

## **B.APPENDIX**

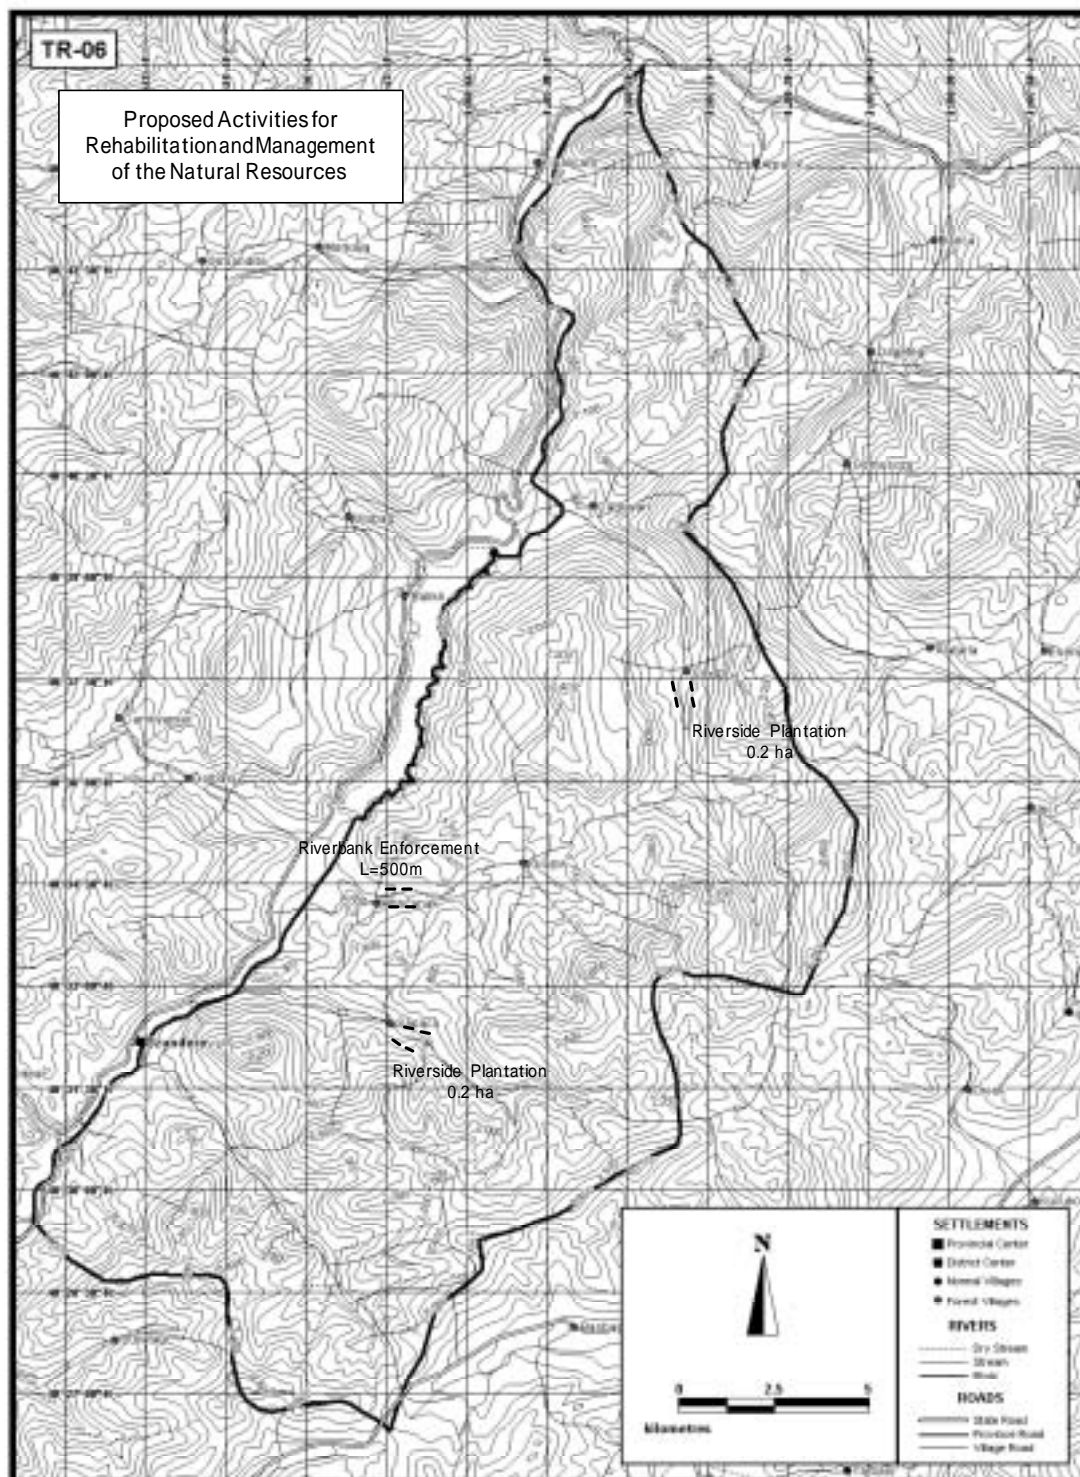

### **APPENDIX-B.1 PROPOSED ACTIVITIES FOR REHABILITATION AND MANAGEMENT OF THE NATURAL RESOURCES**

Illustrate proposed activities for rehabilitation and management of the Natural resources in each MC's.

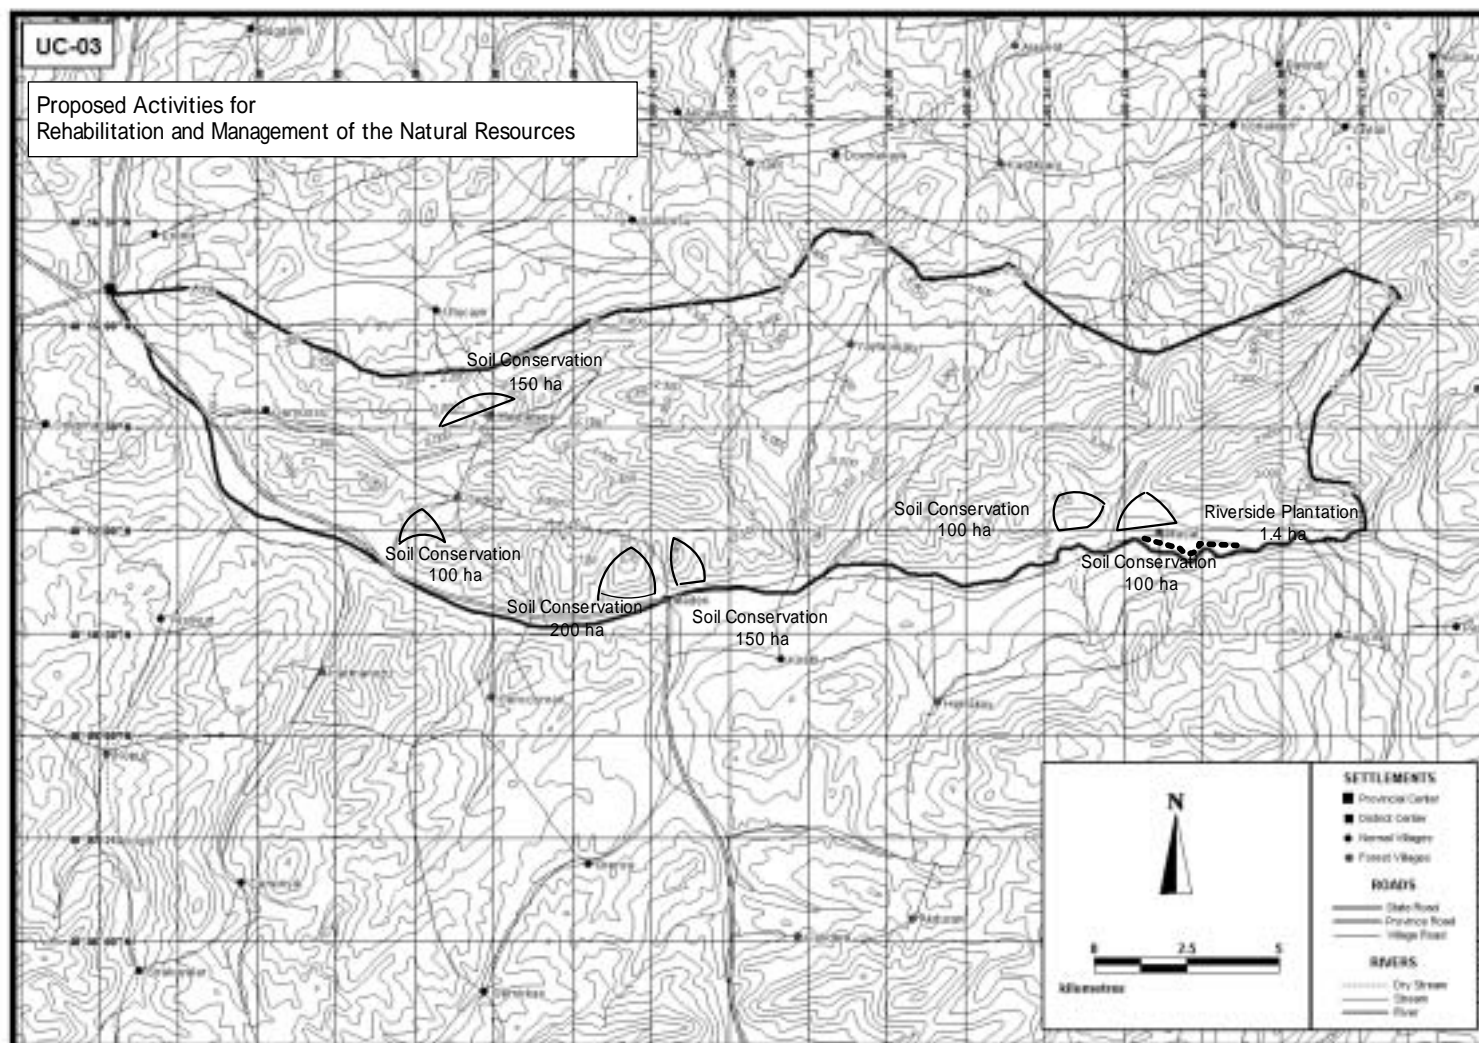

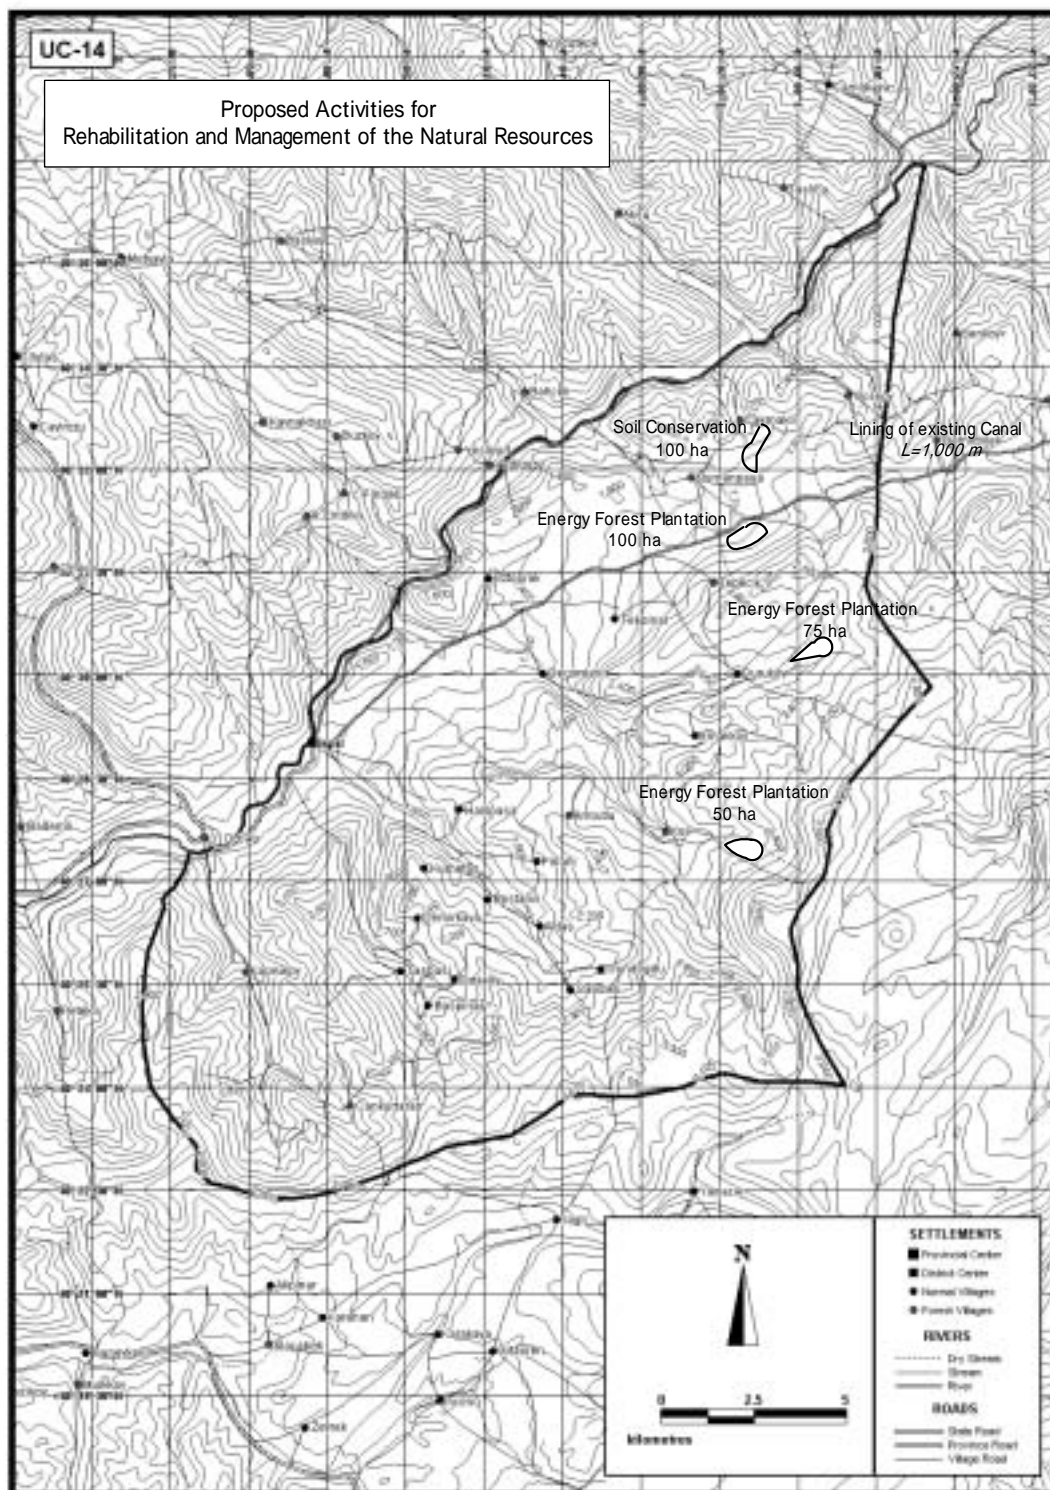

## APPENDIX-B.2 SOURCE MATERIALS FOR COST ESTIMATEMATION

Estimated necessity cost for each activity, and compiled unit cost each activities and its backgrounds.

### UNIT COST

ACTIVITY	UNIT	COST (Mil TL)
1. Soil Conservation		
1.1 Natural regeneration	Ha	64
1.2 Afforestation (type-1)	Ha	1,806
1.3 Afforestation(type-2)	Ha	2,060
1.4 Re-greening (type-1)	Ha	2,892
1.5 Re-greening (type-2)	Ha	2,615
1.6 Gully protection (Gabion type)	10 Units	5,418
1.7 Gully protection (Brush type)	10 Units	3,628
2. Rehabilitation of Degraded High Forest		
2.1 Natural regeneration	Ha	64
2.2 Rehabilitation	Ha	1,254
3. Rehabilitation of Degrade Coppice Forest		
3.1 Natural regeneration	Ha	64
3.2 Rehabilitation	Ha	1,096
4. Energy Forest Plantation	Ha	1,686
5. Rangeland Rehabilitation		
5.1 Natural regeneration	Ha	64
5.2 Rangeland improvement	Ha	520
5.3 Gully protection (Gabion type)	10 Units	5,418
5.4 Gully protection (Brush type)	10 Units	3,628
6. Riverside Plantation	Ha	6,610

## PROGRAM PROFILE

<b>1. Project No.</b>	<b>2. Project Title : Natural Regeneration</b>			
<b>3. Project Location</b>	<b>4. Target Beneficiaries</b> Forest Villagers	<b>5. Project Duration</b> 5 years		
<b>6. Implementing Agency / Body</b> Ministry of environment and Forestry ; AGM				
<b>7. Summary of Objective</b> To increase flora for prevent soil erosion in the rangeland, at the same time to increase biodiversity.				
<b>8. Justification</b> Encourage natural regeneration, if necessary with fencing. This will contribute to the increased potential of soil protection, biodiversity by the reasonable budget.				
<b>9. Expected Benefits/Outputs</b> <ul style="list-style-type: none"> <li>- Decreasing soil erosion</li> <li>- Increasing vegetation coverage</li> <li>- Increasing biodiversity</li> <li>- Ensuring better conditions for wildlife</li> <li>- Ensuring employment</li> <li>- Improving water balance</li> <li>- Increasing aesthetic value of the landscape.</li> </ul>		<b>10. Verifiable Indicator</b> <ul style="list-style-type: none"> <li>- Increases in vegetation cover area</li> <li>- Increases in density of vegetation</li> </ul>		
<b>11. Important Assumptions / Conditions for the project</b> <ul style="list-style-type: none"> <li>- Demands for activities in Forest, OT and MERA area by forest villagers and MEF</li> <li>- Effectives for soil erosion conservation</li> </ul>				
<b>12. Project Linkage / Other Sector Linkage</b> - Coherence with "Forest Management Plan"		<b>13. Relevant Agencies to be Coordinate</b>		
<b>13. Major / Key Activities</b>	<b>14. Major Inputs</b>			<b>15. Estimated Cost</b> (Mil TL / Ha)
	<b>Personnel</b>	<b>Materials</b>	<b>Construction</b>	
Fencing	x	x		23
Protection of project site by village community (5 years)	x			30
Overhead (20%)				11
<b>16. Estimated Total Cost</b>				64
<b>17. Necessary External Inputs / Assistance / Arrangement</b>				
Finance cooperation for rehabilitation		x	x	
Technical cooperation for rehabilitation measures	x			

<b>1. Project No.</b>		<b>2. Project Title : Afforestation (type-1)</b>			
<b>3. Project Location</b>		<b>4. Target Beneficiaries</b> Forest Villagers		<b>5. Project Duration</b> 5 years	
<b>6. Implementing Agency / Body</b> Ministry of environment and Forestry ; AGM & OGM					
<b>7. Summary of Objective</b> To increase flora for prevent soil erosion in the forest villages which are the degradation of natural resources base, at the same time to increase biodiversity.					
<b>8. Justification</b> Type of the afforestation that is applied the forest villagers which is planted forest tree species aimed soil protection and to prevent soil erosion in the forest villages. This will contribute to the increased potential of soil protection and biodiversity.					
<b>9. Expected Benefits/Outputs</b> <ul style="list-style-type: none"> <li>- Decreasing soil erosion</li> <li>- Increasing vegetation coverage</li> <li>- Increasing both quality and quantity of tree stock</li> <li>- Increasing biodiversity</li> <li>- Ensuring better conditions for wildlife</li> <li>- Ensuring employment</li> <li>- Improving water balance</li> <li>- Increasing aesthetic value of the landscape.</li> </ul>		<b>10. Verifiable Indicator</b> <ul style="list-style-type: none"> <li>- Increases in forest area</li> <li>- Increases in density of standing tree volume</li> <li>- Increases in crown density forests</li> </ul>			
<b>11. Important Assumptions / Conditions for the project</b> <ul style="list-style-type: none"> <li>- Demands for afforestation of OT area by forest villagers and MEF</li> <li>- Effectives for soil erosion conservation</li> </ul>					
<b>12. Project Linkage / Other Sector Linkage</b> - Coherence with "Forest Management Plan"		<b>13. Relevant Agencies to be Coordinate</b>			
<b>13. Major / Key Activities</b>		<b>14. Major Inputs</b>			<b>15. Estimated Cost</b> (Mil TL/Ha)
		<b>Personnel</b>	<b>Materials</b>	<b>Construction</b>	
Preparation and making Terraces by labor		x			464
Planting of seedlings		x			335
Seedling cost (1,500 seedling)			x		450
Replacement planting		x	x		45
Fencing		x	x		23
Protection of project site by village community (5 years)		x			30
Other expenditures					15
Maintenance (3 years)		x			143
Overhead (20%)					301
<b>16. Estimated Total Cost</b>					1,806
<b>17. Necessary External Inputs / Assistance / Arrangement</b>					
Finance cooperation for rehabilitation			x	x	
Technical cooperation for rehabilitation measures		x			

<b>1. Project No.</b>		<b>2. Project Title : Afforestation (type-2)</b>			
<b>3. Project Location</b>		<b>4. Target Beneficiaries</b> Forest Villager		<b>5. Project Duration</b> 5 years	
<b>6. Implementing Agency / Body</b> Ministry of Environment and Forestry ; AGM & OGM					
<b>7. Summary of Objective</b> To increase flora for prevent soil erosion in the forest villages which is the degradation of natural resources base, at the same time to increase biodiversity.					
<b>8. Justification</b> Type of the afforestation that is applied the forest villagers which are planted local tree species aimed soil protection and to prevent soil erosion in the forest villages. This will contribute to the increased potential of soil protection and biodiversity.					
<b>9. Expected Benefits/Outputs</b> <ul style="list-style-type: none"> <li>- Decreasing soil erosion</li> <li>- Increasing vegetation coverage</li> <li>- Increasing both quality and quantity of tree stock</li> <li>- Increasing biodiversity</li> <li>- Ensuring better conditions for wildlife</li> <li>- Ensuring employment</li> <li>- Improving water balance</li> <li>- Increasing aesthetic value of the landscape.</li> </ul>		<b>10. Verifiable Indicator</b> <ul style="list-style-type: none"> <li>- Increases in forest area</li> <li>- Increases in density of standing tree volume</li> <li>- Increases in crown density forests</li> </ul>			
<b>11. Important Assumptions / Conditions for the project</b> <ul style="list-style-type: none"> <li>- Demands for afforestation of OT area by forest villagers and MOF</li> <li>- Effectives for soil erosion conservation</li> </ul>					
<b>12. Project Linkage / Other Sector Linkage</b> - Coherence with "Forest Management Plan"		<b>13. Relevant Agencies to be Coordinate</b>			
<b>13. Major / Key Activities</b>		<b>14. Major Inputs</b>			<b>15. Estimated Cost</b> (Mil TL/Ha)
		<b>Personnel</b>	<b>Materials</b>	<b>Construction</b>	
Preparation of hole by labor		x			300
Planting of seedlings		x			466
Seedling cost (2,000 seedling)			x		700
Replacement planting		x	x		45
Fencing		x	x		23
Protection of project site by village community (5 years)		x			30
Other expenditures					15
Maintenance (3 years)		x			143
Overhead (20%)					344
<b>16. Estimated Total Cost</b>					2,066
<b>17. Necessary External Inputs / Assistance / Arrangement</b>					
Finance cooperation for rehabilitation			x	x	
Technical cooperation for rehabilitation measures		x			

