Table C-4 Observation Results of Thin Sections of Rock Samples

1.

Sample Name: G002				
Rock Name: Hornblende andesite				
Field Description: Diorite porphyry				
Description under Microscopy				
Texture: Porphyritic, holocrystalline				
Phenocryst				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	500um-1.5mm	30-40%	Prismatic, clear zoning, colloidal fringes. Tabular, with a resorption border
Hornblende	Subhedral	500um-1.5mm	10-20%	
Groundmass: mosaic of quartz and plagioclase, minor amount of apatite, zircon				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Quartz	anhedral	10-20 um	-20 %	
Plagioclase	anhedral	20-50 um	-20 %	
Opaque	anhedral-granular	20-50 um	- 5 %	
Alteration: Plagioclase phenocrysts strongly alter to calcite and smectite. Fringes of Hornblende phenocrysts are replaced by opaque mineral. Calcite and epidote, and quartz veinlets are observed.				

Note: The 'um' in the 'Grain Size' column means micron meter.

Table C-4 Observation Results of Thin Sections of Rock Samples

2.

Sample Name: G003				
Rock Name: Altered hornblende andesite				
Field Description: Diorite porphyry, similar to G002				
Description under Microscopy				
Texture: Porphyritic, holocrystalline				
Phenocryst				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	300um-2mm	20-30%	Prismatic, clear zoning, colloidal rim. Tabular, with a resorption border.
Hornblende	Euhedral-subhedral	300um-2.5mm	10-20%	
Groundmass: mosaic of quartz and plagioclase, minor amount of apatite, zircon				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Anhedral-mosaic	20-50 um	-30 %	
Quartz	Anhedral	20-50 um	-20 %	
Alteration: Hornblende strongly alters to calcite-chlorite-smectite. Plagioclase alters to calcite and smectite. (mixed layer mineral, opaque)				

Table C-4 Observation Results of Thin Sections of Rock Samples

3.

Sample Name: G014				
Rock Name: Hornblende-augite andesite				
Field Description: Basaltic andesite				
Description under Microscopy				
Texture: Porphyritic, hyalocrystalline-cryptocrystalline, fluidal structure				
Phenocryst				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	200um-1mm	-30%	Inclusion in crystal Fluidal
Augite	Euhedral-subhedral	400um-800um	-10%	Zoning
Hornblende	Subhedral	300um-400um	-5%	Strongly altered
Groundmass: Plagioclase, augite, opaque				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Needle-subhedral	20x100 um	- 30 %	Fluidal
Opaque	Granular	100-200 um	- 5 %	
Augite	Subhedral-anhedral	20-50 um	- 2 %	
Alteration: Hornblende strongly alters to chlorite-smectite mixed layer mineral. Chlorite-smectite mixed layer mineral occurs as vein form. Groundmass does not strongly alter.				

Table C-4 Observation Results of Thin Sections of Rock Samples

4.

Sample Name: G021				
Rock Name: Altered andesite-dacite				
Field Description: Andesite porphyry				
Description under Microscopy				
Texture: Porphyritic, weak fluidal texture				
Phenocryst				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	100um-1.5mm	30-40 %	Zoning
Quartz	Anhedral	300um-400um	5 %	Colloidal, patch-like
Groundmass: Plagioclase lath, weakly altered				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Lath-needle	10 x 100 um	20-30 %	
Quartz	Granular	50 x 200 um	- 1 %	
Opaque	Granular	20-50 um	- 10 %	
Alteration: Plagioclase phenocryst strongly alters to calcite and smectite. Fringes of hornblende phenocrysts are resorbed. Calcite and epidote, and quartz veinlets are observed.				

Table C-4 Observation Results of Thin Sections of Rock Samples

5.

Sample Name: G005				
Rock Name: Two pyroxene hornblende andesite				
Field Description: Andesite				
Description under Microscopy				
Texture: Porphyritic, fluidal structure, a part glomeroporphyritic augite				
Phenocryst: Plagioclase, augite, hypersthene, hornblende				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	euohedral-subhedral	200um-1.2mm	~40%	Tabular
Augite	euohedral	200um-500um		Granular, Glomeroporphyritic (rare),
Hypersthene	euohedral-subhedral	~500um	2-3%	Lath shape
Hornblende	subhedral	500um-1.0mm	2-3%	Tabular to granular, Rim: opacitization
Groundmass: Hyalocrystalline opaque mineral, in augite and groundmass devitrification				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	acicular-lath shape	10-100 um	20~30 %	Flow structured.
Glass	irregular			Devitrified.
Opaque	tabular	100-200 um	- 5 % >	
Alteration: Groundmass (glassy), devitrified.				
Plagioclase phenocryst (interior part): smectitized (mixed layer mineral?).				
Hornblende is strongly resorbed				
Alteration is generally weak.				

Table C-4 Observation Results of Thin Sections of Rock Samples

6.

Sample Name: G008				
Rock Name: Augite hornblende andesite				
Field Description: Similar to G005				
Description under Microscopy				
Texture: Porphyritic, cryptocrystalline to holocrystalline				
Phenocryst: Plagioclase, augite, resorbed hornblende				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	300um-1.2mm	30-40%	Strongly zonal structure. Partly glomeroporphyritic. Disposition of inclusions.
Augite	Euhedral-subhedral	300um-800um	~10%	Fresh, partly cryptocrystalline
Hornblende	Euhedral-subhedral	200um-400um	~5%	Corona form, resorption.
Groundmass: plagioclase, glass, opaque				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Subhedral, needle	5 × 50 um	-20 %	No flow structure. Cryptocrystalline glass.
Opaque	granular, anhedral	100~20 um	- 5 %	
Glass			- 20 %	
Alteration: not remarkably altered.				
Plagioclase alters to smectite.				
Mixed layer mineral occurs.				
Borders of hornblende phenocrysts are resorbed.				
Corona form and reaction rim occur at the periphery.				

Table C-4 Observation Results of Thin Sections of Rock Samples

7.

Sample Name: G033				
Rock Name: Schistose sandstone, or semi-schist (schistose sandstone)				
Field Description: Sandstone				
Description under Microscopy				
Texture: Phyllic to schistose, fine crepey structure (oblique to the sheared schistosity)				
Phenocryst: Alternation of siliceous layer and mafic layer, re-crystallized				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Quartz	mosaic form	50um(simple) 10um-20um(gathering)	20-30% -30%	Schistose, Banded structure
Muscovite (?)	schistose	10um-30um	-10%	
Actinolite (?)	acicular-granular	10um-30um	-10%	
Sphene	subhedral	300um-500um	- 2%	
Opaque	granular	200um-500um	- 2%	
Groundmass				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Alteration: A large amount of banded muscovite occurs in the groundmass.				

