USD \$1.00 = 4.58 Egyptian Pound (LE)

( As of August 2002 )

## PREFACE

In response to a request from the Government of the Arab Republic of Egypt, the Government of Japan decided to conduct the Study for the Transportation Master Plan and Feasibility Study of Urban Transport Projects in Greater Cairo Region in the Arab Republic of Egypt and entrusted the Study to the Japan International Cooperation Agency (JICA).

JICA selected and dispatched a study team headed by Dr. Katsuhide Nagayama of Pacific Consultants International to the Arab Republic of Egypt between March 2001 and September 2002. In addition, JICA set up an Advisory Committee headed by Professor Noboru Harata of Tokyo University between March 2001 and October 2002, which examined the Study from Specialist and technical point of view.

The Study Team held discussions with the officials concerned of the Government of the Arab Republic of Egypt and conducted field surveys at the study area. Upon returning to Japan, the Study Team conducted further studies and prepared this report.

I hope that this report will contribute to development in the Arab Republic of Egypt, and to the enhancement of friendly relationship between our two countries.

Finally, I wish to express my sincere appreciation to the officials concerned of the Government of the Arab Republic of Egypt for their close cooperation extended to the Study Team.

November 2002

---

Takao Kawakami  
President  
Japan International Cooperation Agency

November 2002

Mr. Takao Kawakami  
President  
Japan International Cooperation Agency  
Tokyo, Japan

## Letter of Transmittal

Dear Sir,

We are pleased to formally submit herewith the Final Report of “Transportation Master Plan and Feasibility Study of Urban Transport Project in Greater Cairo Region in the Arab Republic of Egypt.”

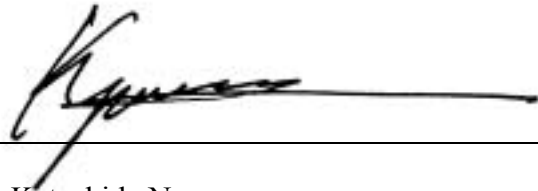

This report compiles the results of the Study which was undertaken in the Arab Republic of Egypt from March 2001 through September 2002 by the Study Team organized by Pacific Consultants International under the contract with the JICA.

This report compiles Transport Master Plan based upon identification of present condition in order to contribute to the sustainable development in Greater Cairo Region.

We would like to express our sincere gratitude and appreciation to all the officials of your agency and the JICA advisory Committee. We also would like to send our great appreciation to all those extended their kind assistance and cooperation to the Study Team, in particular, Ministry of Transport and Egyptian National Institute of Egypt as the counterpart agency. We beg to acknowledge our sincere gratitude to Dr. Ibrahim El Dimeery, the ex-Minister of Transport, for his devoted initiation of the Study as well as H.E. Eng. Hamdy Al Shayeb, the Minister of Transport, for his strong support to our activities.

We hope that the report will be able to contribute significantly to development in the Arab Republic of Egypt.

Very truly yours,

---

Dr. Katsuhide Nagayama  
Team Leader,  
The Study Team for the Transportation Master Plan  
and Feasibility Study of Urban Transport Project in  
Greater Cairo Region in the Arab Republic of Egypt

*Volume IV: CREATS Urban Transport Database*

**TABLE OF CONTENTS**

	Page
<b>CHAPTER 1: INTRODUCTION</b>	
1.1 Overview-----	1-1
1.2 Integration With CREATS Transport Model-----	1-3
1.3 Report Structure-----	1-3
<b>CHAPTER 2: DATA CONCEPTS</b>	
2.1 Data Features and Uses-----	2-1
2.2 Organization Within Individual Datasets-----	2-1
2.3 Database Linkage and Aggregation-----	2-2
2.4 Database Management-----	2-3
2.5 Database Structure Format-----	2-3
<b>CHAPTER 3: HOUSEHOLD INTERVIEW DATABASE</b>	
3.1 Household Interview Survey (HIS)-----	3-1
3.2 Revealed Preference Survey (RPS)-----	3-16
3.3 Stated Preference Survey (SPS)-----	3-36
<b>CHAPTER 4: CORODON LINE DATABASE</b>	
4.1 Overview-----	4-1
4.2 Cordon Line Database Structure-----	4-2
<b>CHAPTER 5: SCREEN LINE DATABASE</b>	
5.1 Overview-----	5-1
5.2 Screen Line Database Structure-----	5-2
<b>CHAPTER 6: TRAFFIC COUNT DATABASE</b>	
6.1 Overview-----	6-1
6.2 Traffic Count Database Structure-----	6-2
<b>CHAPTER 7: PUBLIC TRANSPORT DATABASE</b>	
7.1 Overview-----	7-1
7.2 CTA Routes Database-----	7-1
7.3 On-Board Survey Database-----	7-2
7.4 Shared Taxi Terminal Survey Database-----	7-3
7.5 Public Transport Passenger Survey Database-----	7-4