<b>1. Project No.</b>	<b>2. Project Title : Re-greening (type-1)</b>			
<b>3. Project Location</b>		<b>4. Target Beneficiaries</b> Forest Villagers	<b>5. Project Duration</b> 5 years	
<b>6. Implementing Agency / Body</b> Ministry of Environment and Forestry ; ACM				
<b>7. Summary of Objective</b> To increase flora for prevent soil erosion in the forest villages which are the degradation of natural resources base, at the same time to increase biodiversity.				
<b>8. Justification</b> Type of the re-vegetation that is applied the forest villagers which is planted local shrub and grass species aimed soil protection and to prevent soil erosion in the forest villages. This will contribute to the increased potential of soil protection and biodiversity.				
<b>9. Expected Benefits/Outputs</b> - Decreasing soil erosion - Increasing vegetation coverage - Increasing biodiversity - Ensuring better conditions for wildlife - Ensuring employment - Improving water balance - Increasing aesthetic value of the landscape.		<b>10. Verifiable Indicator</b> - Increases in vegetation cover area - Increases in density of vegetation		
<b>11. Important Assumptions / Conditions for the project</b> - Demands for re-vegetation of OT area by forest villagers and MEF - Effectives for soil erosion conservation				
<b>12. Project Linkage / Other Sector Linkage</b> - Coherence with "Forest Management Plan"		<b>13. Relevant Agencies to be Coordinate</b>		
<b>13. Major / Key Activities</b>	<b>14. Major Inputs</b>			<b>15. Estimated Cost</b> (Mil TL / Ha)
	<b>Personnel</b>	<b>Materials</b>	<b>Construction</b>	
Preparation of hole by labor	x			450
Planting of seedlings	x			699
Seedling cost (3,000 seedling)		x		1,050
Fencing	x	x		23
Protection of project site by village community (5 years)	x			30
Other expenditures				15
Maintenance (3 years)	x			143
Overhead (20%)				482
<b>16. Estimated Total Cost</b>				2,892
<b>17. Necessary External Inputs / Assistance / Arrangement</b>				
Finance cooperation for rehabilitation		x	x	
Technical cooperation for rehabilitation measures	x			

<b>1. Project No.</b>	<b>2. Project Title : Re-greening (type-2)</b>			
<b>3. Project Location</b>		<b>4. Target Beneficiaries</b> Forest Villagers	<b>5. Project Duration</b> 5 years	
<b>6. Implementing Agency / Body</b> Ministry of Environment and Forestry; AGM				
<b>7. Summary of Objective</b> To increase flora for prevent soil erosion in the forest villages which is the degradation of natural resources base, at the same time to increase biodiversity.				
<b>8. Justification</b> Type of the re-vegetation that is applied the forest villagers which are sowed <i>Quercus</i> seed in the planting base block aimed soil protection and to prevent soil erosion in the forest villages. This will contribute to the increased potential of soil protection and biodiversity.				
<b>9. Expected Benefits/Outputs</b> - Decreasing soil erosion - Increasing vegetation coverage - Increasing biodiversity - Ensuring employment - Improving water balance - Increasing aesthetic value of the landscape.		<b>10. Verifiable Indicator</b> - Increases in forest area - Increases in density of standing tree volume - Increases in crown density forests		
<b>11. Important Assumptions / Conditions for the project</b> - Demands for re-vegetation of OT area by forest villagers and MEF - Effectives for soil erosion conservation				
<b>12. Project Linkage / Other Sector Linkage</b> - Coherence with "Forest Management Plan"		<b>13. Relevant Agencies to be Coordinate</b>		
<b>13. Major / Key Activities</b>	<b>14. Major Inputs</b>			<b>15. Estimated Cost ( Mil TL /Ha )</b>
	<b>Personnel</b>	<b>Materials</b>	<b>Construction</b>	
Preparation of hole by labor	x			450
Block setting and Seed sowing	x			563
Seed cost (US\$500/ton-60kg)		x		45
Tending, thinning	x			60
Fencing	x	x		23
"Nurse Block" making (3,000 units)	x	x		225
Press machine and Soil amendments		x		625
Protection of project site by village community (5 years)	x			30
Other expenditures				15
Maintenance (3 years)	x			143
Overhead (20%)				436
<b>16. Estimated Total Cost</b>				2,615
<b>17. Necessary External Inputs / Assistance / Arrangement</b>				
Finance cooperation for rehabilitation		x	x	
Technical cooperation for rehabilitation measures	x			

<b>1. Project No.</b>	<b>2. Project Title : Degraded High Forest Rehabilitation</b>			
<b>3. Project Location</b>		<b>4. Target Beneficiaries</b> Forest Villagers	<b>5. Project Duration</b> 5 years	
<b>6. Implementing Agency / Body</b> Ministry of environment and Forestry ; OGM				
<b>7. Summary of Objective</b> By rehabilitating these degraded high forests to transform them to a productive condition, so that they may achieve their ecological, economic and social functions.				
<b>8. Justification</b> In the Study area, some of the forested area located near villages has been degraded as a result of clearing land for crops, illegal grazing and illicit cutting for construction and fuelwood. These degraded high forests are rehabilitated by using silvicultural activities. This will contribute to the increased potential of soil protection and biodiversity.				
<b>9. Expected Benefits/Outputs</b> - Decreasing soil erosion - Increasing both quality and quantity of tree growing stock - Ensuring better conditions for wildlife - Ensuring employment - Improving water balance - Increasing aesthetic value of the landscape.		<b>10. Verifiable Indicator</b> - Changes in normal high forest area - Changes in density of standing tree volume - Changes in crown density forests		
<b>11. Important Assumptions / Conditions for the project</b> - Demands for rehabilitation of degraded high forest by forest villagers and MEF - Effectives by rehabilitation of degraded forest for soil erosion conservation				
<b>12. Project Linkage / Other Sector Linkage</b> - Coherence with "Forest Management Plan"		<b>13. Relevant Agencies to be Coordinate</b>		
<b>13. Major / Key Activities</b>	<b>14. Major Inputs</b>			<b>15. Estimated Cost</b> (Mil TL/Ha )
	<b>Personnel</b>	<b>Materials</b>	<b>Construction</b>	
Rejuvenation cutting	x			218
Soil preparation by labor	x			266
Seedling cost (US\$5,000/ton -2kg/ha)		x		15
Seed sawing	x			113
Tending, thinning, pruning	x			222
Fencing	x	x		23
Protection of project site by village community (5 years)	x			30
Other expenditures				15
Maintenance (3 years)	x			143
Overhead (20%)				209
<b>16. Estimated Total Cost</b>				1,254
<b>17. Necessary External Inputs / Assistance / Arrangement</b>				
Finance cooperation for rehabilitation		x	x	
Technical cooperation for rehabilitation measures	x			

<b>1. Project No.</b>		<b>2. Project Title : Degraded Coppice Forest Rehabilitation</b>		
<b>3. Project Location</b>		<b>4. Target Beneficiaries</b> Forest Villagers		<b>5. Project Duration</b> 5 years
<b>6. Implementing Agency / Body</b> Ministry of environment and Forestry ; OGM				
<b>7. Summary of Objective</b> By rehabilitating these degraded coppice forests to transform them to a productive condition, so that they may achieve their ecological, economic and social functions.				
<b>8. Justification</b> In the Study area, there area some native oak species. But most of oak coppice forests are degraded and unproductive as a result of illegal grazing, illegal using of leaves and branches for domestic animal feeding and illicit cutting for fuelwood. These degraded coppice forests may be transformed to productive forest by rehabilitation. This will contribute to the increased potential of soil protection and biodiversity.				
<b>9. Expected Benefits/Outputs</b> - Decreasing soil erosion - Increasing both quality and quantity of tree growing stock - Ensuring better conditions for wildlife - Ensuring employment - Improving water balance - Increasing aesthetic value of landscape		<b>10. Verifiable Indicator</b> - Changes in normal coppice forest area - Changes in density of standing tree volume - Changes in crown density forests		
<b>11. Important Assumptions / Conditions for the project</b> - Demands for rehabilitation of degraded coppice forest by forest villagers and MEF - Effectives by rehabilitation of degraded forest for soil erosion conservation				
<b>12. Project Linkage / Other Sector Linkage</b> - Coherence with "Forest Management Plan"		<b>13. Relevant Agencies to be Coordinate</b>		
<b>13. Major / Key Activities</b>	<b>14. Major Inputs</b>			<b>15. Estimated Cost</b> (Mil TL /Ha )
	<b>Personnel</b>	<b>Materials</b>	<b>Construction</b>	
Rejuvenation cutting	x			218
Soil preparation by labor	x			266
Seed cost (US\$500/ton -60kg/ha)		x		45
Seed sawing	x			113
Tending, thinning	x			60
Fencing	x	x		23
Protection of project site by village community (5 years)	x			30
Other expenditures				15
Maintenance (3 years)	x			143
Overhead (20%)				183
<b>16. Estimated Total Cost</b>				1,096
<b>17. Necessary External Inputs / Assistance / Arrangement</b>				
Finance cooperation for rehabilitation		x	x	
Technical cooperation for rehabilitation measures	x			

<b>1. Project No.</b>	<b>2. Project Title : Energy Forest Plantation</b>			
<b>3. Project Location</b>		<b>4. Target Beneficiaries</b> Forest Villagers	<b>5. Project Duration</b> 5 years	
<b>6. Implementing Agency / Body</b> Ministry of Environment and Forestry ; OGM				
<b>7. Summary of Objective</b> To plant trees for corresponding to a lack of quantity of firewood of forest village. At the same time, to increase flora for prevent soil erosion and biodiversity.				
<b>8. Justification</b> Type of the afforestation that is applied the forest villagers which is planted first-growing tree species aimed fuelwood production for villagers. This may contribute to the increased potential of soil protection and biodiversity, too.				
<b>9. Expected Benefits/Outputs</b> - Decreasing soil erosion -Increasing both quality and quantity of tree stock -Increasing quantity of firewood subsidy -Decreasing illicit cutting for firewood -Ensuring employment -Improving water balance -Increasing aesthetic value of the landscape.		<b>10. Verifiable Indicator</b> - Increases in forest area - Increases in density of standing tree volume - Increases in crown density forests - Increases in fuel wood production and decreases expenses for purchase fuelwood		
<b>11. Important Assumptions / Conditions for the project</b> - Demands for afforestation of Forest, OT area by forest villagers and MEF - Effectives for soil erosion conservation				
<b>12. Project Linkage / Other Sector Linkage</b> - Coherence with "Forest Management Plan"		<b>13. Relevant Agencies to be Coordinate</b>		
<b>13. Major / Key Activities</b>	<b>14. Major Inputs</b>			<b>15. Estimated Cost</b> ( Mil TL/Ha)
	<b>Personnel</b>	<b>Materials</b>	<b>Construction</b>	
Preparation of hole by labor	x			375
Planting of seedling	x			558
Seedling cost (2,500 seedling)		x		1,500
Replacement planting	x	x		45
Fencing	x	x		23
Protection of project site by village community (5 years)	x			30
Other expenditures				15
Maintenance (3 years)	x			143
Overhead (20%)				538
<b>16. Estimated Total Cost</b>				3,227
<b>17. Necessary External Inputs / Assistance / Arrangement</b>				
Finance cooperation for plantation		x	x	
Technical cooperation for plantation works	x			

<b>1. Project No.</b>	<b>2. Project Title : Rangeland Improvement</b>			
<b>3. Project Location</b>	<b>4. Target Beneficiaries</b> Forest Villagers	<b>5. Project Duration</b> 3 years		
<b>6. Implementing Agency / Body</b> Ministry of Environment and Forestry ; AGM or/and ORKOY				
<b>7. Summary of Objective</b> By rehabilitating these rangelands to transform them to a productive condition, so that they may achieve their ecological, economic and social functions.				
<b>8. Justification</b> In the Study area, some of the rangeland degraded as a result of clearing land for crops, over grazing. These degraded rangeland forests are rehabilitated by fertilizer application and re-seeding activities. This will improve quantity and quality of feeding, as the same may increase potential of soil protection and biodiversity.				
<b>9. Expected Benefits/Outputs</b> - Declining soil erosion - Increasing vegetation coverage - Increasing fodder production - Ensuring better conditions for wildlife - Ensuring employment - Increasing aesthetic value of landscape		<b>10. Verifiable Indicator</b> - Increases fodder production		
<b>11. Important Assumptions / Conditions for the project</b> - Demands for rehabilitation of rangeland by forest villagers and MEF - Cooperation by MARA should be able to received				
<b>12. Project Linkage / Other Sector Linkage</b> - Coherence with program such as “ Rangeland management program”		<b>13. Relevant Agencies to be Coordinate</b> - Rangeland management plan prepared by MARA		
<b>13. Major / Key Activities</b>	<b>14. Major Inputs</b>			<b>15. Estimated Cost (Mil TL/Ha)</b>
	<b>Personnel</b>	<b>Materials</b>	<b>Construction</b>	
Seed cost		x		120
Seed sawing	x			30
Fertilizer cost (N-50kg/ha, P-43kg/ha)		x		200
Fertilizer application	x			30
Spreader (1unit/25ha-700Mil TL)		x		28
Watering troughs (1units/150ha-200Mil TL)			x	2
Salt troughs (1units/150ha-100 Mil TL)			x	1
Rubbing post (1units/150ha-100 Mil TL)			x	1
Other expenditures (5%)				21
Overhead (20%)				87
<b>16. Estimated Total Cost</b>				520
<b>17. Necessary External Inputs / Assistance / Arrangement</b>				
Finance cooperation for this activities		x	x	
Technical cooperation for this activities	x			

<b>1. Project No.</b>		<b>2. Project Title : Riverside Plantation</b>		
<b>3. Project Location</b>		<b>4. Target Beneficiaries</b> Forest Villagers	<b>5. Project Duration</b> 1 years	
<b>6. Implementing Agency / Body</b> Ministry of Environment and Forestry ; AGM				
<b>7. Summary of Objective</b> To stabilize soils and riverbank which is zigzag planted poplars, willows and other suitable tree species.				
<b>8. Justification</b> Type of the afforestation that is applied the forest villagers which is planted first-growing tree species along the river aimed protect farmland and settlements from flooding disaster. This may contribute to the fuelwood, too.				
<b>9. Expected Benefits/Outputs</b> -Protection of inhabitant's livelihood and farmland -Environmental improvement -Ensuring employment -Increasing aesthetics value of the landscape.		<b>10. Verifiable Indicator</b> - Increases in forest area - Increases in density of standing tree volume - Decreases expenses for purchase fuelwood - Decreases expenses for clean up after disaster		
<b>11. Important Assumptions / Conditions for the project</b> - Demands for afforestation by forest villagers and MEF - Effectives for soil stabilization - Cooperation by GDRS and/or DSI should be able to received				
<b>12. Project Linkage / Other Sector Linkage</b> -Coherence with program such as “ Rehabilitation plan for river”		<b>13. Relevant Agencies to be Coordinate</b> - River rehabilitation plan by GDRS or DSI		
<b>13. Major / Key Activities</b>	<b>14. Major Inputs</b>			<b>15. Estimated Cost</b> (Mil TL/Ha)
	<b>Personnel</b>	<b>Materials</b>	<b>Construction</b>	
Preparation of hole by labor	x			1,500
Planting of seedling	x			2,230
Seedling cost (10,000 seedling)		x		1,500
Replacement planting	x	x		90
Protection of project site by village community (5 years)	x			30
Other expenditures				15
Maintenance (3 years)	x			143
Overhead (20%)				1,102
<b>16. Estimated Total Cost</b>				6,610
<b>17. Necessary External Inputs / Assistance / Arrangement</b>				
Finance cooperation for plantation		x	x	
Technical cooperation for plantation works	x			

<b>1. Project No.</b>	<b>2. Project Title : Gully Protection (Gabion type)</b>			
<b>3. Project Location</b>	<b>4. Target Beneficiaries</b> Forest Villagers		<b>5. Project Duration</b> 5 years	
<b>6. Implementing Agency / Body</b> Ministry of Environment and Forestry ; AGM				
<b>7. Summary of Objective</b> To prevent soil erosion from the mountainous areas by construct gully plugging using gabion walls with erosion control measures by vegetative works.				
<b>8. Justification</b> This will be decreased outflow from the mountains areas.				
<b>9. Expected Benefits/Outputs</b> - Decreasing soil erosion - Increasing vegetation growing chance - Ensuring employment		<b>10. Verifiable Indicator</b> - Increases in quantity of sedimentation (deposition)		
<b>11. Important Assumptions / Conditions for the project</b> - Demands for activities in Forest, OT and MERA area by forest villagers and MEF - Effectives for soil erosion conservation				
<b>12. Project Linkage / Other Sector Linkage</b> - Coherence with "Forest Management Plan"		<b>13. Relevant Agencies to be Coordinate</b>		
<b>13. Major / Key Activities</b>	<b>14. Major Inputs</b>			<b>15. Estimated Cost</b> (Mil TL/10Unit)
	<b>Personnel</b>	<b>Materials</b>	<b>Construction</b>	
Gabion fabricate material (without stone)		x		3,300
Gabion fabricate by labor	x			450
Gabion setting	x			450
Leveling by labor	x			150
Other expenditures (materialx5%)				165
Overhead (20%)				903
<b>16. Estimated Total Cost</b>				5,418
<b>17. Necessary External Inputs / Assistance / Arrangement</b>				
Finance cooperation for rehabilitation		x	x	
Technical cooperation for rehabilitation measures	x			

<b>1. Project No.</b>	<b>2. Project Title : Gully Protection (Bush type)</b>			
<b>3. Project Location</b>	<b>4. Target Beneficiaries</b> Forest Villagers		<b>5. Project Duration</b> 5 years	
<b>6. Implementing Agency / Body</b> Ministry of Environment and Forestry ; AGM				
<b>7. Summary of Objective</b> To prevent soil erosion from the mountainous areas by construct gully plugging using brush walls with erosion control measures by vegetative works.				
<b>8. Justification</b> This will be decreased outflow from the mountains areas.				
<b>9. Expected Benefits/Outputs</b> - Decreasing soil erosion - Increasing vegetation growing chance - Ensuring employment		<b>10. Verifiable Indicator</b> - Increases in quantity of sedimentation (deposition)		
<b>11. Important Assumptions / Conditions for the project</b> - Demands for activities in Forest, OT and MERA area by forest villagers and MEF - Effectives for soil erosion conservation				
<b>12. Project Linkage / Other Sector Linkage</b> - Coherence with "Forest Management Plan"		<b>13. Relevant Agencies to be Coordinate</b>		
<b>13. Major / Key Activities</b>	<b>14. Major Inputs</b>			<b>15. Estimated Cost</b> (Mil TL/10Unit)
	<b>Personnel</b>	<b>Materials</b>	<b>Construction</b>	
Brush type gully plug (10 m <sup>3</sup> )	x	x		3,000
Other expenditures				23
Overhead (20%)				605
<b>16. Estimated Total Cost</b>				3,628
<b>17. Necessary External Inputs / Assistance / Arrangement</b>				
Finance cooperation for rehabilitation		x	x	
Technical cooperation for rehabilitation measures	x			

<b>1. Project No.</b>		<b>2. Project Title : Meteorological Station</b>			
<b>3. Project Location</b> 1 Sub-Micro catchment		<b>4. Target Beneficiaries</b>		<b>5. Project Duration</b> 3 years	
<b>6. Implementing Agency / Body</b> Ministry of Environment and Forestry ; AGM					
<b>7. Summary of Objective</b> Collection of micro- climate (rainfall) data in the micro-catchment					
<b>8. Justification</b> In the Study area, soil erosion is a one of big problem, but there is no useful information to elucidate the cause. This proposed activity can grasp the rainfall characteristic to be related to soil erosion.					
<b>9. Expected Benefits/Outputs</b> - Elucidates a cause of soil erosion - Contributes to planning for soil erosion control			<b>10. Verifiable Indicator</b> - Collected micro-climate information		
<b>11. Important Assumptions / Conditions for the project</b> - Understanding and cooperation of the villagers					
<b>12. Project Linkage / Other Sector Linkage</b> - Existing meteorological station			<b>13. Relevant Agencies to be Coordinate</b> Meteorological observation project prepared by DSI		
<b>13. Major / Key Activities</b>			<b>14. Major Inputs</b>		<b>15. Estimated Cost</b> (Mil TL/Km)
			<b>Personnel</b>	<b>Materials</b>	
Hyetometer (5 Units)				x	16,410
Data logger (5 Units)				x	2,063
Personal Computer (1 Units)				x	3,150
Other expenditures (5%)					1,080
<b>16. Estimated Total Cost</b>					22,703
<b>17. Necessary External Inputs / Assistance / Arrangement</b>					
Finance cooperation for construction of stations				x	x

## UNIT COST UNDERTAKING WATERSHED REHABILITATION WORKS

	Activity	Unit	Unit Cost (1000TL)	Remarks		
<b>1</b>	<b>Soil Conservation Afforestation</b>					
1.1	- Preparation of terraces by labour	Ha	463,500			
1.2	- Planting of seedlings	Ha	189,000			
1.3	- Seedling cost (1500 seedling per Ha as an average)	Ha	90,000			
1.4	- Gully plugging	Ha	30,000			
1.5	- Fencing	Ha	22,500			
1.6	- Preparation of access roads	Ha	7,500			
1.7	- Replacement planting	Ha	45,000			
1.8	- 1st year tending (weeding, hoeing, terrace repair)	Ha	52,500			
1.9	- 2st year tending (weeding, hoeing, terrace repair)	Ha	45,000			
1.10	- 3st year tending (weeding, hoeing, terrace repair)	Ha	45,000			
1.11	- Protection of afforestation sites by forest guard	Ha/Year	15,000			
1.12	- Protection of afforestation sites by village community	Ha/Year	6,000			
1.13	-Overheads (rough estimates for supervision, administrative, planning, etc. expenditures)	Ha	99,000			
<b>2</b>	<b>Rehabilitation / Revegetation by Conservation (on high slope- difficult sites)</b>					
2.1	-Seed sowing	Ha	30,000			
2.2	-Gully plugging	Ha	30,000			
2.3	-Fencing	Ha	22,500			
2.4	-Other expenditures	Ha	15,000			
2.5	- Protection of afforestation sites by forest guard	Ha/Year	15,000			
2.6	- Protection of afforestation sites by village community	Ha/Year	6,000			
<b>3</b>	<b>Rehabilitation of Degraded Oak Coppice Forests</b>					
3.1	-Conservation of natural oak vegetation	Ha	6,000			
3.2	-Rejuvenation cutting	Ha	217,500			
3.3	-Soil preparation by labor	Ha	265,500			
3.4	-Seed sowing	Ha	112,500			
3.5	-Seed	Ton	750,000			
3.6	-Tending, thinning	Ha	60,000			
3.7	-Fencing	Km	1,462,500			
3.8	-Gully plugging	m <sup>3</sup>	15,000			
3.9	-Construction of service road	Km	6,750,000			
3.10	-Maintenance of service road	Km	750,000			
<b>4</b>	<b>Rehabilitation of Degraded High Forest</b>					
4.1	-Protection	Ha	6,000			
4.2	-Rejuvenation cutting	Ha	217,500			
4.3	-Soil preparation by labor	Ha	265,500			
4.4	-Seed sowing	Ha	112,500			
4.5	-Seed	Tton	750,000			
4.6	-Tending	Ha	132,000			
4.7	-Fencing	Km	1,462,500