Table C-4 Observation Results of Thin Sections of Rock Samples

8.

Sample Name: G045				
Rock Name: Augite andesite				
Field Description: Andesite				
Description under Microscopy				
Texture: Porphyritic, cryptocrystalline, opaque				
Phenocryst: large phenocryst of plagioclase, augite				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral (Partly fragmental)	200um-2.0mm	30-40%	Zoning. Partly glomeroporphyritic. Contain melt inclusion.
Augite	Euhedral-subhedral	200um-2.5mm	10-20%	Twin, partly fragmental.
Opaque	Subhedral- granular	200um-500um	- 2%	Together with augite.
Groundmass: Cryptocrystalline~holocrystalline				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Tabular to acicular	10 × 100 um	-20 %	Weak alteration.
Glass (?)			-20 %	
Alteration: Almost unaltered (fresh).				
Plagioclase: Partly altered to smectite				

Table C-4 Observation Results of Thin Sections of Rock Samples

9.

Sample Name: G051				
Rock Name: Altered andesite to dacite (hornblende andesite to dacite)				
Field Description: Altered andesite				
Description under Microscopy				
Texture: Porphyritic, holocrystalline				
Phenocryst: Plagioclase, altered hornblende				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	500um-3.0mm (max)	-40%	Partly carbonatized, epidotized.
Hornblende	Euhedral-subhedral	800um-2.5mm	-20%	Completely chloritized. Resorbed.
Opaque	Anhedral-granular	100um-300um	- 3%	
Groundmass: Holocrystalline plagioclase, quartz				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Subhedral-anhedral	-100 um	10-20 %	Weak alteration.
Quartz	Anhedral	-100 um	10-20 %	
Alteration: Propyritic alteration.				
Mafic mineral: remarkably alters to chlorite (calcite, opaque).				
Plagioclase: partly alters to calcite.				

Table C-4 Observation Results of Thin Sections of Rock Samples

10.

Sample Name: G064				
Rock Name: Altered augite andesite				
Field Description: Altered andesite				
Description under Microscopy				
Texture: Porphyritic, cryptocrystalline~hyalocrystalline				
Phenocryst: plagioclase, augite, altered mafic mineral (orthopyroxene? or hornblende)				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	700um-1.5mm	25-30%	Weak zoning.
Augite	Subhedral	300um-600um	-10%	Weak alteration.
Altered mafic (Orthopyroxene or hornblende)	Euhedral-subhedral	500um-700um	-10%	Tabular, completely altered. Relict-like Intergrowth with augite.
Groundmass: mosaic of quartz and plagioclase, minor amount of apatite, zircon				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Acicular	10×100 um~ 20×200 um	-30 %	Lath form. Flow structured.
Opaque	Granular to subhedral	20-150 um	- 5 %	Irregularly scattered in the matrix part.
Alteration: Plagioclase and mafic mineral phenocrysts strongly alter. Plagioclase alters to calcite, epidote and smectite. Mafic mineral alters to chlorite/smectite, smectite.				

Table C-4 Observation Results of Thin Sections of Rock Samples

11.

Sample Name: G095				
Rock Name: Augite andesite				
Field Description: Andesite				
Description under Microscopy				
Texture: Porphyritic, cryptocrystalline, hyalocrystalline, partly poikilitic augite occurred in plagioclase.				
Phenocryst: Plagioclase, augite, opaque				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Tabular Euhedral-subhedral	500um-1.0mm	20-30%	Weak alteration (carbonitized). Zoning: moderate.
Augite	Euhedral-subhedral	300um-500um	-10%	Alteration is not remarkable. Borders: reaction rim.
Opaque	Granular-anhedral	100um-500um	<5%	Intergrowth (close) with augite. Primary opaque: dominant.
Groundmass: Cryptocrystalline, intersertal~intergranular.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Lath	10×100 um	-40 %	Weak fluidal texture
Opaque	Granular	10-30 um	-10 %	Intergranular.
Alteration: Plagioclase phenocryst weakly alter to calcite and smectite. Smectite: observed in veinlets.				

Table C-4 Observation Results of Thin Sections of Rock Samples

12.

Sample Name: G125				
Rock Name: Diorite				
Field Description: Dioritic rock				
Description under Microscopy				
Texture: Holocrystalline, granitic texture				
Phenocryst: Plagioclase, quartz, hornblende				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Subhedral	800um-1.5mm (max. 3mm)	30-40%	Weak zoning. Partly altered.
Quartz	Anhedral	800um-1.5mm	-20%	
Hornblende	Subhedral	600um-1.2mm	-10%	
Opaque	Subhedral~anhedral		- 5%	
Zircon	Subhedral	50um~	<1%	
Apatite	Tabular	50um-100um	<1%	
Groundmass: Zircon, apatite				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Zircon	subhedral~anhedral	50 um	<1%	
Apatite	tabular	50-100 um	<1%	
Alteration: Hornblende partly alters to chlorite. Plagioclase: weakly alters to calcite and epidote.				

Table C-4 Observation Results of Thin Sections of Rock Samples

13.

Sample Name: G146				
Rock Name: Dacite (quartz porphyry?), weakly altered				
Field Description: Dacitic porphyry				
Description under Microscopy				
Texture: Porphyritic, holocrystalline				
Phenocryst: Plagioclase, quartz				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	800um-1.2mm	20-30%	Isolated or glomeroporphyritic.
Quartz	Anhedral-corroded	500um-1.5mm (max. 2.5mm)	20%~	Remarkably corroded.
Hornblende (?)	Subhedral	500um-1.5mm	5-10%	Altered.
Opaque	Subhedral-granular	500um-1.0mm	~5%	(smectite, chlorite/smectite)
Groundmass: Plagioclase, quartz, holocrystalline				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Tabular-granular	20-50 um	-40 %	Holocrystalline
Quartz	Granular	20-50 um		
Alteration: smectite (saponite) is observed along fissures in plagioclase phenocrysts. Hornblende alters to smectite or smectite/chlorite as relict form.				

Table C-4 Observation Results of Thin Sections of Rock Samples

14.

Sample Name: G147				
Rock Name: Altered dacite (or Quartz porphyry)				
Field Description: Rather strongly altered rock of G146				
Description under Microscopy				
Texture: Porphyritic, holocrystalline, opaque				
Phenocryst: Plagioclase, quartz, hornblende				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-anhedral	700um-2.0mm	-30%	Strongly altered, weak zoning. Partly glomeroporphyritic.
Quartz	Anhedral	1~2.5mm	-20%	Corroded
Hornblende	Subhedral	400um-2.0mm	-10%	Completely altered.
Opaque	Anhedral-granular	200um-300um	- 5%	Primary + secondary (mafic).
Apatite	Acicular			
Groundmass: Holocrystalline.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Subhedral-anhedral	10-50 um	-40 %	Weak alteration
Opaque	Anhedral	10-50 um		
Alteration: Plagioclase alters to smectite, albite, and partly sericite. Hornblende phenocryst alters to chlorite or chlorite/smectite (?).				