**CHAPTER 8: CARGO DATABASE**

8.1 Truck Roadside Interview Survey Database ----- 8-1  
8.2 Cargo Companies Survey Database ----- 8-3

**CHAPTER 9: TRAVEL SPEED DATABASE**

9.1 Overview ----- 9-1  
9.2 Travel Speed Database Structure ----- 9-2

**CHAPTER 10: ROAD INVENTORY DATABASE**

10.1 Overview ----- 10-1  
10.2 Road Condition Database Structure ----- 10-2

**CHAPTER 11: PARKING DATABASE**

11.1 Multi-Storey Garage Interview Database ----- 11-1  
11.2 At-Grade Parking Lot Survey Database ----- 11-6  
11.3 On-Street Parking Survey Database ----- 11-6  
11.4 Parking Occupancy Database ----- 11-10

**CHAPTER 12: ENVIRONMENTAL DATABASE**

12.1 Environmental Awareness Survey (EAS) Database ----- 12-1  
12.2 Noise Survey Database ----- 12-3  
12.3 Air Pollution Survey Database ----- 12-4

**CHAPTER 13: EQUIVALENCE TABLE DATABASE**

13.1 Overview ----- 13-1  
13.2 Equivalence Table Database Structure ----- 13-1

**CHAPTER 14: SOCIO-ECONOMIC DATABASE**

14.1 Overview ----- 14-1  
14.2 Socio-Economic Database Structure ----- 14-1

**CHAPTER 15: PERSON TRIP O-D MATRIX DATABASE**

15.1 Overview ----- 15-1  
15.2 Person Trip O-D Matrix Database Structure ----- 15-1

**CHAPTER 16: GIS DATABASE**

16.1 Overview ----- 16-1  
16.2 GIS Database Structure ----- 16-2

# **CHAPTER 1: INTRODUCTION**

---

## **1.1 OVERVIEW**

The urban transport database can be considered as the backbone of a transport model development. This database is used in quantifying and describing the current conditions of transport system in the Study Area. The precise definition of existing transport problems would lead to appropriate solutions and remedies. Therefore, a great effort has been done to collect all the necessary information relevant to transport planning and compiling it in an extensive database.

CREATS database, which houses the planning and transport system inventory of computer-based data, is the most comprehensive database ever built for urban transport in Greater Cairo Region. It consists of the outcomes of 11 transport and traffic surveys in addition to data collected from different local authorities. An innovative GIS database is a major component of CREATS database. Figure 1.1.1 illustrates the tree structure of different database components. The database structure is built to be consistent with the structure of Volume II of Progress Report (2).

This volume of the Phase I Final Report presents a description of CREATS database structure and summarizes each of its components. In this way it is hoped that a constructive and comprehensive picture will be drawn of how the database will be used.

The details of the data description files are included in this report describing the structure of each database including file name, number of records, file path, data source and data fields definitions.

In this report, it is intended to show anyone with some computing knowledge and experience how to make use of the assembled data. The documentation is aimed at a readership which has some understanding of database concepts, and practical experience of using popular commercially available database software packages and transport analysis. It is also aimed at indicating where certain types of data can be found.