## **APPENDIX-B.4 CLASSIFICATION OF SUB-MICRO CATCEMENT**

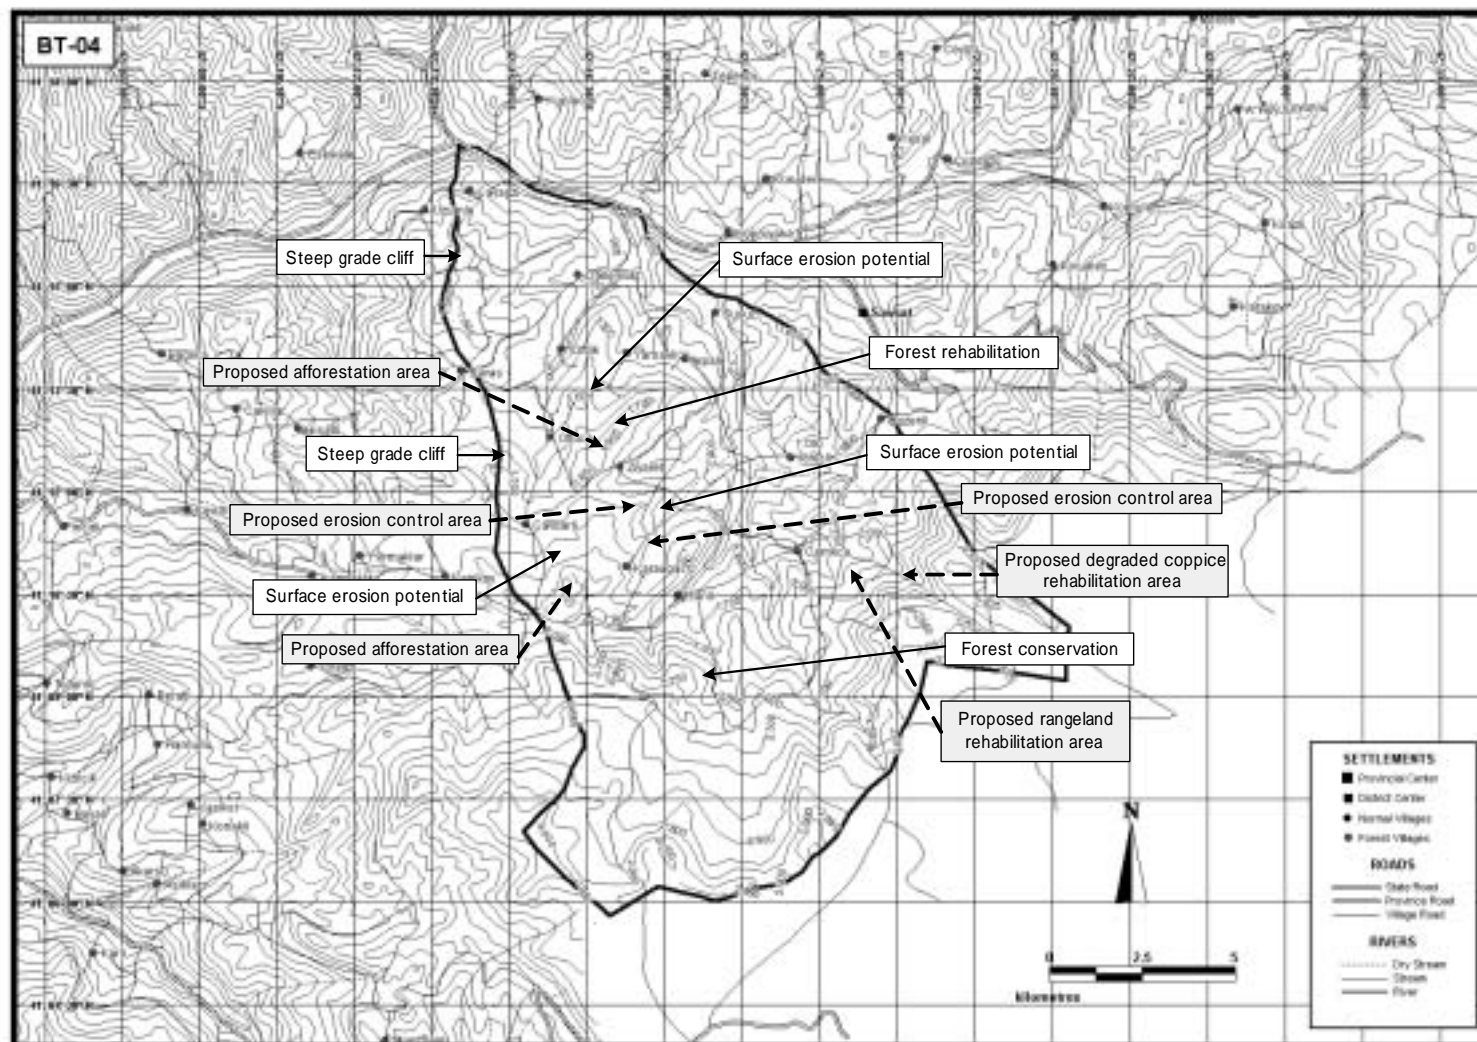

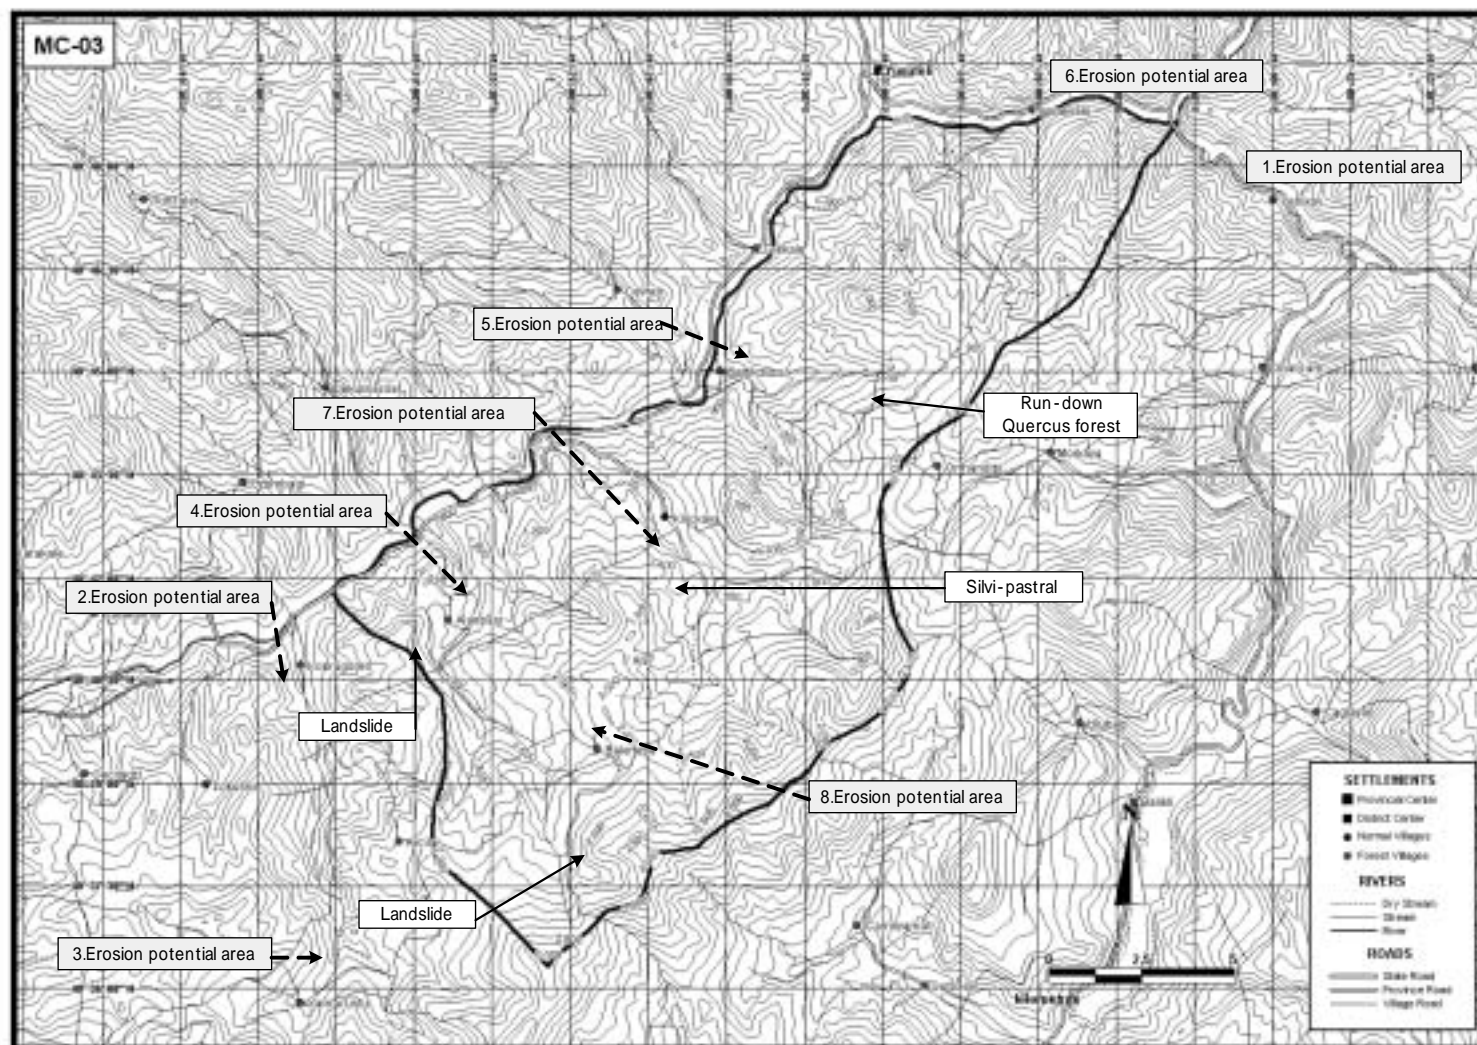

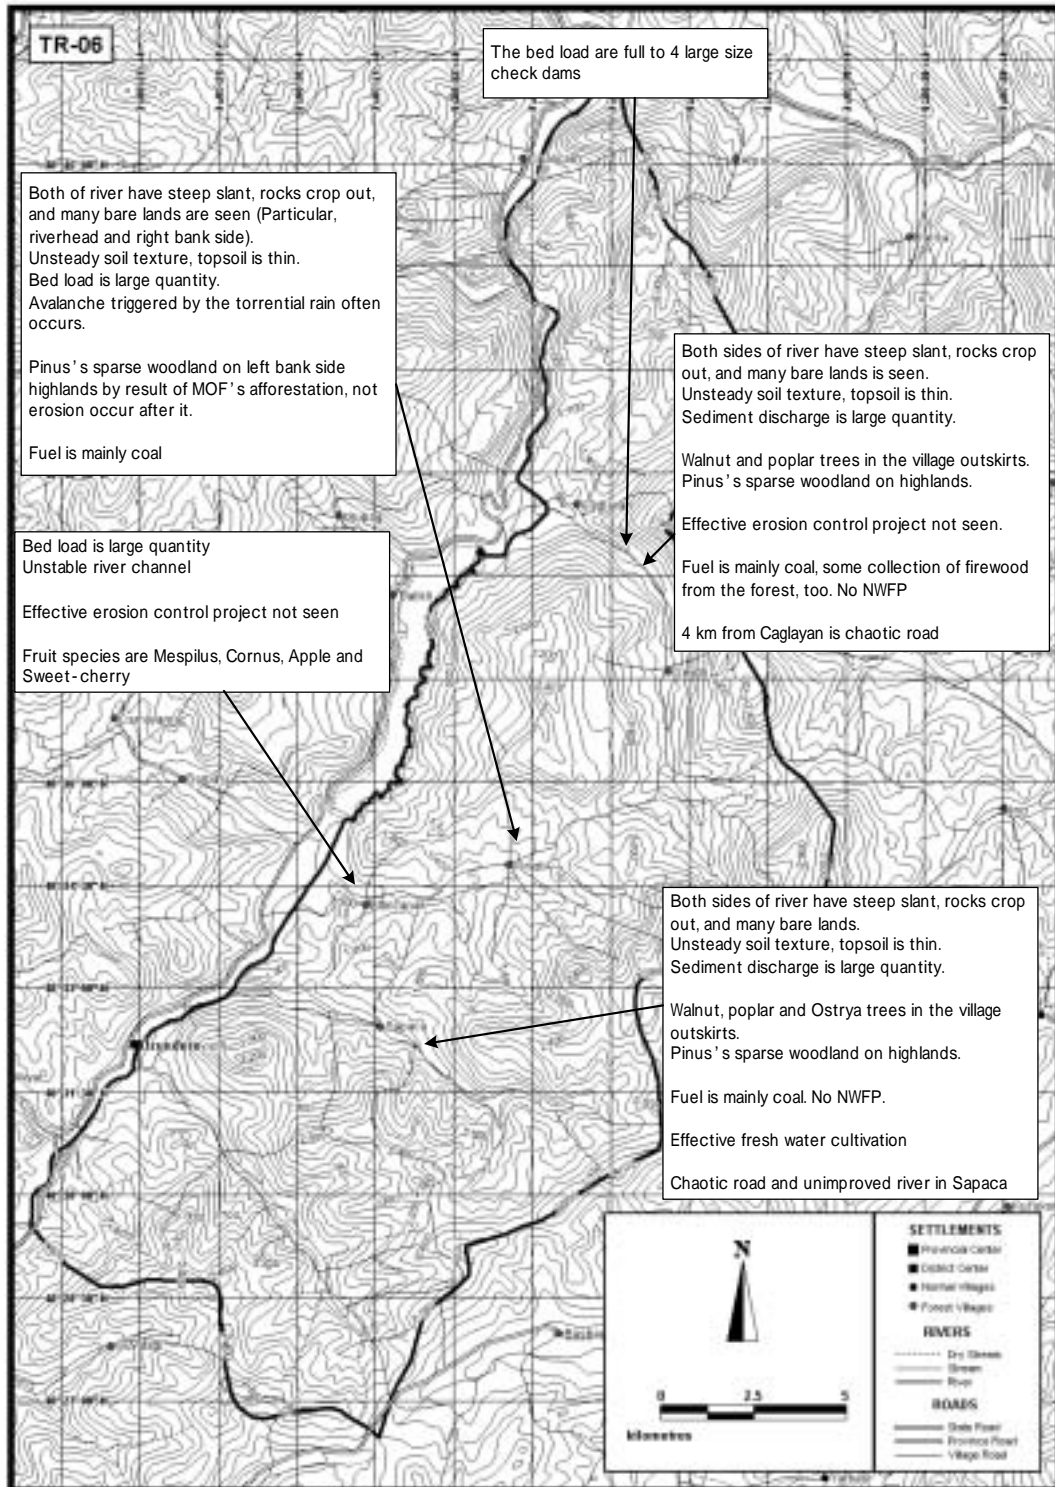

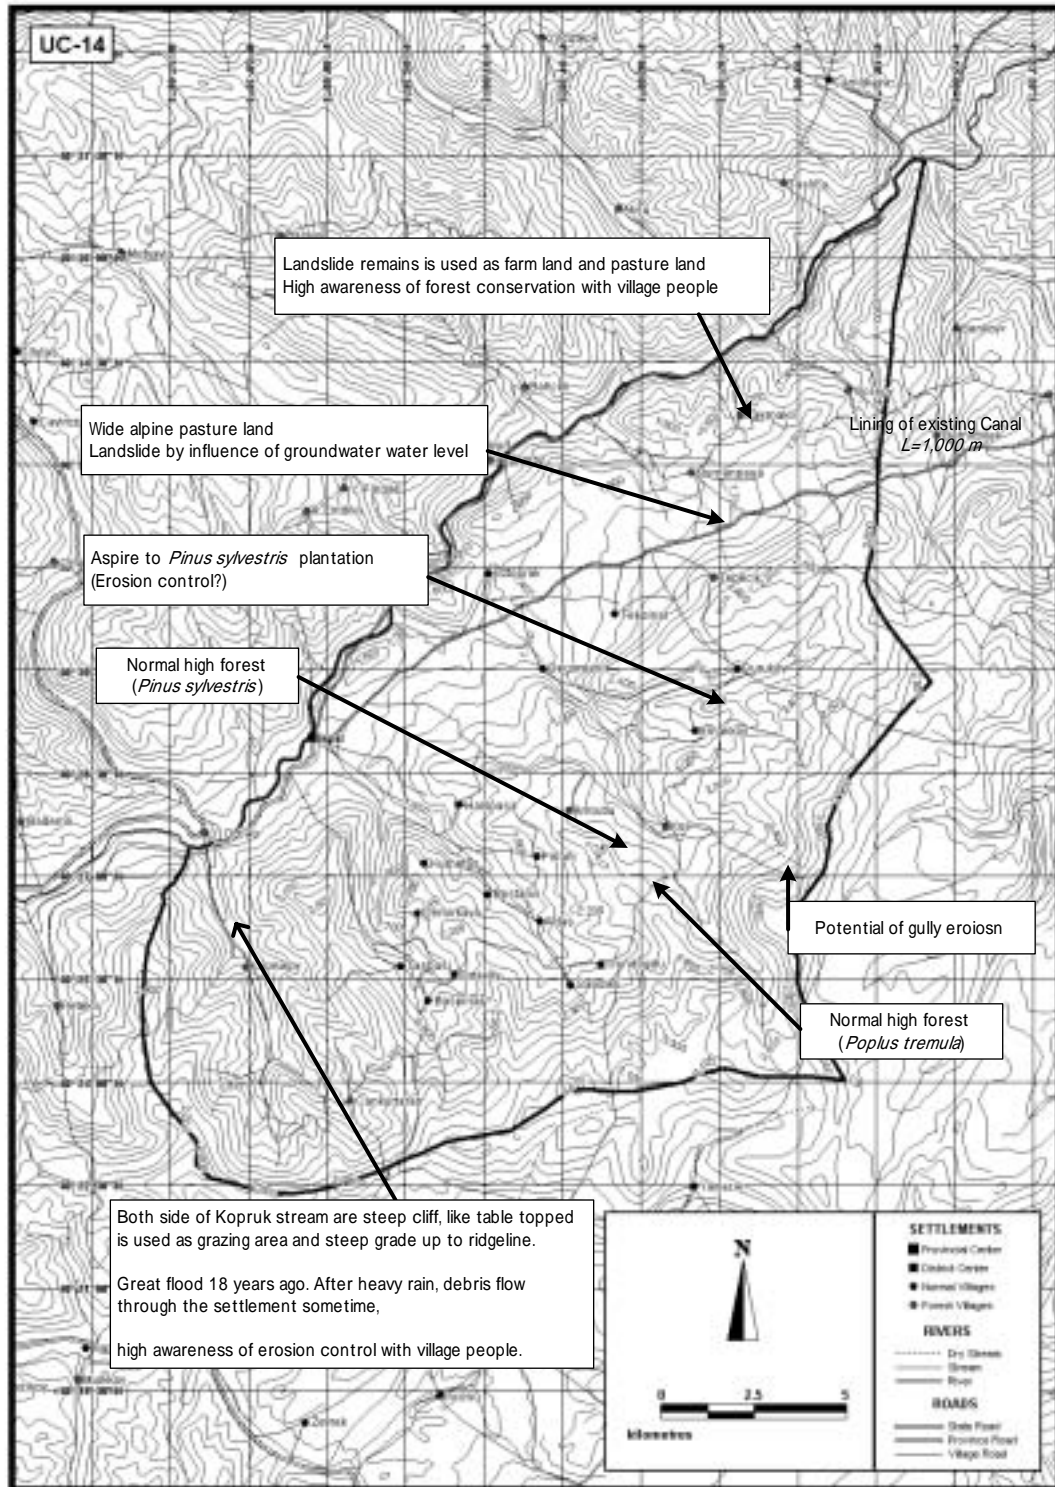

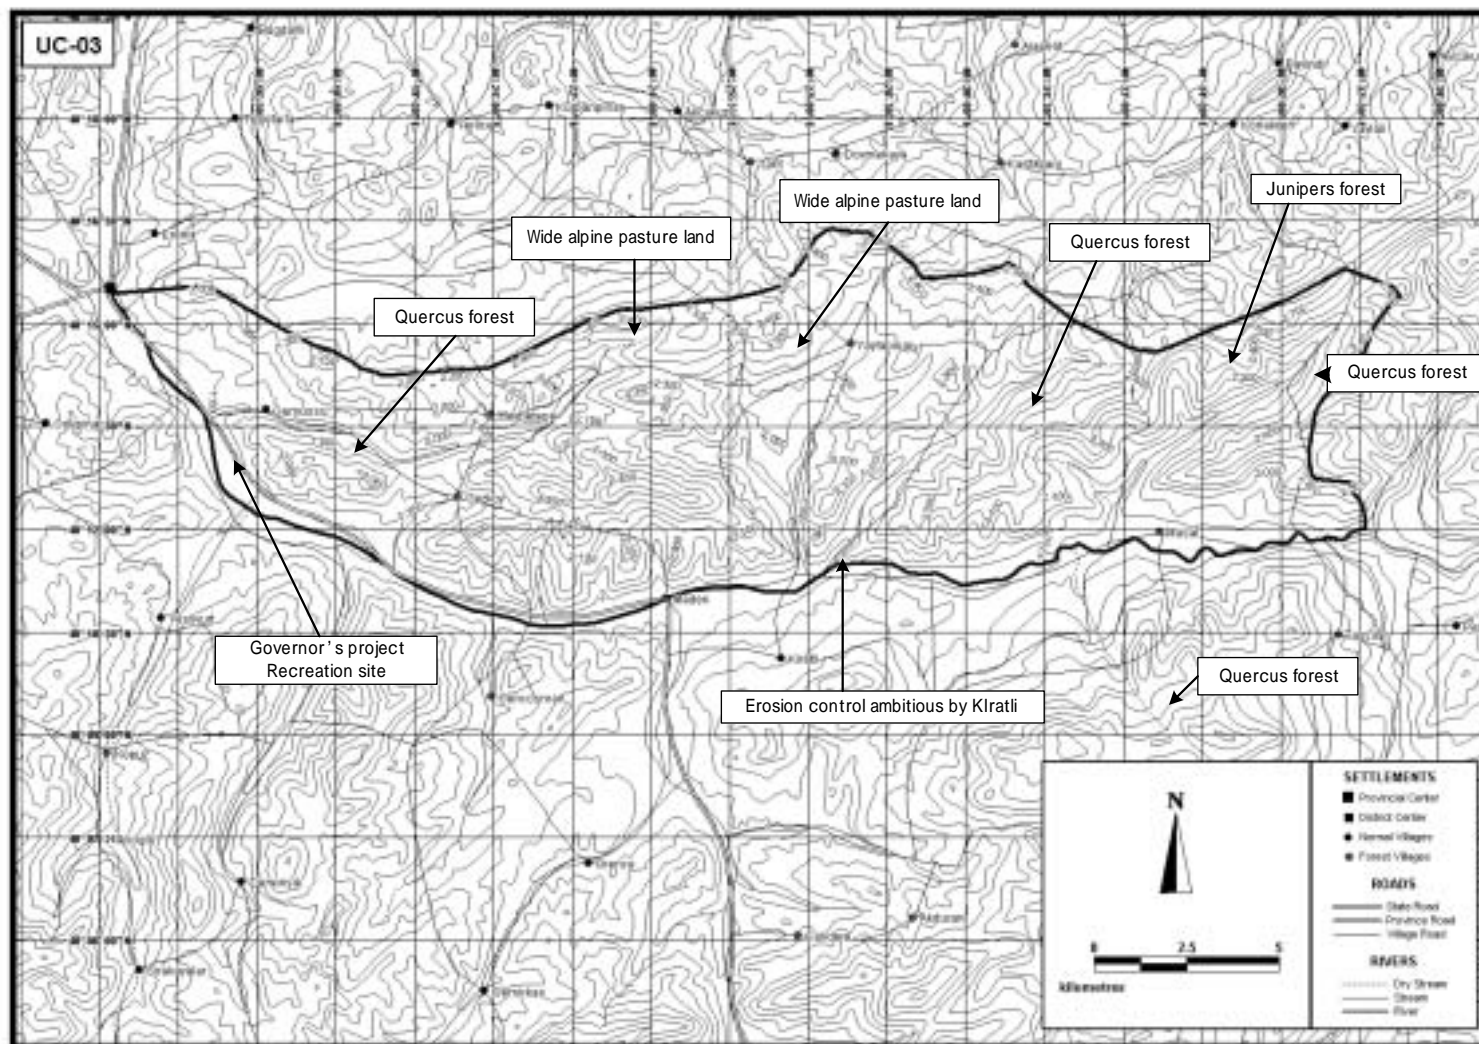

## **APPENDIX-B.5 IMPRESSION OF ON-SITE STUDY**

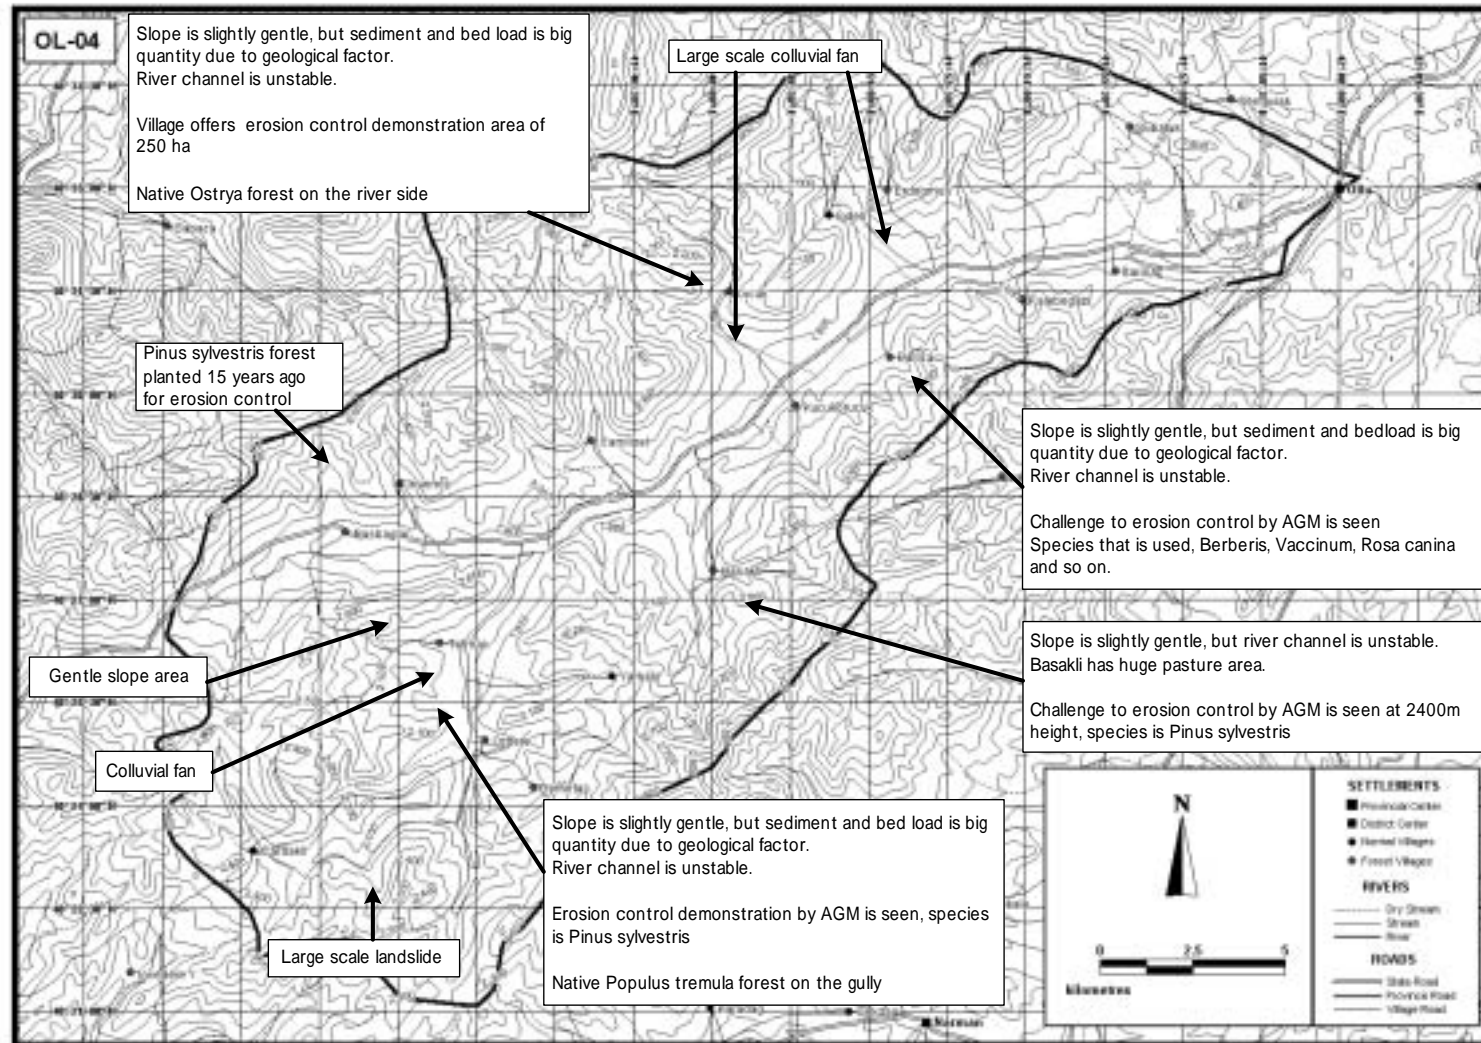

## **APPENDIX-B.6 CALCULATION OF WATER BALANCE BY THORNWAITE'S CLIMATIC CLASSIFICATION METHOD**

Examined relation of the precipitation and evapotranspiration potential. For purpose of a judgment of adequate planting period and plating method.

Classified climatic types based on Thornwaite method, according to result of analysis, all MCs belong Subarid climate type. It was estimated that significantly water shortage in summer in all MCs but surplus of water did not have in Yusufeli and Oltu in the summer.

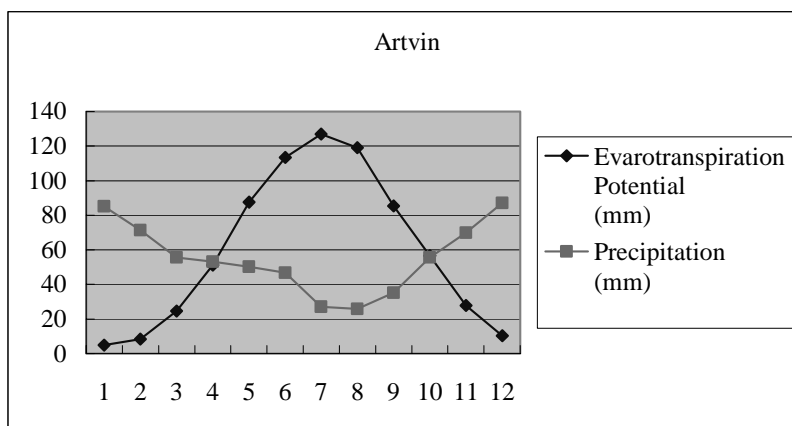

Compared the monthly evapotranspiration potential that demanded by calculation with precipitation, and calculated surplus quantity and shortage quantity of water of every month. According to this analysis, water is short in Artvin between April to October, May to September in Bayburt, March to November in Yusufeli, May to October in Tortum and April to November in Oltu.

By the analysis could understand adequate planting period that is limited in early autumn or late fall. In addition, some measures will be needed after planting for keep moisture surrounding plant root.

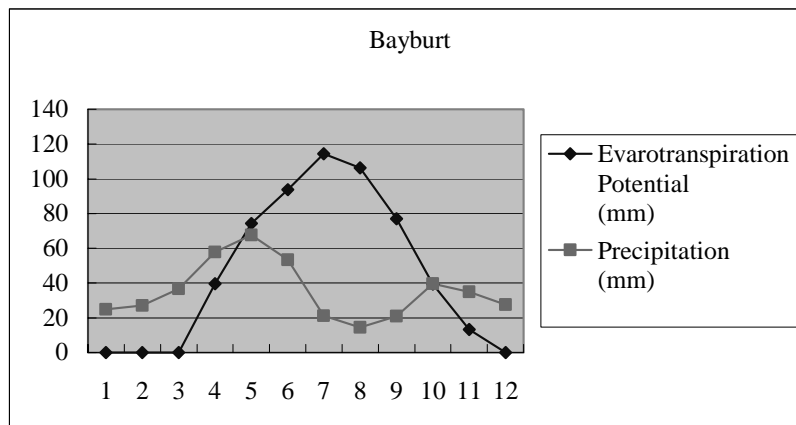

## Artvin

Month	Evapotranspiration Potential (mm)	Precipitation (mm)	Thornwaite's Climatic Index	Climate type		Aspect
1	4.98	85.1	Moisture Index	27.2	W2	Significant water surplus in summer
2	8.3	71.4	Indices of Humidity	34.6	S1	Significant water shortage in summer
3	24.72	55.6	Indices of Aridity	6.5	C2 Type	Subhumid

## **APPENDIX-B.8 FOREST CLASSIFICATION BASED ON THE FOREST MANAGEMENT PLAN**

The Forest Management Plan is created as basics document of forest management in Turkey. The main tree species, crown closeness, forest society (diameter of 1.5m height) and existing condition of forest in each forests are indicated in this Forest Management plan. We gleaned this document for this study and inflected in on-site studies. However, this plan had the following failings for using basics document of this study. Therefore we summarize here it as reference materials.

1. The prepared year is greatly different according to the MC, so we may not have uniformity of information.

BT-04 (Savsat) ; 1984-85 (Scale 1/25,000)

MC-03 (Yusufeli) : 1980? (Scale 1/25,000)

TR-06 (Uzundere) : 2001 (Scale 1/25,000)

UC-14 (Ispir) : 2001, 1990?(some part) (Scale 1/25,000)

UC-03 (bayburt) : 1986-87 (Scale 1/100,000)

OL-04 (Oltu) : 2001, 1990?(some part) (Scale 1/25,000)

2. Even in the same MC, a different part has the Forest Management Plan which prepared different year.

3. The Forest Management Plan is not prepared for the whole selected MCs.

Accordingly it is unfit information to use for the whole plan.

**REVISED FOREST SECTOR REPORT  
FOR THE MASTER PLAN BY MR. MUZAFFER DOGRU**

## Forest Resources and Forest Management

### 1 Area and Conditions of the Forests

According to Landsat image analysis carried out by the Study Team, the area of Forest in the Coruh river catchment is estimated at some 440,000 ha or 22% of the total catchment area. If the area of Transitional Woodland and Shrub (e.g. degraded forest lands) is included, it exceeds 677,000 ha, which corresponds 33% of the total catchment area. On the other hand, according to OGM forest management plans the total forest area within three Provinces is about 786,000 ha. According to these figures, while the forests and woodlands (degraded forests) together make about 40% of the watershed area, normal forests alone cover only 16% of the total watershed area. Normal forests cover 28%, 13.6% and 1% of the watershed areas of Artvin, Erzurum and Bayburt provinces respectively. These figures show that the forest areas in Erzurum and particularly in Bayburt provinces are far from adequate and there is an urgent need for rehabilitation of degraded forests and expansion of forest areas by afforestation on suitable non-forest lands.

**Table 1-1 Forest Conditions in the Study Area unit: ha**

	Artvin			Erzurum			Bayburt			Total

Source: JICA study team based on data of MOF, 1997 and OGM regional offices of Artvin and Trabzon, 2002

High forest accounts for 62% of the forests in the watershed area. Coniferous trees are dominant in the high forests with the share of 71 %, followed by mixed tree species with 19% and broad-leaved with 10%. The major species in the high forests are Scotch pine (*Pinus sylvestris*), spruce (*Picea orientalis*), fir (*Abies nordmandiana*), juniper (*Juniperus orientalis*) for coniferous and beech (*Fagus orientalis*), oak (*Quercus* sp.), alder (*Alnus* sp.), aspen (*Populus tremula*) for broad-leaved, respectively. Coppice forests are dominated by oak species. Shrub and plant species on the forest lands also show a rich diversity throughout the Çoruh Watershed (Capparis species, Rose hip, wild sainfoin sp., etc.).

The high forests and coppice are further classified into “normal (productive)” and “degraded (unproductive)” forest respectively by crown density (canopy closure). The forests with 0-10% of crown density are regarded “degraded” and that of 11-100% is defined as “normal”. Based on this definition, some 51% of the forest areas are classified as degraded and unproductive. The share of degraded forest area in the total forest by Province is: 51% for Artvin, 67% for Erzurum and 73% for Bayburt, respectively. About 37% of high forests are degraded while 95% of the coppice forests are degraded, which is normally utilized for firewood production basically for meeting local demand. The total standing volume of the productive high forest is estimated at 41 million m<sup>3</sup> in Artvin and 20 million m<sup>3</sup> in Erzurum. The average standing volumes per hectare are 149 m<sup>3</sup> for Artvin and 100 m<sup>3</sup> for Erzurum, respectively.

The site classes<sup>1</sup> of the normal forests in the Study area are generally over class III, and indicate the low potentials for wood production. Due to difficult site conditions on most areas, afforestation activities should be carried out under the basis of “selecting appropriate areas”.

Most of the trees in the forests of Artvin are from 31 to 50 years old, while the forests in Erzurum are even younger, and consist of trees aged from 31 to 40 years. Regarding that the standard cutting ages of major wood species for the Study area generally indicates 100 to 120 years, it is shown that the majority of the forests in the study area is too young for harvesting, and needs long years to mature.

All the forests in the Çoruh Watershed region are owned by the state. However, cadastral surveys and delineation works have been completed only for a very small portion of the forests (e.g. 11.6% of the forests in Artvin and for less than 10% in Erzurum and Bayburt).

## 2 Forest Resources Management Activities and Achievements

### 2.1 Management Planning

Forest management activities are carried out according to the forest resource inventories and management plans prepared/renewed every 10 year by the OGM’s central forest management planning teams or private firms on contract. These activities are planned and coordinated by the Management Planning Department of OGM in Ankara. According to the current management plans the breakdown of the forests by management objectives is given in Table 3.5.2.1.1 below. Examination of this table shows that, in spite of very special importance of the biological diversity of the region forests and very harsh and difficult site conditions prevailing in the region, the ratios of the protected forest areas (2%) and of the forest areas assigned for protective functions (15%) are extremely low, and majority of the forests are still managed for forests products’ (mainly wood) utilization purposes.