Table C-4 Observation Results of Thin Sections of Rock Samples

15.

Sample Name: G156-2				
Rock Name: Altered dacite to Quartz porphyry				
Field Description: Altered dacite				
Description under Microscopy				
Texture: Porphyritic, holocrystalline~microcrystalline				
Phenocryst: almost same as G156-1, hornblende completely alters to chlorite.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Groundmass: holocrystalline, mosaic →Quartz porphyry?				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Alteration: Hornblende strongly alters to chlorite.				

Table C-4 Observation Results of Thin Sections of Rock Samples

16.

Sample Name: G156-1				
Rock Name: Hornblende dacite				
Field Description: Dacitic rock				
Description under Microscopy				
Texture: Porphyritic, holocrystalline (or altered matrix)				
Phenocryst: Plagioclase, quartz, hornblende				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	1-2mm	-20%	Zoning, a part
Quartz	Granular	1-1.5mm	-10%	glomeroporphyritic
Hornblende	Anhedral-subhedral	300um-1.2mm	-5%	Corroded. Rim; reaction rim is observed.
Opaque	Granular-anhedral	~200um	- 1%	Partly altered into smectite, chlorite. Intergrowth with hornblende or isolated.
Groundmass: Holocrystalline, almost part are altered into smectite.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Anhedral-mosaic	10-50 um	40-50%	Matrix part;
Quartz	Anhedral-mosaic			Strongly altered to smectite
Alteration: Sericite and smectite alteration is remarkable in the groundmass.				

Table C-4 Observation Results of Thin Sections of Rock Samples

17.

Sample Name: G165				
Rock Name: Augite andesite to basaltic andesite				
Field Description: Basic andesite				
Description under Microscopy				
Texture: Porphyritic, fluidal structure, amygdaloidal, intergranular texture.				
Phenocryst: Plagioclase, augite				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	1-2mm	-30%	Very weak zoning. Glomeroporphyritic or mosaic texture with augite. Unaltered but not xenomorphic texture. Filled by smectite or chlorite/smectite.
Augite	Subhedral-anhedral	700um-1.0mm (max.1.5mm)	-10%	
Amygdale		200um-1.0mm	10-20%	
Groundmass: Weak fluidal structure, intergranular texture.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Lath shape	20 × 200 um	-40%	Weakly altered. Weakly fluidal texture
Opaque	Subhedral-granular	10-200 um	- 2 %	
Augite	Granular-subhedral	20-100 um	- 5 %	
-				

Table C-4 Observation Results of Thin Sections of Rock Samples

18.

Sample Name: G166				
Rock Name: Altered dacitic tuff (fine tuff)				
Field Description: felsic tuff				
Description under Microscopy				
Texture: Tuffaceous texture				
Phenocryst: Quartz, plagioclase, opaque, epidote				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Quartz	Anhedral	30-100 um	30-40%	Fragmental to patch form.
Plagioclase	anhedral	30-100 um	10-20%	Fragmental to patch form.
Epidote	subhedral-prismatic	100-200 um	< 1%	Secondary products.
Opaque	anhedral	50-100 um	- 5%	
Groundmass/matrix:				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Alteration: Strongly carbonatized, in patches and partly in veins.				

Table C-4 Observation Results of Thin Sections of Rock Samples

19.

Sample Name: G170				
Rock Name: Aphyric andesite				
Field Description: Andesite				
Description under Microscopy				
Texture: Aphyric to weak porphyritic, amygdaloidal Cryptocrystalline to hyalocrystalline				
Phenocryst				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	100-200um	5-10%	Zoning: none-very vague Zeolite (?), chlorite, (chlorite/smectite) are observed. Pores are observed.
Amygdale	Long ellipsoidal to lenticular (irregular)	1-3mm	- 5%	
Groundmass: Cryptocrystalline to hyalocrystalline, devitrified				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Lath	20 × 100 um	-20 %	No texture.
Opaque	Granular	20-400 um	- 5 %	
Alteration: Chlorite/smectite replaces plagioclase or occurs in amygdale. Pools and patches of smectite is embedded in groundmass.				

Table C-4 Observation Results of Thin Sections of Rock Samples

20.

Sample Name: H002				
Rock Name: Augite andesite				
Field Description: Andesite				
Description under Microscopy				
Texture: Porphyritic, holocrystalline				
Phenocryst: Plagioclase, augite, opaque				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	500um-1.5mm	-40%	Remarkable zoning. Inclusions in crystals. Weakly altered.
Augite	Subhedral-euhedral	300-800um	-20%	
Opaque	Granular-anhedral	200-800um	5 %	
Groundmass: Holocrystalline				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Lath-subhedral	50-200 um	30-40 %	
Alteration: Smectite replaces augite in the groundmass.				

Table C-4 Observation Results of Thin Sections of Rock Samples

21.

Sample Name: H019				
Rock Name: Augite andesite to andesitic porphyry				
Field Description: Andesitic porphyry				
Description under Microscopy				
Texture: Subporphyritic to subequigranular, holocrystalline				
Phenocryst: Plagioclase, augite				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Subhedral	1-2mm	10-20%	Weak zoning. Partly glomeroporphyritic. Few carbonatized Rather fresh. Partly altered to chlorite/smectite
Augite	Subhedral	500um-1mm	10%	
Groundmass: Holocrystalline, coarse matrix, intergranular				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Subhedral-lath	30-100 um	50-60 %	Weak fluidal structure
Opaque	Granular	-200 um	5-10 %	
Alteration: Plagioclase alters to calcite. Augite alters to chlorite/smectite.				

Table C-4 Observation Results of Thin Sections of Rock Samples

22.

Sample Name: H022				
Rock Name: Altered two-pyroxene andesite				
Field Description: Altered andesite				
Description under Microscopy				
Texture: Porphyritic, fluidal structure, completely altered, coarse-grained				
Phenocryst: Plagioclase, orthopyroxene (?), augite, opaque				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	Max.2mm	30-40%	Remarkably zoning.
Orthopyroxene	Subhedral-tabular	1-1.2mm	-10%	Completely chloritized-smectitized
(?)	Subhedral	-1mm	<10%	
Augite	Anhedral-granular	500um-1mm	- 2%	
Opaque				
Groundmass: Intergranular, holocrystalline				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Lath-shape	10 × 100 um	-30%	Skeletal crystal.
		-50 × 300 um		
Opaque	Granular	10-100 um	- 5 %	
Alteration: Matrix; strongly carbonatized and smectitized. Quartz-smectite veinlets develop.				

