## Appendix F Economic Evaluation

GENERAL
Economic analysis has been examined for the following ten alternatives for the water resources development and management of the Huong River Basin:

| Alternative | Project Component | Flood Control | Hydropower (GWh) | Irrigation (improvement, ha) |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| I-B. 1 | Max. Ta. Trach | Farmland: 10-year EF | 70 | 51,800 | 43.61 |
|  | Reservoir only | Urban area: 20-year MF |  |  | (in 2020) |
|  | Max. Ta Trach + Max. Huu Trach |  | $\begin{gathered} -70 \\ 80.6 \end{gathered}$ | -ditto- | -ditto- |
|  | Reservoirs |  |  |  |  |
| - $\mathrm{I}-\mathrm{B} .3{ }^{-}$ | Max. Ta Trach + | - ditto- | $\begin{aligned} & 70 \\ & 68 \end{aligned}$ | - ditto-- | - ditto- |
|  | Min. Huu Trach |  |  |  |  |
|  | Reservoirs |  |  |  |  |
| - $\mathrm{I}-\mathrm{B} .6{ }^{\text {ch }}$ | Max. Ta Trach + | -ditto- | $\begin{gathered} 70 \\ 80.6 \end{gathered}$ | -ditto- | -ditto- |
|  | Max. Huu Trach + |  |  |  |  |

|  | Max. Huu Trach + |  |  |  |  |
|  | Max. Co Bi Reservoirs |  |  |  |  |
| $\cdots$ | Min. Ta Trach+ | -ditto- | $\begin{aligned} & 70 \\ & 71 \end{aligned}$ | -ditto- | -ditto - |
|  | Max. Huu Trach + |  |  |  |  |
|  | Min. Co Bi Reservoirs |  |  |  |  |

Note: Max: Maximum, Min: Minimum, EF: early flood, MF: major flood

Economic analysis has been conducted devising into two steps, 1) comparison of alternatives and 2) evaluation of optimum plan. In a discounted cash flow analysis, the effects of costs and benefits come out in later year have very small influence to the results of the analysis. Therefore, for the comparison of the alternatives, simultaneous construction is assumed for all the alternatives in order to see the difference of economic efficiency of the project components. Then, for evaluation of an optimum alternative, stage construction will be considered. As for the irrigation improvement and water supply, a practical schedule has been applied for both the steps of the analyses.

## 2

## METHODOLOGY OF ECONOMIC ANALYSIS

The economic analyses of the alternatives are conducted by the methodologies discussed below:

### 2.1 Assumptions

The economic analyses are examined based on the following assumptions:
(A) Price Level and Exchange Rate

The analyses are made at the price level of December 2001 and applied foreign exchange rate is one U.S. dollar equivalent to VND15,068 and 100 Japanese Yen equivalent to VND12,212.
(B) Project Life

The project life of 50 years after construction is assumed for the economic analysis. Average lifetime of the electrical and mechanical facilities related to the projects is assumed 25 years after installation. Replacement costs cover the cost for replacement of such facilities after the lifetime within project life.
(C) Discount Rate

A discount rate of $12 \%$ is applied to reflect the opportunity cost of capital in Vietnam.
(D) Standard Conversion Factor (SCF)

The standard conversion factor (SCF) of 0.9 with reference to recent similar studies is applied to adjust the effects of trade distortion, foreign exchange premiums, the local costs for non-traded goods and services.

## (E) Transfer Payment

From the viewpoint of national economy, the transfer payment such as taxes, duty, subsidy and interest is merely a domestic monetary movement without direct productivity. Therefore, it is excluded from the costs of goods and services.