**Table 2.1.1 : Breakdown of the forests by the major management objective in the Çoruh Watershed Region**

Management Objective	Artvin		Erzurum		Bayburt		Total	
	Area (ha)	%	Area (ha)	%	Area (ha)	%	Area (ha)	%
Conservation forest <sup>1</sup>	-	-	21,813	5.7	-	-	21,813	2.8
Forests managed to produce forest products	295,069	75.5	343,583	90.0	14,163	100.0	652,815	83.0
Forests managed for <sup>2</sup> protective functions	79,912	20.5	16,496	4.3	-	-	96,408	12.2
<u>Protected areas</u>	<u>15,469</u>	<u>4.0</u>	<u>-</u>	<u>-</u>	<u>-</u>	<u>-</u>		2.0

- Nature parks	368	0.1	-	-	-	-		-
- Nature reserves	1,191	0.3	-	-	-	-		0.2
<b>TOTAL</b>	<b>390,449</b>	<b>100</b>	<b>381,892</b>	<b>100</b>	<b>14,163</b>	<b>100</b>	<b>786,504</b>	<b>100</b>

<sup>1</sup> Declared by the government on the areas with serious environmental problems and risks.

<sup>2</sup> Assigned by forest management plan for protective purposes.

<sup>1</sup> Classifications indicating potential wood productivity. The criteria for classification regard the natural conditions of the site, such as climate, soil and topology. Site classes are described in numbers, where the larger number indicates lower productivity.

The areas of the forests assigned for protective functions (mainly for soil and water conservation) has significantly increased in the forest management plans prepared during recent years and this positive trend is expected to continue during coming periods.

## **2.2 Forest rehabilitation and management activities undertaken by AGM and OGM**

Degraded forest areas are shown as the potential reforestation and rehabilitation sites in the management plans. AGM carries out site surveys and assessments on such areas, prepares and implements reforestation, erosion control and range improvement implementation projects for their appropriate rehabilitation and sustainable utilization. AGM undertakes the erosion control and other rehabilitation activities besides on forestlands also on non-forest lands (especially on OT areas<sup>3</sup>) where such measures are urgently needed. Forest management and rehabilitation activities undertaken in the Çoruh Watershed provinces by AGM and OGM during last four years are shown in Table 3.5.2.2.1 - 3.5.2.2.4 below.

Major problems and constraints in relation to the conservation and management of the forests in the watershed regions include the following:

- incomplete cadastral surveys and delineation of the forest areas;
- lack of adequate number of staff in the forestry units (OGM, AGM, ORKÖY, DMPG) in the watershed provinces;
- inadequacies of the current centralized forest management planning system in relation multipurpose (functional) management of forest resources, inadequate attention on local needs during planning, inadequate participation of local villagers and other stakeholders during planning;
- inadequate coordination and integration during planning of different forestry activities by OGM, AGM, ORKÖY and DMPG units. inadequate dialogue and collaboration between MEF and other related government agencies.;
- illicit wood cutting by local communities for meeting their energy (fuel wood) needs, which cause deterioration of the forest resources and failures natural regeneration;
- inadequate silvicultural implementations due to low piece rates paid for forestry implementations, lack of adequate labor force in local villages due to high migration rates;
- increased insect damages in the forests, particularly in Artvin province;
- inadequate attention on natural resources degradation and erosion problems and risks during undertaking of range cadastral and delineation works by MARA;
- inadequate alternative income opportunities, support programs/projects and awareness in the low-income village communities;
- inadequate attention on rehabilitation potential and cost effectiveness during undertaking of the soil conservation and forest rehabilitation implementations;
- lack of mutual confidence between villagers and government agencies.

---

<sup>3</sup> OT areas are the non-forest lands identified by the forest management plans as the sites that should be undertaken under forest regime in order to undertake the urgent rehabilitation.

Contracting of erosion control activities and afforestation works increasingly to local village communities in Artvin and Erzurum provinces should be considered as a positive development, that provides significant contributions in improving the relations between the villagers and AGM and in reducing the opposition of villagers to such activities. Achievements of the erosion control and afforestation activities carried out by local village communities on contract basis, given by AGM, in Artvin province during last three years are shown in Table 3.5.2.2.5 below.

**Table 2.2.5 : Erosion Control and Afforestation Activities Carried out by the Local Village Communities in Artvin Province During 2000-2002**

Protection of erosion control and afforestation sites have also been increasingly contracted to village communities during recent years. 13.6 billion TL was paid to 22 village communities for protection of 3,861 ha in Erzurum, during first 6 months of 2003. In Yusufeli district of Arvin, 8.4 billion TL will be paid to 6 villages for protection of 2,301 ha erosion control and afforestation areas during 2003.

Afforestation activities undertaken with fast growing tree species (mainly poplar) by villagers have also been supported by low interest credit by MEF/AGM. 71 persons established such plantations on 180 ha in Erzurum, by receiving 45 billion credit assistance from AGM during last 10 years.

Opportunities and potentials for the development of forest resources rehabilitation and management in the watershed areas include the following.

- increasing awareness among the villagers in relation to importance of the conservation of forests and other natural resources and their linkages for sustainable development of their livelihoods;
- accumulated knowledge and experiences of the forestry organization based on long-term implementations under different conditions;
- increasing interest and initiatives within the forestry organization for the development of functional (multipurpose) forest management planning;
- increasing interest within the forestry organization and among the other stakeholders (including local villagers) for the development of participation in the planning and implementation of forestry programs;
- positive impacts of the pilot implementations undertaken by AGM and OGM during recent years for contracting forest protection and rehabilitation activities (e.g. protection of regeneration sites, soil conservation, afforestation, tending and maintenance activities on such areas) to village communities, which provides significant employment and revenue opportunities as well as increases interest among the villagers;
- increasing interest among AGM staff for using local multipurpose tree, shrub and plant species (e.g. *Populus tremula*, *Capparis* sp., rose hip, almond, wild pomegranate, sainfoin, etc.) in soil conservation activities, which are appreciated by local communities;
- decreasing pressures on forest resources due to out-migration from the villages within or adjacent the forest areas;
- development of the capacities and contributions of the NGOs in the watershed regions;
- development potential of eco-tourism as a significant income source in some regions (e.g. Şavşat, Borçka, Ispir, Yusufeli, Tortum) of the Çoruh Watershed.
- existence of universities and research institutions working on forestry, other natural resources and rural development issues in Erzurum and Artvin provinces.
- Low salaries paid to forestry staff.