Table C-4 Observation Results of Thin Sections of Rock Samples

23.

Sample Name: H028				
Rock Name: Altered augite andesite				
Field Description: Altered andesite				
Description under Microscopy				
Texture: Porphyritic, holocrystalline, intergranular				
Phenocryst: Plagioclase, augite				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	500um-2mm	-30%	Zoning. Smectite and sericite are common in the interior.
Augite	Subhedral-subhedral	500um-2mm	-10%	Partly strongly alters to calcite-chlorite-quartz-smectite.
Groundmass: Holocrystalline, smectite and chlorite/smectite are observed in the groundmass.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Subhedral-lath	-20 × 100 um	-20 %	Weak fluidal texture.
Smectite, smectite/chlorite	Intersertal	-50 um	10-20 %	Alteration products?
Opaque	Subhedral-granular	30-100 um	<5%	Intergrowth with lath shape plagioclase.
Alteration: Phenocrysts <p style="margin-left: 40px;">Plagioclase alters to smectite, sericite in the interior or whole part.</p> <p style="margin-left: 40px;">Augite alters to smectite, chlorite, calcite and quartz at the border or whole part.</p> <p style="margin-left: 40px;">Matrix alters to smectite and sericite between plagioclase laths.</p>				

Table C-4 Observation Results of Thin Sections of Rock Samples

24.

Sample Name: H030				
Rock Name: Altered andesite				
Field Description: Altered andesite				
Description under Microscopy				
Texture: Porphyritic, strongly altered, amygdaloidal				
Phenocryst: Plagioclase, augite (?) relict form				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	500um-1.5mm	30%±	Fresh to completely altered Weak zoning.
Augite	Euhedral-subhedral	200um-1.5mm	10-15%	Completely altered. Relict form.
Amygdale	Irregular-lenticular	300um-2mm	5-10%	Filled by schistose smectite, calcite and chalcedonic quartz.
Groundmass: Smectite, sericite and calcite filled the groundmass between laths of plagioclase.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Lath: tabular Subhedral	-200 um	-20 %	Periphery; altered Partly completely altered Scattered in intergranular form.
Opaque	Subhedral-granular	50-200um	-5%	
Alteration: Plagioclase Completely alters to smectite, calcite and quartz. Augite phenocrysts are decomposed into calcite, smectite, and chalcedonic quartz. Groundmass: calcite, smectite, chlorite/smectite (?), chalcedonic quartz.				

Table C-4 Observation Results of Thin Sections of Rock Samples

25.

Sample Name: H033				
Rock Name: Two pyroxene andesite to basaltic andesite				
Field Description: Basic andesite				
Description under Microscopy				
Texture: Porphyritic, holocrystalline				
Phenocryst: Plagioclase, augite, hypersthene				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	500um-2mm	30-40%	Zoning. Inner part: replaced by zeolite. Reaction rim and corroded textures are common.
Augite	Euhedral-subhedral	500um-2mm	10-20%	Glomeroporphyritic assemblage
Hypersthene	Euhedral-subhedral	500um-2mm	-5%	Glomeroporphyritic assemblage
Opaque	Granular	500um-1mm	-2%	Intergrowth with pyroxene, or isolated
Groundmass: Holocrystalline, granular, partly replaced by zeolite				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Subhedral	50-200 um	-20 %	Intergranular to granular mosaic.
Quartz	Anhedral	50-100 um	-5 %	
Zeolite	Tabular	200-400 um	-2 %	
Alteration: Generally weak alteration. Plagioclase phenocryst is partly replaced by zeolite, Small amount of smectite is observed.				

Table C-4 Observation Results of Thin Sections of Rock Samples

26.

Sample Name: H035				
Rock Name: Two-pyroxene andesite to basaltic andesite				
Field Description: Basic andesite				
Description under Microscopy				
Texture: Porphyritic, holocrystalline				
Phenocryst: Plagioclase, hypersthene, augite				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	500um-3mm	-30%	Unaltered. Zoning. Abundant inclusions.
Hypersthene	Euhedral-subhedral	800um-6mm	-10%	Large phenocrysts are included. Unaltered.
Augite	Euhedral-subhedral	500um-2mm	-10%	Partly in paragenesis with
Opaque	Granular	500um-1mm	-5%	Orthopyroxene. Intergrowth with pyroxene, or isolated
Groundmass: Holocrystalline, granular, mosaic				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Mosaic-granular (anhedral)	10-50 um	-40 %	Unaltered. Skeletal Plagioclase is observed.
Quartz	Granular	10-50 um		Intergrowth with plagioclase.
Opaque	Granular-anhedral	20-50 um	<2 %	Intergranular.
Alteration: Plagioclase phenocryst is partly alters to epidote, smectite. Matrix part; a few amount of tabular zeolite (?) occurs.				

Table C-4 Observation Results of Thin Sections of Rock Samples

27.

Sample Name: H057				
Rock Name: Altered amygdaloidal basalt				
Field Description: basalt lava				
Description under Microscopy				
Texture: Aphyric, amygdaloidal, cryptocrystalline to hyalocrystalline Fluidal structure (basaltic texture) carbonatized groundmass.				
Phenocryst				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Amygdale	Ellipse	1-2mm	-20%	Calcite, quartz (mosaic). Partly replaced by small amount of smectite and opaque mineral. Observed in amygdales.
Opaque	Euhedral-granular	500um-1.5mm	-5%	
Groundmass: Fluidal texture, lath to acicular shape plagioclase				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Acicular-lath	-10 × 200 um	30-40%	
Alteration: Matrix part; carbonatized, patch form. Calcite; patchy form or in fissures. Smectite; in fissure.				

Table C-4 Observation Results of Thin Sections of Rock Samples

28.

Sample Name: H061				
Rock Name: Altered (silicified-sericitized) dacite				
Field Description: Altered dacite				
Description under Microscopy				
Texture: Porphyritic, holocrystalline (granular matrix), silicified				
Phenocryst: Quartz, altered plagioclase (?)				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Quartz	Corroded-irregular	1-5mm	10-20%	Strongly corroded.
Plagioclase	Subhedral-anhedral	1-2mm	-10%	Strongly altered to sericite or smectite.
Groundmass: Granular quartz (mosaic), fissure filling by smectite or sericite/smectite.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Quartz		50-200 um	-60 %	Granular to mosaic (silicified?)
Smectite or sericite/smectite	Flaky, network	10-50 um	-10 %	
Alteration: Strongly silicified.				
Matrix part; almost quartz and sericite/smectite.				
Opaque (irregular, xenomorphic) minerals are derived from other phenocrysts (mafic mineral?).				