## (F) Economic Prices of Agricultural Outputs

The prices of agricultural outputs are adjusted by SCF on assumption that most of the incremental outputs are for domestic consumption.
(G) Economic Price of Electricity

The economic price of electricity is assumed at 5 US Cents/KWh, which is generally used as a price of electricity in economic analyses.
(H) Economic Price of Domestic and Industrial Water Supply

The economic price of domestic and industrial water is assumed at VND1,800/m3, the long-term marginal cost of production adjusted by SCF.
(I) Economic Project Cost

The economic project cost has been estimated from the financial project cost adjusting by SCF after deducting the direct transfer payment.
(J) Operation and Maintenance Cost

The following annual operation and maintenance costs are assumed:

- Civil construction including dam and irrigation facilities: $0.5 \%$ of construction cost
- Mechanical and electrical facilities including hydropower facility: $1.5 \%$ of facility cost
- Domestic and industrial water supply: $5 \%$ of the construction cost
(K) Replacement Cost

The following replacement costs are assumed for replacement of facilities 25 years after installation:

- Mechanical and electrical facility for dam and hydropower generation
- Pumps and gates for irrigation and water supply facilities

### 2.2 Project Benefits

2.2.1 Flood Control Benefit
a) Definition of Flood Control Effect

Flood control effects are measured from difference of flood damages between those with and without project conditions. In other words, they are flood damage mitigation benefit.
b) Procedure of Flood Damage Estimation

The downstream area of the Huong River basin was suffered from extremely serious damages by the flood in November 1999. The damages were assessed by several institutions after the flood. General Statistical Office of Thua Thien Hue Province also conducted a damage assessment. The results are shown in Table F. 1 and summarized below:

Flood Damage in November 1999

| Item | Damage <br> (VND million) |
| :--- | ---: |
| A. Flood, storm prevention structure and infrastructure | $481,122.9$ |
| 1. Flood and storm prevention structure | $76,500.6$ |
| 2. Water resources | $58,292.8$ |
| 3. Transportation and fishery | $293,081.5$ |
| 4. Electricity and post office | $53,248.0$ |
| B. Damages to business | $523,548.7$ |
| C. Damages to welfare, cultural structure | $86,227.3$ |
| D. Damages to houses | $235,921.8$ |
| E. Other damaged assets | 419,585 |
| Total | $1,746,405.7$ |

The result of the assessment is quite detail and broad though the damages to houses seemed under evaluated comparing with the actual value of houses. The damages to household durable assets, such as TV, radio, other electric devices, cooking stoves, tableware, cloths, and furniture, were not included.

According to the rainfall analysis, two-day rainfall at the time of the flood in November 1999 was almost the same as the rainfall of the occurrence probability of 50 years. The rainfall in November 1999 lasted for more than five days and the continual rain might make the flood damage worse. However, after reviewing the flood damage record discussed above, the damages due to long lasting inundation are not very significant. Therefore, it is assumed that if a 50 -year flood occurred, the same scale of damages may happen regardless of duration of inundation.

From the above consideration, the study team uses this flood damage record for the basis for estimation of the probable flood damages by adjusting the damages to houses and household durable assets.

The procedure to estimate probable flood damages is as follows:

1) To estimate the damages to agricultural production due to early flood for the magnitudes of 2-year, 5-year, and 10-year.
2) To estimate the damages to houses including household durable assets due to major floods of the magnitudes of 2-year, 5year, 10-year, 20-year, 50-year, and 100-year.
3) Newly estimated damages to houses and household durable assets due to 50-year major flood are combined with the actual flood damage statistical data in 1999 except its housing damage.
4) The actual flood damage data except the housing damage are adjusted in proportion with the newly estimated housing damage in different magnitude of floods.
5) The same procedures from 1) to 4) are examined for with-project conditions.
6) Annual mean flood damages are calculated.
7) Flood damage mitigation benefit will be obtained by the difference of the annual mean flood damages under with and without project conditions.
c) Flood Conditions

Based on the point elevations shown in the topographical maps of $1 / 50,000$, the elevation-volume curve (HV curve) and the elevation-area curve (HA curve) have been prepared by the study team as shown in Figure F.1.