### **2.3 ORKÖY Activities Undertaken for Improving Forest Villagers Livelihood and as well as the Relations Between Villagers and Forestry Organization**

Out of 832 of the villages 515 (61.9%) are the forest villages in the Çoruh Watershed region. Of the forest villages 200 are within-forest villages and 315 forest-neighbouring villages. According to 2000 census, total population of the forest villages is 156,130 (58.2% of the rural population), of which 62,657 (23.3%) are living within forest villages and 93,473 (34.8%) in forest-neighbouring villages presently. Average population decreases during recent decade are estimated -3.51% in the within-forest villages and -2.88% in the forest-neighbouring villages. Forest villages are mostly located in the hilly and mountainous areas of upper-catchment regions. Due to limited land resources, lack of adequate alternative income resources and inadequate government support programs and projects, poverty is wide spread and income level is extremely low in the forest villages (per capita income is estimated between \$200-500 by different studies). Consequently, in many areas forest villagers are dependent on excessive utilizations and pressures on the forests and the pasture lands within or near forests (e.g. illicit wood cuttings, overgrazing), which causes destruction and deterioration of the forests.

Present policies and strategies of MOF for poverty reduction and livelihood improvement in the forest villagers include: (i) provision by OGM of the fuel wood and round wood needs of village households at subsidized prices and allocation of part of the wood production at subsidized prices to village households and cooperatives to earn income from their sales; (ii) collection and utilization of Non-Wood Forest Products (NWFPs) by villagers by paying modest charges to OGM; (iii) allocation of degraded forest lands to village households for reforestation purposes and credit support by AGM for their establishment and maintenance; (iv) transferring small shares of hunting revenues to local village communities; (v) protection of forest regeneration, reforestation and wildlife reserve areas by local villagers with the payments made to village budget by OGM, AGM and MPG; (vi) preferential employment of forest villagers and cooperatives in forest works (e.g., wood harvesting and transportation, reforestation, etc.); and (vii) supporting small scale income-generation activities by providing low-interest ORKÖY credits to forest village households and cooperatives.

ORKÖY contributions in relation to supporting small-scale income generation activities in the forest villages during recent years are given in Table 3.5.2.3.1. below. Examination of this table shows that ORKÖY support for income generation activities have reached only to a limited number of villages and families have been far from adequate in the watershed region during recent years. The forest village cooperatives supported by ORKÖY credit assistance have also been very few. Inadequate budget allocation of the governments for ORKÖY programs has been the main reason for this situation. Other constraints include: (i) inadequate staff capacities of ORKÖY; (ii) inadequate linkages, established during planning and implementation stages, between the ORKÖY activities and the forest rehabilitation and management activities carried out by the other units of MEF (AGM, OGM, DNPG); and (iv) inadequate monitoring and assessment of the results of ORKÖY activities with respect to poverty reduction and livelihood improvement, forest resources conservation and development and improvement of the relations between the villagers and forestry organization.

Table 2.3.1 : ORKÖY contributions in small-scale income generation activities in the Çoruh Watershed region forest villages during recent years.

## 2.4 The Activities Undertaken by DNPG in Relation to the Development and Management of the National Parks and Other Protected Areas

Awareness and expectations in the region communities for conservation, sustainable management and appropriate utilization of the rich biological diversity, wildlife and landscape resources have shown a significant increase during recent years. Under MEF, field units of the General Directorate of Nature Conservation and National Parks is the main government agency responsible for undertaking of these activities. Existing protected areas established and managed by this agency are shown in Table 3.5.2.4.1 below. Besides these sites there are also a number of candidate areas (e.g. Tortum Lake Area in Erzurum, Karcil Mountain, Murgul Valley Areas in Artvin) for which assessment and establishment works are continuing.

**Table 2.4.1. Existing Protected Areas in the Çoruh Watershed Regions.**

No	Name of the area	Location	Status	Area (Ha.)
1.	Karagöl-Shara National Park	Artvin-Şavşat	National Park	3,766
2.	Hatilla National Park	Artvin	National Park	17,104
3.	Camili Efeler Ormanı	Artvin-Borçka	Nature Reserve	1,453
4.	Camili-Görgit	Artvin-Borçka	Nature Reserve	490
5.	Karagöl-Nature Park	Artvin-Borçka	Nature Park	368
6.	Çoruh Valley Wildlife Conservation Area	Artvin-Yusufeli	Wildlife Conservation Area	21,821
7.	Oltu Wildlife Conservation Area	Erzurum-Oltu	Wildlife Conservation Area	5,400
8.	Verçenik Mountain Wildlife Conservation Area	Erzurum-Ispir	Wildlife Conservation Area	50,435
9.	Pazaryolu Wildlife Conservation Area	Erzurum-Pazaryolu	Wildlife Conservation Area	20,326
TOTAL			2 national parks, 2 nature reserves, 1 nature park, 4 wildlife conservation areas	20,870 1,943 368 97,982 <b>121,163</b>

DMPG units undertake management (e.g. planning, inventory, protection, awareness creation, public education) activities on these sites. Among DMPG activities, training of hunters and contracting protection of the sites to local villages have gained increased importance during recent years. Establishment and management of the forest recreation sites have also been among the priority activities of DMPG, in order to meet growing demand in the region.

Camili Nature Reserve Area is included among the four sites of the ongoing “Biological Diversity Conservation Project”, supported by the GEF program. Few NGOs (including TEMA) have also been implementing small-scale development projects at the same site.

The major constraints in relation to the national parks and protected areas management include; (i) inadequate coverage of the existing protected areas for conservation of the rich biological diversity resources, endemic and threatened species in the region; (ii) lack of management plans for the protected areas in the region; (iii) lack of sufficient staff capacities and budget resources of DMPG field units; (iv) inadequate cooperation and collaboration between DMPG and the other units of MEF; (v) inadequate dialogue and collaboration with the NGOs, research and education institutions; (vi) inadequate efforts and pilot implementations for the development of community-based, environmentally sound eco-tourism activities in the watershed regions; and (vii) insufficient knowledge and experiences of the DMPG units about inventory and management of wildlife resources.

## **C.1 INTRODUCTION**

The socio-economic development in the eastern part of Turkey, where the Coruh river catchment is located, has been lagged behind in general. Rectification of disparity between east and west is one of the most important policy issues of the present administration.

As one of the present Study objectives addresses to the enhancement of the livelihood, the projects to be proposed in the Study will be expected to contribute to the attainment of one of the national goal.

Socio-economic conditions of the people living in the Coruh river catchment are constrained by many factors including harsh climate, steep topography and fragile geology, poor vegetation, hard access to the major urban centers, etc. Natural resources have been deteriorated as a result of over-exploitation such as over grazing and over logging in the past decades. As local people have depended most of their livelihood on natural resources, their degradation has seriously affected their lives.

In the last two decades, out-migration has been in boom, which resulted in rapid population decrease. Forest villagers, usually located in remote areas of the upper-catchment, have been affected more seriously. Liberalization of trade also brought about the negative impact on their life through the decrease in log price as well as meat price.

In this Paper, the socio-economic situation of the Coruh river catchment as well as people in the Forest Villages in the catchment is presented based on the available data and on the results of the rural socio-economic survey which was conducted as a part of the Study.

## **C.2           PRESENT SOCIO-ECONOMIC SITUATION OF THE CORUH RIVER CATCHMENT**

### **C.2.1   Area and Population**

#### **C.2.1.1 Study area and administrative boundaries**

The Coruh river catchment is located in the north-eastern part of Turkey. Originating from the south-western part of the Bayburt province, the river flows east-northeast-ward along the southern Kackar mountain range, change direction towards north at the junction with the Oltu river up to Borcka, and then again change direction towards north-east to pass the Georgian border. The total catchment area of the river is some 2 million ha.

The Coruh river catchment largely coincides with the administrative boundary of 17 districts of three provinces of Artvin, Erzurum and Bayburt: six districts (Artvin, Ardanuc, Borcka, Murgul, Savsat and Yusufeli) in Artvin, eight districts (Ispir, Narman, Oltu, Olur, Pazaryolu, Senkaya, Tortum and Uzundere) in Erzurum, and three districts (Bayburt, Ayrintepe and Demirozu) in Bayburt as shown in Figure 2.2. The catchment area accounts for 55% of the sum of three provinces.

#### **C.2.1.2 Population and its growth**

The population in the whole Coruh catchment totals 432,259 as of year 2000 with the rural population of 268,459. The population in the catchment shares 35% of total population in the three provinces with 1,226,681. Urbanization rate is 38% compared to 65% in Turkey as a whole), as shown in Table 2.1.

Population density in the basin is as low as 22 people/km<sup>2</sup> compared to 34 people/km<sup>2</sup> for the three province and 88 people/km<sup>2</sup> for the whole Country. Population density does not vary much among districts ranging from 13 people/km<sup>2</sup> in Yusufeli of Artvin to 35 people/km<sup>2</sup> in Borcka of Artvin.

During the last decade the population decreased by 49,275 or 10.2% from 481,534 in 1990. Annual average population growth rate in the last decade was –1.1% on average. In contrast to the increase in urban population at 1.6% per annum on average, rural population has decreased annually at 2.4% on average during the same period. Population decrease occurred rapidly in Murgul, Savsat and Yusufeli districts of Artvin and in Olur, Oltu and Ispir districts of Erzurum with annual average population growth rate of –3.5% or less.

On the other hand, population in the three provinces increased by 58,317 or 5.0% during the last decade with average annual growth rate of 3.0% for urban and –2.0% for rural, respectively. Population decrease has been attributed to out-migration from rural areas to urban centers not only within the catchment but also regional centers and mega cities such as Ankara and Istanbul.

There are only two districts (Tortum of Erzurum and Demirozu of Bayburt) at which rural population has increased during the last decade, while urban population in three districts (Murgul of Artvin, Bayburt and Demirozu of Bayburt) has decreased during the same period.

**Table 2.1 Demographic Features of the Coruh River Catchment**

Province	Population as of 2000			Annual average growth rate (1990-2000; %)			Surface area (km <sup>2</sup> )	Pop. density (nos./km <sup>2</sup> )

### C.2.1.3 Age structure

Median age in the three provinces has increased during the last two decades as shown in Table 2.2.

**Table 2.2 Median Age and Dependency Ratio by Province**

Census year	Median age			Dependency ratio					
	Artvin	Erzurum	Bayburt	Artvin		Erzurum		Bayburt	
				65+	0-14	65+	0-14	65+	0-14
1960	19.4	19.3		8.6	81.6	5.7	79.8		
1970	18.8	18.2		9.9	80.1	6.8	83.8		
1980	20.6	17.6		11.1	65.3	6.4	84.0		
1990	24.8	19.0	20.3	12.4	50.1	6.5	73.5	8.3	65.2
2000	29.4	21.4	23.1	17.1	38.2	8.0	58.5	12.6	56.5

Note: Dependency ratio is calculated by dividing the population at 65 years of age and over or 0-14 age group by the population at 15-64 age group, and expressed as percentage.

Source: JICA Study Team based on Census of Population 2000, Artvin, Erzurum and Bayburt; SIS 2001

In Artvin it has increased from 20.6 in 1980 to 29.4 in 2000, from 17.6 to 21.4 in Erzurum during the same period and from 20.3 in 1990 to 23.1 in 2000 in Bayburt. This is reflected in dependency ratio. Dependency ratio of the population with the ages of 65 and over to the population with the age

between 15 and 64 (dependency ratio on 65+) has increased while that at 0-14 has decreased.

Dependency ratio on 65+ is higher in rural areas as shown in Table 2.3. dependency ratio on 65+ in sub-districts and villages in Artvin is 24.2 compared to 12.1 in Erzurum and 16.1 in Bayburt.

**Table 2.3 Dependency Ratio by Locality and by Province**

Province	Provincial center		District centers		Sub-districts & villages	
	65+	0-14	65+	0-14	65+	0-14
Artvin	6.5	35.7	9.3	43.4	24.2	35.6
Erzurum	5.1	47.4	6.6	58.8	12.1	71.1
Bayburt	8.0	52.9	8.8	72.1	16.1	56.3

#### C.2.1.4 Composition of population by sex

The population of male and female in the whole catchment is almost even; 216,995 for male and 215,294 for female, respectively, as shown in Table 2.4, but female population surpasses male population by 10,000 in rural areas (129,084 for male and 139,375 for female, respectively). There is a common tendency for the whole three provinces that more male in urban area and more female in rural areas. In Erzurum province particularly, urban male population is 14% more than urban female population.

**Table 2.4 Urban and Rural Population by Sex in the Coruh River Catchment**

Province	Urban population			Rural population			Total population		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Artvin	44,471	39,727	84,198	52,128	55,608	107,736	96,599	95,335	191,934

## C.2.2 Economic Structure

### C.2.2.1 Labor force and employment

According to the population census 2000, the number of labor force is 486,022 in total of Artvin, Erzurum and Bayburt provinces, as shown in Table 2.5.

**Table 2.5 Labor Force by Locality and by Province**

Province	Urban			Rural			Province total		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Artvin	21,019	4,228	25,247	31,954	29,151	61,105	52,973	33,379	86,352
Erzurum	123,086	15,749	138,835	100,158	114,947	215,105	223,244	130,696	353,940
Bayburt	9,413	905	10,318	16,299	19,113	35,412	25,712	20,018	45,730

Total	153,518	20,882	174,400	148,411	163,211	311,622	301,929	184,093	486,022
-------	---------	--------	---------	---------	---------	---------	---------	---------	---------

Note: Labor force includes both employed and unemployed population.

Source: JICA Study Team based on Population Census 2000, Artvin, Erzurum and Bayburt, SIS

In urban area, the number of labor force totals 174,400 of which 153,518 are male. On the other hand in rural area, labor force totals 311,622, more than half of which are female. The majority of women in urban area stay at home as housewives while most rural women work in the field.

Employment opportunities in urban area are limited in all the provinces. Urban unemployment rates are 14% for Artvin, 22% for Erzurum and 18% for Bayburt, respectively, as shown in Table 2.6.

**Table 2.6 Unemployment Rate by Locality and by Province**

Province	Urban			Rural			Province total		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Artvin	11%	31%	14%	6%	2%	4%	8%	6%	7%
Erzurum	21%	37%	22%	1%	0%	1%	12%	5%	9%
Bayburt	17%	31%	18%	1%	0%	1%	7%	2%	5%

Source: JICA Study Team based on Population Census 2000, Artvin, Erzurum and Bayburt, SIS, 2001

While the unemployment rate for male in urban area employment opportunity for urban female is very limited with the unemployment rates of more than 30%. On the other hand, most labor force both male and female in rural areas is employed.

### C.2.2.2 Occupation

In all the three provinces, nearly half of the employed in urban areas are engaged in community, social and personal services including public administration, as shown in Table 2.7.

**Table 2.7 Employed People in the Three Provinces by Locality, Sex and Occupation**

Occupation	Urban			Rural			Total		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Agriculture, hunting, forestry & fishery	6,217	894	7,111	113,902	160,819	274,721	120,119	161,713	281,832

Community, social and personal services	60,184	9,125	69,309	16,201	1,115	17,316	76,385	10,240	86,625
Activities not adequately defined	323	22	345	88	4	92	411	26	437
Total	124,386	13,384	137,770	145,462	162,312	307,774	269,848	175,696	445,544

Source: JICA Study Team based on Census of Population 2000, Artvin, Erzurum and Bayburt; SIS

Other important occupations are wholesale and retail trade, restaurants and hotels, construction, manufacturing, transport and communication and storage, etc. On the other hand, self-employment in the agricultural sector is by far dominant in rural areas. Some 80% of male and almost all female are

engaged in agriculture including livestock. Actually female in most cases are employed as unpaid family labor.

Agriculture sector absorbs 63% of the total employment in the whole three provinces, followed by community, social and personal services with 19%, wholesale and retail trade, restaurants and hotels with 5.6%, construction with 4.1%, manufacturing industry with 3.0%, transportation, communication and storage with 2.3%, etc.

### C.2.2.3 Gross Regional Domestic Products (GRDP)

GRDP in the three provinces totals TL.935,071 x 10<sup>6</sup> as shown in Table 2.8.

**Table 2.8 Gross Regional Domestic Products as of 2000 by Province and by Sector**

Unit: million TL. at 1987 constant price

GDP (In purchasers' value)	299,303	100.0	577,505	100.0	58,263	100.0	935,071	100.0	118,789,113	100.0

Source: Gross Domestic Product by Province 2000; SIS 2002

The total GRDP accounts for 0.8% of the GDP. Major sectors contributing to GRDP in the provinces include trade with 22.9%, agriculture with 21.9%, transportation and communication with 16.7%, industry with 12.9%, government services with 12.0%, etc. Compared with the GDP, the composition of GRDP in the three provinces as a whole is characterized by higher share in agriculture and government services, and lower share in manufacturing industry.

### C.2.2.4 Productivity

Labor productivity by sector is calculated by dividing sector GRDP by the number of employed labor

in each sector. The result is shown in Table 2.9.

Agriculture and livestock in which the largest number of employment is absorbed shows the lowest productivity with TL.664,153 per labor, followed by the government services with TL.1,417,704, construction with TL.3,040,827, etc.

On the other hand, high productivity sectors include fishery, mining and quarrying, forestry, transportation and communication, ownership and dwelling, wholesale and retail trade, etc. High productivity of mining and quarrying industry in Artvin province is due to the large scale copper mining in Murgul, which are to be closed in 2004. The productivity in Artvin is the highest among three provinces.

**Table 2.9 Productivity by Sector and by Province as of 2000**

Sector/Sub-sector	Unit: TL/employment			
	Artvin	Erzurum	Bayburt	Total
Agriculture	1,186,329	661,075	443,081	726,894

### C.2.2.5 Rural economy

As mentioned above, rural economy mostly depends on agriculture sector. Among sub-sectors, crop and livestock are the major income sources as shown in Tables 2.10 and 2.11. More than 80% of the total households in the Coruh river catchment earn income from both crops and livestock. Some 13% earn from crops only while 2.5% earn from livestock only. Those households living on non-agricultural activities are less than 5%.

The crops and livestock are the two major earners in the villages of the Coruh river catchment. Of the total villages in the catchment, some 42% earn most from crops such as barley and fodder crops, and another 38% from livestock/poultry activity. Fruits are the major income source for 11% of the total, and vegetables and forest products for 2% each of the total, respectively.

Villages in Artvin have diversified income sources. Two thirds of the villages have three income sources including crops, fruits, vegetables, livestock/poultry, forest products and others. While in Bayburt, most villages have only two income sources: crops and livestock/poultry. This may reflect the difference in natural conditions such as topography and climate between the areas. Forest products as income source are more important in Artvin than other areas.

**Table 2.10 Major Income Sources of Rural Households in the Coruh River Catchment**

Province	District	Nos. of household	Agricultural household (%)					Non-agric. Household (%)

### C.2.2.6 Land holding size and number of animals

#### (1) Land holding size

Due to the harsh topographic conditions, available farmland area in each household is generally limited with many parcels as shown in Table 2.12.

**Table 2.12 Number of Households and Land Parcels by Land Size Category in the Coruh River Catchment**

Category		Land size groups (ha)					Total
		0-0.5	0.6-1.1	1.2-2.0	2.1-5.0	5.0+

Note: Data shown are confined to the Coruh river catchment only.

Source: Village inventory 1997, Artvin, Erzurum, Bayburt; SIS

Average land holding size per household in the Coruh river catchment is 2.5 ha with 6.3 parcels. It is the smallest in Artvin with an area of 1.6 ha, while largest in Bayburt with 5.2 ha. Average land holding size per land parcel is 0.2 ha in Artvin, 0.4 ha in Erzurum and 1.0 ha in Bayburt, respectively, with the overall average area of 0.4 ha. In Artvin, average number of land parcels per household is 6.7, larger than the other two provinces. Even in the land size category of 0 – 0.05 ha, average number of land parcels is 5.0, compared to 3.5 in Erzurum and 1.4 in Bayburt. The share of the number of

households having not more than 2.0 ha of land is 67% in the whole catchment, ranging from 37% in Bayburt to 82% in Artvin, while that having more than 5.0 ha of land is 10% in the Coruh river catchment as a whole, ranging from 3% in Artvin to 29% in Bayburt. As a comparison, the average land holding size per household in the Country is 5.9 ha, according to the 1991 Agricultural Census. Also the share of the number of household having not more than 2.0 ha of land in the whole Turkey is 35%, and that having more than 5.0 ha is 33%.

## (2) Number of animals

Average number of animals raised per household in the Coruh river catchment is shown in Table 13.

**Table 2.13 Average Number of Raised Animals per Household in the Coruh River Catchment**

Prov.	Cattle	Sheep	Goat
Artvin	3.4	3.7	0.7
Erzurum	6.0	4.0	0.8
Bayburt	5.9	9.2	0.2
Coruh basin	5.0	4.7	0.7

Note: Data shown are confined to the Coruh river catchment only.

Source: Village inventory 1997, Artvin, Erzurum, Bayburt; SIS

Average number of animals raised per household in the whole Coruh river catchment is 5.0 for cattle, 4.7 for sheep and 0.7 for goat, respectively. The average number of cattle raised per household is 3.4 in Artvin, 6.0 in Erzurum and 5.9 in Bayburt. As for sheep it is 3.7 in Artvin, 4.0 in Erzurum and 9.2 in Bayburt. The number of goat per household is less than one in all provinces. As a matter of fact, cattle are raised by most of the agricultural households while sheep and goat are raised by limited number of farm households. The number of sheep and goat per raiser is much more large.

## C.2.3 Social Aspects

### C.2.3.1 Size of Household

Number of households, distribution of household size and average household size in the three provinces are shown in Table 2.14. Average household size in each province is 4.5 for Artvin, 5.7 for Erzurum and 5.6 for Bayburt, respectively. In all provinces, average household size is the smallest in the province center. Average household size in the district centers and rural areas of Erzurum and in rural areas of Bayburt is more than 6.0 due to higher percentage of the households with more than 10 members. Noteworthy is the higher percentage of the households with the size of 2 in rural areas of all the provinces, which may suggest the outmigration of younger generation leaving older couple behind. Particularly in Artvin, 18% of the households in the rural area are 2 members only.