Table C-4 Observation Results of Thin Sections of Rock Samples

29.

Sample Name: H087-1				
Rock Name: Weakly altered augite andesite				
Field Description: Andesite				
Description under Microscopy				
Texture: Porphyritic, altered matrix				
Phenocryst: Plagioclase, augite				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	500um-2.5mm	30-40%	Almost no zoning. Weakly corroded, effected by alteration?
Augite	Subhedral	800um-1.5mm	5-10%	Almost unaltered (fresh) (Mostly unaltered).
Groundmass: -(Holocrystalline)				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Lath-tabular	-30 × 100 um	-20 %	Randomly scattered
Opaque	Granular-anhedral	50-200 um	- < 5 %	Scattered in the groundmass
Zeolite	Radial-tabular	200-500 um	- < 1 %	Replaced from calcite (pseudomorph)
Alteration: Phenocrysts mostly alters. Groundmass: alters to smectite or chlorite/smectite (glassy material origin?). Radial crystals of zeolite are observed (derived from calcite replacement, pseudomorphic). Zeolite vein occurs.				

Table C-4 Observation Results of Thin Sections of Rock Samples

30.

Sample Name: H087-2				
Rock Name: Same as H087-1				
Field Description: Altered andesite				
Description under Microscopy				
Texture: Tabular to semi-radial. Zeolite veins (width; 200-300 um) develop.				
Phenocryst:				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase				Alters along the border of crystals.
Groundmass:				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Alteration:				

Table C-4 Observation Results of Thin Sections of Rock Samples

31.

Sample Name: H090				
Rock Name: Altered dacitic pumice tuff				
Field Description: Acidic tuff				
Description under Microscopy				
Texture: Tuffaceous texture, pumice (devitrified?), composed of fragments.				
Phenocryst: Quartz, pumice				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Quartz	Corroded	500um-1.2mm	-10%	Corroded. Unaltered (primary). Fragmental.
Pumice	Fragmental	1. 5mm	10-20%	Re-crystallized to chalcedonic quartz and smectite (?) Partly mosaic quartz occurs
Opaque	Granular	300-600 um	1-2%	Chalcedonic quartz: radial or spherulitic textures.
Groundmass: Glassy matrix (re-crystalline part: chalcedonic quartz and smectite).				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Alteration: Glass is replaced by chalcedonic quartz smectite. Zeolite (?) occurs (in the matrix with patchy form).				

Table C-4 Observation Results of Thin Sections of Rock Samples

32.

Sample Name: H091				
Rock Name: Amygdaloidal basalt				
Field Description: Basaltic rock				
Description under Microscopy				
Texture: Aphyric, cryptocrystalline to holocrystalline, fluidal structure (basaltic texture) Intergranular to intersertal texture.				
Phenocryst: Aphyric, large phenocrysts of plagioclase are rare, amygdale				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Amygdale	Rounded-ellipse	500um-5mm	10-20%	Elongated coarse grains. Chlorite/smectite occurs. Filled by zeolite.
Plagioclase	Subhedral	-4mm	5%)	Large phenocryst, Unaltered Chlorite/smectite, zeolite occurs in mesh like form.
Groundmass: Fluidal structure (lath or acicular plagioclase hyaloophitic to fluidal texture).				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Lath-acicular	20×200 um	50-60 %	Lath form, fluidal texture
Augite	Granular-subhedral	50-100 um	-10 %	Intergranular-Intersertal No alteration
Opaque	Granular	10-50 um	< 1 %	Intergranular
Alteration: smectite, chlorite/smectite, chalcedonic quartz, calcite are embedded between grains of plagioclase and augite. Partly chlorite/smectite are observed in veinlets.				

Table C-4 Observation Results of Thin Sections of Rock Samples

33.

Sample Name: H092				
Rock Name: Silicified dacite~rhyolitic tuff				
Field Description:				
Description under Microscopy				
<p>Texture: Tuffaceous texture, few amount of plagioclase (phenocryst?) are observed. Contain mosaic quartz fragment and no structure.</p> <p>Quartz vein developed.</p> <p>Generally silicified.</p>				
Phenocryst: Plagioclase, quartz				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	subhedral-anhedral Fragmental	800um-1.2mm	-10%	Dusty, albitized
Quartz	Mosaic-aggregate	500um-1.5mm	10-20%	Mosaic form
Opaque	Granular	200-300um	-5%	Fragmental.
Groundmass: Fragmental quartz, plagioclase distributed with no structures.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Quartz	Fragmental	20-200 um	-30 %	
Plagioclase	Fragmental	20-200 um	-30 %	
<p>Alteration: Quartz veins (width 50-200 um) develop as a network form.</p> <p>Plagioclase phenocryst is dusty and albitized.</p> <p>Smectite (?) occurs.</p>				

Table C-4 Observation Results of Thin Sections of Rock Samples

34.

Sample Name: H093				
Rock Name: Amygdaloidal basalt				
Field Description: Basalt				
Description under Microscopy				
Texture: Amygdaloidal, hyalopilitic, hyalocrystalline				
Phenocryst: Amygdale, plagioclase				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral Tabular	100-500um	<3%	Long prismatic form, Very scarce.
Amygdale	Ellipsoidal	400um-2mm	10-15%	Smectite alteration Central part* acicular or schistose form mineral (smectite?). Marginal part: filled by calcite Partly chalcedonic quartz (?) occurs.
Groundmass: Basaltic texture, Arrangement of acicular plagioclase. Weak fluidal structure.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Acicular	10-100 um	-60 %	Weak fluidal structure
Alteration: Glassy matrix alters to smectite (?).				

Table C-4 Observation Results of Thin Sections of Rock Samples

35.

Sample Name: H094				
Rock Name: Augite andesite				
Field Description: Andesite				
Description under Microscopy				
Texture: Generally dusty, sub porphyritic, weak fluidal structure, cryptocrystalline~hyalocrystalline				
Phenocryst: Plagioclase, augite				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Subhedral-euhedral	500um-1mm	5-10%	Dusty. Partly glomeroporphyritic. Zoning at the most outer part.
Augite	Euhedral-subhedral	300-800um	5-10%	Fresh. Zoning
Groundmass: Lath-tabular plagioclase; weak fluidal structure. Augite; Intersertal-intergranular.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	50-200 um	-60 %	Skeletal crystal.
Augite	Granular-subhedral	50-100 um	-5 %	Intergranular, No alteration.
Opaque	Granular	30-80 um	- 3 %	Intergranular Random distribution.
Alteration: Smectite (or chlorite/smectite?) occurs in the groundmass (glassy); Devitrification is remarkable.				