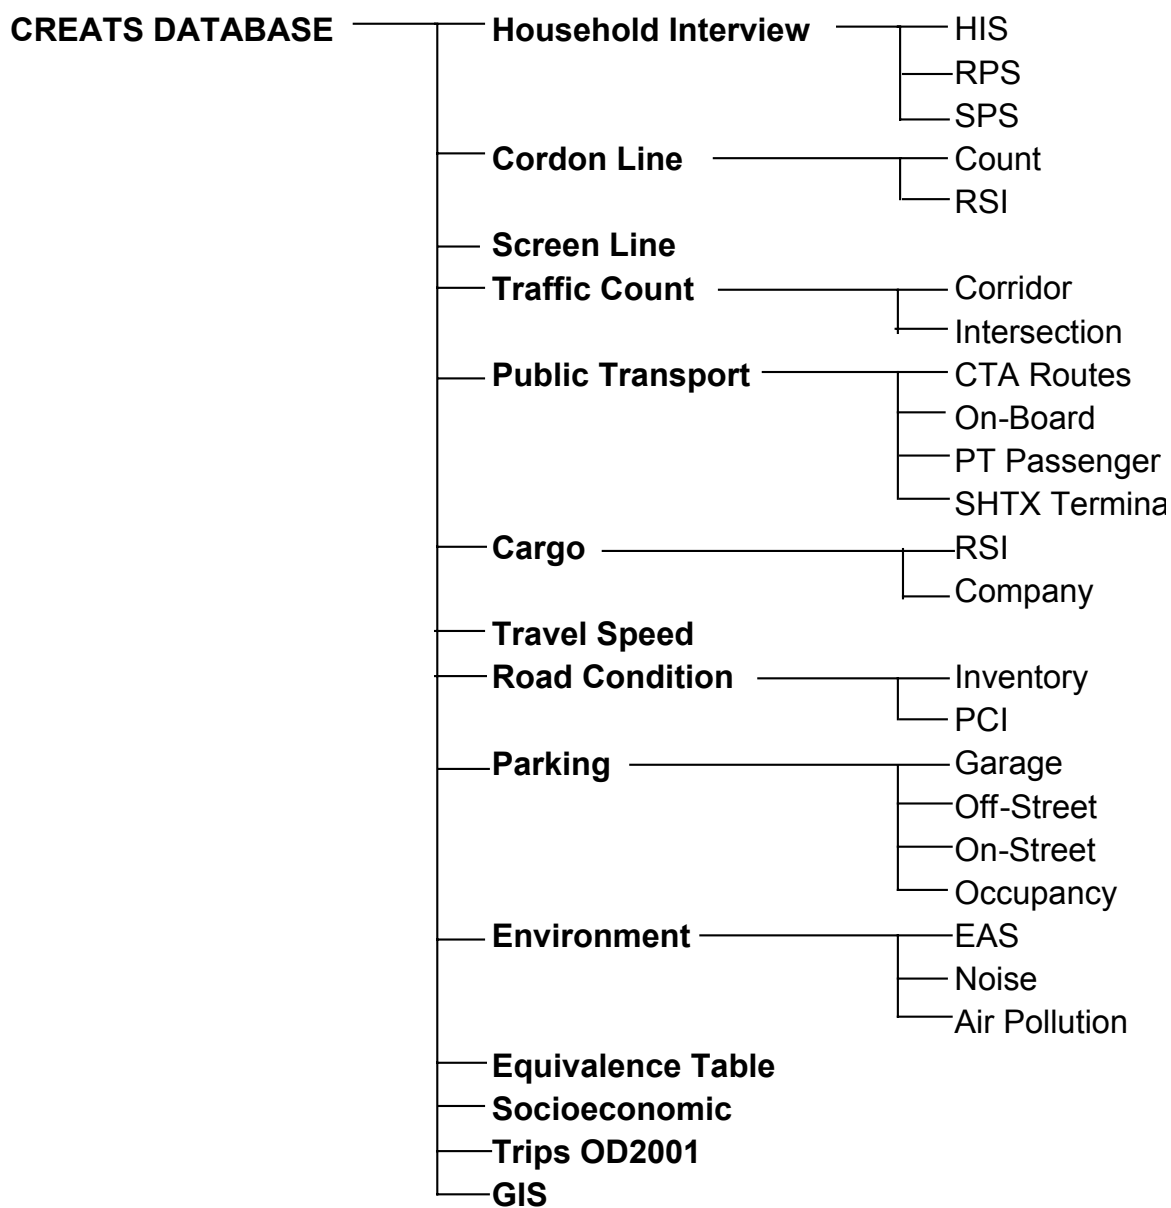

Figure 1.1.1 CREATS Urban Transport Database Structure

## **1.2 INTEGRATION WITH CREATS TRANSPORT MODEL**

CREATS database provides the necessary supporting information and inputs to the developed transport model. The structure of the database has been built to ensure great flexibility of use and the ability to accommodate new survey and other data sources as and when they become available.

In particular, it is important the structure of the database should allow:

- Adoptability to future needs.
- Ease of familiarity to relevant staff.
- Ease of interaction with transport models and levels of model operation.
- Ease of interaction with outside agencies for data provision.
- Minimization of repetitive tasks.
- Minimization of costs and staff time including training.
- Maximization of efficiency and economies of scale.
- Full integration and interfacing with GIS systems.

A unique structure format for database files can help understanding the contents of CREATS database and retrieving necessary information easily. Therefore, most of the survey data has been converted to a database format except for some surveys that require different arrangement and formatting for collected data such as travel speed and road inventory surveys.

