PART I

PRE-FEASIBILITY STUDY FOR PRIORITIZATION OF IRRIGATION SCHEMES

CHAPTER 1 STUDY AREA

1.1 General

North Sumatra Province with a land area of $71,680 \text{ km}^2$ is administratively composed of 14 districts, 6 municipalities, 269 sub-districts and 5,333 villages. The number of districts covered by the target irrigation schemes (the project districts) is 13. Some administrative, demographic and socio-economic features of the province and project districts are presented in Table A-1.1.1 and as follows;

Division	Land Area (km ²)	No. of Districts	No. of Sub-districts	Population (1,000)	Household (1,000)
Province	71,680	13	269	11,722	2,756
Project Districts	71,155	13	226	8,977	2,122

Administrative, Demographic and Socio-economic Features in 2001

Source: Statistic data of BPS, North Sumatra

The main economic activity of the province and the project districts is an agriculture sector accounting respectively for 31 % and 45 % of the total GRDP. In the agriculture sector, the food crops agriculture is a leading sub-sector accounting for 39 % of the sector GRDP followed by the estate crops sub-sector in the province. The provincial per capita GRDP in 2000 is estimated at Rp. 5.9 million.

1.2 Conditions of Paddy Fields and Irrigation Systems

The table below shows the area and percentage of irrigated and rainfed paddy fields to the total paddy fields of North Sumatra Province in comparison with those of the whole country:

Condition of Paddy Field	North Sumatra Province		Whole Country	
Condition of Faddy Freid	Area (ha)	Ratio (%)	Area (ha)	Ratio (%)
Irrigated Paddy Field	285,700	57.4	4,868,800	62.5
Rainfed Paddy Field	212,300	42.6	2,918,600	37.5
Total	498,000	100	7,787,400	100

Classification of Paddy Fields

Source: Laporan Tahunan 2001, Dinas Pertanian Tanaman Pangan Sumatera Utara.

In the case of the whole country, the areas of each type of paddy field exclude those of Maluku and Irian Jaya.

It is seen from the above table that the percentage of irrigated paddy fields in North Sumatra Province is 57.4, while that of the whole country is 62.5. That fact indicates that the percentage of irrigated paddy fields in North Sumatra Province is much lower than that of the whole country. The table below shows the area and percentage of the respective categories in North Sumatra Province in comparison with those of the whole country based on the above classification:

Tashnisal Laval	North Sumatra Province		Whole Country	
	Area (ha)	Ratio (%)	Area (ha)	Ratio (%)
Technical Systems	71,600	25.0	2,214,300	45.5
Semi-technical Systems	72,300	25.3	979,200	20.1
Simple Systems	141,800	49.7	1,675,300	34.4
Total	285,700	100	4,868,800	100

Classification of Categories of Irrigation Systems depending on Technical Level

Source: Laporan Tahunan 2001, Dinas Pertanian Tanaman Pangan Sumatera Utara.

In the case of the whole country, the areas of Maluku and Irian Jaya are excluded from those of the respective systems.

It is seen from the above table that the percentage of technical systems in North Sumatra Province is 25.0, while that of the whole country is 45.5. On the other hand, the percentage of simple systems in North Sumatra is 49.7, while that of the whole country is 34.4. Those facts indicate that the technical level of irrigation systems in North Sumatra is much lower than that of the whole country.

1.3 Technical Level of Irrigation System

In North Sumatra, there are 770 government-developed irrigation schemes having potential areas of 299,521 ha. These schemes comprise 172 technical irrigation schemes with potential irrigation areas of 130,135 ha, 398 semi-technical irrigation schemes with potential areas of 121,421 ha and 200 simple irrigation schemes with potential of 47,965 ha as shown in Table A-1.3.1. Regarding the size of irrigation schemes, 635 schemes are less than 500 ha covering 40% of the total potential irrigation areas, while 76 schemes range from 500 ha to 1,000 ha and 59 schemes are more than 1,000 ha as shown in Table A-1.3.2.

In addition, another 276 village irrigation schemes have been developed by communities with the total potential area of 27,151 ha and average size of 98 ha.