**Table 2.14 Distribution of Households by Size and Average Household Size by Locality**

Province	Locality	Total nos. of hh*	Size of household										Total population	Average hh size
			1	2	3	4	5	6	7	8	9	10+

### C.2.3.2 Housing facilities

Common housing facilities including toilet, bath, kitchen and piped water are well equipped in urban areas of all the three provinces, as shown in Table 2.15.

**Table 2.15 Provision of Housing Facilities by Locality and by Province**

Facility		Artvin			Erzurum			Bayburt			Total		
		Urban	Rural	Total	Urban	Rural	Total	Urban	Rural	Total	Urban	Rural	Total
Toilet	Inside the house	97%	60%	75%	93%	34%	69%	98%	83%	89%	93%	46%	72%
	Outside the house	3%	39%	24%	7%	47%	23%	2%	14%	9%	6%	42%	22%
	Doesn't exist	0%	1%	1%	1%	18%	8%	0%	2%	2%	1%	12%	6%
	Unknown	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%
Bath	Inside the house	97%	69%	80%	94%	55%	79%	97%	86%	91%	95%	62%	80%
	Outside the house	1%	4%	2%	1%	5%	3%	0%	1%	1%	1%	4%	3%

	Unknown	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%
Kitchen	Inside the house	98%	81%	88%	96%	65%	84%	98%	92%	94%	97%	72%	86%
	Outside the house	0%	2%	1%	1%	6%	3%	0%	1%	0%	1%	4%	2%
	Doesn't exist	1%	17%	11%	3%	29%	13%	1%	8%	5%	3%	24%	12%
	Unknown	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%	0%
Piped water	Inside the house	99%	73%	83%	96%	49%	78%	98%	94%	95%	97%	60%	80%
	Outside the house	1%	13%	8%	1%	9%	5%	0%	2%	1%	1%	10%	5%
	Doesn't exist	1%	14%	9%	2%	41%	18%	2%	4%	3%	2%	30%	15%
	Unknown	0%	0%	0%	0%	1%	0%	0%	0%	0%	0%	0%	0%
Total		18,828	27,382	46,210	98,374	64,773	163,147	7,291	10,649	17,940	124,493	102,804	227,297

Source: JICA Study Team based on Population Census 2000, Artvin, Erzurum and Bayburt, SIS 2001

More than 90% of the urban houses are equipped with those facilities. But the provision conditions of those facilities differ much in rural areas among provinces. In Bayburt rural houses are also well equipped with those facilities: 97% with toilet; 87% with bath; 93% with kitchen and 96% with piped water. However, in Erzurum provision conditions are lower: 81% with toilet, 60% with bath, 71% with kitchen, and 58% with piped water. In rural houses of Artvin, provision of housing facilities is intermediate except toilet with which almost all rural houses are equipped.

### C.2.3.3 Literacy and education

Literacy rate of the populace with six years old and over in the three provinces is 84.4%, male having higher literacy rate of 92.7% while female being 75.7%, as shown in Table 2.16.

**Table 2.16 Literacy Rate by Locality, Sex and Province**

Province	Urban			Rural			Province		
	Male	Female	Total	Male	Female	Total	Male	Female	Total
Artvin	97.0	88.4	92.9	92.0	72.7	82.0	94.3	79.2	86.8
Erzurum	95.1	82.2	89.1	87.2	64.0	75.2	92.2	74.6	83.6
Bayburt	96.4	84.9	91.0	92.3	74.7	83.1	94.2	78.8	86.5
Average	95.4	83.1	89.7	88.8	67.0	77.5	92.7	75.7	84.4

Source: JICA Study Team based on Population Census 2000, Artvin, Erzurum and Bayburt, SIS 2001

There is little difference in literacy rate among urban areas of the three provinces. Literacy rate in rural areas is lower than that in urban areas: 90% in urban versus 78% in rural. The literacy rate of female in rural areas is much lower than that in urban areas.

Educational attainment of literate population varies among provinces. Those literate who did not finish school accounts for 22% in Artvin, 30% in Erzurum and Bayburt, respectively, and those who attained high school and higher education shares 22% in Artvin, 21% in Erzurum and 15% in Bayburt, as shown in Table 2.17. Noteworthy is high rate of higher education attainment (high school and higher) in the rural areas of Artvin. Some 15% of the literate finished higher education, compared to 8% in Erzurum and Bayburt.

Female do not attain higher education in both urban and rural areas in general. Those male who attained high school or higher education shares 21 to 27% in three provinces, only 7 to 15% of female attained the same education level. Particularly in rural areas of Erzurum and Bayburt, not more than 3% of females finished high school or higher education.

**Table 2.17 Educational Attainment among Literate by Locality, Sex and Province**

Unit: % of population										
Educational attainment		Urban			Rural			Province total		
		Male	Female	Total	Male	Female	Total	Male	Female	Total

## C.2.4 Forest Villages

### C.2.4.1 Forest village inventory

#### (1) Definition of forest village

According to the Forest Villagers Development Fund Regulations prepared in 1977 by ORKOY, MOF, forest village is defined as “the village that has forest within its boundaries”. Forest villages are classified into two categories: (i) “within forest villages” and (ii) “forest neighboring villages”. Within forest village is defined as “the village that has forest within its boundaries and its lands around village settlement is surrounded by forest in four directions”. While, forest neighboring village is defined as “the village that has forest within its boundaries and its land around village settlement is surrounded by forest in at least one direction”.

According to the census of population 2000 and Orkoy, MOF, in the Coruh river catchment there are 832 villages, 62% of which or 514 are forest villages, as shown in Table 2.18.

**Table 2.18 Number and Population of Villages and Forest Villages in the Coruh River Catchment by District**

Province	District	All villages			Forest village total		
		no.	population 2000	Annual growth 1990-2000 (%)	no.	population 2000	Annual growth 1990-2000 (%)

Source: JICA Study Team based on Census of Population 2000, Artvin, Erzurum, Bayburt; SIS 2001 and ORKOY, MOF

In Artvin 250 out of 254 villages are under the category of forest village, while in Bayburt only 37 out of 175 villages are forest villages. In Erzurum, 228 villages out of the total 403 villages are forest

villages. Population in the forest villages has decreased at higher rate with 3.14% per annum during the last decade than all villages with 2.27% per annum.

#### Forest village inventory

All the forest villages are listed and presented in an appendix 1 of this Paper, and the summary table is shown in Table 2.19. Spatial distribution of the forest villages in the Catchment is shown in Figure 2.1.

**Table 2.19 Summary of Forest Village Inventory**

Province	District	Within forest village			Forest neighboring village			Forest village total		
		nos.	population 2000	Annual growth 1990-2000 (%)	nos.	population 2000	Annual growth 1990-2000 (%)	nos.	population 2000	Annual growth 1990-2000 (%)

Total		200	62,657	-3.51	315	93,473	-2.88	515	156,130	-3.14

Source: JICA Study Team based on Census of Population 2000, Artvin, Erzurum, Bayburt; SIS 2001 and ORKOY, MOF

Out of 515 forest villages, there are 200 “within forest villages”, 77% of which or 155 are in Artvin province, and merely two are in Bayburt. The remaining 315 are “forest neighboring villages”, 59% of which or 185 are in Erzurum. The forest village population in the Coruh catchment totals 156,130, of which 62,657 or 40% live in “within forest villages” and the remaining 93,473 or 60% reside in “forest neighboring villages”. Average village size in terms of population does not differ between two forest village categories: 313 per village for “within forest village” and 298 per village for “forest neighboring village”. Population decrease has occurred in both categories of villages but at faster rate in “within forest villages” with –3.51% per annum on average during the last decade than in “forest neighboring villages” with –2.88% per annum during the same period.

**Figure 2.1    Spatial Distribution of Forest Villages**

Same as Figure 3.5-1 of the Interim Report (Page 3-72)

### C.2.4.2 Socio-economic conditions of the Forest Villages

#### (1) Rural Socio-Economic Survey

In order to grasp the socio-economic conditions of the forest villages in the Coruh river catchment, a rural socio-economic survey was conducted in villages in the selected six micro-catchments<sup>1</sup>. Total of 27 forest villages, one normal villages (to be a forest village in the future), and one municipality (nearby forest) in the six micro-catchments were selected for the survey, considering accessibility, spatial distribution of the villages, topographic features, population, etc., through map study and through consultation with Turkish counterparts. The name of the villages and their demographic data in each micro-catchment are shown in Table 2.20.

**Table 2.20 Villages to which Rural Socio-Economic Survey was Conducted**

No.	District/village	Population in 2000			Total population in 1990	Annual average population growth rate 1990-2000	Forest villages	
		Male	Female	Total			inside forest	nearby forest
Oltu (OL-04)								
009	Ballica	80	102	182	425	-8.13%		●
010	Basakli	280	319	599	948	-4.49%		●
044	Orucuk	213	302	515	701	-3.04%		●

Source: JICA Study Team based on Population Census 2000, SIS and Ministry of Environment and Forestry

<sup>1</sup> The method for selecting micro-catchments is explained in Chapter 6 of the Master Plan Report

The rural socio-economic survey consisted of key informant survey to muhtar in each village and household survey to 20 households in each village. For both surveys, a questionnaire was prepared by the JICA Study Team in consultation with the Ministry of Forestry. Those questionnaires are presented in Appendixes 2 to 5 in both English and Turkish. Six survey teams, consisting of two members each, were organized by the Department of Agricultural Economics of the Ataturk University so that each team would cover one of the six micro-catchments. The survey was conducted in about a month from June to July 2003. It took three days for each team to finish the survey each village. The survey results were encoded into computer for analysis. The data arrangement and analysis were made by the JICA Study Team.

Aside from the questionnaire survey,

## **(2) Results of the Rural Socio-Economic Survey**

The results of the survey are shown by micro-catchments and by village in Tables 2.21 to 2.26. Socio-economic features of the forest villages in each micro-catchment are generally described below.

### **Oltu micro-catchment (OL-04) (refer to Table 2.21)**

#### **Location and pattern of the villages**

The villages are located generally in mountain slopes or bottom of valley in mountainous area. Ballica and Tutmac show compacted village pattern while others consist of two to three settlements or “mahalles”. Distance from the district center of Oltu to the villages ranges from 15 km to 35 km, taking 20 to 35 minutes by vehicle.

#### **Educational attainment of the head of households**

This MC shows the lowest educational attainment of the head of households with more than 90% being primary school graduates or lower.

#### **Household size and land holding size**

Average household size is 5.1 ranging from 4.3 in Basakli to 6.2 in Ballica. Average cultivated land area is 1.9 ha, ranging from 1.1 ha in Orcuk to 3.7 ha in Basakli.

#### **Agricultural activities**

In the MC on average, wheat shares the largest area with 44% of the cultivated land, fodder crops come next with 26%, followed by barley with 14% and vegetables with 11%. In Ozdere and Tutmac villages, fodder crops shares more than 50% of the area cultivated, while wheat is dominant in the other three villages. Yield of wheat is some 1,500 kg/ha on average, ranging from 930 kg/ha in Basakli to 1,870 kg/ha in Tutmac.

The use of manure is popular only in Ozdere and Tutmac, where about half of the households use manure with the amount of 3.7 ton to 10.9 ton per household. On the other hand, most farmers in all villages use chemical fertilizer with the average amount of 323 kg per household. Chemical fertilizer is applied mainly to wheat, barley and vegetables.

More than 50% of the farmers use agro-chemicals on average, ranging from 30% in Orcuk to 90% in Tutmac. Hiring tractor is rather common in all the villages. More than 80% of the farmers rented tractor for cultivation.

#### Livestock activities

Livestock raising, especially cattle, is common practice in the villages. More than 80% of the farmers raise cattle. Average number of raised cattle per household is eight. The share of local breed cattle in the total number of cattle is 31%, ranging from 0% in Ozdere to 76% in Ballica.

Other animals raised are sheep and goat. Some 24% of the farmers raise sheep and 6% raise goat. Average number of raised 15 for sheep and 7 for goat. Sheep raising is more popular in Orcuk (40% of the farmers) than in Ozdere (10%) and Basakli (11%). On the other hand, scale of sheep raising is larger in Ozdere with the average number of raised sheep per household of 30, compared to seven in Ballica.

On average more than 50% of the farmers raise chicken. Average number of chicken raised per household is 10. Chicken raising is more popular in Ballica. Three quarters of the farmers raise 11 chicken on average.

#### Other agricultural activities

More than 30% of the villagers practice beekeeping. It is more popular in Orcuk, Ozdere and Tutmac. Average number of beehives per household is 14, ranging from 23 in Ballica to 7 in Basakli and Ozdere. Some 30% of the villagers grow fruit trees, ranging from zero in Ozdere to 40% in Orcuk and Ozdere. Average number of fruit trees per household is 26, ranging from zero in Ozdere to 37 in Basakli.

Greenhouse is less developed in the MC. That can be seen only in Basakli and Orcuk. There is only one inland aquaculture in Basakli.

#### Source of income, income level and income composition

Some 80% of the villagers derive their income from agriculture including crop and livestock. Remaining 20% derive income from non-agricultural activities like construction, taxi driver, etc. Some 5% of the villagers earn from honey production. Unearned incomes such as pension, support from other family members and revenue from rent are also important for many villagers. More than 65% of the villagers have such income.

Annual household cash income, calculated from the sale of agricultural products (gross income) and other incomes (non-agricultural income and unearned income), averages TL.5,497 million or US\$3,665, ranging from TL.3,915 million in Orcuk to TL.7,740 million in Ozdere. Agricultural income shares some 44% of the total income or US\$1,613. Average per capita annual cash income is US\$739.

Livestock shares 36% of the total income, followed by crops (6%) and bee keeping (2%) on average, while unearned income accounts for 41% and while 13% for non-agricultural income. The income composition varies from village to village. Income from crop accounts for 12% of the total income in Tutmac while 33% in livestock. The share of livestock income in the total income is 46% in Ballica, while the share of unearned income is as low as 2%.

### Debts

Some 23% of the villagers have debts with the average amount of TL.889 million, which is some 16 % of the average annual cash income. Many borrow from their friends at interest free, otherwise from merchants who are more accessible.

### Gender aspects

In almost all household matters, decision is made by men. Accordingly women's activities are controlled by men. In general, men mainly do work outside while women do housework. In the field men mainly do cultivation, fertilizer application, sowing, irrigation and harvesting. Women mainly do hoeing and weeding, and do harvesting together with men. In barn, feeding is mainly done by men, while milking and processing milk are done mainly by women. Cowdung making is done by both men and women. Marketing agro-products and shopping is predominantly done by men. Women are responsible for all the housework including cleaning, bread making, cooking and childcare, etc.

As described above, women are responsible for various works both inside and outside houses. Although women's house works have been eased as many households have vacuum cleaner and washing machine, they have to work from early morning till late night. Walking long distance on a poor conditioned road to their farm is one of their serious problems.

### Assets

Almost all households have refrigerator, TV set and telephone. More than 75% of the households have electric oven, and more than half have washing machine and vacuum cleaner. Some 15% of households have mobile phone, and more than 10% own private vehicle.

More than 30% of the households have properties such as house, lot and shop in town.

### Energy sources for heating and cooking

Most villagers depend their heating energy mainly on fuelwood and coal. Consumption volume of the fuelwood varies from two (2) to six (6) sters with the average volume of four (4) sters,. The shortfall is filled mainly with coal, which have been becoming popular although expensive. The use of LPG, as cooking energy, has been very common.

### Infrastructure

All the villages are electrified, and have telephone line. Drinking water supply system has also been established in almost all villages. A primary school has been constructed in most villages. Clinic is not always available in the villages. Ballica and Ozdere do not have clinic, and even if exists, it is poorly equipped and staffed.

### Natural environment

Being located in the bottom of the valley in steep mountain ranges, and due to fragile geological condition in nature, natural disasters such as flood and landslide are among others serious concern of the villagers. Ballica, Orcuk and Tutmac have experienced flood disaster during the last five years.

In Basakli, Ozdere and Tutmac, Muhtars think that forest resources within their territory have increased during the last decade, and those in the remaining villages think the resources have deteriorated. Most Muhtars think that their pastureland/rangeland has been improved. Only Muhtar in Tutmac think it has not been changed.

### Problems/constraints on living

According to the villagers, the most serious problem in Ballica, Basakli and Orcuk is insufficient irrigation water. Nearly half of the villagers interviewed identified this as the problem. On the other hand, bad condition of farmroad is the most serious problem in Ozdere, and low income is the most important problem in Tutmac. Problems varies from village to village depending on their conditions. However, irrigation water insufficiency, low income, bad farm road conditions, floods are among others important concerns among villagers.

Other important problem raised by many villagers is lack of knowledge on agriculture. Due to the lack of agricultural extension activities, the forest villagers are facing several problems including pest and diseases, low productivity, etc.

### Development ideas

Livelihood improvement through irrigation is among others important development idea by many villagers. Prevention of natural disasters like flood, erosion control, etc., is another priority concern among villagers who live in disaster prone areas.

**Table 2.21 Results of the Rural Socio-Economic Survey - Oltu (OL-04) (1/3)**

Village (no. of HH interviewed)	Ballica (20)	Basakli (20)	Orcuk (20)	Ozdere (20)	Tutmac (20)

Constraints/ problems identified by the muhtar	1. Sediments on low agricultural land 2. Low productivity of livestock 3. Low irrigation coverage	1. Lack of water troughs in rangeland	1. Sediments on agricultural land 2. Erosion 3. Insufficient irrigation water	1. Road is not asphalted 2. Removal of sediments in riverbed 3. Insufficient irrigation water	1. Soil erosion 2. Construction of revetment along the Sivri Cayi 3. Insufficient irrigation water
Top 5 problems identified by villagers (no. of households)	1. Insufficient irrigation water (15) 2. Insufficient supply of drinking water (10) 3. Low income; Lack of manpower; Flood; Access to potential agricultural area; Livestock; Lack of sewerage (2)	1. Insufficient irrigation water (9) 2. Lack of farmroad (7) 3. Low income; Flood; Insufficient heating energy; Low productivity of crops (3)	1. Flood; Insufficient irrigation water (9) 3. Low income (7) 4. Erosion (5) 5. Insufficient heating energy; Infertile land for agriculture (3)	1. Lack of and bad condition of farmroad (12) 2. Flood (9) 3. Insufficient irrigation water (8) 4. Low income; No clinic (7)	1. Low income (11) 2. Lack of and bad condition of farmroad (7) 3. Insufficient irrigation water (4) 4. Erosion; No health service; Insufficient heating energy (3)
Projects proposed by the Muhtar	1. Rehabilitation of agricultural land 2. Road to potential agricultural fields 3. Water pond for irrigation	1. Livestock development project (especially sheep)	1. Rehabilitation of agricultural land	1. Riverbed rehabilitation project	1. Erosion control project
Willingness of the Muhtar to participate in project activities	Yes	Yes	Yes	Yes	Yes

## **Uzundere micro-catchment (TR-06) (refer to Table 2.22)**

### **Location and pattern of the villages**

The villages are located generally in mountain slopes or bottom of valley in very steep mountainous area. None of the villages show compacted village pattern, and they consist of three to 10 settlements or “mahalles”. Distance from the district center of Uzundere to the villages ranges from 9 km to 30 km, taking 10 to 40 minutes by vehicle.

### **Educational attainment of the head of households**

More than 50% of the head of households attained the highest education at primary school or lower. In Altincanak, 25% of the interviewed head of household received no education and illiterate. On the other hand, 35% finished secondary school. In Sapaca, 90% finished primary school education and the rest finished high school.

### **Household size and land holding size**

Average household size is 5.5 ranging from 4.5 in Kirazli to 6.6 in Cevizli. Average cultivated land area is 2.8 ha, ranging from 1.3 ha in Altincanak to 4.1 ha in Kirazli.

### **Agricultural activities**

On average, fruit trees shares the largest area with 34% of the cultivated land, wheat comes next with 32%, followed by fodder crops with 12% and vegetables and barley with 11% each.

In Altincanak, fruits trees shares nearly 70 % of the area cultivated, while wheat shares only 8%. In Sapaca, wheat is the most dominant crop with 58% share of cultivated land. Importance in fodder crops is high in Kirazli with 21% share, and low in Caglayan with 4% share. Yield of wheat is some 1,300 kg/ha on average, ranging from 1,000 kg/ha in Kirazli to 1,750 kg/ha in Caglayan.

The use of manure is popular in the villages except Caglayan where livestock raising is not active. On average, 67% of interviewed use manure with average dosage of 5,840 kg per household. The use of chemical fertilizer is more common in the villages. Nearly 75% use chemical fertilizer with the average dosage of 357 kg per household. Farmers in Sapaca use less chemical fertilizer with 168 kg per household while those in Caglayan use more with 586 kg per household. Chemical fertilizer is applied mainly to wheat, vegetables and fodder crops.

Less than 30% of the farmers use agro-chemicals on average, ranging from zero in Cevizli to 65% in Altincanak. Hiring tractor is rather common in all the villages. More than 70% of the farmers rented tractor for cultivation ranging from 40% in Altincanak to 90% in Kirazli and Sapaca.

### Livestock activities

Livestock raising, especially cattle, is common practice in the villages except Caglayan where greenhouse farming is dominant. On average 60 % of the households raise cattle ranging from 30% in Caglayan to 80% in Cevizli. Average number of raised cattle per household is four (4). The share of local breed cattle in the total number of cattle is 46%, ranging from 0% in Altincanak to 98% in Cevizli.

Other animals raised are sheep and goat. Some 18% of the farmers raise sheep and 13% raise goat. Average number of raised 12 for sheep and 14 for goat. Sheep households is more popular in Cevizli (40% of the farmers) than in Caglayan and Altincanak (11%). On the other hand, scale of sheep raising is larger in Kirazli with the average number of raised sheep per household of 25, compared to seven in Caglayan. In Sapaca, a quarter of farmers raise goat with an average number of 47.

On average some 15% of the households raise chicken. Average number of chicken raised per household is six (6). Chicken raising is more popular in Sapaca. Some 35% of the farmers raise five (5) chicken on average.

### Other agricultural activities

More than 30% of the households interviewed practice beekeeping. Average number of beehives possessed per household is 13, ranging from four (4) in Caglayan to 31 in Kirazli.

Nearly all of the households grow fruit trees. Average number of fruit trees per household is 173, ranging from 150 in Altincanak to 187 in Cevizli.

Greenhouse is most developed in the MC. Some 33% of the farmers have greenhouses ranging from 10% in Cevizli to 60% in Altincanak. The average floor area of greenhouses per household is more than 400 m<sup>2</sup> on average, ranging from 180 m<sup>2</sup> in Kirazli to 840 m<sup>2</sup> in Altincanak.

Inland fishery activity is seen in Sapaca. Some 15% of the interviewed in the village have fish pond with average area of 850 m<sup>2</sup>.

### Source of income, income level and income composition

Some 74% of the households derive their income from agriculture including crop and livestock. Remaining 26% derive income from non-agricultural activities like construction, taxi driver, etc. Some 9% of the villagers earn from honey production. Unearned incomes such as pension, support from other family members and revenue from rent are also important for many villagers. More than 50% of the households have such income.