## **1.3 REPORT STRUCTURE**

This report includes fifteen Chapters in addition to this introduction. Chapter two describes the flexible yet comprehensive structure of the CREATS database. It also addresses some of the data concepts such as different structures of database, database linkage, database aggregation and management. Standard format of database structure is also presented in Chapter 2. Data dictionaries for different database files are presented in the remaining chapters of this report. Chapters 3 through 12 describe the database files of CREATS traffic and transport surveys including:

- Household Interview Survey
- Cordon Line Survey
- Screen Line Survey
- Traffic Count Survey

- Public Transport Passenger Survey and Transport Network Survey
- Cargo Survey
- Vehicle Travel Speed Survey
- Road Condition Survey
- Parking Survey
- Environmental Survey

Chapters 3 through 12 are arranged to reflect the sequence mentioned in Progress Report II, Vol. (2). However, public transport passenger survey and transport network surveys are combined together in Chapter 7.

The equivalence table database, which defines the relationship between different zoning systems (Shiakha, traffic zone, Qism, Sector and Super Zone) is presented in Chapter 13. Population, employment, number of students and income class in various planning years (2001, 2007, 2012 and 2022) are gathered in a socio-economic database as shown in Chapter 14. The last Chapter addresses the Geographic Information System database including the relationship between different zoning system and some land use data connected to traffic zone, which can be easily aggregated to a coarser zoning system.

The presentation of CREATS database depends to a great extent on the traffic survey forms. Therefore, most of the traffic survey forms used by the Study Team are provided in the Appendix for the convince of database user.

## **CHAPTER 2: DATA CONCEPTS**

---

This chapter focuses on the technical aspects of database structure and management. It highlights the main features of databases and what database is commonly used for. It discusses concepts and terms and the way in which database hierarchies and structures can be organized to optimize data storage and retrieval.

### **2.1 DATA FEATURES AND USES**

Organization and storage of computer datasets into databases affords the manager/user some useful features such as:

- Organization and storage of survey and other data.
- Ease of maintenance and updating of contents.
- Location and retrieval of subsets of the data that meet a given set of specifications.
- Linking data items in separate database files to achieve an indirect indexing on the data items.
- Making use of the retrieval and linkage facilities to produce cross-tabulations and data report summaries.

### **2.2 ORGANAZATION WITHIN INDIVIDUAL DATASETS**

The database would be made up of numerous computer datasets (files). Each dataset is composed entirely of individual data records. However, the information stored at this level can be organized and viewed in a number of ways. The two most popular methods of organization are the hierarchical method and the relational method. Both of which are discussed below.

#### **2.2.1 Hierarchical Structure**

The hierarchical method involves the use of a tree structure. The tree not only defines the data elements but also the inter-relationship amongst the data elements. Typically, home interview transport-based survey databases utilizes a hierarchical

structure, for the data obtained from such surveys usually comprises several different types of data records interlinked at the household level, such as:

- Household data.
- Person characteristics data.
- Individual trip travel characteristics data.

### 2.2.2 Relational Structure

A relational structure is used in Relational Databases, in which a simple relationship exists amongst the data elements. The data is organized into a two-dimensional structure, with each row containing one entry in the database. Data within a row is divided into several columns, each column representing a particular attribute. Each row is termed a data record, whilst each column is termed a data field. A typical example would be a traffic count survey dataset, stored in a relational database structure. In general, CREATS database structure employs the relational type. However, the user can change some of the database components such as household interview database to a hierarchical type.

## 2.3 DATABASE LINKAGE AND AGGEGATION

The ability to link data items together across different databases, using linkage variables common to each is an important database feature, as is the ability to aggregate data to produce summary report tables. The linkage of database items is an essential feature in all database system. They are various levels in the database hierarchy, where this may take place depending upon user requirements and the particular categories and subsets of data being accessed.

It is important to explain what the terms linkage and grouping mean in the context of a database structure. In simple terms, linkage connects to separate and distinct databases. Grouping and amalgamation, either for reporting purposes or for the creation of data subsets, involve aggregating data once the linkage connections are in place.

The common spatial variable which will link all urban transport databases together is the *traffic zone*. The function of traffic zones is to provide data at the most appropriate level for transport model operation and therefore represents the smallest acceptable spatial data unit. As for CREATS, 464 traffic zones have been built based on the 512-Shiakha zoning system.

A hierarchal database structure, by definition, has an implicit built into its structure. In the case of home interview transport survey data, the database houses three types of data records interlinked at the household level. By selecting a code unique to a specific household, the linkage ensures the selection of all data records relating to that household, whether they be household data records, person data records or

individual trip data records. The linkage is achieved by having the household identification variable as a data field common to all three types of data records.

