1. Traffic Survey	A-1
2. Survey Point Location Map	A-4
3. Summary of Traffic Count Survey	A-5
4. Summary of Intersection Count Survey	A-7
5. Traffic Volume Survey and Required Lane Number	A-10
6. List of Enterprises for Goods Transportation Operators	A-11
7. Cord Number and Number of Lane	A-16
8. Land Acquisition Map	A-18

## *1. Traffic Survey*

The traffic in the vicinity of Tanjung Priok Port is mixed traffic, comprising short-journey traffic (intra urban) and long-journey traffic (inter urban).

Tanjung Priok Port is the inbound and outbound gate for the movement of goods, international (export-import) and inter-island movements and the transportation of people between island using west corridor from the port area.

The study included the following surveys:

- a. Traffic count survey
  - i. Road section
  - ii. Intersection
- b. Interview survey on the movement of goods transportation
- c. Interview survey on industrial enterprises
- d. Interview survey on operators of goods transportation

Summary of Traffic Data and findings of the survey are shown as follows

a) *Traffic Count Survey*

The Traffic Count survey was carried out on two working days with the location of survey at the entrance gate of Tanjung Priok Port and various locations in Depo Peti Kemas (Container Depot) around Cilincing. The survey at each location was for one day (i.e. 24 hours).

The survey was conducted at two locations namely at road intersections and on road section. Surveys at road intersections were at Koja Intersection and Enggano Intersection. Each movement was recorded for each vehicle classification. The survey at the road sections recorded the incoming and out-going traffic, based on classification (10 types of vehicles). The vehicles were classified as follows:

- a. Motorcycle
- b. Sedan, jeep, wagon, kijang
- c. Van, comby, minibus
- d. Mikrolet, bajaj
- e. Medium-size bus, big-size bus
- f. Pick up
- g. Truck 2 axles
- h. Truck 3 axles
- i. Truck trailer
- j. Trailer/ container

Each vehicle passing the survey point at the location of survey was counted based on its classification. Traffic was counted for hourly periods.

b) *Interview Survey on the Movement of Goods Transportation*

To determine the origin and destination of vehicles, interviews with truck drivers were necessary.

The survey was conducted at the entrance and exit gates from Tanjung Priok area and some areas of the container depot in Cilincing. This survey was done for one day, started from 06:00 AM until the final incoming and out-going vehicles.

c) *Interview Survey on Industrial Enterprises*

The interview was also conducted to some industries existing around Jakarta, Bekasi, Bogor, Cirebon and Cilegon. Considerable time was required to coordinate implementation of the survey with the relevant authorities.

The purpose of the survey was to determine the interrelation between the industry and the port used for the import and export of raw materials and products. The questions were designed to obtain information directly from use of the port.

The survey form also requested input from industrial enterprises, with respect to accessibility in distribution of the raw material and the processing of products. Input could be submitted to the regional administration and the central government as the policy makers. The survey also asked which routes were taken to the port.

*d) Interview Survey on Operators of Goods Transportation*

Interview surveys were also conducted to some operators involved with goods transportation to determine the movement pattern of operators involved with goods transportation. Each operator focused on one vehicle and the route passed in daily activity.

The goods transportation operators were surveyed by random sampling from the list of enterprises existing in DKI Jakarta. The operators were surveyed from two enterprises.

**3) Output of Survey**

A-4 Survey location of A-5,A-7 are mentioned

A-10 Traffic volume of W/O(without )and W(with)of vehicle number PCU are explained

A-11 Location of enterprises for good transportation operater and material handling by each operater are summarized (A-12~A-15)

A-16 ,A-17 Code number and required lane number by handling by each enterprise are shown(

A-18 Land acquisition area of Tanjung Priok and Bojonegara ae illustrated

# 6 List of Enterprises for Good Transportation Operators

# DATA PROFIL PERUSAHAAN DI LINGKUNGAN PELABUHAN TANJUNGPRIK

ID	Kategori	Nama Perusahaan	Kontak Person	Posisi Jabatan	Alamat	No Telepon
1	Perkantoran	PT. Samudra Eiko Jaya (Gralia Samudera)	Lusi Ang	Marketing	Jl. Pelayari no. 1, Pelindo II	4356286
2	Perkantoran	PT. Djakarta Lloyd (Peters)	M. Zamroui	Kabag Umum/ Personalia	Jl. Raya Pelabuhan no. 37	4301053 hunting 4 lines
3	Perkantoran	PT. Dharma Lautan Nusantara Cab. Tj. Priok	Hansono S	Kepala Bag. Umum	Jl. Pulau Payung no. 1	4303585
4	Perkantoran	PT. Multi Terminal Indonesia	Hari Toto Budiarto, SH	Manajer Personalia & Umum	Jl. Pulau Payung no. 1	4301080 ext. 2320
5	Perkantoran	PT. PELNI Cabang Tj. Priok	Wisnomo, SH	Kepala Cabang	Jl. Palmas no. 2	493196
6	Perkantoran	PT. Gosuri Lloyd Cab. Tj. Priok	Wajawai	Sekretaris	Jl. Raya Pelabuhan no. 25	4351107
7	Perkantoran	Kantor Kesehatan Pel. Tj. Priok	H. Ishaka	Kasub Bag. Tata Usaha	Jl. Raya Pelabuhan no. 17	491045
8	Perkantoran	PT. Pelindo II (Office Center I & II)	Rahman	Pelayanan/Pelanggan	Jl. Panatun	
9	Perkantoran	Kanwil Ben Cukai - Tj. Priok	Isadi	Kasubag TU & RT	Jl. Raya Pelabuhan	494364 - 496024
10	Perkantoran	PT. Pelindo II Cab. Tj. Priok	Firdaus	Koordinator Terminal Penumpang	Terminal Penumpang Nusantara Pura	
11	Perkantoran	KPBC Tj. Priok I, II dan III	Seyadi	Korlak TU & Kepegawaian	Jl. Pabean no. 1	4369633
12	Terminal Operator	PT. Andalas Tami	Himran Saleh	Ka. Gd. 201	Terminal Operator H, Jl. Ambon, (Gudang, 201)	4306663
13	Terminal Operator	PT. Prima Nur Panurjwan	Doyo	Kepala Gudang 005, 006, 007	Terminal Operator C, Jl. Nusantara II	
14	Terminal Operator	PT. PBMI Hainparan Jala Segara	Rachmat Soemadineja	Manager Operasional (08128499161)	Terminal Operator A, Jl. Nusantara I	4303058 - 4371540 - 4371541
15	Terminal Operator	PT. Mahardi Sarana Tami	Muhardin/ Alfred	Kepala Gudang 108, 109, 110	Terminal Operator F, Jl. Atlas	4391070
16	Terminal Operator	PT. Indodaya Abadi Sakti	Abdul Muis	Kepala Gudang	Terminal Operator K, Jl. Kalimantan	4371642
17	Terminal Operator	PT. Dharma Lautan Nusantara (Jakarta Lloyd)	Iskandar	Kepala Gudang 301	Terminal Operator N, Jl. Bangka (gd 301)	4351415 - 7205
18	Terminal Operator	PT. Dwipa Harsi Ummahdita	Karel Yohannes L	Kasi. Pergudangan	Terminal Operator G, Jl. Atlas	4359676 Gd. 4390577 - 4351415 - 7210
19	Terminal Operator	PT. Sri Kreasi Unggul Persada	Heri Wijaya/ Wardoyo	Direktur/ Kep. Operasional (Hp. 0811175788)	Terminal Operator B, Jl. Nusantara I (Gudang 004)	652 1970
20	Container Terminal	PT. Multi Terminal Indonesia (Cont-term 009)		Supervisor Lapangan	Jl. P. Payung no. 1	4301080
21	Container Terminal	Terminal Peti kemas Kojia (TPK Kojia)	Achmad Syachiu	Manager Marketing	Jl. Timor I/1	4374142, Fax: 4374150
22	Container Terminal	PT. Jakarta International Container Terminal	Agus Haryanto	St. Staf MIS	Jl. Sulawesi Ujung no. 1	430447 Ps. 621
23	Industri	PT. ISM Tbk. Bogasari Flour Mills	Suhartono	VP-HRMA	Jl. Raya Cilincing - Tanjung Priok	43900170
24	Industri	PERTAMINA LPG Filling Plant UPMS III	Siswo K	Kepala LPG Filling Plant	Jl. Jampen I	490484 - 4301031 - 3368
25	Pergudangan	PT. Agung Raya	Agus Tejo Purnomo	Finance Manager	Jl. Bangka I, Tanjung Priok	4307777
27	Industri	PT. Golden - Castle	Victor Chandra	Chief Accounting	Jl., Nusantara II, KBN	495481