1.4 Agricultural and Agro-economic Situations

The agricultural and agro-economic situations in the province and project districts relating to agro-demography, land holding & tenure, land use, food crops agriculture, agricultural institutions and support services is presented in Table A-1.4.1 and summarized in the followings:

1.4.1 Agro-demography and Land Holding & Tenure

The agro-demographic features of the province and project districts are estimated based on the Agriculture Census 1993 by BPS (*Badan Pusat Statistik*, Central Statistic Agency) as presented in Table A-1.4.1 and shown in the following table:

Agro-demographic Indicators	Range among Project Districts (%)	Province (%)
Proportion of Farm Households to Total Households	50-92	52
Proportion of Farm Households Having Activity in:		
- Food Crops Farming	66-97	81
- Horticulture Crops Farming	8-50	21
- Estate Crops Production	16-75	37
- Livestock	8-50	22

Agro-demographic Features of Province in 1993

On the basis of the census results, the number of farm households of the province in 2001 is estimated at some 1,433,000 or accounting for 52% of the total households of about 2,756,000. The primary farming activity of the farm households in the province is food crops production followed by estate crops production. Food crops farmers are about 81% of the total farmers.

The current land holding status in the province and project districts has been roughly estimated based on the number of farm households and the present agricultural land use as shown in Table A-1.4.1 and summarized below:

Indicators	Range among Project Districts	Province
Average Farm Land Holding Size/Farm Household	$0.62 \sim 1.68$ ha	1.00 ha
Average Holding Size of Paddy Field/Farm Household	$0.17{\sim}0.60$ ha	0.35 ha
Distribution of Farm Household by Holding Size		
- < 0.5 ha	15~54 %	41 %
- ≥ 0.5 ha	46~85 %	59 %

Roughly Estimated Land Holding Status in Province

Source: Agricultural Census, 1993, BPS

1.4.2 Agricultural Land Use

Range among

The present agricultural land use of the province and project districts has been studied based on the statistic data reported by the BPS province as shown in Table A-1.4.2. The largest farm land category in the province and the project districts is estate crops land occupying about 56 or 57% of the total farm land, followed by paddy field accounting for 15% as summarized below:

Present Agricultural Land Use in the Province in 2001

Land Liza Catagomy	Province		Project Districts	
Land Use Category	Area (ha) *1	Ratio (%)	Area (ha) *1	Ratio (%)
Paddy Field	498,000	15	487,700	15
Home Garden	280,900	9	262,400	8
Dry Land/Garden	430,500	13	423,800	13
Upland Field	231,400	7	228,300	7
Estate Crops Land *2	1,802,200	56	1,799,700	57
Total Farm Land	3,243,000	100	3,201,900	100

Note: *1. Rounded figures, *2. Estate operated by public or private firms

Source: Laporan Tahunan 2001, Dinas Pertanian Tanaman Pangan Sumatera Utara

1.4.3 Food Crops Agriculture

Paddy production is by far the most important farming activity in the food crops agriculture sub-sector both in the province and the project districts, representing 71% of the total harvested area with food crops (not including vegetables) in 2001 as shown in Table A-1.4.3 and summarized below:

Maize (%) Beans *1 (%) Tubers *2 (%) Total (%) Province Paddy (%) Province 71 20 4 100 5 71 20 4 5 100 **Project Districts**

Harvested Area of Food Crops by Proportion in 2001 in Province & Project Districts

Note: *1 Include soybeans, mungbeans & groundnut, *2 Include cassava & sweat potatoes Source: Laporan Tahunan 2001, Dinas Pertanian Tanaman Pangan Sumatera Utara

The second most important food crop in terms of harvested area in the province and project districts is maize accounting for 20% of the total harvested area, followed by tuber crops.

The production of food crops in 2001 in the province and project districts is shown in Table A-1.4.3 and summarized below:

Production of Food Crops in 2001 in Province & Project Districts (unit: 1,000ton)

Province	Paddy	Maize	Beans ^{*1}	Tubers ^{*2}
Province	3,111	634	42	626
Project Districts	3,046	630	41	610
	1 0	1	1 1	0

Note: *1. Includes soybeans, mungbeans & groundnut, *2. Includes cassava & sweat potatoes Source: Laporan Tahunan 2001, Dinas Pertanian Tanaman Pangan Sumatera Utara

1.4.4 Agricultural Institutions and Extension

The current status of agricultural institutions and extension in the province is discussed in the following section.