Table C-4 Observation Results of Thin Sections of Rock Samples

36.

Sample Name: I003				
Rock Name: Hornblende andesite				
Field Description: Andesite				
Description under Microscopy				
Texture: Porphyritic, holocrystalline~cryptocrystalline, no texture, fresh				
Phenocryst: Plagioclase, hornblende				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	200um-1mm	-30%	Small fragmental grains. Zoning, Abundant inclusions.
Hornblende	Euhedral-subhedral	200um-1.5mm	-20%	Border part: resorbed (Opaque mineral occurs). Oxidation?
Augite	Subhedral	200-300um	-5%	Only a few amounts, Unaltered.
Opaque	Granular	100um-1mm	-5%	Isolated or intergrowth with plagioclase, hornblende and pyroxene.
Groundmass: Hyalocrystalline-glassy				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Acicular	10-100 um	-5 %	minor amounts.
Glass			-30 %	Very weak devitrification.
Alteration:				

Table C-4 Observation Results of Thin Sections of Rock Samples

37.

Sample Name: I004				
Rock Name: Two-pyroxene (?) andesite				
Field Description: Andesite				
Description under Microscopy				
Texture: Porphyritic, cryptocrystalline~ hyalocrystalline				
Phenocryst: Plagioclase, augite, hypersthene (? altered)				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	250um-1.5mm	-30%	Unaltered. Partly glomeroporphyritic. Fresh, twinning, Partly glomeroporphyritic. Completely altered to smectite, calcite.
Augite	Euhedral-subhedral	500um-1.5mm (max.3mm)	10-20%	
Hypersthene (?)	Subhedral			
Opaque	Anhedral-granular	200-400um	-5%	
Groundmass: Cryptocrystalline~hyalocrystalline				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	10-50 um	-20 %	Very weak fluidal texture.
	Lath			
Opaque	Granular	10-50 um	-10 %	Partly smectitized.
Glass			- 20 %	
Alteration: Hypersthene (?) completely alters to smectite/chlorite (?) and calcite. Augite; no alteration which paragenesis with hypersthene. Plagioclase; unaltered. In the groundmass; devitrification is not so strong.				

Table C-4 Observation Results of Thin Sections of Rock Samples

38.

Sample Name: I020				
Rock Name: Meta-granodiorite				
Field Description: Granodioritic rock				
Description under Microscopy				
Texture: Equigranular, granitic texture generally dusty and altered.				
Phenocryst: Plagioclase, quartz, hornblende (altered)				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Subhedral-anhedral	1-2mm	-60%	Slightly altered. Zoning: partly.
Quartz	Anhedral	200um-1mm	-10%	Patchy form, amoebic form. Fissure filling.
Hornblende	Subhedral	1- 2mm	10-15%	Altered intergrowth with actinolite chlorite and smectite.
K-feldspar	Anhedral	500um-1mm	-5%	Fissure filling.
Groundmass:				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Opaque	Granular	100-500 um	-1 %	Adjacent to altered hornblende
Apatite	Tabular	50-200 um	- <1 %	
Zircon	Granular-pyramidal	50-100 um	- <<1 %	
Alteration: Hornblende (?) alters to actinolite, chlorite/smectite. Plagioclase: relatively fresh, partly sericitized with vermiculated form.				

Table C-4 Observation Results of Thin Sections of Rock Samples

39.

Sample Name: I041				
Rock Name: Obsidian (?)				
Field Description:				
Description under Microscopy				
Texture: Volcanic glass glassy~aphanitic, flow structure, weakly devitrified.				
Phenocryst: Plagioclase, augite				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Tabular-anhedral	-1mm	<5%	Very few amount. Parallel to the fluidal structure.
Augite	Tabular-anhedral	200-600um	-1%>	Very few amount. Close to plagioclase phenocrysts.
Chalcedonic quartz	Colloform -spherulic	50-100 um	-10%	Secondary growth with colloform -spherulitic texture.
Groundmass: Volcanic glass with obsidian texture, in general, partly flow structure, Secondary chalcedonic quartz occupy interspaces.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Opaque Glass	Granular	10-30 um 70-80 um	-2 %	Scattered irregularly.
Alteration:				

Table C-4 Observation Results of Thin Sections of Rock Samples

40.

Sample Name: I077				
Rock Name: Altered porphyrite ~ porphyritic andesite (or microdiorite)				
Field Description: Altered andesite				
Description under Microscopy				
Texture: Subporphyritic, holocrystalline (subequigranular ~ subgranitic texture)				
Phenocryst: Plagioclase, altered mafic (biotite, chlorite/smectite).				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Anhedral-mosaic	1.2-2mm	-10%	Alteration is not strong.
Mafic (altered)	Subhedral-anhedral (flaky)	1-1.5mm	-10%	Biotitized (or vermiculite), Chloritization is remarkable. Original shapes are undetermined. (Hornblende?)
Groundmass: Microdioritic texture in general.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Subhedral-anhedral	300-800 um	-60 %	Mosaic
Mafic?	Subhedral-anhedral	100-500 um	5 %-	Aggregates (after hornblende)
Opaque	Granular	50-300 um	-5%	Scattered irregularly
Alteration: Mafic mineral; remarkably alters to biotite (?), chlorite/smectite.				

Table C-4 Observation Results of Thin Sections of Rock Samples

41.

Sample Name: I078				
Rock Name: Altered andesite				
Field Description: Silicified andesite				
Description under Microscopy				
Texture: Porphyritic, holocrystalline				
Phenocryst: Plagioclase				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	300um-2mm	-30%	Weak zoning. Fresh to completely altered
Groundmass: Strongly silicified, mosaic texture. Quartz occurs.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Quartz	Anhedral-mosaic	10-50 um	-50 %	Strongly silicified?
Apatite	Euhedral-tabular	-200 um	-1 %	Primary; (in plagioclase)
Opaque	Granular	100-500 um	-2 %	Primary and secondary (resorbed products)
Alteration: Plagioclase phenocryst is partly fresh, partly strongly alters to calcite, epidote, chlorite and smectite. Groundmass: strongly silicified and quartz grains occurs.				

Table C-4 Observation Results of Thin Sections of Rock Samples

42.