## LAND ACQUISITION MAP

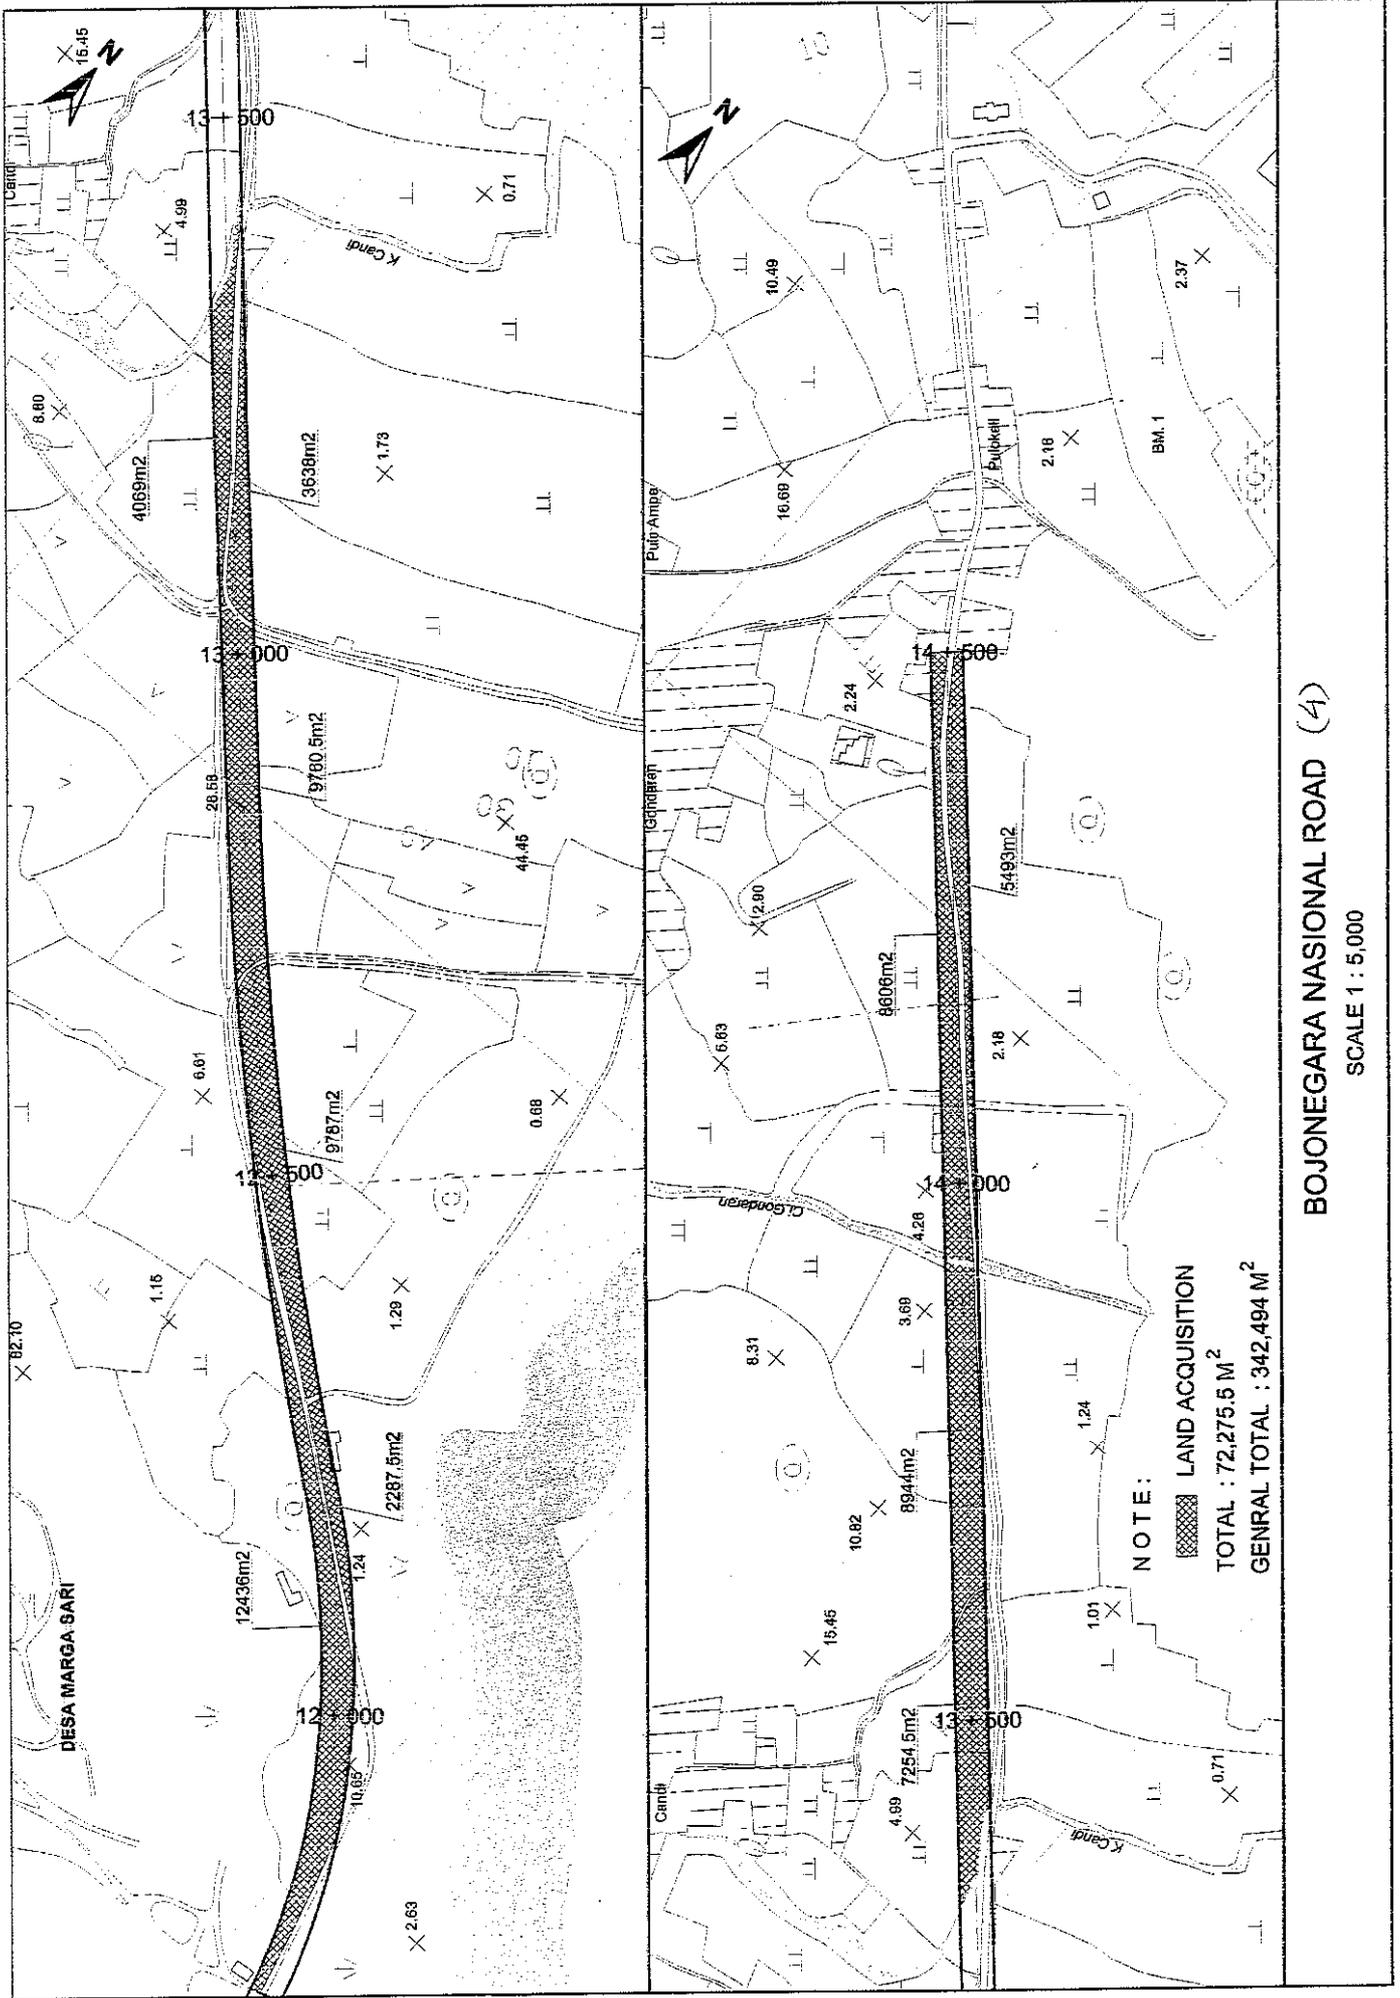

1. EASTERN ACCESS PORT HIGHWAY  
( TANJUNG PRIOK )
2. BOJONEGARA NATIONAL ROAD

**BOJONEGARA NASIONAL ROAD (4)**

SCALE 1 : 5,000

**NOTE:**  
 [Hatched Box] LAND ACQUISITION  
 TOTAL : 72,275.5 M<sup>2</sup>  
 GENERAL TOTAL : 342,494 M<sup>2</sup>

---

## **APPENDIX B: NATURAL CONDITIONS SURVEY**

### **CONTENTS**

1. Natural Condition at Tanjung Priok Port
  - 1.1 Natural Condition Survey by Study Team
    - 1.1.1 1:10,000 Scale Digital Topographic Mapping
    - 1.1.2 Sounding Survey
    - 1.1.3 Soil Investigation and Soil Laboratory Test
  - 1.2 Topography
  - 1.3 Seabed Depth Condition
  - 1.4 Climate
  - 1.5 Tide
  - 1.6 Wave
  - 1.7 Surface Current and Tidal Stream
  - 1.8 Maintenance Dredging
  - 1.9 Estimation of Seabed Variation
  