(1) Agricultural Institutions

The government agricultural support institutions of in the province include the Agriculture Services Office, Estate Crops Services Office, Livestock Services Office and Food Security Agency. The Agriculture Services Office is composed of five sub-services and Technical Implementation Units (*Unit Pelaksana Teknis Daerah*/UPTD) as shown in Figure A-1.4.1. The agricultural institutions in the province and project districts are shown in Table A-1.4.4.

The government agricultural support institutional set-up at district level is not consistent with the provincial set-up and there are differences among the districts concerned. The district institutions are placed under the jurisdiction of the district governor, although the technical guidance and support linkages with the central and provincial agencies are still maintained. Differences in organization set-up between central/province agencies and district agencies present constraints for maintaining coordination and technical support or guidance linkages between province and district and for coordination activities among districts. The formation of a certain task force team among province and districts will be essential to perform well-coordinated agriculture development activities.

A number of farmers' organizations involved in agricultural activities have been formed in the province. Among these, a major one is the Farmers' Group (*Kelompok Tani*/KT). A number of KTs formed in the province and their development status assessed by district agricultural agencies is shown by district in Table A-1.4.4. In the province, 39% of KTs are classified as primary level (pemula), 35% as secondary level (lanjut), 21% as middle level (madya) and 5% as advance level (maju).

There are 563 Village Unit Cooperatives (*Koperasi Unit Desa*/KUD) in the province with varying activities from dormant status to actively operated status. General problems encountered by KUD are reported to be: (i) cooperative funds still limited, (ii) management capability still poor and (iii) awareness of members on cooperative activities, member's right & responsibility, and implementation of the cooperative principle still limited.

(2) Agricultural Extension

One of the main features of the decentralization policy in the agriculture sector is the devolution of agricultural extension activities to the district government. Therefore, the functions of the provincial extension agencies have faded away and their current main functions are to provide technical guidance and support to district agencies. The arrangements for institutions for the agricultural extension services are not uniform in the project districts.

The extension services to farmers in Indonesia are basically provided by Field Extension Workers (*Penyuluhan Pertanian Lapangan*/PPL) of district agricultural agencies, who are to guide and serve to farmers through farmers' groups in their working area. PPLs are deployed by sub-district basis to Rural Extension Centers (*Balai Penyuluhan Pertanian*/BPP).

The number of BPPs and food crops extension staffs (PPLs) deployed in the province and the project districts in 2002 are shown in Table A-1.4.4. The number of BPPs and PPLs in the province is 172 and 1,363, respectively.

The weaknesses or problems involved in the current extension services are:

- Limitation of funds for implementation of extension activities, insufficient number of extension staffs and; capabilities of extension

staffs especially on post-harvest and marketing issues, which are still limited, and

- Coordination & collaboration of extension agencies under different jurisdictions yet to be established to introduce holistic approaches for extension.

1.4.5 Farm Machinery and Post-harvest Facilities

The numbers of farm machinery including tractor, water pump, thresher, paddy dryer etc. and rice mills possessed in the project districts are shown in Table A-1.4.5. The availability of hand tractors are quite in shortage when land preparation works of all the paddy fields in the districts are to be carried out by machinery. The results of the Inventory Survey indicate sufficiency of rice mills in most of the target schemes.

1.4.6 Non-food Crops Agriculture

The primary non-food crops agriculture in the province is an estate crops sub-sector operated both by public & private estates and smallholders. Major estate crops include rubber, oil palm and coffee. Statistics figures for non-food crops agriculture are shown in Table A-1.4.6.

1.5 Institution

Based on Regional Regulation No.3/2001, the North Sumatra Provincial Water Resources Service Office (PWRS, *Dinas PU Propinsi Pengairan*) was reorganized. Under the Head of PWRS, four Sub-divisions are set up to handle technical matters and a further seven Technical Implementation Units (UPTs) / Bureau for Water Resources Management (*Balai* PSDA, *Balai Pengelolaan Sumber Daya Air*) are directly controlled as illustrated in Figure A-1.5.1. The functions of UPT/PSDA are to implement: (i) operational services to the community, (ii) water resources conservation activities, and (iii) technical/administrative aspects related to such services and activities.

In North Sumatra, each DWRS organization establishes its branch offices in order to provide supporting services to the existing Water Users' Association (WUA) and encourage water users to establish new WUA and/or to activate previously established WUA. The current fulfillment rate of staff allocated to the whole DWRS is 50% as shown in Table A-1.5.1.