Data aggregation must provide a basis for deriving data control totals, as well as facilitating a clear summary presentation of data in forms which are readily comprehensible. Traffic zones are far too numerous to facilitate ease of presentation. The next level up would be the Qism level or even coarser at Sector level. For reporting purposes, the database can be analyzed, aggregated and presented at coarser zoning systems such as 60-Qism, 18-Sector or 8-Superzone.

## **2.4 DATABASE MANAGEMENT**

The term Database Management System (DBMS) is a common term used to refer to the systematic organization and management of a large collection of computer held information. The database software package carries out these functions under the control of the user either by means of interactive screen menu-led computing sessions or by writing and utilizing database computer programs developed for specific tasks.

A database itself is a collection of useful information organized in a specific manner; in other words a reference library of computerized data. Most commonly, the term “database” is a generic term used to describe the complete library.

## **2.5 DATABASE STRUCTURE FORMAT**

A unique structure format is maintained for most of CREATS database files except for a limited number of traffic surveys. Unless it is mentioned explicitly, this unique structure format will be the default file structure. The description of each database file is presented in two tables. The first table describes file structure and the other table defines field codes of the first table. The following items are listed for each database file in the first description table:

- File name
- Number of data records
- File path on the hard disk
- Source of database file
- Filed number, name, data type, width, code type and description

If any of the data field is coded, i.e. tagged with “Y” under the column “Coded”, a second description table is provided to list field code values together with their definitions. Figure 2.5.1 and 2.5.2 illustrate a sample of the two standard tables used to describe CREATS urban transport database.

**Figure 2.5.1 Sample of the Standard Table Format for Describing Database File Structure**

## **CHAPTER 3: HOUSEHOLD INTERVIEW DATABASE**

---

This Chapter addresses three database components; Household Interview Survey (HIS), Revealed Preference Survey (RPS) and Revealed Preference Survey (RPS). HIS, RPS and SPS are presented in Sections 3.1, 3.2 and 3.3, respectively.

### **3.1 HOUSEHOLD INTERVIEW SURVEY (HIS)**

#### **3.1.1 Overview**

It is well known to transport specialists that home interview survey is the most accurate and comprehensive Origin/Destination survey method. This can be attributed to its nature involving visiting a large sample of households at their residence places to ask about socio-economic features and travel characteristics of the household and its individual members.

Household interview survey (HIS) is aiming at identifying the characteristics of households, persons and trips within the study area. The collected information constitutes a comprehensive database of transport and traffic related data that would facilitate the diagnosis of existing conditions including the current travel patterns. One major objective of HIS is to build a transport demand forecast model.

HIS includes the important household characteristics such as family size by gender, car ownership and income level supported by telephone bill and electricity consumption as proxies. Person attributes such as gender, age, profession, employment sector, monthly income and vehicle availability were also identified. The travel pattern could be monitored through total number of daily trips, where the trip starts and where it ends (origin- destination movement), trip purpose, travel time, mode of transport. The un-linked trips were further investigated to identify different components of total travel time (access, waiting, in-vehicle and egress time) in addition to the transport mode and transfer points.

HIS of CREATS is the largest O/D home interview survey made in Greater Cairo Region calling for a sample of around 60,000 households, which necessitates the mobilization of around 1,000 persons including different specialties such as interviewers, supervisors, data coding team and data entry operators under the leadership of transport experts.

The execution of full-scale HIS took five weeks to be completed starting on 23 September 2001 and ending on 16 October 2001.

### **3.1.2 HIS Database Structure**

HIS database is divided into 3 basic elements including household, person and trip characteristics. Person and trip files are further sub-divided into 2 files, which are compatible with HIS survey forms. Tables 3.1.1 and 3.1.2 presents the description of database file structure for household characteristics. The first four lines of Table 3.1.1 provide the computer file name, number of database records, file path and data source, respectively. The columns of this table give the field number, field name, field data type (numeric, character, date, etc.), type of field coding (Y if Yes or blank if No) and field description. For instance, fields number 2, 3, 4, 27, 29, 30 and 31 of Table 3.1.1 are stored as codes instead of their actual values. Therefore, the description of these codes are listed in the second description Table 3.1.2. It can be observed from Table 3.1.1 that the total number of interviewed households are 56,013 as shown in the second line, which is less than the total number of interviewed household during HIS survey. This is due to the deletion of some invalid household interview records.