2. Natural Condition at Bojonegara
  - 2.1 Natural Condition Survey by Study Team
    - 2.1.1 1:10,000 Scale Digital Topographic Mapping
    - 2.1.2 Sounding Survey
    - 2.1.3 Topographic Survey
    - 2.1.4 Soil Investigation and Soil Laboratory Test
    - 2.1.5 Seismic Reflection Survey
    - 2.1.6 Primary Wave Logging
  - 2.2 Topography
  - 2.3 Seabed Depth Condition
  - 2.4 Climate
  - 2.5 Tide
  - 2.6 Wave
  - 2.7 Tidal Stream
  - 2.8 Maintenance Dredging
  - 2.9 Estimation of Seabed Variation

### **APPENDIX**

- Appendix – 1 1:10,000 Scale Topographic/Sounding Map at Tanjung Priok Port  
Appendix – 2 1:10,000 Scale Topographic/Sounding Map at Bojonegara  
Appendix – 3 1:10,000 Scale Topographic Map at Bojonegara  
Appendix – 4 1:10,000 Scale Topographic/Hydrographic Map at Bojonegara  
Appendix – 5 1:10,000 Scale Topographic/Bedrock Contour Map at Bojonegara

## 1. Natural Condition at Tanjung Priok Port

### 1.1 Natural Condition Survey by Study Team

#### 1.1.1 1:10,000 Scale Digital Topographic Mapping

Urbanization and overpopulation affected the surrounding area of Tanjung Priok Port, resulting in heavy traffic congestion around the port facilities. The problem of traffic congestion around this port among other factors hindered the prosperity and redevelopment of Tanjung Priok Port.

On the other hand, the present premises of the port facilities offer little space for expansion, so that any other site than the present facilities site should be considered for redevelopment of the said Port.

The 1:10,000 scale digital topographic maps covering the Tanjung Priok Port and its surrounding area were produced by photogrammetric mapping method for the main purposes of planning the construction of access roads to the port facilities and selecting the sites of the planned new port facilities.

Figure 1-1-1 “1:10,000 Scale Digital Topographic Mapping Area, Tanjung Priok Port” shows the mapping area of 1:10,000 scale digital topographic mapping of Tanjung Priok Port by photogrammetric method. The specifications of the 1:10,000 scale digital topographic maps produced are as follows:

- 1) Scale of topographic mapping 1:10,000
- 2) Mapping area Approximately 3,600 ha  
A-0 size, 1 sheet
- 3) Spheroid WGS-84
- 4) Map projection Universal Transverse Mercator (U.T.M.)  
Zone No. 48
- 5) Datum level Lowest Low Water Level (LLWL)
- 6) Reference point of elevation PEM. DKI/P.05  
(Existing benchmark established by DKI Jakarta)  
Elevation = Elevation from MSL + 0.6 m ( $Z_0$ )  
 $= 2.013 \text{ m} + 0.6 \text{ m} = 2.613 \text{ m}$

481	704,590.798	9,323,049.035	1.698
491	706,227.169	9,323,867.874	2.049
492	708,527.414	9,324,615.627	1.469

Note: Spheroid: WGS-84, Projection: U.T.M. Zone No. 48  
Datum of elevation: LLWS  
Reference point for elevation: PEM. DKI/P.05,  
Elevation = Elevation from MSL + 0.6 m = 2.013 + 0.6 m = 2.613 m

Appendix-1 shows the topographic/sounding map in which the latest results of sounding survey at navigational channels and anchorages are added to the produced 1:10,000 scale digital topographic maps.