Inundation volumes under various magnitudes of floods have been calculated by flood simulation analyses. The flood conditions based on HV/HA curves and the inundations volumes under various magnitudes of floods are summarized below:

Flood Conditions by Magnitude of Flood

| Magnitude of <br> flood |  | Inundation <br> volume <br> (Million m3) | Max. inundation <br> depth <br> (m) | Inundation area <br> $(\mathrm{km} 2)$ |
| :--- | :--- | :---: | :---: | :---: |
| Early flood | 5-year | 12 | 1.4 | 14 |
| -ditto - | 10-year | 41 | 2.7 | 26 |
| Major flood | 2-year | 206 | 3.1 | 30 |
| -ditto - | 5-year | 393 | 4.7 | 59 |
| - ditto - | 10-year | 534 | 5.7 | 87 |
| - ditto- | 20-year | 686 | 6.5 | 125 |
| - ditto - | 50-year | 879 | 7.3 | 179 |
| - ditto - | 100-year | 1,050 | 8.0 | 226 |

d) Estimation of Flood Damage

## Agricultural Produce in Early Flood Season

According to the information obtained during the site reconnaissance, farmers in the flood prone area do not cultivate crops during the major flood season in order to avoid flood damages. However, in the early flood season, paddy cultivation is widely practiced and it suffers from flood damage sometimes.

The paddy cultivation area is estimated at about $72 \%$ of inundation area from the present land use map. The expected value of unit gross output under present condition is VND6.3 million/ha.

Flood damage to paddy cultivation is decrease in yield due to submergence. In order to estimate the flood damage to paddy cultivation, the flood damage rates developed by Ministry of Construction, Japan are applied since no such uniformed standard is available in Vietnam.

Flood Damage Rates to Paddy

|  | Depth of Submergence |  |  |
| :--- | :---: | :---: | :---: |
|  | -49 cm | $50-99 \mathrm{~cm}$ | $100 \mathrm{~cm}-$ |
| Paddy | 0.30 | 0.44 | 0.54 |
| Source: | Manual for flood control benefit survey, Ministry of <br> Construction, Japan |  |  |

It is assumed that the cultivation area and unit production volume will not change during the project life. The flood damage due to the early flood has been estimated as shown in Table F. 2 and summarized below:

Damage to Agricultural Produce due to Early Flood

|  | Flood Damage (VND million) |  |  |
| :--- | ---: | ---: | ---: |
|  | Without project | With project | Damage reduction |
| Early Flood 2-year | 0 | 0 | 0 |
| Early Flood 5-year | 2,767 | 0 | 2,767 |
| Early Flood 10-year | 5,489 | 0 | 5,489 |

Note: "With project" means all the alternatives.

## Houses/building

Number and value of houses are estimated by the following procedures:

- Average value of a house is estimated based on "Average current sales value of house by type of house and region" in Viet Nam Living Standards Survey (VLSS) 1997-1998, GSO. The prices have been adjusted by CPI to the prices in 2001.
- In order to separate the value of land use right from the sales value of house, half the value is considered as the value of house. The estimated value of a house is shown in Table F. 3 and summarized below:

Unit Value of House

| Region | Unit Value <br> (VND million) | Equivalent <br> (US\$ million) |
| :---: | :---: | :---: |
| North Central Coast | 71 | 4.7 |

- Numbers of houses in flood prone areas are estimated from population density of the districts in flood prone areas dividing by average family size. The flood prone area of the Huong River basin is about 536 km 2 as shown in Figure F.2. The household density has been estimated as shown below:

Number of Houses in Flood Prone Areas

| City/District | Flood <br> prone area <br> $(\mathrm{km} 2)$ | Population <br> in flood <br> prone area | Ave. <br> family <br> size | Number of <br> household | Household <br> density <br> (per km2) |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Urban area |  |  |  |  |  |
| Hue City | 47 | 272,800 | 5.1 | 53,490 | $\mathbf{1 , 1 3 8}$ |
|  |  |  |  |  |  |
| Suburban area |  |  |  |  |  |
| Phong Dien | 28 | 31,800 | 5.1 | 6,235 | 223 |
| Quang Dien | 91 | 66,600 | 5.1 | 13,058 | 143 |
| Huong Tra | 74 | 90,800 | 5.1 | 17,803 | 241 |
| Huong Thuy | 53 | 74,600 | 5.1 | 14,627 | 276 |
| Phu Vang | 194 | 142,600 | 5.1 | 27,960 | 144 |
| Phu Loc | 49 | 54,600 | 5.1 | 10,705 | 218 |
| Sub-total | 489 | 461,000 | 5.1 | 90,388 | $\mathbf{1 8 5}$ |
|  |  |  |  |  |  |
| Total | 536 | 733,800 | 5.1 | 143,878 | $\mathbf{2 6 8}$ |