The person characteristics database is shown in Tables 3.1.3 and 3.1.4, which utilize the standard file structure format of Tables 3.1.1 and 3.1.2, respectively. Around 234,800 persons were interviewed during HIS execution to identify their characteristics such as, gender, age, occupation, employment sector, status for non-working person, monthly income, type of driving license, car availability, total number of trips per day, etc. As for working persons and students, the work/school place is coded together with place of residence as shown in Tables 3.1.5 and 3.1.6.

Tables 3.1.7 and 3.1.8 present the description of database file structure for trip characteristics such as trip origin, destination, purpose, mode of transport, start time, end time. The characteristics of unlinked trips are shown in Tables 3.1.9 and 3.1.10. A total of 268,360 trips per day were reported by interviewed persons from which part of them constitute unlinked trips. The unlinked trip data includes mode of transport, fare type, fare cost, access time, waiting time, in-vehicle travel time, egress time, parking type, parking cost and Qism code of transfer point for modal interchange.

It should be noted that HH\_ID field is a common field in all HIS database files to easily connect between them and to establish a relationship that can be used to extract some information from different database files on different hierarchical levels. The same rule is applied for PERSON\_ID and TRIP\_ID when possible. Each of them is connected to all its corresponding lower-level database files.

## 3.2 REVEALED PREFERENCE SURVEY (RPS)

### 3.2.1 Overview

Revealed Preference Survey (RPS) aims at gathering information of individual modal choice so as to develop disaggregate mode choice models. Therefore, the RPS includes individual attributes, which is similar to the HIS, actual modal choice with information on the travel, which is also similar to the HIS in addition to information on available alternative travel modes for the trip made by an individual, which is not in the HIS.

The RPS survey intends to collect actual modal choice information of the residents. To collect such information efficiently, the Study Team decided to adopt “choice based sampling method” and conducted the survey at transport terminals for public transport and parking areas for private transport in principle.

A sample of travelers were planned to be interviewed in the RPS at the terminals classified as follows:

- Formal public transport modes: Bus, Metro, Tram/Heliopolis Metro and Suburban Rail.
- Informal public transport: Shared Taxi and Cooperative Minibus.
- Parking places: On Street and Off Street for private car user.

However, it appeared difficult to conduct the interview at the terminals in some cases. The first case was interviews at large-scale railway stations of ENR, where it was difficult to distinguish between commuting passengers and long-distance travel passengers. The other case was cooperative minibus passenger interview, because the cooperative minibuses have no terminals. The Study Team decided to conduct on-board interview surveys to the users of those two modes instead of terminal interviews.

The RPS started on 16 October 2001 and ended by 10 November 2001, in which 2,940 passengers were interviewed. The total sample is distributed among different transport modes as follows:

Private Car (on street parking)	565
Private Car (off street parking)	520
Bus	304
Minibus	224
Tram/Heliopolis Metro	210
Metro	324
Suburban Rail	264
Shared Taxi	308
Cooperative Minibus	221

### **3.2.2 RPS Database Structure**

The RPS database is divided into two major categories including private car and public transport users. Database structure file of the interviews with private car users are shown in Tables 3.2.1 through 3.2.4, while public transport users database structure is presented in Tables 3.2.5 and 3.2.8. As long as the files take the extension of (dbf), the standard description files are utilized. The file structure containing the survey records of private car users is outlined in Table 3.2.1.

It can be observed that around 1,085 car users were interviewed either at off-street or on-street parking locations. The dataset file name is given in the first line of Table 3.2.1 as “RPS\_CAR\_FORM1.DBF”, which has a file path indicated in the third line of this table. Usually, the database source is shown in the fourth line of the first description table.

The definition of field codes that have been tagged with “Y” under the column “Coded” of Table 3.2.1 are illustrated in Table 3.2.2. Field number, filed name, filed description, code and field code description are arranged in five columns of Table 3.2.2, respectively.

The evaluation of private car user for different public transport modes (advantages and disadvantages) is presented in Tables 3.2.3 and 3.2.4. The evaluation includes bus, metro, shared taxi, tram, taxi, suburban railway and Nile ferry. The importance of travel time, travel cost, number of transfers, comfort, security, safety and accessibility were also evaluated.

The survey results of public transport users are stored in database files, whose structure is shown in Tables 3.2.5 through 3.2.8. The format of these tables follows the format of Tables 3.2.1 through 3.2.4.

### 3.3 STATED PREFERENCE SURVEY (SPS)

#### 3.3.1 Overview

The main objective of the Stated Preference Survey (SPS) is to clarify individual choice change when some conditions change, while the Revealed Preference Survey (RPS) analyzes actual choice activity of individuals. Therefore, the SPS is generally utilized to analyze individual choice activity, which would not be done by the RPS provided that some conditions change drastically.