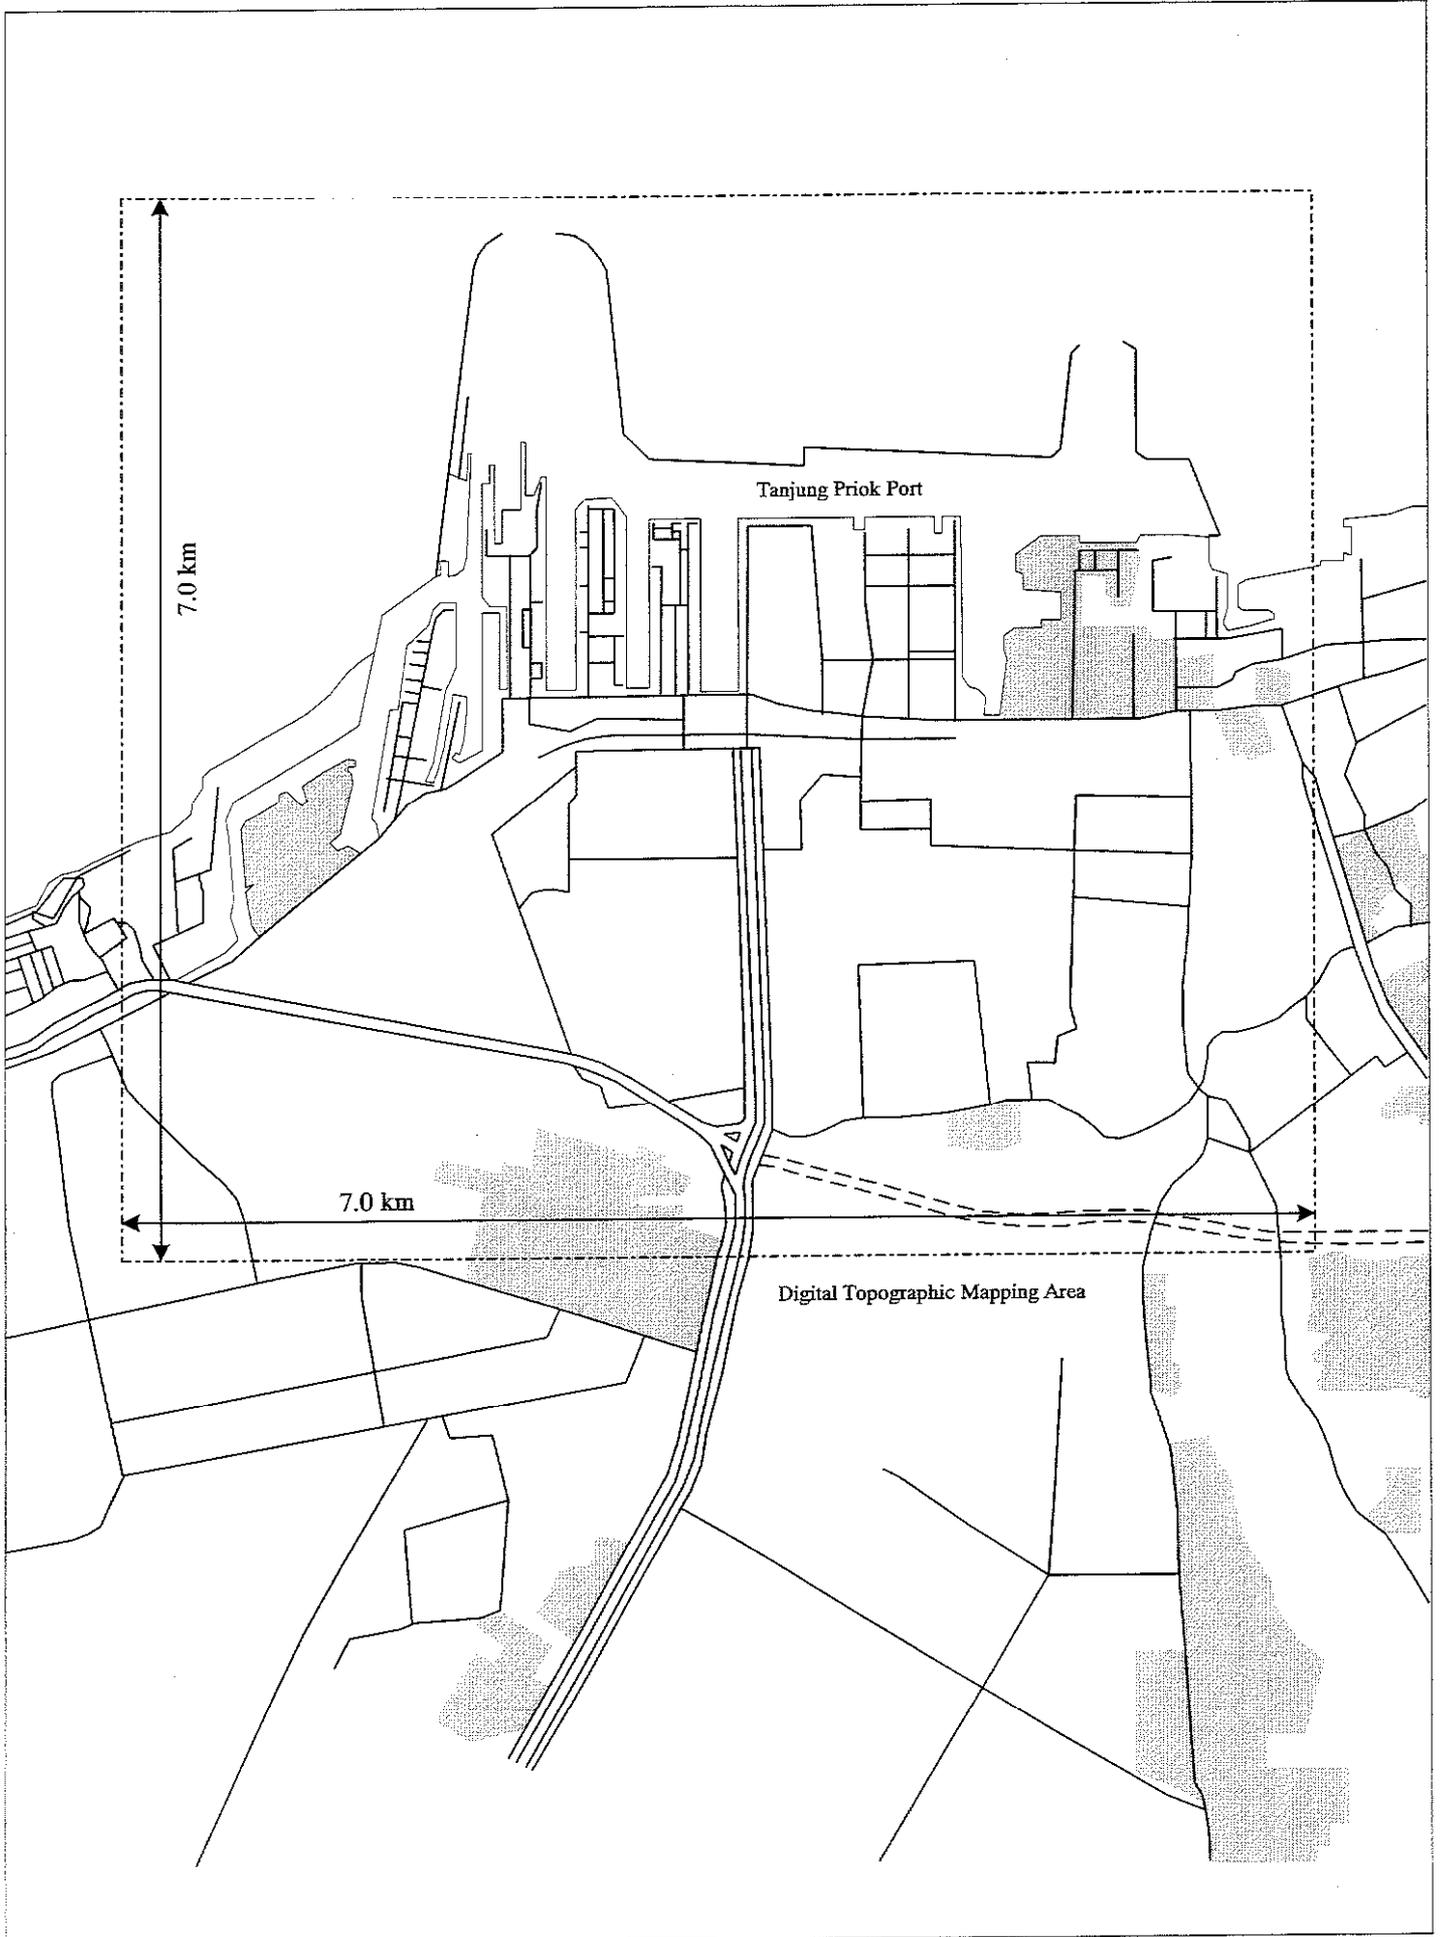

Figure 1-1-1 "1:10,000 Scale Digital Topographic Mapping Area, Tanjung Priok Port"

### 1.1.2 Sounding Survey

#### a) Existing Sounding Data

The first facilities at Tanjung Priok Port were constructed at the end of the 19<sup>th</sup> Century and the entrance channels, breakwaters, basins and port facilities were expanded for more than one century.

In Tanjung Priok Port, sounding surveys are made several times a year and are used for maintenance dredging, and eventually for the construction of port facilities, so that sufficient sounding data including the latest sounding maps are accumulated and kept by IPC-2.

Data collected by the JICA Study Team on the existing sounding surveys made, Tanjung Priok Port for the past 3 years are shown in Table 1-1-2 “List of Existing Sounding Map, Tanjung Priok Port”.

The ranges of sounding surveys are given in Figure 1-1-2 “Existing Sounding Map at Tanjung Priok Port”. These data were used to estimate the changes in the seabed surface in Tanjung Priok Port and entrance channels.

#### b) Sounding Survey

As already mentioned above, the sounding survey at Tanjung Priok Port has been made by IPC-2 periodically. However, the sounding survey at the east entrance channel has not been made in recent years because this channel is not used at present.

In addition, the sounding map of the planned west development site has not been provided yet. Thus, the sounding survey at Tanjung Priok Port was made in order to investigate the actual conditions of the water area for the east entrance channel rehabilitation plan and the front water area of the west development area for which the expansion of port facilities for Tanjung Priok Port is planned.

The range of sounding survey is shown in Figure 1-1-3 “Sounding Survey Area, Tanjung Priok Port”. The specifications of the sounding survey that has been carried out are shown below.

#### East Entrance Channel

1) Sounding survey area	Approximately 0.8 km × 4.3 km (344 ha)
2) Sounding line direction	Perpendicular to the center line of entrance channel
3) Sounding line interval	50 m
4) Positioning method	GPS
5) Sounding method	Deeper than –2 m: echo sounder Less than –2 m: staff or lead
6) Scale of sounding map prepared	1:2,500
7) Spheroid	WGS-84
8) Map projection	Universal Transverse Mercator (U.T.M.) Zone No. 48
9) Datum level	Lowest Low Water Level
10) Reference point for elevation	Tide pole at Tanjung Priok Port owned by IPC-2
11) Format style of digital data	AutoCAD format

#### West New Development Area

1) Sounding survey area	Approximately 2 km × 3.3 km (500 ha)
2) Sounding line direction	East – West direction
3) Sounding line interval	100 m
4) Positioning method	GPS
5) Sounding method	Deeper than –2 m: echo sounder Less than –2 m: staff or lead
6) Scale of sounding map prepared	1:10,000
7) Spheroid	WGS-84
8) Map projection	Universal Transverse Mercator (U.T.M.) Zone No. 48
9) Datum level	Lowest Low Water Level
10) Reference point for elevation	Tide pole at Tanjung Priok Port owned by IPC-2
11) Format style of digital data	AutoCAD format

Appendix-1 shows the topographic/sounding maps in which the results of sounding survey are added to the 1:10,000 scale digital topographic maps produced at the same time as the sounding survey.

### 1.1.3 Soil Investigation and Soil Laboratory Test

#### a) Existing Boring Data

IPC-2 has already executed many boring works and soil laboratory tests for the study of the construction of new berth and these data are very useful to estimate the subsoil condition at Tanjung Priok Port.

The existing boring data acquired by the JICA Study Team are shown in Table 1-1-3 “Location of Existing Boring Points, Tanjung Priok Port” and the locations of boring points are indicated in Figure 1-1-5 “Location of New and Existing Boring Point and Geological Profile Lines, Tanjung Priok Port”.

Table 1-1-3 “Location of Existing Boring Points, Tanjung Priok Port”

Project Name	Boring No.	Horizontal Coordinates		Boring Depth (m)
		X (m)	Y (m)

	B-5	-----	-----	24.0

Source: Information from IPC-2

The geological profiles based on the existing boring data are shown in Figure 1-1-6 “Geological Profile (B-B’ Section) at the Eastern Breakwater, Tanjung Priok Port”, Figure 1-1-7 “Geological Profile (C-C’ Section) at the Existing Western Breakwater, Tanjung Priok Port”, Figure 1-1-8 “Geological Profile (D-D’ Section) at the Existing Front Break Water, Tanjung Priok Port” and Figure 1-1-9 “Geological Profile (E-E’ Section) and Entrance of Western Channel, Tanjung Priok Port”.