- The ground elevation of Hue City is higher than 2.5 m and it is slightly higher than surrounding suburban areas. Therefore, if the maximum inundation depth is less than 2.5 m , Hue City will not be suffered and the housing density of 185 houses $/ \mathrm{km} 2$ is applied. If the maximum inundation depth is more than 2.5 m , both Hue City and suburban area will be suffered and both the housing densities of 1,138 and 185 are applied according to the ratios of the flood prone area of urban and suburban areas.

## Household Durable Assets

Value of the household durable assets has been estimated based on "Average value of durable assets per household at current price by 10 regions" in the same VLSS. The price has been adjusted by CPI to 2001 price. The estimated value of household durable assts is presented in Table F. 4 and summarized below:

## Unit Value of Household Durable Assets

| Region | Unit Value (VND1,000) |
| :--- | :---: |
| Large cities | 15,895 |
| Rural area of North Central Coast | 3,677 |

With respect to house/building and household durable assets, basically the standard flood damage rates developed by Ministry of Construction, Japan are applied since no such uniformed standard is available in Vietnam. Floor level of houses is assumed 30 cm above ground level based on actual situation observed through site reconnaissance (no flood damage considered for 30 cm depth inundation above ground level).

Flood Damage Rates

|  | Inundation depth above floor level |  |  |  |  |
| :--- | :---: | :---: | :---: | :---: | :---: |
|  | -49 cm | $50-99 \mathrm{~cm}$ | $100-199 \mathrm{~cm}$ | $200-299 \mathrm{~cm}$ | $300 \mathrm{~cm}-$ |
| House | 0.092 | 0.119 | 0.266 | 0.580 | 0.834 |
| Household effects | 0.145 | 0.326 | 0.508 | 0.928 | 0.991 |

Source: Manual for flood control benefit survey, Ministry of Construction, Japan

Flood damages to houses and household durable assets are estimated from number of houses in inundation areas, unit value of houses and assets multiplied by the damage rate corresponding to inundation conditions. Difference of the flood damage between those with and without project is the flood reduction benefit.

From now to the target year, 2020, the number of houses in the flood prone area is supposed to increase and the urban area will expand according to population increase and economic development. In other words, flood damage potential will increase gradually to 2020. The future number of houses has been estimated by applying the increasing rates discussed in the socio-economic target in Phase-I study. The flood damages have been estimated for the conditions without project and with the various alternatives under both the situations in 2001 and 2020. It should be noted that even after implementation of the alternatives, flood inundation may occur in the low-lying areas and flood damages may remain. The results of calculation are summarized in Table F. 5 and the process of calculation is shown in Table F.6.

## Other Damages

Based on the newly estimated flood damages to houses and household durable assets, the flood damage in November 1999 has been recalculated as shown below:

Recalculation of Flood Damage in November 1999

| Item | Damage <br> (VND million) | Ratio to <br> Item 1 |  |
| :--- | :--- | ---: | :---: |
| 1. | Newly estimated damages to houses and household | $1,417.2$ |  |
| durable assets (50-year flood) |  |  |  |
| 2. Flood, storm prevention structure and infrastructure | 481.1 | $33 \%$ |  |
| 3. Damage to business | 523.5 | $36 \%$ |  |
| 4. | Damage to welfare, cultural structure | 86.2 | $6 \%$ |
| 5. | Other damaged assets | 419.6 | $29 \%$ |
| $\quad$ Total | $2,927.6$ |  |  |

The above calculation is regarded as the flood damages of 50-year probable flood and the same ratios against the newly estimated housing damages are applied for
the damage estimation of other magnitudes of floods. The results of calculation are shown in Table F.7(1). The relation between flood magnitude and probable flood damage is visually shown in Figure F.3.
e) Annual Mean Flood Damage and Flood Mitigation Benefit

Annual mean flood damage is estimated as accumulation of flood damage segments derived from various magnitude of probable flood damage multiplied by the corresponding probability of occurrence, from non-damageable flood up to design protection level of flood. Table F.7(2) shows the annual mean flood damage under the conditions without project and with various alternatives.