For example, if a new transport mode is to be introduced, it is generally difficult to analyze how many passengers would use the new proposed mode when the RPS survey is the only information for the analysis. In this case, an opinion survey is conducted to obtain individuals tendency to use the new mode, by showing level of service and fare level of the new mode. Based on this kind of survey (SPS), modeling exercise can cope with the issue. SPS is also utilized to estimate people's choice changes when a drastic change happens to, for example, transport fare, petrol cost, travel speed and so on.

In the Greater Cairo Region, population concentration to the city center has been a big problem. The Government has been constructing "new communities" around the region to move the residents from center to the suburbs. In this context, transport modes between new communities and central Cairo has been one of big topics for years. The existing road network would not be able to satisfy the transport demand in future. A new rail-based public transport mode might be necessary by considering environmental aspect.

Based on the above discussion, the Study Team conducted the SPS for a sample of the residents of new communities around Cairo to obtain:

- Individual potential to use public transport modes in case the service is improved drastically between the new communities and the central Cairo;
- Private car user potential to use the public transport instead of his own car as a result of various public transport oriented measures; and,
- Individual opinion on living environment of the new communities.

The SPS was conducted during 27 and 31 October 2001 to a sample of the residents of eight new communities in the suburbs of Cairo: 6<sup>th</sup> of October, Sheikh Zayed, 10<sup>th</sup> of Ramadan, Badr, Shebeen El Qanater, Shorooq, Oboor, 15<sup>th</sup> of May and New Cairo. The distribution of 1,375 interviewed residents in different new communities is shown below.

15 <sup>th</sup> of May	272	El Shorooq	116
10 <sup>th</sup> of Ramadan	349	El Oboor	58
6 <sup>th</sup> of October and Sheikh Zayed	290	Badr	74
New Cairo	116	Shebeen El Qanater	100

### **3.3.2 SPS Database Structure**

The SPS database is divided into 3 components based on 3 survey forms. The first survey form is designed to identify the person characteristics (sex, income, car availability, having a driving license), resident information (reasons of selecting place of residence and trip information (number of weekly trips to Cairo, trip destination and purpose). The second survey form is intended to identify the characteristics of both private car and public transport users and their willingness to pay more if the service is improved. It should be noted that private car and public transport users are coded in two separate database files (Form 2-1 and Form 2-2). The last survey form aims at investigating individual evaluation of the level of service of existing public transport modes.

The database structure of the first component of SPS is presented in Tables 3.3.1 and 3.3.2. Around 1,375 residents were interviewed during SPS to identify some aspects such as: gender, age, driving license status, car ownership, income class, occupation, reason of choosing this community to live in, number of weekly trips to Cairo, trip purpose and transport mode. The willingness to move to Cairo and its reasons were also declared.

The second survey form of SPS is presented in Tables 3.3.3 through 3.3.6 because it is divided into car user and public transport user. Individual motivation to use alternative transport mode was investigated. Travel time, travel cost, waiting time, walking time and number of transfers both current used mode and its alternatives were reported by each interviewee as shown in Table 3.3.3. The effect of improving the level of service of public transport modes was also inferred in addition to the individual willingness to pay more based on level of service improvement.

Public transport users survey records are stored in a file named “SPS-FORM3.DBF” and presented in Table 3.3.5 together with field code description in Table 3.3.6. The characteristics of various transport modes such as travel time, fare type, ticket cost, pass cost, number of transfer, access time, waiting time and egress time were examined. The importance of travel time, travel cost, number of transfers, comfort, security, safety and accessibility were also evaluated by each interviewed person.

The individual opinion survey (Form 3) is presented in Tables 3.3.7 and 3.3.8, in which the advantages and disadvantages of public modes (bus, metro, shared taxi, tram, taxi, suburban railway and Nile ferry) were evaluated in terms of speed, cost, on-time, access/egress, comfort, direct, safety, security and crowding.

## **CHAPTER 4: CORODON LINE DATABASE**

---

### **4.1 OVERVIEW**

The objective of Cordon Line Survey (CLS) is to collect data on both person trips and cargo entering and leaving the Study Area. The selected count stations cover all intersections of the external boundary of the Study Area with road network. The Cordon Line Survey comprises the following four major survey types:

- Classified traffic count survey and roadside interview at cordon stations, around 24,800 interviews in 22 stations.
- Passenger interview and counting survey at five intercity bus terminals, around 5,210 interviews.
- Passenger interview and counting survey on ENR trains and/or at stations, around 3,020 interviews on seven suburban ENR railway lines.
- Passenger interview and counting survey at Cairo International Airport, around 2,140 interviews at two terminals.