According to the existing report, the soil conditions on the front water area of Tanjung Priok Port could be summarized as follows:

- 1) The seabed soil (from the seabed to approx. -35m) in the front of Tanjung Priok Port consists of nearly three layers.
- 2) The first layer is a soft clay layer in the depth range of nearly -13m, and its N-value is approximately 0.
- 3) The second layer is a deposit consisting of volcanic ash in the depth range of approx. -12m to -20m, with a N-value of approx. 6.
- 4) The third layer is a deposit consisting of volcanic ash, sand and silt in the depth range of approx. -20 m below, with a N-value of approx. 50 or more than 50.

#### b) Soil Investigation and Soil Laboratory Test

As described above, many soil surveys were carried out for the port facilities expansion plans at Tanjung Priok Port. However, no soil survey had been made before at the west development area. Therefore, the soil survey by offshore boring was carried out at the planned west development area.

The outline of the soil investigation and soil laboratory test is as follows:

##### West New Development Area

- |                              |                  |                                |
|------------------------------|------------------|--------------------------------|
| 1) Number of boring          | Offshore boring: | 3 locations                    |
| 2) Boring length             |                  | 30 m per hole, total 90 m      |
| 3) Standard Penetration Test |                  | 1.5 m interval, total 60 times |
| 4) Undisturbed sampling      |                  | 13 samples                     |

5) Soil Laboratory Test	Grain size analysis:	73 samples
	Specific gravity test:	73 samples
	Density test	73 samples
	Moisture content test:	73 samples
	Plastic/liquid limit test	73 samples
	Unconfined compression test:	12 samples
	Consolidation test:	12 samples

The locations of boring points are shown in Figure 1-1-4 “Location of New and Existing Boring Points and Geological Profile Lines, Tanjung Priok Port”. The horizontal coordinates, water depth and boring depth of each boring point are shown in Table 1-1-4 “Horizontal Coordinates and Elevation, and Boring Depth, Tanjung Priok Port”.

Table 1-1-4 “Horizontal Coordinates and Elevations, and Boring Depth, Tanjung Priok Port

Boring No.	Horizontal Coordinates		Elevation	Boring Depth	SPT
	X (m)	Y (m)	H (m)		
OSB-1	706,429	9,324,778	-2.4	30 m	20 times
OSB-2	707,015	9,325,520	-2.5	30 m	20 times
OSB-3	707,629	9,327,149	-3.4	30 m	20 times

Note: Elevation reference is LWS.

The Geological profile showing the results of boring is shown in Figure 1-1-10 “Geological Profile (A-A’ Section) at New West Development Area, Tanjung Priok Port”.

The boring log of each bore hole is shown in Figure 1-1-11 “Boring Log, Tanjung Priok Port (No. OSB-1)”, Figure 1-1-12 “Boring Log, Tanjung Priok Port (No. OSB-2)” and Figure 1-1-13 “Boring Log, Tanjung Priok Port (No. SOB-3)”.

The outline of soil conditions at the west development area obtained from the results of boring is shown in Table 1-1-5 “Outline of Soil Condition at Boring No. OSB-1, Tanjung Priok Port”, Table 1-1-6 “Outline of Soil Condition at Boring No. OSB-2, Tanjung Priok Port” and Table 1-1-7 “Outline of Soil Condition at Boring No. OSB-3, Tanjung Priok Port”.

Table 1-1-5 “Outline of Soil Condition at Boring No. OSB-1, Tanjung Priok Port”

Elevation from LWS	Layer Thickness	Description of Soil	N-Value	Characteristic
-2.40 ~ -11.4 m	9.0 m	Clay and shell fragment	1 ~ 4	Soft
-11.4 ~ -16.4 m	5.0 m	Silty sand	6 ~ 9	Soft
-16.4 ~ -18.4 m	2.0 m	Gravelly sand	> 60	Hard
-18.4 ~ -24.4 m	6.0 m	Sandy clay	26 ~ 60	Medium to hard
-24.4 ~ -32.4 m	8.0 m	Sand	44 ~ > 60	Hard

Table 1-1-6 “Outline of Soil Condition at Boring No. OSB-2, Tanjung Priok Port”

Elevation from LWS	Layer Thickness	Description of Soil	N-Value	Characteristic
-2.50 ~ -13.5 m	11.0 m	Clay and shell fragment	1 ~ 4	Soft
-13.5 ~ -22.0 m	8.5 m	Silty clay	60	Hard
-22.0 ~ -27.0 m	5.0 m	Sandy clay	48 ~ 60	Hard
-27.0 ~ -32.5 m	5.5 m	Clay	51 ~ 60	Hard

Table 1-1-7 “Outline of Soil Condition at Boring No. OSB-3, Tanjung Priok Port”

Elevation from LWS	Layer Thickness	Description of Soil	N-Value	Characteristic
-3.4 ~ -12.4 m	9.0 m	Clay and shell fragment	1 ~ 2	Soft
-12.4 ~ -19.9 m	7.5 m	Silty clay	4 ~ 60	Soft to Hard
-19.9 ~ -25.9 m	6.0 m	Sandy clay	45 ~ 60	Hard
-25.9 ~ -33.4 m	7.5 m	Clay	32 ~ 54	Hard

---

The soil condition at west development area is summarized as follow.

- 1) The soil conditions can be divided into three layers in boring depth.
- 2) The first layer consists of clay layer in the depth range from the seabed to nearly -11 m, eventually with shell fragments. This clay layer is very soft and the N-value is found in a range of 1 to 4.
- 3) The second layer is a silty clay layer in the depth range from -11 m to -19 m and the N-value varies from 4 to 60.
- 4) The third layer is a sand layer or a sandy clay layer in the depth range from -19 m to -30 m and it can be used as a foundation layer having the N-value of 40 to more than 60.

The results of soil laboratory test are simply shown in Table 1-1-8 "Summary of Soil Laboratory Test at Boring No. OSB-1, Tanjung Priok Port", Table 1-1-9 "Summary of Soil Laboratory Test at Boring No. OSB-2, Tanjung Priok Port" and Table 1-1-10 "Summary of Soil Laboratory Test at Boring No. OSB-3, Tanjung Priok Port".

## 1.2 Topography

Tanjung Priok Port is located along the coastline in the northeastern direction from the center of Jakarta City. The surrounding area of Tanjung Priok Port is flat with the elevation of approximately 2 m (MSL), and the coastline runs nearly in the east-west direction and varies in the northeast to southwest direction at the west end of Tanjung Priok Port.

Many rivers and drain channels run in the south-north direction through the flat terrain surrounding the Tanjung Priok Port. The following three rivers or drain channels flow into the waters of Tanjung Priok Port:

- 1) Kali Sunter Baru flowing into Pertamina Berth at Tanjung Priok Port
- 2) Terusan Lagoa flowing into the front water area of Koja Terminal at Tanjung Priok Port
- 3) Kali Ancor flowing into Pelabuhan Nusantara on the west side of Tanjung Priok Port

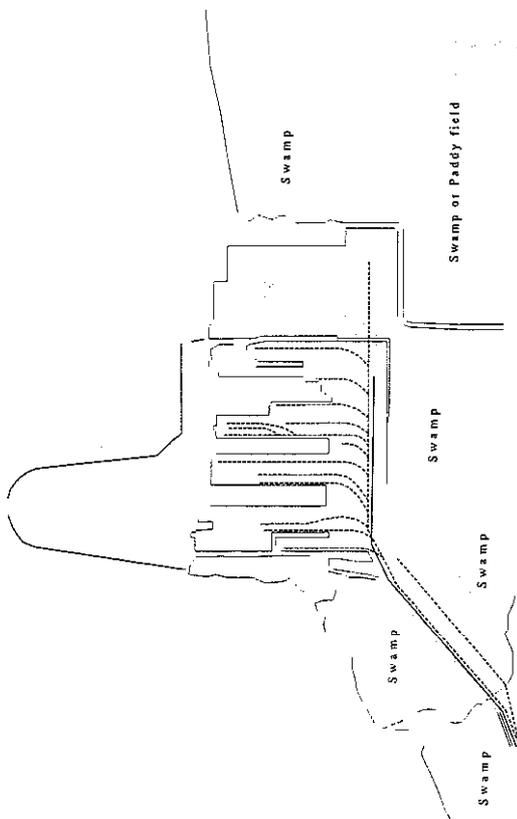

Figure 1-2-1 “Terusan Lagoa”