With respect to irrigation water users, there are 1,359 WUA already established throughout the existing irrigation schemes. Compared with 2,251 WUA as the target for establishment in North Sumatra, about 60 % have been realized as

shown in Table A-1.5.2. In the case of technical irrigation scheme areas, the rate of establishment has reached 74%.

Because of time-consuming procedures, only 163 WUA or 12% have legitimate status through registration in local courts of justice. Either registered or yet to be registered, 100 WUA are recognized as well developed with good performance on physical, administrative and financial aspects related to operation and maintenance works. However, 689 units are under development in terms of setting-up internal administration and physical aspects of irrigation water management as well as facility operation and maintenance at on-farm level, legal registration, and so on. The remaining 570 WUA have not been developed yet. Table A-1.5.3 shows the present condition of WUA performance and status by District in North Sumatra as of April 1999.

1.6 Financial Condition of District/Municipal Governments

In Table A-1.6.1, financial condition of the respective District and Municipal Governments in North Sumatra is summarized by using such indicators as per capita income and revenue for 2001 as well as actual receipts and expenditures for 2000. As for the latter indicator, some of financial reports for 2001 are still under internal auditing by officials concerned so that data for 2000 are referred to. In the course of transition period for synchronizing fiscal year with calendar year by the Government, the actual receipts and expenditures for 2000 were born during the 9-month period from April 1 to December 31, 2000.

The consolidated per capita provincial revenue for 2001 comprised Rp.64,442 for own fiscal capacity consisting of own source revenue, non-tax from natural resources and share taxes and Rp.298,978 for general allocation fund (DAU) plus contingency. Among 13 Districts and 6 Municipalities, the own fiscal capacity on per capita basis of 5 Municipalities is over the consolidated provincial level, while the per capita general allocation fund of 8 Districts and 5 Municipalities exceeds over the consolidated provincial level.

CHAPTER 2 SELECTION OF IRRIGATION SCHEMES

2.1 Database of Irrigation Schemes prepared by MOSRI

2.1.1 Verification of MOSRI's Database (WRDC)

The Ministry of Settlement and Regional Infrastructure prepared a database for water resources and irrigation systems called "WRDC", which consists of the following components:

- (a) Database for irrigation schemes, crop yield and water users' associations,
- (b) Location map of irrigation schemes, and
- (c) Irrigation diagrams for irrigation schemes.

The WRDC was established in the year 2001. However, the autonomy, accountability and responsibility for operation and maintenance are still unclear according to information from the Directorate of Technical Guidance, MOSRI.

The status of the WRDC is as follows:

- (a) System operation commenced in 2001.
- (b) The number of columns (information to be filled out) is 306 in total.
- (c) The WRDC is composed of administrative division such as Province, District and Sub-district.
- (d) The WRDC is still under preparation and the only information available is the area registered (potential area and non-potential area). Other information such as i) kind of water resources structure/intake, ii) length of canal, and iii) kind and number of related structures have not been input yet.

As a result, it is necessary to collect most of the data from each province and from field investigations, which have been executed on a sub-contract basis.

2.1.2 Contents of the List of Irrigation Schemes

The following basic information is shown in the list, which is provided by the central office of MOSRI and provincial offices:

- (a) Registration Code Number
- (b) Name of irrigation scheme
- (c) Location of irrigation scheme (province, district, sub-district)
- (d) Technical level of irrigation scheme
- (e) Area (potential and non-potential area)

2.2 Criteria for Selection of Irrigation Schemes

The Inception Meetings were held between the Water Resources Management Services Office (Dinas PSDA) of North Sumatra province and the Study Team in the initial stage of field investigation. In the meeting, the irrigation schemes to be studied were examined and determined based on the following criteria:

- (a) The Study area shall be determined based on the original list presented in the Scope of Work (S/W),
- (b) The irrigation schemes with the conditions stated below shall be excluded from the original list:
 - The schemes which have been recently completed and are functioning appropriately,
 - The schemes for which implementation has been pledged by the Government and/or international donors,
 - The schemes for which potential is too low (less than 1,000 ha), even though they are included in the original list.
- (c) The irrigation schemes that need urgent rehabilitation, have been added to the list in addition to the original schemes presented in the Scope of Work (S/W).

