: _____ person diarrhea, cough, fever, vomiting, unknown)
 - j. Others (Specify _____)
 - k. How much (if possible, estimated damage in Rp.)? _____ (Rp.)
- 7-5 As for the floods that caused you the most serious damages in the past, when did it occur? and how serious was it?
- a.-c. When? How many days? How high was it? (cm)
- 7-6 Have there been any of your assets which were covered or damaged by the debris?
- If Yes, Specify:
- (a-1) rice field (a-2) other agricultural lands (a-3) fishing boats
 - (a-4) fishing tools (net, hook and others) (a-5) furnitures
 - (a-6) business equipment/ machine (a-6) others
- 7-7 When did the latest debris flow occurred? (Year & Month)
- 7-8 As for the latest debris flow, how many days did you need to remove it out from

Q8 History and background of the dwelling in present place concerning floods

- 8-1 Do you know the causes of the floods you experienced?
 - 8-2 Do you know how to mitigate damage of floods?
 - 8-3 Do you know how to prevent/ avoid the floods?
 - 8-4 Did you evacuate when your house was inundated at the latest floods? (Yes/ No)
- If Yes, a-1. Where ? (school, mosque, church, house of relative, other)
- a-2. How long did you stay there?
- 8-5 What were the measures taken at your latest floods?
- 8-6 Is there any community based organization/ initiative which can help you at flooding?
- If Yes, a-1. What is the name of it ? _____
- a-2. How did it help you? (food supply, help evacuation, health care, subsidy, other)
- 8-7 Have you heard the warning or public announcement of evacuation in advance or not?
- If Yes, a-1. From whom? (_____)
- 8-8 If you are to move to new residence due to the land acquisition by reason of meadow being provided with proper compensation, do you agree to?
- a. Agree to move
 - b. Depends on condition(s)
- What is the condition(s) required?
- c. Disagree to move --> The reason?
 - d. Don't know

Q9 Relationship between local populations and the rivers in the region

- 9-1 For what do you use river or water? (Yes/No)
- If Yes,
- a. For drinking
 - b. For washing clothes and dishes
 - c. For washing body
 - d. For fishing (to eat at home or sell)
 - e. For religious purposes
 - f. others
- 9-2 Do you think that the quality of water you are using now becomes worse than before?
- If Yes,
- a. See sometimes dead fish now
 - b. Water became muddy
 - c. Feel bad smell now
 - d. Cannot drink a glass of water
 - e. other changes you feel or find now
- 9-3 Do you think that floods occur now more frequently than before (20 years ago)?
- If Yes,
- a. The rise of river water level and floods observed more often than before
 - b. River becomes muddy more often than before when it rains
 - c. River becomes shallow with more sediment than before
 - d. other remarks that you make

* village in a flood prone area

SELECTION CRITERIA

- 1) Villages within the flood prone areas
- 2) Villages invited for the First Public Consultation Meeting (August 2001)
- 3) Villages situated along the principal rivers (upstream, midstream and lower reach)
- 4) Villages with a large population
- 5) Villages with high population density
- 6) Villages with similar characteristics/situation for comparison

a= move to high and safe place
 b= keep belongings in a safe place
 c= construct, improve and clean up water channel
 d= tree planting, reforestation
 e= construct bronjong
 f= other

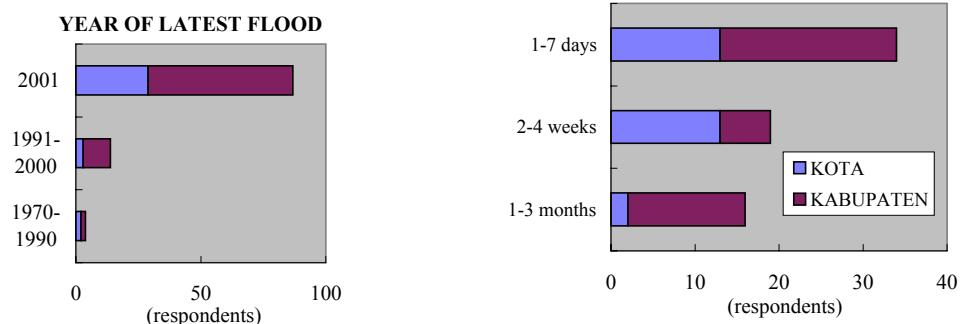

**Pengalaman mngungsi pada saat banjir terakhir/
Evacuation experience at the latest floods**

EVACUATION EXPERIENCE?

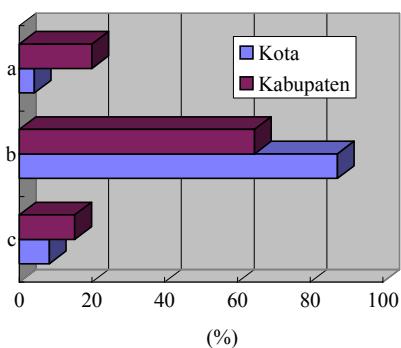

HOW LONG EVACUATED?

Tindakan-tindakan saat banjir terakhir / The measures taken at the latest floods

MEASURES TAKEN AT FLOOD

a= no measures, because don't know what to do and sacred
 / Tidak ada karena tidak tahu dan takut

 b= put thing in a safer place, high place, or prepare for a move
 / Mengamankan barang ke tempat tinggi atau bersiap mengungsi

 c= drain, clean up the house, yard and water duct
 / Menguras, membersihkan rumah, halaman dan saluran air

**Organisasi yang menolong saat banjir terakhir /
Community based organisations helped respondent at flood disaster**