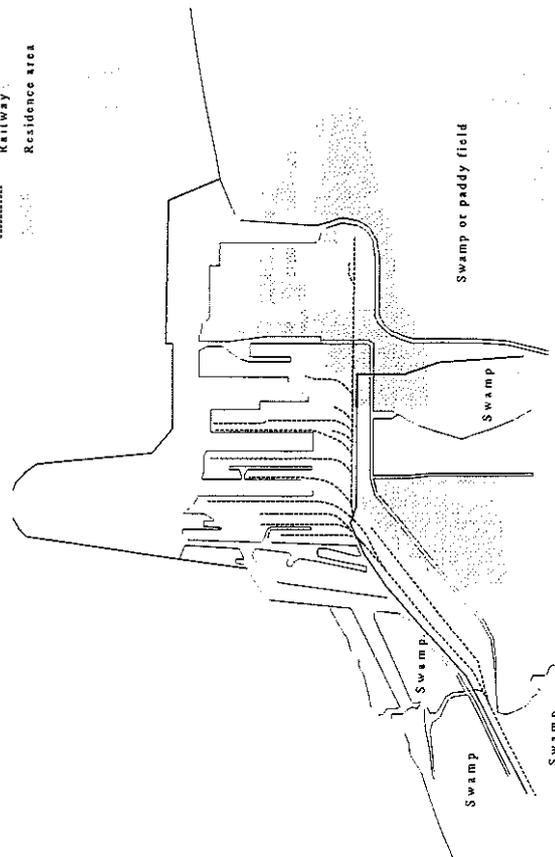

Figure 1-2-2 “Kali Sunter Baru”

The first port facilities at Tanjung Priok Port were constructed at the end of the 19th Century and the said Port was constructed in the suburbs of Batavia City, surrounded only by paddy fields and swampy areas as seen from the topographic map produced in the 1930's.

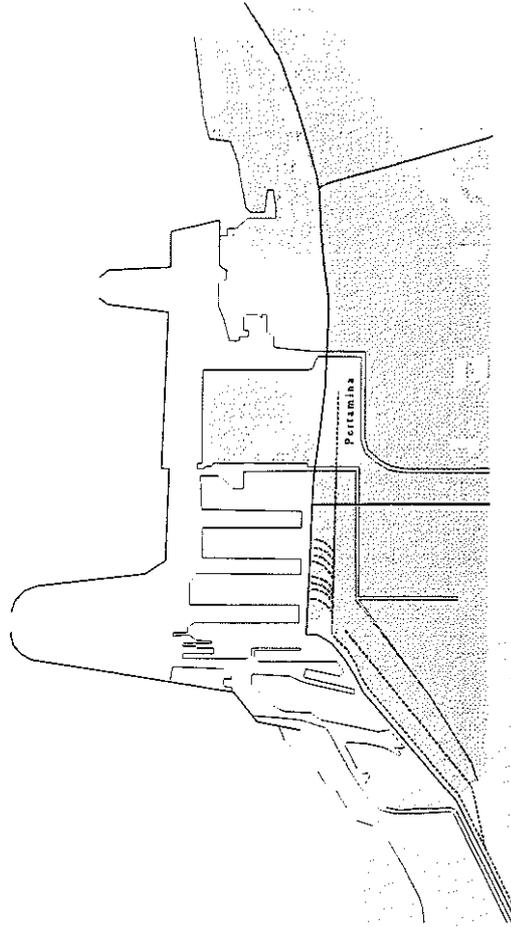

In the 1950's, villages began appearing in the surrounding area of Tanjung Priok Port, which has been rapidly urbanized in the 1980's. The situation with many villages and factories built around the Tanjung Priok Port is seen in Figure 1-2-3 “History of Tanjung Priok Port” that was prepared based on the topographic map produced in the same years.

Figure 1-2-3 "History of Tanjung Priok Port

### **1.3 Seabed Depth Condition**

Tanjung Priok Port locates almost at the center of coastal line of Jakarta Bay. The coastal line runs nearly in the east-west direction and varies in the northeast to southwest direction at the west end of Tanjung Priok Port.

The seabed of Tanjung Priok Port forms a gentle slope that extends gradually deeper to offshore and the depth contour lines run nearly in parallel with the coastline.

According to the sounding survey at the east channel, the seabed is inclined at about 1/400 to 1/500 and the water depth increases in parallel with the coastline.

At the west end of Tanjung Priok Port, the depth contour lines vary from the east to west direction to the northeast to southwest direction as the coastline varies from the east to west direction to the northeast to southwest direction.

#### **1.4 Climate**

The region covering the study area has a tropical monsoon climate. Temperature (23°C ~ 33°C) and humidity (23°C ~ 33°C) are high with small seasonal variation.

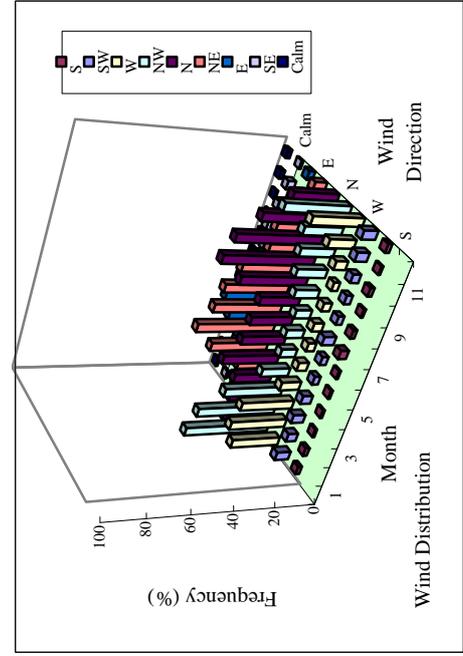

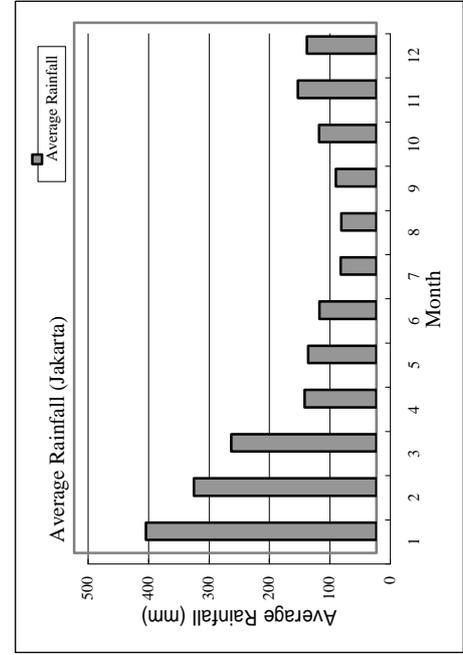

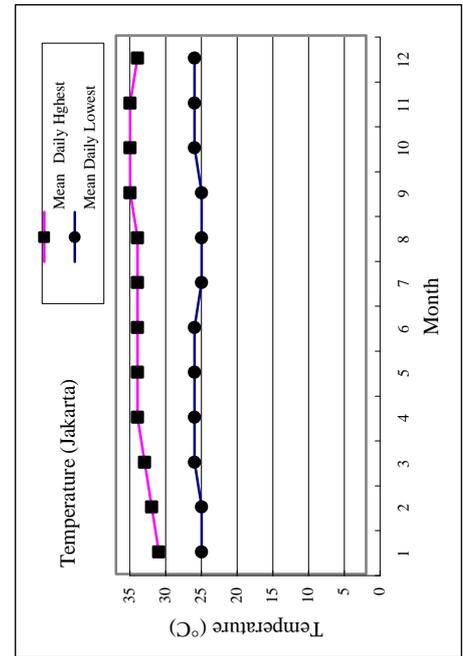

Rainfall is high with a yearly total of about 1,800 mm. In the rainy season, from November to March, it has about four to five times as much rain as the dry season, from June to September.

Winds are frequently light to moderate through the year although strong winds are blowing more likely during the rainy season between November to March. Gale force winds are rare.

Figure 1-4-1 “Climate of West Jawa Region (Jakarta) compiled from Observation (1936 – 1994)” shows the outline of climate at Jakarta from the existing meteorology data open to public use.

### 1.5 Tide

Tide forms and the principal harmonic components of the tide at Tanjung Priok Port which is opened to the public by Ddinas Hidro-Oceanografi are as follows. Tide is of diurnal type at Tanjung Priok Port.