2.3 Definitions

2.3.1 Definition of Land Use and Irrigation Area

The Irrigation Area for the Study is determined by the following formula:

Irrigation Area = (potential area for irrigation + non-potential area for irrigation) - (other land use in potential area + other land use in non-potential area)

2.3.2 Definition of Technical Level of Irrigation System

According to the Indonesian standards for irrigation system design, the irrigation area is classified into three categories, depending on their technical levels, namely technical systems, semi-technical systems, and non-technical systems, as explained below:

Standard of Irrigation System

	Irrigation system			
Items	Technical system (T)	Semi-technical	Non-technical	
	rechinical system (1)	system (ST)	system (NT)	
Main intake	Permanent structure	Permanent structure and semi-permanent structure	Temporary structure	
Diversion structure with measuring devices	Good	Fair	Poor	
Canal system	Complete independent canal systems for irrigation and drainage	Not complete independent canal systems for irrigation and drainage	Dual function of irrigation and drainage	
Tertiary canal system	Well developed	Developed to some extent	Not developed yet	
Irrigation efficiency	50 - 60%	40 - 50%	Less than 40%	
Size of irrigation area	No limitation	Up to 2,000 ha	Less than 500 ha	

2.3.3 Definition of Rehabilitation

The term of rehabilitation is classified into two, "so-called rehabilitation" and "upgrading" according to the definition stated in the table below. Such classification will be applied for all the irrigation schemes to be studied, and for the selection of irrigation schemes for preliminary investigation.

Classification of	Definition of Rehabilitation
renabilitation	
1. Rehabilitation	1) Rehabilitation is not accompanied by an increase of irrigation area.
	2) Rehabilitation aims at recovering the system designed irrigation capacity (recovering as designed) from the reservoir/intake facilities to the terminal system.
	3) Rehabilitation will increase cropping intensity of dry season crops by 0.2 for Java and 0.3 for outer Java.
	4) Rehabilitation aims at repairing reservoir/intake facilities, canals and related structures, which are damaged, defective and deteriorated
	5) The grade to be applied to the irrigation system should be technical
	level.
2. Upgrading	1) It is possible to expand the irrigation area by upgrading existing irrigation facilities.
	2) Extension of the irrigation area by means of upgrading can be made within rainfed paddy fields. More than one cropping can be increased
	 3) Rehabilitation of the existing facilities is considered to be the same as 2.1) above. However, as rehabilitation aims at upgrading the quality of structures, deterioration can be decreased (life span can be approx. 50 years).
	4) Effectiveness of implementation of upgrading works is expected to be high if the extension area is large
	5) The grade to be applied to the irrigation system should be technical level.

Classification of rehabilitation has been carried out based on the collected information from province and determined as indicated in Tables A-2.3.1, and summarized as shown in the following table:

Type and Number of Rehabilitation Works

No. of Schemes	Classification of Irrigation Scheme			
	Rehabilitation	Upgrading		
50	21	29		

2.4 Selected Irrigation Schemes

The original list of irrigation schemes attached to the Inception Report indicates that 57 schemes with a total area of 119,472 ha were to be studied in North Sumatra Province.

Rehabilitation of the capacity and function of 6 irrigation schemes with areas of 17,699 ha will be carried out under JBIC Loan No. IP-476, 'Rehabilitation and O&M Capacity Improvement Project'. Improvement of another 4 irrigation schemes with areas of 5,125 ha is being conducted under ADB Loan, 'Northern Sumatra Irrigated Agriculture Sector Program (NSIASP)'. In this context, 10 irrigation schemes with areas of 22,824 ha are excluded from the original list.

There were 4 irrigation schemes with areas of 8,261 ha on the original list. However, as these schemes have not actually been constructed, no rehabilitation can be anticipated. Therefore, these schemes have been dropped from the list.

On the other hand, the inventory survey conducted in 2002 by the Dinas PSDA of North Sumatra indicates that there are 7 irrigation schemes newly registered in the list in addition to the original one. As these schemes require rehabilitation works according to the Dinas PSDA, they are to be included for the study.

Accordingly, it was decided to study 50 irrigation schemes with a total area of 108,511 ha in North Sumatra Province as shown in Table A-2.3.1 and a Location Map attached at the top of this report.