Annual household cash income, calculated from the sale of agricultural products (gross income) and other incomes (non-agricultural income and unearned income), averages TL.5,710 million or

US\$3,806, ranging from TL.3,468 million in Cevizli to TL.7,758 million in Altincanak. Agricultural income shares some 39% of the total income or US\$1,484. Average per capita annual cash income is US\$705, ranging from US\$350 in Cevizli to US\$976 in Altincanak.

Crops shares 28% of the total income, followed by livestock (6%) and bee keeping (5%) on average, while unearned income accounts for 44% and while 17% for non-agricultural income. The income composition varies from village to village. Income from crop accounts for 44% of the total income in Altincanak and 12% in beekeeping. In general, share of livestock income in the total income is not more than 10%. In Caglayan income from crops is the sole agricultural income. While unearned income shares nearly half of the total income in most villages, that in Altincanak is 26% only.

### Debts

Some 64% of the households have debts with the average amount of TL.1,994 million, which is some 35 % of the average annual cash income. Many borrow from their friends at interest free, otherwise from cooperatives and merchant.

### Gender aspects

In almost all household matters, decision is made by men. Accordingly women's activities are controlled by men. In general, men mainly do work outside while women do housework. In the field men mainly do cultivation, fertilizer application, sowing, weeding, irrigation and harvesting. Women mainly do hoeing and do harvesting together with men. In barn, feeding is mainly done by men or both, while milking and processing milk are done mainly by women. Marketing agro-products and shopping is predominantly done by men. Women are responsible for all the housework including cleaning, bread making, cooking and childcare, etc.

As described above, women are responsible for various works both inside and outside houses. Although women's house works have been eased as many households have vacuum cleaner and washing machine, they have to work from early morning till late night. Walking long distance on a poor conditioned road to their farm is one of their serious problems.

### Assets

Almost all households have refrigerator, and telephone. More than 80% of the households have TV sets, and more than half have oven, washing machine and vacuum cleaner. More than 30% of households have mobile phone, and nearly 20% own private vehicle.

Reflecting the lower income level, household assets possessed by villagers in Cevizli are less than those in other villages. Except telephone, refrigerator and TV set, all of which are possessed by more than half of the villagers, other assets are hardly possessed by villagers. Especially washing machine is possessed by merely one villagers out of 20 interviewed.

Less than 20% of the households have properties such as house, lot and shop in town.

#### Energy sources for heating and cooking

Most of the households depends their heating energy mainly on fuelwood and coal. Consumption volume of the fuelwood varies from two (2) to three (3) sters with the average volume of three (3) sters,. The shortfall is filled mainly with coal, which have been becoming popular although expensive.

The use of LPG, as cooking energy, has been very common.

#### Infrastructure

All the villages are electrified, and have telephone line. Drinking water supply system has also been established in almost all villages. A primary school has been constructed in most villages.

Clinic is not always available in the villages. Altincanak and Sapaca do not have clinic, and even if exists, it is poorly equipped and staffed.

#### Natural environment

Being located in the bottom of the valley in steep mountain ranges, due to degraded vegetation, and due to fragile geological condition in nature, natural disasters such as flood and landslide are among others serious concern of the villagers. All villages but Sapaca have experienced flood or landslide during the last five years.

In all villages except Sapaca, Muhtars think that forest resources within their territory have increased during the last decade, and that in Sapaca thinks the resources have deteriorated.

In Altincanak Muhtars thinks that their pastureland/rangeland has been deteriorated. Two muhtars in Caglayan and Cevizli think it has been unchanged, and the other two Muhtars think it has been improved.

#### Problems/constraints on living

According to the villagers, the most serious problem in Altincanak, Caglayan and Cevizli is no enough income. More than half of the villagers interviewed identified this as the problem. On the other hand, bad condition of road is the most serious problem in Sapaca, and insufficient irrigation water is the most important problem in Kirazli. Problems vary from village to village depending on their conditions. However, irrigation water insufficiency, low income and bad farm road conditions are among others important concerns among villagers.

Other important problem raised by many villagers is lack of knowledge on agriculture. Due to the lack of agricultural extension activities, the forest villagers are facing several problems including pest and diseases, low productivity, etc.

### Development ideas

Livelihood improvement through irrigation is among others important development idea by many villagers. Prevention of natural disasters like flood, erosion control, etc., is another serious concern among villagers who live in disaster prone areas.

## **Ispir micro-catchment (UC-14) (refer to Table 2.23)**

### Location and pattern of the villages

The villages are located either on mountain slopes, at the bottom of valleys or mountain tops. Three of five villages show compact village pattern, while the other two villages consist of several settlements or “mahalles”. Distance from the district center of Ispir to the villages ranges from 9 km to 26 km, taking 10 to 60 minutes by vehicle.

### Educational attainment of the head of households

More than 85% of the head of households attained the highest education at primary school or lower. In Durukoy, Gockoy and Kockoy, there are no head of households interviewed, who attained higher than primary school. There are only five (5) out of 100 head of households who attained secondary school education or higher.

### Household size and land holding size

Average household size is 3.9 ranging from 3.5 in Gockoy to 4.7 in Koprakoy. Average cultivated land area is 3.3 ha, ranging from 1.8 ha in Gockoy to 5.8 ha in Numanpasa.

### Agricultural activities

In the area, fodder crops are most widely cultivated. The share of the area under fodder crops in the total cultivated area is 64%, followed by wheat with 17%, vegetables with 11% and barley with 8%. In Durukoy and Kockoy, the share of fodder crops in the total cultivated area is particularly high with 80%. In Koprakoy the share of vegetables is as high as 26%.

Yield of wheat is some 1,342 kg/ha on average, ranging from 1,078 kg/ha in Numanpasa to 1,643 kg/ha in Durukoy.

The use of manure is popular in the villages. On average 58% of interviewed use manure with average dosage of 7,936 kg per household. In Numanpasa, 75% of the villagers interviewed use more manure with 19,300 kg per household. The use of chemical fertilizer is less common in the villages. Nearly 39% use chemical fertilizer with the average dosage of 335 kg per household. Villagers in Durukoy use chemical fertilizer more commonly with 65%. Farmers in Kockoy use less chemical fertilizer with 200 kg per household while those in Numanpasa use more with 693 kg per household. Chemical fertilizer is applied mainly to wheat, vegetables and fodder crops.

Less than 20% of the farmers use agro-chemicals on average, ranging from 10% in Kockoy to 25% in Numanpasa. Hiring tractor is rather common in all the villages. More than 70% of the farmers rented tractor for cultivation ranging from 25% in Koprakoy to 95% in Numanpasa. The reason for low tractor hire rate in Koprakoy is small size of farms and not easy access.

### Livestock activities

Livestock raising, especially cattle, is common practice in the area. On average, 74 % of the farmers raise cattle ranging from 65% in Koprukoy to 85% in Durukoy. Average number of raised cattle per household is 10, ranging from seven in Gockoy and Koprukoy to 15 in Numanpasa. The share of local breed cattle in the total number of cattle is 65%, ranging from 22% in Kockoy to 97% in Gockoy.

Raising of other animals is not active. Merely some 2% of the farmers raise sheep and 1% raise goat. Average number raised is five (5) for sheep and one (1) for goat. In Kockoy and Numanpasa, there is no households which raise sheep or goat.

Some 25% of the households raise chicken. Average number of chicken raised per household is seven (7). Chicken raising is more popular in Numanpasa. Some 35% of the households raise eight (8) chicken on average.

### Other agricultural activities

More than 40% of the households interviewed practice beekeeping on average. Some 60% of Durukoy households practice beekeeping while 20% in Numanpasa. In Numanpasa, beekeepers from Black Sea region come to settle every year. Average number of beehives possessed per household is nine (9), ranging from three (3) in Durukoy to 19 in Numanpasa.

More than half of the households interviewed grow fruit trees on average, ranging from 10% in Durukoy to 90% in Numanpasa. Average number of fruit trees per household is 33, ranging from 11 in Koprukoy to 64 in Gockoy.

Greenhouse is seldom seen in villages. No inland fish culture is seen.

### Source of income, income level and income composition

More than 80% of the households derive their income from agriculture including crop and livestock. Remaining 20% derive income from non-agricultural activities like construction, taxi driver, etc. Some 15% of the villagers earn from honey production. Unearned incomes such as pension, support from other family members and revenue from rent are also important for many villagers. More than 65% of the households have such income.

Annual household cash income, calculated from the sale of agricultural products (gross income) and other incomes (non-agricultural income and unearned income), averages TL.5,115 million or US\$3,410, ranging from TL.4,073 million in Durukoy to TL.6,457 million in Koprukoy. Agricultural income shares some 35% of the total income or US\$1,194. Average per capita annual cash income is US\$874, ranging from US\$696 in Durukoy to US\$1,112 in Numanpasa.

Income from livestock shares 25% of the total income, followed by crops (6%) and bee keeping (4%)

on average, while unearned income accounts for 43% and while 22% for non-agricultural income. The income composition varies from village to village. Income from livestock accounts for 41% of the total income in Numanpasa, followed by 5% in crops, 3% in bee keeping. The share of income from crops in Gockoy is 15%, followed by 14% in livestock and 6% in bee keeping. The share of unearned income varies from 23% in Numanpasa to 62% in Gockoy. The share of non-agricultural income also varies from 4% in Gockoy to 38% in Kockoy.

### Debts

Some 30% of the villagers have debts with the average amount of TL.1,930 million, which is some 38 % of the average annual cash income. Many borrow from their friends at interest free, otherwise from cooperatives and merchant.

### Gender aspects

In almost all household matters, decision is made by men. Accordingly women's activities are controlled by men. In general, men mainly do work outside while women do housework. In the field men mainly do cultivation, fertilizer application, sowing, weeding, irrigation and harvesting. Women mainly do hoeing and do harvesting together with men. Preparation of cowdung cake for energy is done by both male and female. In barn, feeding is mainly done by men or both, while milking and processing milk are done mainly by women. Marketing agro-products and shopping is predominantly done by men. Women are responsible for all the housework including cleaning, bread making, cooking and childcare, etc.

As described above, women are responsible for various works both inside and outside houses. Although women's house works have been eased as many households have vacuum cleaner and washing machine, they have to work from early morning till late night. Walking long distance on a poor conditioned road to their farm is one of their serious problems.

### Assets

Almost all households have refrigerator, and telephone. More than 60% of the households have TV set and washing machine, and more than half have oven. Some 15% of households have mobile phone, and less than 10% own private vehicle.

Reflecting the higher income level, household assets possessed by households in Numanpasa are more than those in other villages. All the households interviewed in Numanpasa possess telephone and refrigerator, 90% possess TV set, and more than 70% possess oven, washing machine and vacuum cleaner. 35% possess mobile phone and 15% possess private vehicle.

Less than 20% of the households have properties such as house, lot and shop in town.

### Energy sources for heating and cooking

Most villagers depend their heating energy mainly on fuelwood and coal. Consumption volume of the fuelwood varies from three (3) to six (6) sters with the average volume of four (4) sters. The shortfall is filled with grasses, cowdung or coal, depending on the availability of the material and on financial capacity.

The use of LPG, as cooking energy, is very common.

### Infrastructure

All the villages are electrified, and have telephone line. Drinking water supply system has also been established in almost all villages. A primary school has been constructed in most villages.

Clinic is available in all villages, but most of them are poorly equipped and staffed.

### Natural environment

Those villages located in the bottom of the valley in steep mountain ranges, natural disasters such as flood and avalanche are among others serious concern of the villagers. Durukoy, Gockoy and Koprukoy have experienced flood during the last five years.

In those villages, Muhtar thinks that forest resources within their territory have deteriorated during the last decade, while Muhtar in the other villages thinks they have increased.

In all villages except Kockoy, Muhtar thinks that their pastureland/rangeland condition has been improved. The Muhtar in Kockoy thinks it has been unchanged.

### Problems/constraints on living

According to the head of households interviewed, the most serious problem in Durukoy, Gockoy, Kockoy and Numanpasa is poor road conditions, while that in Koprukoy and Numanpasa is lack of irrigation water. Problems varies from village to village depending on their conditions. However, irrigation water insufficiency, bad farm road conditions, loneliness and harsh winter conditions are among others important concerns among villagers.

Other important problem raised by many villagers is lack of knowledge on agriculture. Due to the lack of agricultural extension activities, the forest villagers are facing several problems including pest and diseases, low productivity, etc.

### Development ideas

Development ideas vary from village to village, depending on the conditions of villages.

Willingness of the Muhtar to participate in project activities	Yes	Yes	No	Yes	Yes

## **Savsat micro-catchment (BT-04) (refer to Table 2.24)**

### Location and pattern of the villages

The villages are located either on mountain slopes, at the bottom of valleys or mountaintop. All the villages consist of three (3) to 10 settlements or “mahalles”. Distance from the district center of Savsat to the villages ranges from 11 km to 21 km, taking 30 to 85 minutes by vehicle.

### Educational attainment of the head of households

This MC is characterized by higher educational attainment. Nearly half of the head of households attained higher than primary school, 19% finished secondary school, 18% finished high school, and 11% finished college/university.

### Household size and land holding size

Average household size is 3.8 ranging from 3.0 in Ciftlik to 4.5 in Kirecli. Average cultivated land area is 3.7 ha, ranging from 2.5 ha in Kirecli to 5.8 ha in Cavdarli.

### Agricultural activities

Fodder crops are dominantly cultivated in the area. The share of the area under fodder crops in the total cultivated area is 80%, followed by vegetables with 9%, wheat and maize with 4% each and barley with 2%. The share of fodder crops is particularly high in Hanli with 91%.

Yield of wheat is some 1,670 kg/ha on average, ranging from 1,110 kg/ha in Ciftlik to 2,470 kg/ha in Kirecli.

The use of both manure and chemical fertilizer is not common in the area. Merely 8% of the households use manure with an average dosage of 4,824 kg per household, and 6% use chemical fertilizer with 122 kg per household.

None of the household use agro-chemicals. Some 60% of the farmers rented tractor for cultivation ranging from 30% in Savaskoy to 95% in Cavdarli.

### Livestock activities

Livestock raising, especially cattle, is common practice in the area. On average, 78 % of the households raise cattle, ranging from 65% in Savaskoy to 85% in Ciftlik and Hanli. Average number of raised cattle per household is five (5), ranging from four (4) in Savaskoy to seven (7) in Cavdarli. The share of local breed cattle in the total number of cattle is 17%, ranging from 10% in Cavdarli to 27% in Savaskoy.

Other animals raised include sheep and goat. Some 10% of the household raise 59 head of sheep on average. Particularly in Cavdarli, 30% keep 133 head of sheep on average. On the other hand, goat is

raised in Cavdarli only with average number of four (4).

Some 40% of the households raise chicken. Average number of chicken raised per household is nine (9). Chicken raising is more popular in Cavdarli. Some 60% of the households raise eight (8) chicken on average.

#### Other agricultural activities

Nearly 15% of the households interviewed practice beekeeping on average, ranging from 0% in Cavdarli to 25 % in Hanli. Average number of beehives possessed per household is 12, ranging from three (3) in Ciftlik to 21 in Hanli.

More than 9% of the households interviewed grow fruit trees on average, ranging from 70% in Savaskoy to 100% in Ciftlik, Hanli and Kirecli. Average number of fruit trees per household is 30, ranging from 19 in Hanli to 40 in Ciftlik and Savaskoy.

Greenhouse is seldom seen in area. No inland fish culture is seen.

#### Source of income, income level and income composition

More than 80% of the households derive their income from agriculture including crop and livestock. Remaining 20% derive income from non-agricultural activities like construction, taxi driver, etc. Some 15% of the villagers earn from honey production. Unearned incomes such as pension, support from other family members and revenue from rent are also important for many villagers. More than half of the households have such income.

Annual household cash income, calculated from the sale of agricultural products (gross income) and other incomes (non-agricultural income and unearned income), averages TL.5,203 million or US\$3,469, ranging from TL.3,962million in Savaskoy to TL.5,858 million in Hanli. Agricultural income shares some 43% of the total income or US\$1,492. Average per capita annual cash income is US\$926, ranging from US\$713 in Savaskoy to US\$1,078 in Ciftlik.

Income from livestock shares 29% of the total income, followed by crops (11%) and bee keeping (3%) on average, while unearned income accounts for 43% and while non-agricultural income for 10%. The income composition varies from village to village. Income from livestock accounts for 53% of the total income in Cavdarli, followed by 14% in crops. The share of income from crops in Savaskoy is 14%, followed by livestock with 13% and beekeeping with 6%. The share of unearned income varies from 27% in Cavdarli to 63% in Savaskoy. The share of non-agricultural income also varies from 6% in Cavdarli and Savaskoy to 14% in Kirecli.

#### Debts

More than half of the households have debts with the average amount of TL.2,023 million, which is

some 39 % of the average annual cash income. Many borrow from their friends at interest free, otherwise from Agricultural Bank and merchant.

#### Gender aspects

In almost all household matters, decision is made by men. Accordingly women's activities are controlled by men. In general, men mainly do work outside while women do housework. In the field men mainly do cultivation, fertilizer application, sowing, weeding, irrigation and harvesting, while women mainly do hoeing and also help men's works. In barn, feeding is mainly done by men or both, while milking and processing milk are done mainly by women. Marketing agro-products and shopping is predominantly done by men. Women are responsible for all the housework including cleaning, bread making, cooking and childcare, etc.

As described above, women are responsible for various works both inside and outside houses. Although women's house works have been eased as many households have vacuum cleaner and washing machine, they have to work from early morning till late night. Walking long distance on a poor conditioned road to their farm is one of their serious problems.

#### Assets

More than 85% of the households interviewed have refrigerator, TV set and telephone. More than 70% of the households have vacuum cleaner, and more than 60% have washing machine. Oven is possessed by some 30%. Some 18% of households have mobile phone, and less than 10% own private vehicle.

All the households interviewed in Kirecli possess telephone, 95% possess refrigerator and TV set, and more than 80% possess washing machine and vacuum cleaner. 35% possess mobile phone and 10% possess private vehicle.

More than 30% of the households have properties such as house, lot and shop in town.

#### Energy sources for heating and cooking

Most villagers depend their heating energy mainly on fuelwood and coal. Consumption volume of the fuelwood varies from six (6) to 12 sters with the average volume of 10 sters. The shortfall is, if there is, filled with grasses or coal.

The use of LPG, as cooking energy, is very common.

#### Infrastructure

All the villages are electrified, and have telephone line. Drinking water supply system has also been established in almost all villages. A primary school has been constructed in Ciftlik, Kirecli and Savaskoy but none in two other villages.

Clinic is not available at any of the villages.

#### Natural environment

Hanli and Kirecli experienced flood in 2002.

In three villages of Ciftlik, Hanli and Kirecli, Muhtar thinks that forest resources within their territory have deteriorated during the last decade, while Muhtar in the other villages thinks they have increased.

In all three villages of Ciftlik, Kirecli and Savaskoy, Muhtar thinks that their pastureland/rangeland condition has been improved, while in Hanli Muhtar thinks they have unchanged and while deteriorated in Cavdarli.

#### Problems/constraints on living

According to the head of households interviewed, the most serious problem in all the villages is poor road conditions, followed by health problem and irrigation.

Other important problem raised by many villagers is lack of knowledge on agriculture. Due to the lack of agricultural extension activities, the forest villagers are facing several problems including pest and diseases, low productivity, etc.

#### Development ideas

Livelihood improvement through irrigation and livestock including dairy industry is among others important development idea by many villagers. Road upgrading and rehabilitation is the next priority.

Poor conditions of irrigation canal (4)
Projects proposed by the Muhtar	1. Livestock and dairy processing; 2. Provision of new livestock breed; 3. Irrigation canal improvement	1. Road upgrading; 2. Irrigation development; 3. Farmers' training in livestock, apiculture and handicraft	1. Irrigation development; 2. Road rehabilitation; 3. Livestock support project	1. Dairy industry modernization; 2. Road rehabilitation; 3. Irrigation development	1. Upgrade of the irrigation canal; 2. Milk processing; 3. Marketing promotion
Willingness of the Muhtar to participate in project activities	Yes	No	Yes	Yes	Yes

### **Yusufeli micro-catchment (MC-03) (refer to Table 2.25)**

#### Location and pattern of the villages

The villages are located generally in mountain slopes or bottom of valley in very steep mountainous area. Except for Kilickaya municipality which is compacted pattern, other three villages consist of two (2) to five (5) settlements or “mahalles”. Distance from the district center of Yusufeli to the villages ranges from 13 km to 41 km, taking 30 to 90 minutes by vehicle.

#### Educational attainment of the head of households

More than 70% of the head of households attained the education at primary school or lower. In Celtikduzu, 25% of the interviewed head of households received no education. In Bakirtepe, 65% finished primary school education, 5% finished secondary school, 10% finished high school and 15% finished college/university.

#### Household size and land holding size

Average household size is 4.0 ranging from 3.5 in Kirecli to 4.8 in Alanbasi. Average cultivated land area is 3.1 ha, ranging from 2.3 ha in Celtikduzu to 4.6 ha in Bakirtepe.

#### Agricultural activities

On average, Fodder crops shares the largest area with 53% of the cultivated land, wheat comes next with 14%, followed by barley with 12%, paddy rice with 11% and vegetables with 9%.

In Bakirtepe, fodder crops shares 54 % of the area cultivated, while wheat shares 26%. In Celtikduzu, fodder crops are the dominant crop with 61% share of cultivated land, followed by vegetables with 13% and rice with 11%. Yield of wheat is some 917 kg/ha on average, ranging from 583 kg/ha in Bakirtepe to 1,329 kg/ha in Kilickaya.

The use of manure is popular in the area except Celtikduzu where cattle raising is not active. On average, 77% of interviewed use manure with average dosage of 4,025 kg per household. Nearly 51% use chemical fertilizer with the average dosage of 293 kg per household. Some 90% of households interviewed villagers in Bakirtepe use manure with the highest dosage of 7.830 kg per household. In Celtikduzu 65% of the households use 139 kg of chemical fertilizer per household on average. Chemical fertilizer is applied mainly to rice, vegetables and fodder crops.

More than 20% of the households interviewed use agro-chemicals on average, ranging from 15% in Alanbasi and Bakirtepe to 38% in Kilickaya. Hiring tractor is rather common in all the villages. Some 65% of the households rented tractor for cultivation ranging from 30% in Celtikduzu to 65% in Alanbasi.

### Livestock activities

Livestock raising, especially cattle, is common practice in the area. On average 65 % of the households raise cattle ranging from 60% in Kilickaya to 80% in Alanbasi. Average number of raised cattle per household is six (6), ranging from three (3) in Celtikduzu and Kilickaya to 11 in Alanbasi. The share of local breed cattle in the total number of cattle is 47%, ranging from 29% in Celtikduzu to 87% in Alanbasi.