Table 1-5-1 “Tide and Principal Harmonic Components, Tanjung Priok Port”

Components	M <sub>2</sub>	S <sub>2</sub>	N <sub>2</sub>	K <sub>2</sub>	K <sub>1</sub>	O <sub>1</sub>	P <sub>1</sub>	M <sub>4</sub>	MS <sub>4</sub>	Z <sub>0</sub>
Amplitude (cm)	5	5			25	13	8			60

Source: Tide Tables 2002, Dinas Hidro-Oceanografi

Ratio of principal harmonic constants

$$(K_1 + O_1) / (M_2 + S_2) = 3.80 \quad \text{Diurnal type}$$

Table 1-5-2 “Four Principal Harmonic Components

Component	Name	Period (Hours)
M <sub>2</sub>	Principal Semidiurnal Lunar	12.42
S <sub>2</sub>	Principal Semidiurnal Solar	12
K <sub>1</sub>	Principal Diurnal Luni-Solar	23.93
O <sub>1</sub>	Principal Diurnal Lunar	25.82

Table 1-5-3 “Ratio of Principal Harmonic Constants: (K<sub>1</sub>+O<sub>1</sub>)/(M<sub>2</sub>+S<sub>2</sub>)

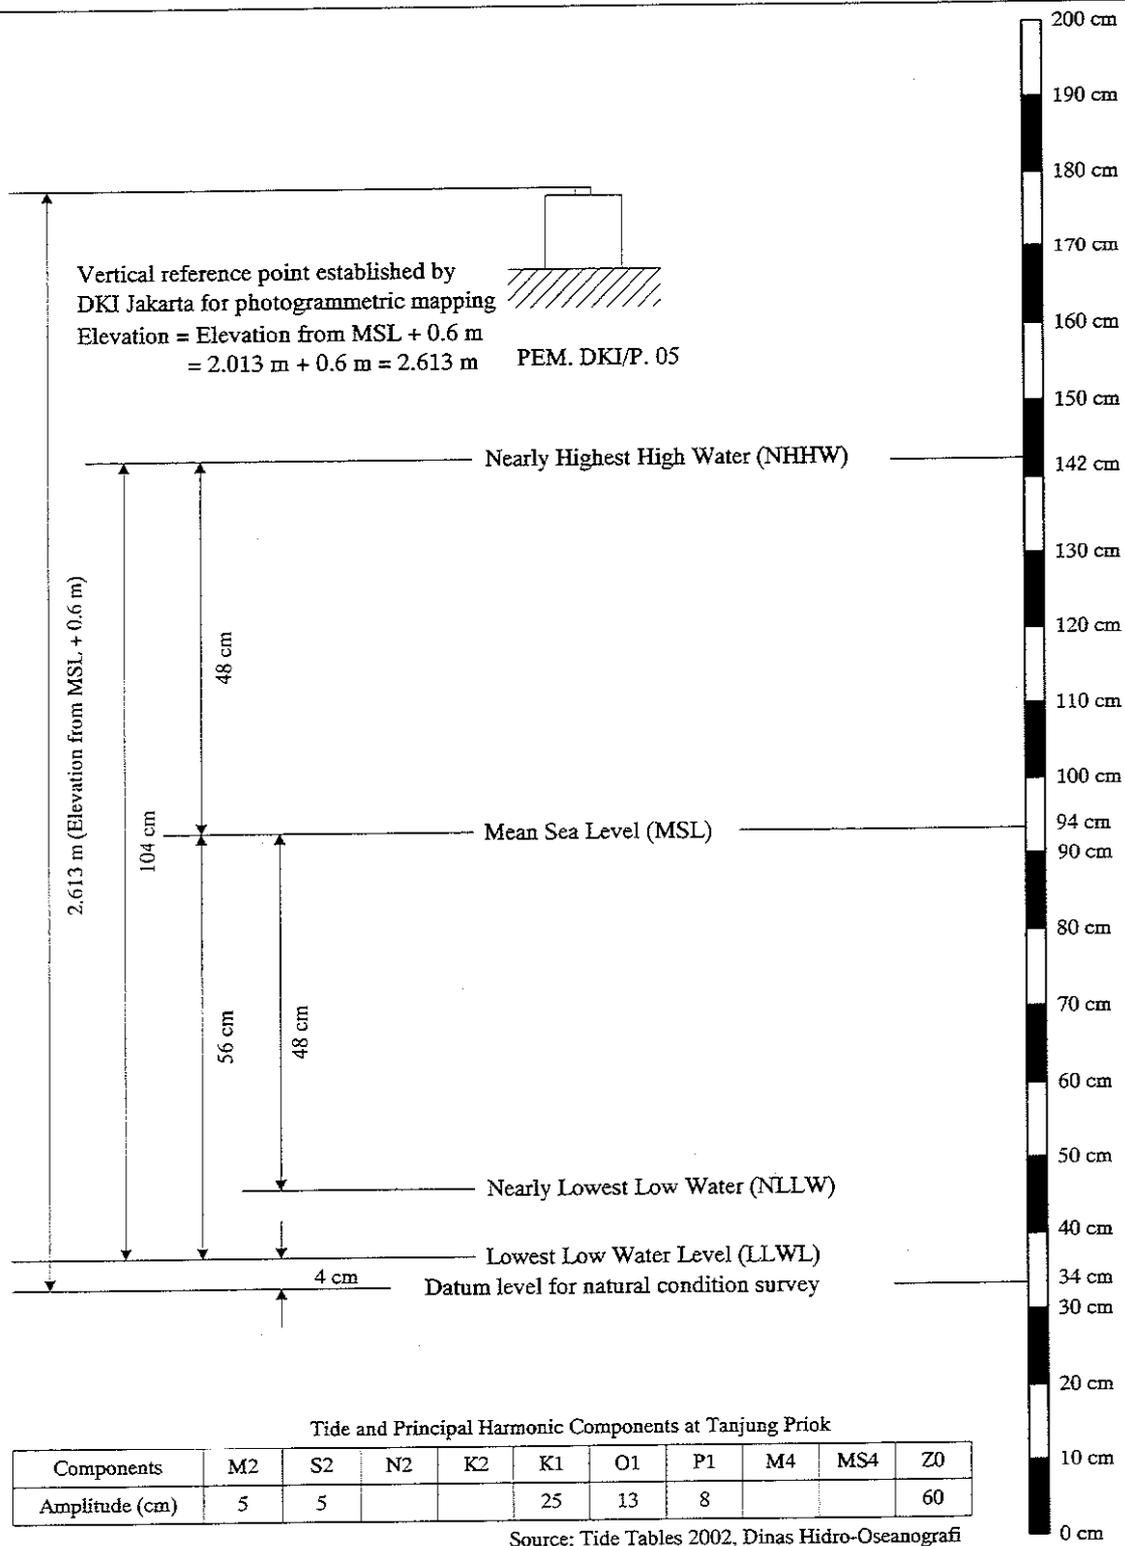

Ratios	Type	Description
0 to 0.25	Semidiurnal	Two highs and two lows of almost equal elevation each day.
0.25 to 1.5	Mixed, dominant semidiurnal	Two highs and two lows each day, but of unequal elevation and time of high water.
1.5 to 3.0	Mixed, dominant diurnal	Usually one high and one low each day. Time of high water varies.
3.0 and higher	Diurnal	One high and one low each day.

Source: The Ecology of the Indonesia Seas, Part One; Periplus Editions 1997

Also, tidal range is described as follows (source: Didnas Hidro-Oceanografi).

HHWL (highest High Water Level):	+105.15 cm
MHWS (Mean High Water Spring):	+90.64 cm
MSL (Mean Sea Level):	+47.55 cm
MLWS (Mean Low Water Spring):	+8.59 cm
DL (Datum Level = LLWL: Lowest Low Water Level)	0.0 cm

The relation between tidal range, bench mark which was used for 1:10,000 scale digital topographic mapping and tide pole owned by IPC-2 is shown in Figure 1-5-1 “Relation between Vertical Reference Points for Natural Condition Survey and Tide, Tanjung Priok Port”.

Tide pole owned by IPC-2

$$\text{Lowest Low Water Level} \cong (M2 + S2 + N2 + K2 + K1 + O1 + P1 + M4 + MS4) \text{ below MSL}$$

$$\cong 5 + 5 + 25 + 13 + 8 \cong 56 \text{ cm below MSL}$$

$$\text{Nearly Lowest Low Water} = (M2 + S2 + K1 + O1) \text{ below MSL}$$

$$= 5 + 5 + 25 + 13 = 48 \text{ cm below MSL}$$

$$\text{Nearly Highest High Water} = (M2 + S2 + K1 + O1) \text{ above MSL}$$

$$= 5 + 5 + 25 + 13 = 48 \text{ cm above MSL}$$

Figure 1-5-1 "Relation between Vertical Reference Points for Natural Condition Survey and Tide, Tanjung Priok Port"

### **1.6 Wave**

No observed wave data along the north coast of West Java are available to the public. Wave condition is analyzed based on wave hindcast in Jawa Sea by 5-year wind data at the Chengkareng meteorological station (Soekarno-Hatta Airport, 1997 – 2001).

Wave frequency at offshore Tanjung Priok Port by the wave hindcast is shown in Table 1-6-1 “Wave Characteristics off-Tanjung Priok Port by Wave Hindcast (1997 – 2001).

Wave condition is generally calm in the western portion of Jawa Sea and the cumulative frequency of wave height of less than 0.5 m is about 87 %.

Westerly incident waves are most frequent in the table with about 11 % frequency due to the wind of northwest monsoon and transitional seasons. N ~ NNE ~ NE incident waves area also frequent, accounting for about 10 % of the frequency.

