A. Attendance List

Cambodian Counterpart Team Members

- 1) Mr. Chhin Kong Hean : Team Leader, Director General, Directorate of Public Works
- 2) Mr. Tauch Chankosal : Coordinator, First Director General, Directorate of Public Works
- 3) Dr. Yit Bunna : Coordinator, Director, Public Works Research Center
- 4) Mr. Phy Sophort : Coordinator, Deputy Director, Public Works Research Center
- 5) Mr. Khun Srun : Traffic Engineer, Public Works Research Center
- 6) Mr. Kong Sophal : Pavement Specialist, Public Works Research Center
- 7) Mr. You Dara : Highway Engineer, Department of Road and Bridge
- 8) Mr. Nop Kilarith : Bridge and Structure Engineer, Department of Road and Bridge
- 9) Mr. Mak Samnang : Hydrological and Hydraulic Analysis, Department of Waterway

JICA Study Team Members

- 1) Mr. Kenji MARUOKA : Team Leader, Road Planning
- 2) Mr. Takashi FURUKAWA : Deputy Team Leader, River and Flood Control
- 3) Mr. Tatsuyuki SAKURAI : Deputy Team Leader, Road Design
- 4) Dr. Tadanori KITAMURA : Hydrological and Hydraulic Analysis
- 5) Mr. Kenji ISOMOTO : Traffic Survey / Traffic Demand Forecast
- 6) Mr. Yoshimi TAKAI : Structure Design
- 7) Mr. Ryohei WATANABE : Construction Planning / Cost Estimate
- 8) Mr. Shinichi MATSUNAGA : Agriculture / Irrigation / Colmatage Survey
- 9) Mr. Toshio KIMURA : Economic and Financial Analysis
- 10) Mr. Hiroshi TANAKA : Social Environmental Analysis
- 11) Mr. Hidetoshi NAKANO : Coordination, Design of River Facilities

B-7. Protection against Erosion and Scouring for Openings

B-7.1 Protection for Opening Bed of Bridges

Sudden contraction flow occurs at upstream and sudden expansion flow occurs at the downstream of bridge. If the opening bed is not protected, by these contraction flow and expansion flow as well as local scouring around piers, erosion and scouring of opening bed at bridges and its surrounding areas will occur. As can be seen at the existing Cut-off No.1, the erosion and scouring will be deep and large size. There is a high possibility that piers, abutments and revetments of the bridges will be damaged by the erosion and scouring. Therefore, it is necessary to provide bed protection as described in the Sub-section 9.8.2 of the Main Report.

Based on the similar erosion and scouring at Bridge 26 of NR-6A, and survey for the existing Cut-off No.1 and No.2 of NR-1(C-1), horizontal and longitudinal shape of scouring are assumed as follows:

Assumed Horizontal and Longitudinal Shape of Scouring

Horizontal shape	Angle of sudden contraction at the upstream of bridge	11deg.	See plan below
	Angle of sudden expansion flow in the downstream of bridge	26deg.	See plan below
Longitudinal shape	Angle of stability of river bed under water (upstream side)	17deg.	See longitudinal profile below
	Angle of stability of river bed under water (downstream side)	14deg.	See longitudinal profile below

Area of Scouring

Although the contraction flow will make large erosion and scouring with longitudinal length with about 100 m order, it is important to prevent erosion and scouring in initial stage, which may start at just downstream of bridge including piers. In this study, depth of scouring by floods is estimated by applying the Laursen's Equation. Length of scouring is calculated by applying the calculated scouring depth with angle of stability of bed around bridges under water (17deg. for upstream side and 14deg. for downstream side). Width of scouring is calculated by applying angle of sudden contraction flow (26 deg.) and that of sudden expansion flow (11 deg.). Results of the estimation are shown below:

Proposed Area of Protection for Opening Bed

Protection for opening bed at bridges shall be provided to cover the potential area of scouring, which will occur under condition of without bed protection. Gabion mats shall be applied for the protection. Furthermore, in order to protect the most downstream part of the gabion mats against scouring, boulders shall be put along the most downstream of the bed protection.

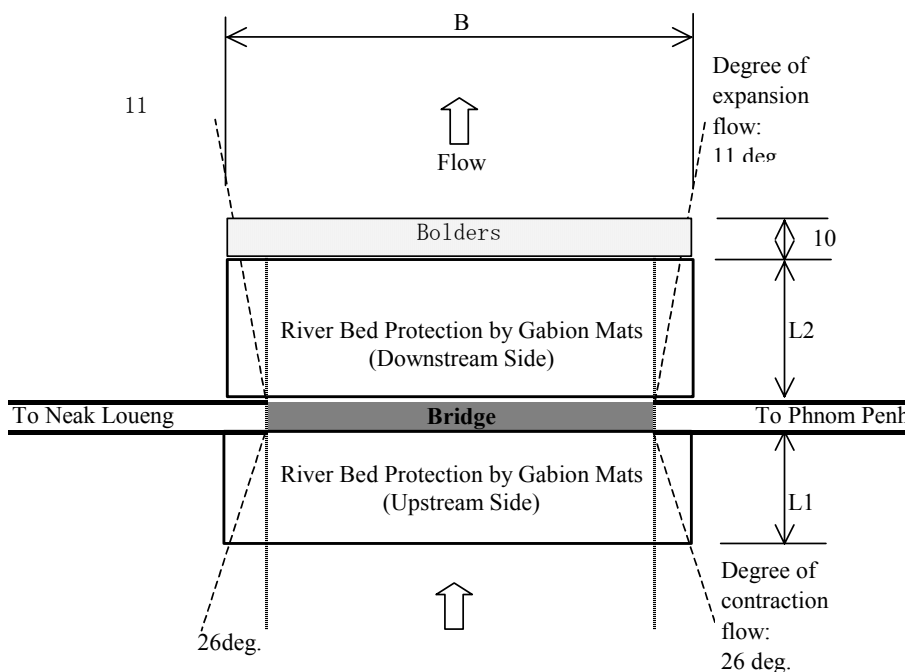

Design length of the bed protection at the upstream side and downstream side of the bridge shall be 1.5 times of the potential scouring length for safety. Width of the bed protection is determined