As a result of discussion, number and area of irrigation schemes finally selected for the Study are summarized in comparison with those of the Inception Stage as shown below:

Inception Stage		Selected Scheme		
Number of Scheme Area		Number of	Scheme Area	
Schemes	(ha)	Schemes	(ha)	
57	125,706	50	108,511	

Irrigation Schemes selected for the Study

CHAPTER 3 PRELIMINARY INVESTIGATION

3.1 General Description

3.1.1 Purposes

The purposes of the preliminary investigation for quantification of rehabilitation are as follows:

- (a) Confirmation of the related agencies for the investigation and availability of information and holders (agencies),
- (b) Analysis of the cause of malfunctioning of the irrigation system,
- (c) Collection of basic data necessary for the preparation of evaluation indicators for prioritization of rehabilitation,
- (d) Finalization of technical specification for inventory survey work, and
- (e) Collection and examination of evaluation standards consisting of standard rehabilitation methods, standard unit prices and information on cost estimates.

The purposes of the preliminary investigation for the irrigation systems are (i) finalization of the specifications for the implementation of the quantification of rehabilitation to be entrusted by analyzing the cause of malfunctioning of the irrigation systems, and (ii) confirmation of the related agencies for the investigation and availability of information and holders (agencies).

In preparation of evaluation indicators for prioritization of rehabilitation in an irrigation network, the past study report, "Technical Guideline, Rehabilitation and Upgrading of Irrigation Network (JICA, 1999, original is written in Indonesian) were reviewed in order to summarize the problems with irrigation facilities.

Evaluation indicators for prioritization of rehabilitation in an irrigation network were prepared respectively for (i) headworks, (ii) free intakes, (iii) canals and related structures, (iv) terminal facilities and on-farm, and (v) inspection roads.

Standard rehabilitation methods were prepared on the basis of, in principle, the "Irrigation Design Standards" prepared by the Directorate General of Water Resources Development, Ministry of Public Works in 1986. In addition, whenever necessary, recent design standards prepared by the Ministry of Agriculture, Fisheries and Forestry in Japan, and United States Development of the Interior, Bureau of Reclamation (USBR). The standard unit prices were determined referring to the recent similar rehabilitation works and bid prices.

3.1.2 Selection of Irrigation Schemes for preliminary investigation

The criteria for the selection of schemes for preliminary investigation were as follows:

- (a) Schemes to be selected to represent the types of rehabilitation, i.e., (i) rehabilitation, (ii) upgrading.
- (b) The beneficiary areas to be the average of all schemes, i.e., 2,000 to 3,000 ha.
- (c) WUAs in the schemes must have been established and be functioning.

Sample areas for the preliminary investigation were further discussed and selected as shown in the table below. The Study Team made the investigations at the beginning of March 2003 in collaboration with engineers of Dinas PSDA.

Item	Schemes				
Irrigation Scheme	Bandara Sidoras Medan Krio				
District	Deli Serdang	Deli Serdang			
Sub-district	Percut	Sunggal			
Registered area (ha)	3,017	3,016			
Technical level	Semi Technical	Technical			
Completion year of system	1985	1978			
Water resources river	Percut	Lau Tuntungan			
Type of water resources facility	Headworks	Headworks			
Settling basin	Not provided	Not provided			
Max. intake discharge (m^3/s)	6.8	2.8			
Length of main canal (km)	1.4	2.8			
Length of secondary canal (km)	37.5	23.3			
Number of WUAs (Target/Established)	24/5	29/7			
Number of farmers	Not available	Not available

3.2 Main Issues Identified and Study Agenda

3.2.1 Analysis of Causes of Incompleteness and Defectiveness of Facilities

By means of preliminary investigation and reference to past documents, analysis of the causes of problems with each irrigation scheme was carried out in terms of incompleteness, structural and functional defectiveness and necessity for rehabilitation. The causes thus analyzed were classified into five (5) classes according to the kind of structures. In all cases, the study was carried out for the following:

- (a) Appropriateness of planning and design (including availability of necessary data and information),
- (b) Construction technique and accuracy (including possibility of corner-cutting in the construction works), and
- (c) Operational condition of structures.