Difference of the annual mean flood damage between those with and without project is considered as annual flood reduction benefit. The results of calculation is summarized below:

| Annual Mean Flood Damage and Flood Mitigation Benefit (VND billion) |  |  |  |  |
| :---: | ---: | ---: | ---: | ---: |
| Alternative | 2001 |  | 2020 |  |
|  | Annual mean <br> flood damage | Flood mitigation <br> benefit | Annual mean <br> flood damage | Flood mitigation <br> benefit |
| Without project | 479.0 | - | 595.2 | - |
| I-B.1 | 42.6 | 436.4 | 49.0 | 546.2 |
| I-B.2 | 6.6 | 472.4 | 7.6 | 587.6 |
| I-B.3 | 6.6 | 472.4 | 7.6 | 587.6 |
| I-B.6 | 6.6 | 472.4 | 7.6 | 587.6 |
| I-B.7 | 6.6 | 472.4 | 7.6 | 587.6 |
| I-B.8 | 6.6 | 472.4 | 7.6 | 587.6 |
| I-B. 9 | 6.6 | 472.4 | 7.6 | 587.6 |
| I-C.2 | 13.1 | 465.9 | 15.0 | 580.2 |
| I-C.6 | 13.1 | 465.9 | 15.0 | 580.2 |
| I-C. 7 | 13.1 | 465.9 | 15.0 | 580.2 |

### 2.2.2 Incremental Agricultural Benefit

Agricultural benefits of the projects have been estimated for production of crop, livestock, and aquaculture.

According to the agronomic study, using model crops and cropping patterns based on the characteristics of the project area, after implementation of the projects, improvement in crop yields and production of higher value crops are expected. The benefits of incremental crop production are estimated as presented in Table F. 8 (1) and summarized below:

| Incremental Crop Benefit |  |  |
| :--- | :---: | :---: |
|  | Planted Area <br> (ha) | Net Income <br> (US\$1,000) |
| Without Project | 44,386 | 7,949 |
| With Project (all the alternatives) | 51,800 | 22,376 |
| Incremental Crop Benefit | 7,414 | 14,427 |

Unit values of livestock and aquaculture have been estimated by the study referring to "Statistical Data of Vietnam, Agriculture, Forestry, and Fishery 1995 2000, GSO". The process of estimation is shown in Table F. 8 (2).

The benefits from livestock and aquaculture production have been estimated as shown in Tables F. 8 (3) and (4). The results of the estimation are summarized below:

Incremental Livestock and Aquaculture Benefits

| Incremental Livestock and Aquaculture Benefits |  |  |
| :--- | :---: | :---: |
|  | Livestock <br> (US\$ million) | Aquaculture <br> (US\$ million) |
| Without Project | 2.5 | 0.9 |
| With Project (all the alternatives) | 6.0 | 3.7 |
| Incremental Benefit (2020) | 3.5 | 2.8 |

### 2.2.3 Hydropower Generation Benefit

Electricity production in Vietnam by mid-2000 was 350 kWh per capita, about the half the level of Indonesia and one-fifth of that of Thailand. Although electricity output rose by $111 \%$ between 1993 and 1999, it has had difficulty in keeping up with demand.

The government has a master plan to increase power generation double by 2010 and five times from present level by 2020. Especially the government gives priority to develop hydropower plants, which bring about combined benefits such as flood control, water supply, irrigation, and electricity generation. The plan also mentions that exchange of electricity with neighboring countries will necessary in order to meet power demand in each region and whole country.