Other animals raised include sheep and goat. Some seven (7) % of the households raise sheep with 39 heads each on average. While, five (5) % raise goat with 62 heads each.

On average some eight (8) % of the households raise chicken ranging from 0% in Celtikduzu to 20% in Alanbasi. Average number of chicken raised per household is seven (7), ranging from 0 in Celtikduzu to 18 in Alanbasi.

### Other agricultural activities

Some 15% of the households practice beekeeping. Average number of beehives possessed per household is 18, ranging from seven (4) in Kilickaya to 28 in Bakirtepe.

About 40% of the households grow fruit trees. Average number of fruit trees per household is 40, ranging from zero in Bakirtepe to 60 in Kilickaya.

None of households interviewed has greenhouse nor fish ponds.

### Source of income, income level and income composition

Some 57% of the villagers derive their income from agriculture including crop and livestock. Remaining 43% derive income from non-agricultural activities like construction, taxi driver, etc. Some 7% of the villagers earn from honey production. Unearned incomes such as pension, support from other family members and revenue from rent are also important for many villagers. More than 69% of the villagers have such income.

Annual household cash income, calculated from the sale of agricultural products (gross income) and other incomes (non-agricultural income and unearned income), averages TL.4,830 million or US\$3,220, ranging from TL.3,870 million in Alanbasi to TL.5,885 million in Bakirtepe. Agricultural income shares some 34% of the total income or US\$1,095. Average per capita annual cash income is US\$825, ranging from US\$538 in Alanbasi to US\$1,060 in Bakirtepe.

Income from livestock shares 19% of the total income, followed by bee keeping (8%) and crops (7%) on average, while unearned income accounts for 53% and while non-agricultural income for 14%. The income composition varies from village to village. Income from livestock accounts for 27% of the total income in Alanbasi and 8% in beekeeping. In general, share of crop income in the total income is

not more than 10%. Income from bee keeping accounts for 17% of the total income in Bakirtepe. While unearned income shares nearly half of the total income in most villages, that in Celtikduzu is as high as 64%.

#### Debts

Some 30% of the villagers have debts with the average amount of TL.2,096 million, which is some 43 % of the average annual cash income. Many borrow from their friends at interest free, otherwise from cooperatives and merchant.

#### Gender aspects

In almost all household matters, decision is made by men. Accordingly women's activities are controlled by men. In general, men mainly do work outside while women do housework. In the field men mainly do cultivation, fertilizer application, sowing, weeding, irrigation and harvesting. Women mainly do hoeing and do harvesting together with men. In barn, feeding is mainly done by men or both, while milking and processing milk are done mainly by women. Marketing agro-products and shopping is predominantly done by men. Women are responsible for all the housework including cleaning, bread making, cooking and childcare, etc.

As described above, women are responsible for various works both inside and outside houses. Although women's house works have been eased as many households have vacuum cleaner and washing machine, they have to work from early morning till late night. Walking long distance on a poor conditioned road to their farm is one of their serious problems.

#### Assets

Almost all households have refrigerator, and telephone. More than 80% of the households have TV sets, and more than 70% have oven and washing machine. Some 20% of households have mobile phone, and nearly 20% own private vehicle.

Nearly 40% of the households have properties such as house, lot and shop in town.

#### Energy sources for heating and cooking

Most villagers depend their heating energy mainly on fuelwood. Consumption volume of the fuelwood varies from three and half (3.5) to six (6) sters with the average volume of five (5) sters,. The shortfall is filled mainly with coal, which have been becoming popular although expensive.

The use of LPG, as cooking energy, has been very common.

#### Infrastructure

All the villages are electrified, and have telephone line. Drinking water supply system has also been

established in all the villages. A primary school has been constructed in all the villages except for Bakirtepe where no school is available.

Clinic is only available in the Alanbasi. But even in Alanbasi staff and equipment are short.

#### Natural environment

Being located in the mountain slope in steep mountain ranges, natural disasters such as flood and hailstorm are among others serious concern of the villagers. Villages of Alanbasi and Celtikduzu experienced flood in 2001.

Muhtars in Alanbasi and Celtikduzu think that forest resources have been degrading, while other Muhtars thinks they are deteriorate.

Muhtar in all the villages thinks that their pastureland/rangeland has been improved.

#### Problems/constraints on living

According to the villagers, the most serious problem in the area is poor quality of road. More than half of the head of households interviewed identified this as the problem. Other important problems include no sewerage system, health related, difficult living conditions and marketing.

Other important problem raised by many villagers is lack of knowledge on agriculture. Due to the lack of agricultural extension activities, the forest villagers are facing several problems including pest and diseases, low productivity, etc.

#### Development ideas

Livelihood improvement through livestock and apiculture is among others important development idea by many villagers.

### **Bayburt micro-catchment (UC-03) (refer to Table 2.26)**

#### **Location and pattern of the villages**

The villages are located generally in mountain slopes or bottom of valley in gentle mountainous area. Two of the five villages show compact pattern, and the others consist of a few settlements or “mahalles”. Distance from the district center as well as provincial center of Bayburt to the villages ranges from 3 km to 34 km, taking 7 to 40 minutes by vehicle.

#### **Educational attainment of the head of households**

More than 90% of the head of households attained the education at primary school level or lower. In Heybetepe, 50% of the interviewed head of households received no education, half of which are illiterate, and the remaining 50% finished primary school.

#### **Household size and land holding size**

Average household size is 5.4 ranging from 4.4 in Gezkoy to 6.5 in Masat. Average cultivated land area is 4.3 ha, ranging from 2.8 ha in Masat to 5.9 ha in Yaylapinar.

#### **Agricultural activities**

On average, fodder crops shares the largest area with 66% of the cultivated land, wheat comes next with 22%, followed by barley with 10%. Crops are not diversified.

In Yaylapinar, fodder crops share 85 % of the area cultivated, while wheat shares 15 % only. In Maden, Fodder crops share 61%, and wheat 36%. Yield of wheat is 1,281 kg/ha on average, ranging from 617 kg/ha in Maden to 1,890 kg/ha in Gezkoy.

The use of manure is not popular in the area despite there are many cattle. On average, 22% of interviewed use manure with average dosage of 27,264 kg per household. The use of chemical fertilizer is more common in the area. Nearly 50% use chemical fertilizer with the average dosage of 505 kg per household, ranging from 333 kg in Masat to 892 kg in Maden.

The use of agro-chemicals is not common. Merely 4% of the households interviewed use agro-chemicals. None of households interviewed in Heybetepe, Masat and Yaylapinar use agro-chemicals

Some 55% of the households rented tractor for cultivation.

#### **Livestock activities**

Livestock raising, especially cattle, is common practice. On average more than 80 % of the farmers raise cattle, ranging from 70% in Gezkoy and Maden to 100% in Heybetepe. Average number of raised cattle per household is eight (8). The share of local breed cattle in the total number of cattle is 31%,

ranging from 3% in Maden to 78% in Masat.

Other animals raised are sheep and goat. Some 22% of the farmers raise sheep and 9% raise goat. Average number of raised 30 for sheep and 9 for goat. Sheep raising is more popular in Heybetepe (75% of the households interviewed) than in Gezkoy and Yaylapinar (5% each). Scale of sheep raising is larger in Yaylapinar with the number of raised sheep per household of 80, compared to four (4) in Masat. Goat is raised more in Heybetepe. Some 35% of the households interviewed raise five goat each.

On average some 35% of the farmers raise chicken. Average number of chicken raised per household is eight (8). Chicken raising is more popular in Maden. Some 75% of the farmers raise 12 chicken each on average.

#### Other agricultural activities

Some 14 % of the households practice beekeeping. Average number of beehives possessed per household is 13, ranging from zero in Heybetepe to 30 in Yaylapinar.

Only some households in Gezkoy grow fruit trees with average tree number of 39. Also some households in Gezkoy possess greenhouse with the average area of 114 m<sup>2</sup>. No fish culture is seen in the area.

#### Source of income, income level and income composition

Some 95 % of the households derive their income from agriculture including crop and livestock. Remaining 5 % derive income from non-agricultural activities like construction, taxi driver, etc. Some 8% of the villagers earn from honey production. Unearned incomes such as pension, support from other family members and revenue from rent are also important for many villagers. Some 30% of the villagers have such income.

Annual household cash income, calculated from the sale of agricultural products (gross income) and other incomes (non-agricultural income and unearned income), averages TL. 6,859 million or US\$4,572, ranging from TL.4,248 million in Heybetepe to TL.8,892 million in Maden. Agricultural income shares some 66% of the total income or US\$3,017. Average per capita annual cash income is US\$887, ranging from US\$506 in Heybetepe to US\$1,253 in Gezkoy.

Livestock shares 43% of the total income, followed by crops (23%) and bee keeping (3%) on average, while unearned income accounts for 15% and while 15% for non-agricultural income. The income composition varies from village to village. Income from livestock accounts for 70% of the total income in Heybetepe, followed by crops with 26% and non-agricultural income with 4%. In Maden income from livestock share merely 29% of the total, followed by unearned income with 20% and crops with 8%, while non-agricultural income shares as high as 42%.

### Debts

Some 57% of the households have debts with the average amount of TL.3,939 million, which is some 57 % of the average annual cash income. Many borrow from their friends at interest free, otherwise from cooperatives, Agricultural Bank and merchant.

### Gender aspects

In almost all household matters, decision is made by men. Accordingly women's activities are controlled by men. In general, men mainly do work outside while women do housework. In the field men mainly do cultivation, fertilizer application, sowing, hoeing, weeding, irrigation and harvesting. Some women work together with men in doing hoeing, weeding and harvesting. In barn, barn cleaning is done by both men and women, feeding is mainly done by men, while milking and processing milk are done mainly by women. Marketing agro-products and shopping is predominantly done by men. Women are responsible for all the housework including cleaning, bread making, cooking and childcare, etc.

As described above, women are responsible for various works both inside and outside houses. Although women's house works have been eased as many households have vacuum cleaner and washing machine, they have to work from early morning till late night. Walking long distance on a poor conditioned road to their farm is one of their serious problems.

### Assets

More than 90% of the households have refrigerator, TV set and telephone. More than 70% of the households have washing machine, and more than half have vacuum cleaner and oven. More than 20% of households have mobile phone, and some 20% own private vehicle.

Assets possessed by households in Masat are less than those in other villages. Except telephone, refrigerator, washing machine and TV set, all of which are possessed by more than half of the households, other assets are possessed by less than half of the households.

Some 25 % of the households have properties such as house, lot and shop in town.

### Energy sources for heating and cooking

Most villagers depend their heating energy mainly on fuelwood. Consumption volume of the fuelwood varies from three (3) to five (5) sters with the average volume of four (4) sters,. The shortfall is filled mainly with cowdung and coal, which have been becoming popular although expensive. Cowdung is more important energy source in Heybetepe and Masat.

The use of LPG, as cooking energy, has been very common.

### Infrastructure

All the villages are electrified, and have telephone line. Drinking water supply system has also been established. A primary school has been constructed in all the villages, but pupils in Gezkoý go to a primary school in Bayburt.

Clinic is not always available in the villages. Gezkoý and Yaylapinar do not have clinic, and even if exists, it is poorly equipped and staffed.

### Natural environment

As the topographic conditions of the area is not so harsh, the fear of natural disaster is less than other micro-catchments. Only Gezkoý experienced landslide in 2002.

In Gezkoý, Heybetepe and Masat, Muhtar thinks that forest resources within their territory have increased during the last decade, while in the other villages Muhtar thinks the resources have deteriorated.

While the Muhtar in Masat thinks pasture/rangeland conditions have been unchanged, Muhtar in the other villages thinks the conditions have been improved.

### Problems/constraints on living

According to the villagers, the most serious problem in the area is poor road conditions, followed by no sewerage system, lack of irrigation water, no enough income and unemployment. Problems vary from village to village depending on their conditions. However, irrigation water insufficiency, low income and bad farm road conditions are among others important concerns among villagers.

Other important problem raised by many villagers is lack of knowledge on agriculture. Due to the lack of agricultural extension activities, the forest villagers are facing several problems including pest and diseases, low productivity, etc.

### Development ideas

Livelihood improvement through livestock and bee keeping is among others important development idea by many villagers.

**Table 2.26 Results of the Rural Socio-Economic Survey - Bayburt (UC-03) (1/3)**

***Rural Socio-Economic Survey  
for  
The Master Plan Study  
on  
Participatory Watershed Rehabilitation  
in Coruh River in the Republic of Turkey***

***Undertaken by the Japan International Cooperation Agency (JICA)  
in cooperation with Ministry of Environment and Forestry***

***June 2003***

### Key Informant Survey Questionnaire

Micro-Catchment No.

		-		
--	--	---	--	--

Village:

--

Sub-district:

--

District:

--

Province:

--

Name of the Interviewer: \_\_\_\_\_

Name of the Interviewee: \_\_\_\_\_

Title of Interviewee: \_\_\_\_\_

Date of Interview: \_\_\_\_\_

## Appendix 2 Questionnaire for Key Informant Survey (English) (2/8)

### Key Informant Survey

1.	Location of the village (Filled in by interviewer)	A) Mountain slope .....1    Top of mountain.....2 Plain lowland.....3    Valley .....4 B) Inside village .....1    Nearby village .....2 C) Near lake .....1    Near dam reservoir ....2 Near river .....3    Near spring .....4 D) Near the highway (less than 5 km) ...1 (more than 5 km) ...2		
2.	How far is it from the village to district center and to provincial center?	Province center _____ km    _____ minutes by vehicle District center _____ km    _____ minutes by vehicle		
3.	What is the village pattern?.	Compact .....1 Houses are scattered .....2 More than one settlement .....3 (how many.....)		
4.	Material of Houses (%)	1. Stone (    ); 2. Concrete (    ); 3. Bricks (    ); 4. Wood (    )		
<b>POPULATION</b>				
5.	What is the population and the number of household in last population census (2000) and at present (2003)?		<b>Population</b>	<b>Nos. of household</b>
		<b>Male</b>	<b>Female</b>	
		<b>Last Census(2000)</b>		
		<b>At present (2003)</b>		
6.	How many people are over the age of 60 at present?	Male _____; Female _____		
<b>OCCUPATION AND MIGRATION</b>				
7.	What are the main economic activities? (if plural answer, ask order of importance)	<u><b>Activities</b></u>	<u><b>Order of importance</b></u>	
		1. Cereals cultivation	_____	
		2. Vegetables	_____	
		3. Fruits	_____	
		4. Animal husbandry	_____	
		5 Forestry	_____	
		6. Others (Specify:_____)	_____	
8.	Are there anyone who live in the village but work out of the village everyday?	Yes ...1    ➔ How many (male:____; female____) ➔ Where do they go mainly?_____ ➔ Main occupation: _____ No...2		
9.	Are there any seasonal workers working outside the village? (Those who are migrated out to work seasonally)	Yes ...1    ➔ Number : male _____; female _____		
		<b>The place where people go to work</b>	<b>Type of work</b>	<b>Season of work go to work</b>
				<b>Duration (months)</b>
		No...2		

## Appendix 2 Questionnaire for Key Informant Survey (English) (3/8)

10.	Are there any people/households out-migrated from the village in the last five years?	<p>Yes ...1 → Number of people : male _____; female _____          Number of households: _____          → Major destination? _____          → Main reason for migration _____          _____</p> <p>No.....2</p>
11.	Are there any people/households who returned to the village in last five years? (permanently)	<p>Yes ...1 → Number of people : male _____; female _____          Number of households: _____          → From where: _____          → Main reason for return _____          _____</p> <p>No.....2</p>
12.	Are there any people/households who returned to the village temporarily every year?	<p>Yes ....1 → Male _____; Female _____; Household _____          Main reason for temporal return _____</p> <p>No .....2</p>
13.	Are there any seasonal in-migrant workers coming in your village?	<p>Yes ....1    How many workers were there last year? _____          How are the working conditions?          1. Rent lands _____ TL./decar          2. Share cropping _____ % of harvest          3. Wage _____ TL./day</p> <p>No ....2</p>
14.	Are there any problems in the village due to the increase in out-migration?	<p>Yes....1    Kind of problem : _____          _____</p> <p>No.....2</p>
<b>BASIC INFRASTRUCTURE</b>		
15.	Is your village electrified?	<p>Yes ....1 → Number of households not electrified: _____          Reason for not electrified: _____          How often is the electricity out? : _____</p> <p>No .....2</p>
16.	Is telephone line connected?	<p>Yes ....1 → How many households have telephone: _____</p> <p>No .....2</p>
17.	Does your village have drinking water supply system (tap water)?	<p>Yes ....1 → How many households are connected with it? _____</p> <p>No ....2 → What is the main drinking/domestic water source?          1. spring; 2. river; 3. well; 4. others(specify) _____</p> <p>Is the water supply sufficient all the year?    Yes ....1</p> <p>No ....2 → When is water short? (spring, summer; autumn, winter)          Reason for shortage: _____</p> <p>Is the water quality good?    Yes ....1; No .....2</p> <p>If no, how is it? _____</p>

## Appendix 2 Questionnaire for Key Informant Survey (English) (4/8)

18.	Are you satisfied with the condition of road connecting the village with the highway nearby?	Yes ....1 No.....2 ➤ What makes you unsatisfied? 1. Road is closed often in winter due to snow. 2. Road surface is not smooth due to poor maintenance. 3. Road is eroded by flood almost every year. 4. Others (specify: _____)					
<b>EDUCATION</b>							
19.	Is there a primary school in your village?	Yes ..... 1   ▼ How many pupils are there? Boy _____; Girls _____ How many teachers are there ? _____ (permanent teachers _____) Where do(es) permanent teacher(s) live? _____ No .....2   ▼ How far is it from the village to the nearest primary school? _____ km ; _____ minutes by vehicle					
20.	Are there any students going to high school/college/university?	Yes ....1 High school: male _____; female _____ College/university: male _____; female _____; No ....2					
21.	What are the main problem related to education in your village?	_____ _____ _____					
<b>PUBLIC HEALTH AND SANITATION</b>							
22.	What are the main diseases in your village?	1. _____; 2. _____ 3. _____;					
23.	What are the main diseases for children in your village?	1. _____; 2. _____ 3. _____;					
24.	Do villagers usually own medicines in their houses?	Yes .....1 What kind of medicines do they own? _____ Where do they get them? _____ No .....2					
25.	Is there a clinic in your village?	Yes...1 1 ➤	Specialist Doctor	Doctor	Nurse	Midwife	Officers
		No...2 ➤ How far is it from the village to the nearest clinic? _____ km; _____ minutes (by car)					
26.	How far is it from the village to the nearest hospital?	_____ km; _____ minutes (by car)					
27.	In case of emergency, what kinds of actions do villagers take?	_____ _____ _____					
28.	What are the main problems related to health in your village?	_____ _____ _____					

## Appendix 2 Questionnaire for Key Informant Survey (English) (5/8)

NATURAL DISASTERS									
29.	Were there any natural disasters occurred in the last five (5) years?	Yes ...1 →	Disaster	Year	Nos. of death				
		No ....2							
30.	Were any countermeasures taken after the disasters?	Yes ....1 →	Disaster	Countermeasures taken					
		No ....2							
31.	Do you think that any of natural disasters can be protected by human efforts?	Yes ....1 →	Disasters to be protected		Necessary measures				
			1. Landslides						
			2. Flood						
			3. Avalanche						
		No.....2							
LAND USE AND OWNERSHIP									
32.	Was any cadastral survey made in your village?	Yes .....1 →	When started? _____						
			Was it finished? Yes ....1; No .....2						
			If No, why was it not finished? _____						
		No .....2							
33.	How many decars does your village have by land use category?  (Please complete the table )	Type of land						Area (decar)	
		Rainfed farmland							
		Irrigated land							
		Fallow land							
		Poplar/willow							
		Pasture/rangeland							
		Forest							
		State properties (specify:_____)							
		Unutilized land due to serious soil erosion							
		Unused land due to out-migration (fallow)							
		Unused land due to inheritance disputes							
		Others (specify:_____)							
		Total							
34.	How many decars do farmers own the land? (Please complete the table below)								
	Land size(unit:decar)	Landless	0<2	2-5	5-10	10-20	20-30	30-50	>50
	Nos. farmers								

## Appendix 2 Questionnaire for Key Informant Survey (English) (6/8)

35.	Is there buy and selling or leasing of farmland in the village?	Yes ....1      Price for buy and selling : TL._____/decar Price for lease in/out:      TL._____/decar No ....2						
36.	What are the major crops cultivated in your village? (please select 5 important crops)	1. Wheat;    2. Barley;    3. Corn;    4. Potatoes; 5. Dry beans; 6. Vegetables; 7. Alfalfa;    8. Fruits 9. Other crop (specify: _____)						
37.	Are there any greenhouses in your village?	Yes ....1    How many greenhouses? _____ houses; _____ m2 No ....2						
38.	What kind of animals are there in your village?	Animal	Cattle			Sheep	Goat	Chicken
			Local	Pure breed	Crossbred			
		Number						
39.	How many households raise livestock?	Cattle: _____; Sheep: _____; Goat: _____						
40.	Do any animals come into the rangeland/pasture in your village from outside?	Yes ....1 ➔ How many animals come? Cattle _____ heads; Goat _____ heads; Sheep _____ heads No ....2						
41.	Are there bee keeping activities in your village?	Yes ....1      How many beehives are there? _____ beehives No ....2						
42.	What kind of public facilities are there in your village?	Facility	1. Mosque	2. Community hall	3. Irrigation	4. Others		
		Yes .....1 No .....2						
<b>COMMUNITY ACTIVITIES</b>								
43.	How is the decision making process concerned with the village?	Discussed with elders committee.....1 Asked to villagers .....2 Asked to elder people in the village.....3 Asked to intellectual people in the village. ....4 Others (specify)..... 5						
44.	Are there any cooperative/communal organizations in the village?	Yes...1 ➔	Name	Member	Major activities			
		No ....2						
45.	Do villagers help mutually without compensation?	Yes ....1    What kind of works _____ No.....2						
46.	Does the village have any disagreement or conflicts within the village?	Yes ....1 ➔ Disagreement/conflict _____ _____ No .....2						
47.	Does the village have any conflicts with neighbouring villages?	Yes ....1 ➔ Disagreement/conflict _____ _____ No .....2						
48.	Are there any administrative/ institutional/organizational problems in your village?	Yes ....1    Kind of problem _____ _____ No.....2						

## Appendix 2 Questionnaire for Key Informant Survey (English) (7/8)

<b>CHANGE IN SOCIO-ECONOMIC ENVIRONMENTS</b>																														
49.	Were there any change in the abundance of forest resources within the village area over the last decades?	Yes ....1    increased (    ); decreased (    ); unchanged (    ) Reason for change : _____ _____ No ....2																												
50.	Has the change in the abundance of forest resources affected your villagers' life?	Yes....1 → How affected    _____ _____ Any solution?    _____ _____ _____ No ....2