Sample Name: J047				
Rock Name: Altered andesitic tuff (?)				
Field Description: andesitic tuff				
Description under Microscopy				
Texture: Fine tuff texture in general, partly porphyritic texture.				
Phenocryst: Plagioclase (altered)				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	1.5mm ±	-5% >	Altered. Partly fresh.
Mafic (?)	Subhedral	1-1.5mm	-5% >	Altered.
Opaque	Subhedral-granular	500um-1mm	-1%	
Groundmass: Plagioclase, opaque. Matrix part chlorite with patch form.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral Fragmental	50-200 um	-50 %	Lath shape, Skeletal form, Weak alteration (dusty)
Opaque	Granular	10-50 um	- 5 %	
Alteration: Plagioclase strongly alters to epidote, smectite, chlorite and calcite. Mafic mineral alters to chlorite and smectite/chlorite.				

Table C-4 Observation Results of Thin Sections of Rock Samples

43.

Sample Name: J053				
Rock Name: Altered granite				
Field Description: Granitic rock				
Description under Microscopy				
Texture: Equigranular, granitic texture. Mafic mineral; completely alters to epidote, chlorite.				
Phenocryst: Quartz, plagioclase, K-feldspar				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Quartz	Anhedral	300um-1.2mm	30-40%	Intergrowth with mosaic form.
Plagioclase	Subhedral-anhedral	600um-1.5mm	20-30%	Plagioclase and K-feldspar; slightly alters to smectite and sericite.
K-feldspar	Anhedral	500um-1.2mm	-20%	
Mafic mineral	Subhedral-anhedral	500um-1.0mm	-10%	Original mineral is undetermined, Completely altered into epidote and chlorite.
Opaque	Granular	100-350um	-2%	Observed as accessory minerals.
Zircon	Prismatic	100-350um	- <1%	
Apatite	Acicular-tabular	100-200um	- <1%	
Groundmass:				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Alteration: Felsic mineral is weakly altered. Plagioclase phenocryst and K-feldspar slightly alters to smectite and sericite by vermiculated form. Mafic mineral is completely altered into assemblage of tabular or radial form epidote and chlorite.				

Table C-4 Observation Results of Thin Sections of Rock Samples

44.

Sample Name: K020				
Rock Name: Augite andesite				
Field Description: Andesitic rock				
Description under Microscopy				
Texture: Porphyritic, cryptocrystalline-hyalocrystalline. Weak fluidal structure				
Phenocryst: Plagioclase, augite, opaque				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral (-subhedral)	200um-1.2mm	-40%	Weak fluidal structure Isolated or intergrowth with augite.
Augite	Euhedral (-subhedral)	200um-1.5mm	-20%	
Opaque	Subhedral-granular	50-300um	-5%	
Groundmass: Cryptocrystalline-hyalocrystalline				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Glass			-20%	Unaltered.
Plagioclase	Lath-prismatic Euhedral-subhedral	50-100um	-20%	Lath shape, irregular
Opaque	Granular	10-50um	-3%	Scattered in the matrix
Augite	Subhedral-granular	20-100um	-3%	Intersertal with plagioclase and glass
Alteration:				

Table C-4 Observation Results of Thin Sections of Rock Samples

45.

Sample Name: K047				
Rock Name: Altered dacite				
Field Description: Dacitic rock				
Description under Microscopy				
Texture: Porphyritic, (partly tuffaceous texture?)				
Phenocryst: Quartz, plagioclase, matrix part; hyalocrystalline texture				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Quartz	Corroded, anhedral	200um-1.5mm	-20%	Corroded. Partly; medium-grains of quartz scattered (secondary?).
Plagioclase	Anhedral- subhedral	500um-1.2mm	-10%	Completely altered. Partly albitized.
Opaque	Anhedral- subhedral	100-500um	-3%	Pyrite? (from the form)
Mafic (?)	Granular Aggregate	50um-1.5mm		Completely alters to chlorite, chlorite/smectite. Part of original texture is glomeroporphyritic.
Groundmass: Quartz, plagioclase				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Quartz	Anhedral-mosaic	30-200um	-30%	Weak alteration. Intergrowth with mosaic form part.
Plagioclase	Subhedral-mosaic	30-200um	-20%	Chlorite/smectite replaces plagioclase.
Alteration: Plagioclase alters to smectite, epidote, sericite and calcite (Quartz occurs scarcely). Mafic mineral alters to chlorite/smectite and chlorite (also opaque occurs).				

Table C-4 Observation Results of Thin Sections of Rock Samples

46.

Sample Name: K048				
Rock Name: Altered andesite-dacitic andesite				
Field Description: Dacite to andesite				
Description under Microscopy				
Texture: Porphyritic, hyalocrystalline, strong alteration (silicification)				
Phenocryst: Plagioclase, quartz				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Anhedral- subhedral	200um-1.5mm	-20%+	Diversity alterations, (Partly, completely altered, partly only albitization is observed). Borders of crystals strongly alters.
Quartz	Anhedral	200-400um	-10%	Granularly scattered in the groundmass.
Opaque	Subhedral-granular	100-400um	5-10%	Scattered in the grounmass
Groundmass: Quartz, plagioclase				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Quartz	Anhedral	10-100um	-30%	Hyalocrystalline.
Plagioclase	Subhedral- anhedral (Partly lath shape)	50-100um	-20%	Densely occupy
<p>Alteration:</p> <p>Plagioclase; Strongly altered.</p> <p>Coarse crystals of quartz occur at the border part.</p> <p>Amorphous texture (maybe chalcedonic quartz?) occurs at the interior part.</p> <p>Alters to calcite, albite and chlorite/smectite</p> <p>Quartz;</p> <p>Secondary products of plagioclase.</p> <p>Alteration products of matrix materials.</p>				

Table C-4 Observation Results of Thin Sections of Rock Samples

47.

Sample Name: K068				
Rock Name: Altered dacite-andesitic tuff				
Field Description:				
Description under Microscopy				
Texture: Porphyritic				
Phenocryst: Plagioclase, quartz				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Subhedral- fragmental	200um-1mm	-20%	Fragmental; glomeroporphyritic. Partly strongly altered. Fragmental, occurs as patches. Disseminated
Quartz	Anhedral-fragmental	100-300um	-5%	
Opaque	Subhedral-granular	100-300um	-3%	
Groundmass: Plagioclase, quartz, opaque clay mineral: epidote, chlorite/smectite densely occurs.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Tabular-subhedral	10-100um	-40%	
Quartz	Fragmental			
Opaque	Patchy			
Epidote	Prismatic, radial			
Chlorite/smectite	Radial			
Alteration:				
<p>Plagioclase partly completely alters to epidote (assemblage of tabular~prismatic or radial form).</p> <p>Radial aggregated chlorite/smectite (?) occurs widely.</p> <p>Matrix is replaced by chlorite/smectite remarkably.</p>				

Table C-4 Observation Results of Thin Sections of Rock Samples

48.