The economic price of electricity is assumed at 5 US Cents $/ \mathrm{kWh}$, which is generally used as a price of electricity in economic analyses. Annual mean energy produced by the projects is calculated as shown in Table F.9:

### 2.2.4 Water Supply Benefit

Future demand increase of domestic and industrial water supply in the Huong River Basin has been estimated at 14.50 million $\mathrm{m}^{3} /$ year in the year 2010, 27.29 million $\mathrm{m}^{3} /$ year in 2015 , and 43.61 million $\mathrm{m}^{3} /$ year in 2020 as discussed in Chapter 1.9. The economic value of water is estimated at VND1,800/m ${ }^{3}$. Therefore, annual benefits of the water supply are estimated as summarized
below:

| Water Supply Benefit (Million US\$) |  |  |  |
| :--- | :---: | :---: | :---: |
|  | 2013 <br> (Completion of Dam) | 2015 | 2020 |
| Water supply benefit | 2.85 | 3.26 | 5.21 |

### 2.2.5 Other Intangible Benefits

Other than benefits discussed above, various effects are expected by the implementation of the projects as listed below:

- Contribution to national food security,
- Reduction of food import and saving foreign exchange holdings,
- Creation of new job opportunity,
- Improvement of self-sufficiency and nutritional level of rural farmers,
- To narrow the earnings differentials among regions,
- Convenience of rural population by improvement of access roads to the dam sites and the roads may reduce the cost of moving produce from the farm to the consumer,
- Improvement of public health and quality-of-life by supplying better quality water including decrease of water-related disease,
- To ease the water carrying works,
- Groundwater recharge and improvement of vegetation, and
- Stabilization of rural farmers' livelihood and prevention of influx of rural population into urban areas.

The benefits listed above are very valuable, they are nevertheless virtually impossible to value satisfactory in monetary terms.

### 2.2.6 Indirect Benefit

During construction period, the construction works may fuel various demand for other industries. Meanwhile, after construction works, incremental agricultural production will also arouse various demands for many different industries such as chemical industries, transportation services, trade services, etc. Flood control effect may prevent inundation of highway or railway and paralysis of economic activity may be prevented or mitigated. Such ripple effects must be enormous. However, such benefits are also very hard to value in money terms without more detailed study.

### 2.3 Economic Project Cost

The financial and economic costs of the alternatives are shown in Table F.10.

Annual project costs of the alternatives for comparative purposes (simultaneous construction) are presented in Table F.11. Annual project cost of the optimum plan (alternative I-B.2) based on stage construction is shown in Table F.12.

### 2.4 Cost-Benefit Analysis

Based on the benefits and costs discussed above, economic viabilities of the projects are examined by cost-benefit analysis. The analysis is conducted by the discounted cash flow analysis. The cash flow of the alternatives is presented in Table F. 13 and that of the optimum alternative I-B. 2 is shown in Table F.14. The results of the economic analysis are summarized in Subsection 2.16.2.1.

### 2.5 Sensitivity Analysis

Sensitivity analysis of the economic evaluation has been examined for the optimum plan I-B. 2 by increase in cost and decrease in benefit. The results of the analysis are shown below:

| Sensitivity Analysis (EIRR \%) |  |
| :--- | :---: |
| Case | Alternative I-B.2 |
| a) Base estimate | 17.4 |
| b) Cost increase of $10 \%$ | 16.4 |
| c) Cost increase of $20 \%$ | 15.5 |
| d) Benefit decrease of $10 \%$ | 16.3 |
| e) Benefit decrease of $20 \%$ | 15.0 |
| f) Combination of c) and e) | 13.2 |

Even under the most downbeat case, the combination of cost increase of $20 \%$ and benefit decrease of $20 \%$, the alternative has sufficient economic efficiency (EIRR more than 12\%).