by applying the design length of the bed protection with the angle of sudden contraction and enlargement flow. In addition to the bed protection by gabion mats, boulders are planned to be deposited along the most downstream of the bed protection area with 10m width to the flow direction.

Following table shows the proposed bed protection for Bridge 1, 2 and 3.

Proposed Area of Bed Protection for Bridges

Bridge	Length of Protection		Width of Protection		
	U/S Side	D/S Side	U/S Side Necessary Width	Downstream Side Necessary Width	Design Width of Protection
	L1 (m)	L2 (m)	B1 (m)	B2 (m)	
BR1	16.50	20.00	82.10	73.78	82.00
BR2	16.50	20.00	116.10	107.78	116.00
BR3	16.00	19.50	81.61	73.58	82.00

Particle Size of Boulders for River Bed Protection

Considering the case of damage or corrosion of the steel lines of the gabion mats, particle size of a boulder to be used for the gabion mats is determined from the critical size of a boulder against flow with safety factor (x 1.5). Critical size of a boulder is calculated by Iwagaki's Equation.

Particle size of a rubble stone: 25cm to 30cm

Particle size of the boulders to be put along the most downstream of the bed protection shall be the same size as the boulders for gabion mats.

B-7.2 Protection against Scour at Outlet of Culvert

Severe erosion of bed is expected at outlet of culvert. According to the observation of scour at outlet of previous Colmatage gate, scour hole extends more than 50m. The erosion around embankment should be prevented because the base of wet mason exists there. However, to prevent the occurrence of scour hole, it is necessary to protect the whole area of bed that would be eroded, which requires unrealistic high construction cost. Therefore, the necessary protection with existence of the scour hole is proposed here.

When one installs gabion mat to protect bed as shown in Fig.B-7-2-1, the bed at immediately downstream of the gabion mat would be eroded. The erosion could proceed toward upstream, making scour hole deep. The progress of erosion would continue until the top of the deformed gabion mat reaches to the deepest scour point. If the erosion stops before reaching the base of wet mason, the structure is safe.

Fig. B-7-2-1 Expected Erosion at Downstream of Gabion Mat

As shown in Fig.B-7-2-2, scour at point A should be avoided for the worst case by considering the existence of the base of wet mason. From this point, by giving scour hole depth and angle of repose of bed material, one can determine necessary length of protection.

The estimation of scour depth is very difficult because of uncertainty of bed material and turbulence of flow. In this study, the scour depth is estimated based upon the observed scour depth in similar situations along NR-1 (C-1). The flow condition at outlet of culvert can be regarded as a jet. According to Hoffmans's study¹, the depth of scour due to a jet is proportional to square root of momentum of flow per unit width as below:

$$D_s \propto \sqrt{qV}$$

where D_s = scour depth (m), q = unit discharge (m^2/s) and V = velocity (m/s).

Fig.B-7-2-2 Determination of Protection Length

The observed scour depth at previous Colmatage gates and artificial cut-offs in 2000 flood shows same tendency as Hoffman's study as shown in log-log plot of Fig.B-7-2-3. In this study, upper limit line is used for predicting the scour depth, which is conservative.

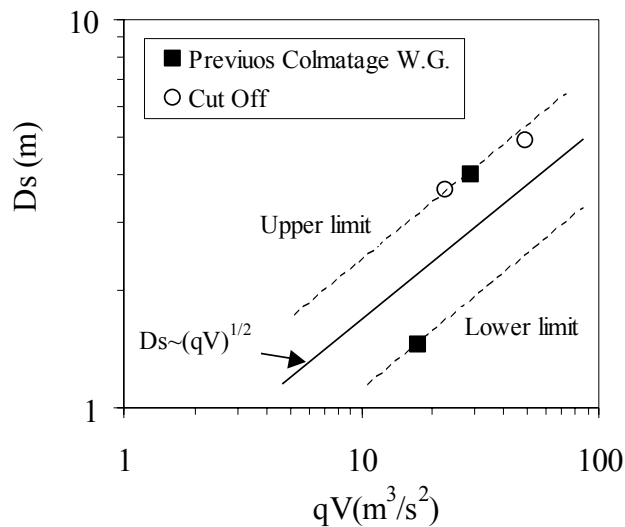

Fig.B-7-2-3 Observed Scour Depth

Table B-7-2-1 shows estimated necessary length of protection at downstream of point A. The angle of repose is assumed to be 30° in the estimation. The necessary length varies with each culvert. However, protection of 9 m in length at downstream of point A covers necessary length for each culvert. The gabion mat of 6 m in length and boulder area of 4 m in length, which includes a little safety portion, is recommended.