The CLS was carried out on normal weekdays, e.g. Monday through Wednesday. Public holidays were excluded from the survey such as the national festival on the 6<sup>th</sup> of October.

Twelve vehicle types were counted for 24 hours from 6:00 AM to 6:00 AM of the following day for all sites. On the other hand, the roadside interview survey (RSI) period was only 16 hours from 6:00 AM to 10:00 PM to ensure safety during CLS implementation.

## **4.2 CORDON LINE DATABASE STRUCTURE**

Cordon line database includes two major components; traffic counts and passenger interview at different locations for several transport modes. Tables 4.2.1 through 4.2.3 describe the database file structure of traffic counts carried out during roadside interview completion. Information of site code, direction, survey data and 12 vehicle type are shown in Table 4.2.1 followed by a description of some fields in Table 4.2.2. A third table is provided to define the survey locations as shown in Table 4.2.3.

The results of Roadside Interview (RSI) are stored in two files; “RSI\_FORM1.DBF” and “RSI\_FORM2.DBF”, which consist of 24,812 and 28,655 records as shown in Tables 4.2.4 and 4.2.5, respectively. Number of passengers including driver, trip origin, trip destination, trip purpose were identified for each interviewed passenger as illustrated in Table 4.2.6. In case of interviewing a truck some addition information was obtained such as commodity type, truck loading type and loading condition (see Table 4.2.7 for field code description).

Around 5,210 bus passengers were interviewed at 5 bus terminals to define their travel pattern such as trip origin, trip destination, departure station, arrival station, trip purpose, access mode, egress mode. The bus passengers database is explained in Tables 4.2.8 through 4.2.11. A quite similar database is built for railway passengers (3,020 interviews) as shown in Tables 4.2.12 through 4.2.15.

A sample of around 2,140 passengers leaving the Study Area to other countries were interviewed at International Airport. Similar information to bus and railway passengers was collected except for meaningless data such as egress mode because it will happen in another country. The database description of Airport passengers is illustrated in Tables 4.2.16 through 4.2.19

## CHAPTER 5: SCREEN LINE DATABASE

---

### 5.1 OVERVIEW

The Screen Line Survey (SLS) aims at obtaining the existing traffic volume on the screen line, analyzing the existing traffic condition and adjusting the results of HIS.

The Nile River was set as the most preferable screen line in the study area. The Nile divides the study area into the east and the west into two. Cairo Governorate, the Gazeera Island, the Rooda Island and Qalyobeya Governorate are included in the east. The western part of the Giza Governorate is included in the west.

The screen line consists of the following eleven (11) bridges crossing the Nile:

1	Waraq	7	Gamaa
2	Rood El Farag	8	Giza
3	Imbaba	9	Moneeb
4	15th of May	10	Marazeeq
5	6th of October	11a	Delta Barrage at Damietta
6	Galaa	11b	Mohammed Ali Barrage

The screen line survey was performed on normal weekday from Monday through Wednesday excluding public holidays. Survey hours were 24 hours from 6:00 in the morning to 6:00 in the morning on the next day.

Some of these surveys were repeated for a typical weekday during Ramadan. The reason for the repeated surveys was to estimate changing traffic patterns during Ramadan

The following outcomes were obtained from the screen line survey:

- Traffic volumes by location, by direction, by hour and by vehicle type.
- Vehicle composition.
- Hourly fluctuation of traffic volume.
- Average passenger occupancy by vehicle type

The counted vehicle were classified into 12 vehicle types as follows:

- Passenger car.
- Taxi (Cairo taxi and intercity taxi).
- Public buses (CTA, GCBC, Governorate and intercity bus).
- Public minibus.
- Private buses (school bus, company and tourist bus).
- Shared taxi.
- Light commodity vehicle (pickup and vans).
- 2 Axles truck.
- 3 Axles truck.
- Heavy truck (over three axles, trailer, semi-trailer).
- 2-wheeler (motorcycle).
- Others (military, police, ambulance and etc.).

## **5.2 SCREEN LINE DATABASE STRUCTURE**

The screen line database is simple and consists of three datasets in Tables 5.2.1 through 5.2.3. Traffic count database at screen line includes 3,456 records, which covers 11 count sites in addition to other traffic counts during Ramadan for 7 selected bridges.

The database structure of screen line counts is presented in Table 5.2.1 followed by a code description to some of its fields, i.e., site code, direction and duration. A third database file is provided to describe the count locations including type of traffic count, site number, site code, site description, direction of travel, traffic count duration, survey date and name of traffic count site.