## 3 RESULTS OF ECONOMIC ANALYSIS

The results of the economic analyses showed all the alternatives have sufficient economic efficiency with EIRRs of more than $16 \%$, which are far higher than the opportunity cost of capital in Vietnam (12\%). The results did not show significant difference among the alternatives from the viewpoint of economic efficiency. All the alternatives can be rated as being economically feasible. However, the alternative I-B. 2 showed the largest NPV and EIRR of $17.3 \%$, which is slightly higher than others except the alternative I-B.1. Economic indicators are calculated as shown in Table F. 13 and summarized below:

Economic Indicators (simultaneous construction)

| Alternative | EIRR <br> $(\%)$ | B/C <br> Ratio | NPV <br> (Million US\$) |
| :---: | :---: | :---: | :---: |
| I-B.1 | 17.5 | 1.73 | 57.6 |
| I-B.2 | 17.3 | 1.68 | 61.5 |
| I-B.3 | 17.3 | 1.68 | 60.8 |
| I-B.6 | 16.6 | 1.58 | 55.6 |
| I-B.7 | 16.8 | 1.61 | 57.3 |
| I-B.8 | 16.6 | 1.58 | 55.1 |
| I-B.9 | 16.8 | 1.61 | 56.8 |
| I-C.2 | 17.3 | 1.68 | 60.6 |
| I-C.6 | 16.6 | 1.58 | 54.6 |
| I-C.7 | 16.8 | 1.61 | 56.3 |

Note: B/C and NPV are calculated with a discount rate of $12 \%$.

The economic analyses based on practical implementation schedule (stage construction) have been examined for the alternative I-B.2. The results also indicated the alternative has sufficient economic efficiency with EIRRs of 17.4\%, which is higher than the opportunity cost of capital. The alternative can be rated as being economically feasible. The cash flow table of the analysis is shown in Table F. 14 and the results are summarized below:

Economic Indicators (stage construction)

| Alternative | EIRR <br> $(\%)$ | B/C <br> Ratio | NPV <br> (Million US\$) |
| :---: | :---: | :---: | :---: |
| I-B.2 | 17.4 | 1.70 | 59.9 |

Note: B/C and NPV are calculated with a discount rate of $12 \%$

Table F. 1 Results of Flood Damage Assessment, November 1999 (Source: General Statistical Office of Thua Thien Hue Province)

## FROM NOVEMBER, 1st TO 6th, 1999

## A. HUMAN DAMAGE

1. Dead: 352 people (357)
2. Lost: 11 people (12)
3. Injured: 305 people

Table F. 8 Agricultural Benefit of Huong River Project (1/2)

Table F. 8 Agricultural Benefit of Huong River Project (2/2)

## (2) Estimation of Unit Value of Livestock and Aquaculture

1) Livestock

Livestock Gross Output of 1999
VND 25,388 billion (Adjusted to 2001 constant price)
2 Conversion to Head Number of Cattle (Ox)
(1) Head Number in Whole Country
(a) Cattle ( $O x$ )
3,638,900 heads
(b) Buffalo $\quad 2,955,700$ heads
(c) Pig
2,955,700 heads
(2) Conversion Rate

Weight Ratio is used.
Weight Ratio is derived from daily water consumption rate. /2
(a) Cattle ( Ox )
35 lit/head/day
(b) Buffalo
35 lit/head/day
(c) Pig
15 lit/head/day
(3) Converted Head Number to Cattle (Ox)

| (a) Cattle (Ox) | $3,638,900$ heads |
| :--- | ---: |
| (b) Buffalo | $2,955,700$ heads |
| (c) Pig | $6,988,500$ heads |
| Total | $13,583,100$ |

3 Gross Output per Converted Head Number of Cattle (Ox) | VND |
| :---: |

VND 1,869,087 per head

## 2) Aquaculture

1 Aquaculture Gross Output of 1999 /1 VND 7,978 billion
(Adjusted to 2001 constant price)
2 Aquaculture Area
535,000 ha
3 Gross Output per Pond Area
/1: Ref. "Statistical Data of Vietnam, Agriculture, Forestry and Fishery 1975-2000"
/2: Ref. "Guideline for the Preparation of National Master Water Plans, Water Resources Series No.65, ESCAP, 1989"
(3) Incremental Livestock Benefit