A table was prepared listing the structural items, problems with the structures and their causes as shown below:

Structure	Problems	Causes	
Headworks	1) The design discharge cannot be taken	1) Sediment exists in front of intake	
	because of sediment in front of intake.	and/or scouring sluice and settling	
	2) The river water level cannot be	basin is not provided or it is	
	maintained as designed.	malfunctioning.	
	appropriately made	2) CIVII WORKS (Intake Well, etc.) are damaged or defective	
	4) Operation of gates is difficult due to	3) Steel gates or other metal	
	damage of gates	structures are damaged or	
	5) Intake discharge cannot be measured	deteriorated.	
	accurately.	4) No proper maintenance and repair	
		is being executed.	
		5) No measuring devices (even	
		gauging) are provided.	
Free Intake	1) The design discharge cannot be taken	1) No fundamental measures, such as	
	because of 1) lowering of river water	provision of weir, are undertaken	
	intervel and II) sedimentation in front of	2) No removal of sedimentation	
	make.	located at or in front of intake is	
		undertaken.	
Canal and related	1) Irrigation water cannot be conveyed to	1) This is due to seepage loss,	
structures	the tail of the canal.	obstruction of flow by sediment,	
	2) Contour canal located in the upstream	collapse of canal, etc.	
	section of a system is choked with	2) Sediment is flowing into canal	
	sediment.	from headworks/intake due to	
	3) Structures with a service life of more than 30 years are malfunctioning in	improper operation of scouring	
	some irrigation systems	provision of settling basin	
	4) Irrigation water is not equitably	3) Structures are older than service	
	distributed due to insufficient water	life and no rehabilitation/	
	supply.	replacement has been done.	
	5) Less activity on O&M works.	4) Due to inadequacy of diversion	
		structure, no proper water	
		management could be done.	
		5) Low density of inspection roads,	
		culvert not in working condition	
Terminal facility	1) Irrigation water is not used efficiently	1) This is due to insufficient density	
and on-farm	due to shortage of provision of canals.	of tertiary and quaternary (feeder)	
	2) Drainage is not appropriately	canals.	
	practiced due to shortage of provision	2) This is due to insufficient density	
	of tertiary and quaternary drains.	of tertiary and quaternary drains.	
	3) Transportation of farming input and	3) Provision of appropriate length of	
	output 1s poor.	tarm road 1s necessary.	

Problems and their Causes on Irrigation Facilities found through Preliminary Investigation

Inspection road	1) O&M are difficult due to poor	1) Inadequate proper maintenance
	condition of inspection road along	has been done and related
	main and secondary canals.	facilities are in a damaged state.
	2) Transportation of farming input and	2) Low density or no provision of
	output is poor due to lack of farm road	roads.
	connecting village with inspection	
	road.	

3.2.2 Evaluation Indicators for Rehabilitation Priority

Rehabilitation for the irrigation facilities was to be evaluated by verifying their condition with respect to (i) type, size and condition of headworks/intake, (ii) functional status of canals and their related structures, (iii) condition of terminal facility and on-farm, and (iv) condition of inspection roads.

Evaluation indicators for the rehabilitation that are to be applied for the investigation for all schemes were prepared based on the findings through the preliminary investigation. Evaluation indicators were further examined and finalized mainly referring to the "Technical Guideline, Rehabilitation and Upgrading of Irrigation Network (JICA 1999)".

The following are the principal evaluation indicators for the preparation of prioritization for the rehabilitation.

Facility	Indicators			
1. Headworks	1) Crack/damage on crest			
(Concrete Weir)	2) Erosion and seepage in stilling basin			
	3) Leakage from foundation			
	4) Gate/Leakage from gate			
	5) Sedimentation/mud in front of gate			
	6) Flushing of sedimentation/mud			
	7) Settling basin			
	8) Measuring device			
2. Free Intake	1) Lowering of river water level or degradation of riverbed			
	2) Intake gate/scouring gate			
	3) Leakage from gate			
	4) Sedimentation/mud in front of gate			
	5) Flushing of sedimentation/mud			
	6) Settling basin			

Evaluation Indicators

3. Canals and Related Structures	
3.1 Canals	1) Lined or unlined canal
	2) Lining of canal, broken or cracked
	3) Sedimentation
	4) Seepage loss
	5) Collapse of canal bank
3.2 Regulating, Conveyance,	1) Gate
Crossing, Protection Structure	2) Leakage on gate
	3) Crack on concrete/stone masonry
	4) Scouring on structures
	5) Settlement
	6) Measuring devices
4. Terminal Facilities and On-Farm	1) Leakage on canal
	2) Sedimentation/mud on canal
	3) Density of canal, road
5. Inspection Roads	1) Condition
	2) Density

The method of evaluation of the existing facilities against respective indicators is discussed in Chapter 6.