### **1.7 Surface Current and Tidal Stream**

In the open sea, the direction of the predominant surface current generally sets in the same direction to which the monsoon wind is blowing.

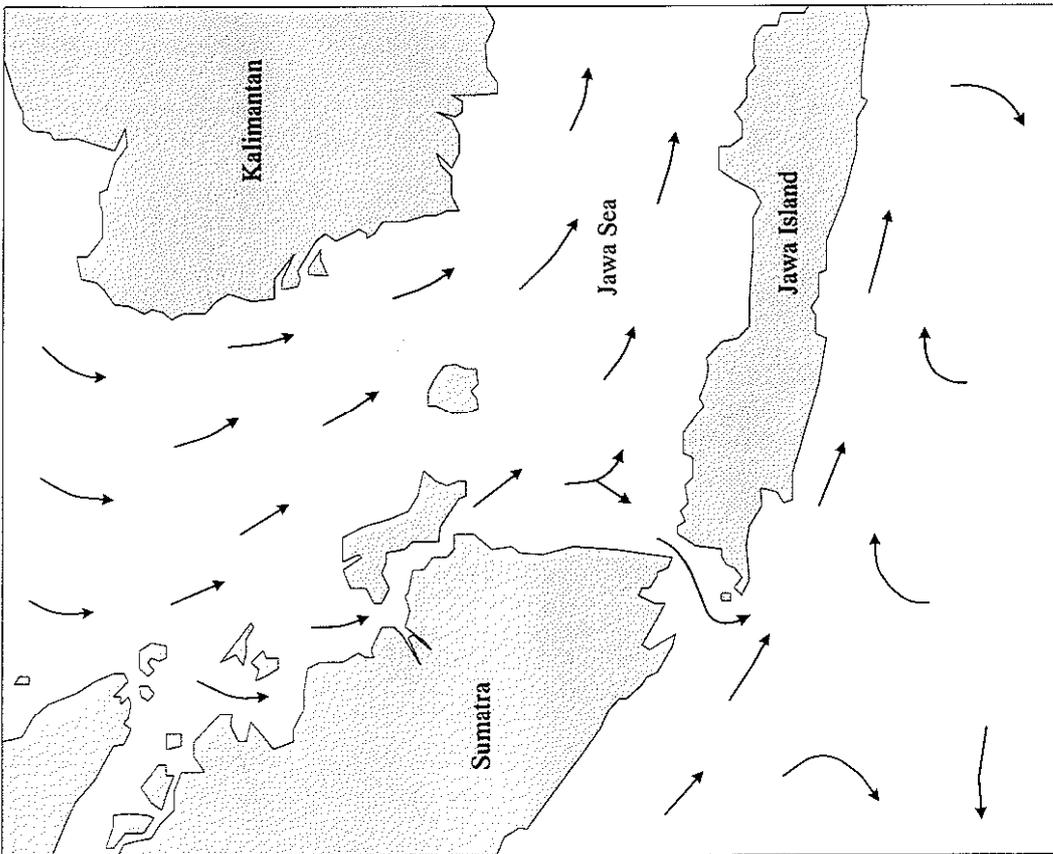

Figure 1-7-1 “Predominant Surface Current of Sea Around West Jawa” shows the predominant surface current of SE monsoon season (May to September) and NW monsoon season (November to March) at Westa Jawa Area.

From November to March the current set ESE in Jawa Sea with an average rate of 0.75 – 1.25 knots (0.4 – 0.6 m/sec). Between May and September the direction of the current is reversed with a WNW set in Jawa Sea with an average of about 0.75 knots. Maximum rates are usually less than 2 knots (1 m/sec).

Tidal streams are generally weak in the open sea, in general, negligible compared with the seasonal currents driven by the monsoon winds.

May to September (SE monsoon)

November to March (NW monsoon)

Figure 1-7-1 "Predominant Surface Current of Sea around West Jawa"

### 1.8 Maintenance Dredging

Maintenance dredging at channels and basins at Tanjung Priok Port has been executed regularly and maintained at -14 m depth at major channels and basins of Tanjung Priok Port.

The summary of maintenance dredging in the channels and basins of Tanjung Priok Port is shown in Table 1-8-1 “Summary of Maintenance Dredging Volume in Channel and Basin at Tanjung Priok Port”

The annual volumes of maintenance dredging are about 400,000 m<sup>3</sup>/year in the navigation channels and basins. Figure 1-8-1 “Annual Maintenance Dredging Volume at Major Channel and Basin, Tanjung Priok Port” gives the average dredging volume per year at major navigation channels and basins at Tanjung Priok Port.

From the eastern innermost of the port (DKP) to the western entrance (DKP s/d Pintu Masuk Barat; depth: -14 m, length: 5,530 m) shows the largest maintenance dredging volume and the average volume is about 140,000 m<sup>3</sup>/year.

The channel section adjacent to the Pertamina oil berth (Pelabuhan Minyak; depth: -12 m, length: 1,145 m) also shows a large maintenance dredging volume with an average of more than 110,000 m<sup>3</sup>/year.

As for the access channel outside the western entrance (Pintu Masuk Barat s/d Ambang Luar; depth: -14 m, length: 1,925 m), the average volume of maintenance dredging is about 60,000 m<sup>3</sup>/year.

Meanwhile, for the channel inside and outside the eastern entrance, no maintenance dredging has been executed in the last 10 years. This section of the channel is neither maintained nor used by any outgoing or entering major vessels except some small ships.

The maintenance dredging volume at basin shows a small volume. The maintenance dredging at some basin such as Kolam Pelabuhan I, Dermaga Syabandar, has not been executed in the last 11 years.

### 1.9 Estimation of Seabed Variation

The sounding survey using echo sounder for navigation channels and basins has been executed several times per year by IPC-2. These existing sounding data are very useful to study the seabed variation at the access and inner channels and basins of Tanjung Priok Port.

The date of sounding survey at each location is mentioned in Table 1-1-2 “List of Existing Sounding Map, Tanjung Priok Port” and the location of sounding area is shown in Figure 1-1-2 “Existing Sounding Map, Tanjung Priok Port”

Using these existing sounding data, the cross sections and longitudinal profiles are prepared and the water depth at the same location of longitudinal profiles was compared to estimate the seabed variation.

The estimated yearly seabed variations at the access and inner channels and basins of Tanjung Priok Port are shown in Figure 1-9-1 “Estimation of Yearly Seabed Variation at Tanjung Priok Port”. The details of the estimation are also shown in Table 1-9-1 “Estimation of Yearly Seabed Variation at Tanjung Priok Port”.

The following features could be thus verified.

- 1) In the wet access channel to the Tanjung Priok Port (Ambang Luar), the seabed had risen for about +0.5 m per year at the channel center. The value of seabed rise becomes small with respect to the distance from the entrance of breakwater.
- 2) In east access channel to the Tanjung Priok Port (Lampu Merah Hijau), the seabed risen for about +0.6 m per year at the channel center. The value of seabed rise becomes small with respect to the distance from the entrance of breakwater.
- 3) The outlet of Kali Sunterbaru at Pelabuhan Minyak shows the highest value of seabed rise. The seabed rise at the outlet of Kali Sunterbaru (drainage channel) is estimated at about +7.0 m per year and about +2.0 m per year at the middle of Pertamina berth.
- 4) The area in front of the outlet of Terusan Lagoa (drainage channel) (Depan DKP) also shows a high value of seabed rise of +1.05 m per year. However, the seabed rise in the area within 100 m from the outlet of Terusan Lagoa shows a higher value of +3 ~ +4 m per year.
- 5) The outlet of Kali Japat shows a relatively small seabed variation of +0.4 m if compared with the outlets of Kali Sunterbaru and Terusan Lagoa.
- 6) The seabed rise at the Kolam Pelabuhan I, II and III is very small and estimated at less than +10 cm per year.
- 7) In general, the seabed rise at the area within breakwater is higher than in the outside area of the breakwater.

The tidal stream within the breakwater is considered very weak, due to the existing breakwater of Tanjung Priok Port. Therefore, the main reason of the seabed rise within breakwater is due to materials that are flown from the drainage channels such as Kali Sunterbaru, Terusan Lagoa and Kali Japat, into the inside of breakwater of Tanjung Priok Port.

Figure 1-9-2 shows the longitudinal profile at the channel center of Pelabuhan Minyak and Figure 1-9-3 shows the seabed variation at the channel center of Pelabuhan Minyak.

This figure shows that the seabed variation curves between December 2000 and March 2001, and between August 2001 and March 2002 are almost identical. Also, the annual maintenance dredging volume at Pelabuhan Minyak (Tahap I) remains constant at about 100,000 ~ 110,000 m<sup>3</sup>/year.

Thus, the total volume of sedimentation within the breakwater may not increase to that extent, even if the seabed depth becomes deeper from -14 m to -15 m.