Sample Name: L004				
Rock Name: Weakly altered augite andesite				
Field Description: Andesite				
Description under Microscopy				
Texture: Porphyritic, cryptocrystalline, intergranular-hyalocrystalline				
Phenocryst: Plagioclase, augite, opaque, few amount of hornblende, biotite				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral- subhedral	300um-1.2mm	-30%	Partly alters as a vermiculated form (inner part). Sporadic poikilitic augite is included. Partly shows reaction form at the border. Isolated or close to augite. Reaction rim (resorbed) is observed.
Augite	Euhedral- subhedral	300um-1mm	-10%	
Opaque	Subhedral-granular	100-400um	-3%	
Hornblende	Flaky	300-500um	<1%	
Biotite	Flaky			
Groundmass: Plagioclase, augite, opaque. Intersertal texture, cryptocrystalline				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral Lath shape	10-100um	20-30%	Weak fluidal texture. Distributed as an intersertal form.
Augite	Granular	-10um	- <1%	
Opaque	Granular	10-50um	-5%	
Glass			10-20%	
Alteration: Plagioclase; Partly plagioclase phenocryst is alters to chlorite/smectite forming vermiculated shape.				

Table C-4 Observation Results of Thin Sections of Rock Samples

49.

Sample Name: L028-1				
Rock Name: Altered basaltic andesite				
Field Description: Basic andesite				
Description under Microscopy				
Texture: Fluidal, porphyritic, hyalocrystalline				
Phenocryst: Plagioclase, altered mafic mineral, opaque, fluidal structure				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	euhedral- subhedral	200um-1.5mm	-30%	A part alters as a vermiculated form.
Altered mafic	Euhedral- subhedral	1-2mm	10-15%	Completely altered (originate mineral; olivine?).
Augite	Euhedral- subhedral	1-15mm	-3%	Large phenocrysts occur close to plagioclase. Weak alteration.
Groundmass:				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	20-100um	20-30%	Fluidal texture with laths of plagioclase.
Glass	Lath, acicular		30%±	Weak devitrification.
Opaque	Granular	100-300um	<1%	Occurs as intersertal form.
Augite	Subhedral-granular	100-200um	-1%	
Alteration:				
Plagioclase alters as vermiculated form.				
Mafic mineral alters to chlorite/smectite and carbonate (?) with pseudomorphic texture.				

Table C-4 Observation Results of Thin Sections of Rock Samples

50.

Sample Name: L028-2				
Rock Name: Altered basaltic andesite				
Field Description: Same as L028-1				
Description under Microscopy				
Texture:				
Phenocryst:				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Groundmass:				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Alteration:				
<p>Plagioclase phenocryst alters to chlorite/smectite (radial flaky aggregate) with vermiculated form.</p> <p>Olivine (?) alters to chlorite/smectite (saponite?), partly chalcedonic quartz occurs.</p> <p>Carbonate (dolomite or magnesite?) occurs as secondary products.</p>				

Table C-4 Observation Results of Thin Sections of Rock Samples

51.

Sample Name: L029				
Rock Name: Altered (silicified-carbonatized) dacite				
Field Description: Dacite				
Description under Microscopy				
Texture: Porphyritic, matrix: weakly fluidal texture. Hyalocrystalline (?) - cryptocrystalline				
Phenocryst: Plagioclase, quartz				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	400um-1mm	15-20%	Partly; glomeroporphyritic.
Quartz	Anhedral-mosaic	500-800 um	5-10%	Fragmental, primary (?).
Opaque	Subhedral	100-200 um	-2%	Isolated or close to plagioclase.
Groundmass: Plagioclase, quartz, apatite				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Acicular-lath	5-100 um	20-3-% 10-15%	Laths with flow structure.
Quartz	Anhedral-mosaic	50-100 um	<1%	At the matrix part: observed as pool or mosaic form (secondary alteration).
Apatite	Prismatic	50-100 um	-5%	Close to plagioclase.
Opaque	Granular	10-100 um	-10%	
Glass				Devitrification is weak.
Alteration: Vesiculars, filled by calcite. Groundmass, replaced by calcite in fissures or as replacement. Strongly silicified. Partly; plagioclase alters to quartz, calcite, chlorite/smectite and small amount of epidote (pseudomorphic texture). Quartz veinlets also develops.				

Table C-4 Observation Results of Thin Sections of Rock Samples

52.

Sample Name: L033				
Rock Name: Strongly altered (sericitized-silicified) dacite				
Field Description: Dacitic rock				
Description under Microscopy				
Texture: porphyritic, strongly altered (sericitized, silicified)				
Phenocryst: Plagioclase, quartz				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral	1-2mm	-20%	Completely altered (sericitized, silicified).
Quartz	Corroded-anhedral	500um-2mm	-20%	Overgrowth by silicification is observed.
Groundmass: Quartz occurs as silicification products. Small amount of sericite occurs in the interspaces of quartz grains.				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Quartz	Granular-mosaic	20-100um	-50%	Derived from hydrothermal alteration of the original groundmass.
Sericite	Flaky	10-50um	-5%	
Alteration: Plagioclase phenocryst and matrix part is strongly altered. Phenocryst; sericite, quartz, limonite and hematite occurs as secondary products (remaining of fringes form; pseudomorphically).				

Table C-4 Observation Results of Thin Sections of Rock Samples

53.

Sample Name: L045				
Rock Name: Two-pyroxene basaltic andesite				
Field Description: Basic andesite				
Description under Microscopy				
Texture: Porphyritic, hyalocrystalline, fluidal texture				
Phenocryst: Plagioclase, augite, hypersthene, opaque				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Euhedral-subhedral	800um-1.5mm	25-30%	Isolated or glomeroporphyritic. Partly ophitic texture, in intergrowth with pyroxene. Weak alteration
Augite	Euhedral-subhedral	600um-1.2mm	10-15%	Independent or together with plagioclase. Weak alteration
Hypersthene	Euhedral-subhedral		-5%	
Opaque	Subhedral-granular	200-600um	-5%	
Groundmass: Intersertal texture, fluidal texture Plagioclase, augite, opaque, glass				
Mineral	Grain Shape	Grain Size	Volume Ratio	Description
Plagioclase	Acicular-lath (microlite-like)	50-100um	20-30%	Poikilitic texture-fluidal texture is observed.
Augite	Granular-	10-20um	-5%	Pl+Au+Op+glass=40%. Glassy texture with fluidal texture is observed with intersertal form.
Opaque	(subhedral)	10-30um	-5%	
Glass	Granular Intersertal		10-20%	
Alteration: Plagioclase partly alters to chlorite/smectite with vermiculated form. Generally weak alteration.