3.2.3 Technical Specifications for Inventory Survey Work

Draft technical specifications for inventory survey work were prepared in initiation stage and finalized based on the findings of preliminary investigation. The composition and contents of the technical specifications are as follows:

Part-I: Inventory of Irrigation Schemes

- 1.1 General
- 1.2 Structure of Water Source
- 1.3 Irrigation Canals
- 1.4 Terminal Facility and On-farm
- 1.5 Socio-economy and Agriculture
- 1.6 Present Condition of WUAs
- 1.7 Rehabilitation Plan

Part-II: Survey for Estimate of Rehabilitation Works

- 2.1 General Layout
- 2.2 Irrigation Diagram
- 2.3 Schematic Layout of Related Structures
- 2.4 Survey Sheets
- 2.5 Quantity Estimate
- 2.6 Photographs

3.2.4 Standards for Design and Construction

For the Evaluation of existing condition and preparation of measures for rehabilitation, the following criteria for the design and construction of rehabilitation is provisionally shown in the below table:

Facilities	Condition of structures	Measures for recovery of function
Dam	Leakage from foundation	1) Cement grouting
	Sliding of embankment/	1) Re-construction
	insufficient stability of slope	2) Extra embankment
	Damaged/defective spillway/	1) Repair by concrete works
	structure	
	Insufficient capacity of spillway	1) Extend crest length of spillway
	for flood discharge	
	Damages/inadequate function of	1) Repair/replace
	gate, valve, metal works	
Headworks	Damages due to settlement,	1) Reconstruction/renovation
	broken, washed away, deterioration	
	Insufficient intake capacity	1) Widening of gate
		2) Heightening of weir crest
	Influx sediment load	1) Provision of settling basin
		2) Increase of basin barrel
		3) Proper operation of scouring sluice
		gates
	Damages/inadequate function of	1) Repair/replace
	gate and metal works	
Irrigation	Retarded design capacity	1) Dredging, removal of foreign materials
canal		2) Provision of concrete lining
	Collapsed embankment/lining	1) Re-embankment
		2) Provision of concrete lining
	Earth canal	1) Provision of concrete lining with n =
		0.017
Related	Decrepit more than 50 years after	1) Replace/reconstruct
structure	construction	
	Deflection, settlement and no	1) Replace/reconstruct
	function for gate operation	
	Broken/damaged	1) Repair/replace
	Insufficient load capacity for traffic	1) Replace with required design load ($T =$
	(bridge, culvert)	10, 14, 20)
	Clogging	1) Remove foreign materials
		2) Provision of screen
		3) Widening of barrel section

Standards for Design and Construction

3.2.5 Estimation of Work Quantities and Costs

The work quantities for rehabilitation are estimated by means of site survey works and summarized in each work item. The unit prices of each work item are collected through the actual expenditures and/or average of tender and contracted prices of similar works.

CHAPTER 4 FIELD INVESTIGATION

4.1 Execution of Field Investigation

4.1.1 Works by Indonesian Consultant

The inventory survey work was carried out by an Indonesian Consultant on a sub-contract basis (PPA Consultants), who was selected through competitive bidding. The work was commenced on April 11, 2003 and completed in the middle of June 2003.

4.1.2 Procedures

Major assignments entrusted to the sub-contractor were as follows:

- (1) Preparatory work
 - (a) Coordination meeting with Dinas and Balai PSDA for the orientation of the investigation methods, and
 - (b) Collection of data and information, which were required for field investigation, from said offices.
- (2) Field work
 - (a) Collection of basic information regarding water resource facilities to the on-farm level of each irrigation and drainage system, agriculture and agro-economy, and status of WUAs,
 - (b) Field investigation of the existing condition of irrigation facilities, evaluation of their functions and analysis of the cause of problems, and
 - (c) Preparation of the latest irrigation diagram and the schematic structure diagram of each scheme.
- (3) Outcomes
 - (a) Preparation of investigation report, and
 - (b) Estimation of work quantities for rehabilitation work on major irrigation works.

4.2 **Results and Findings**

4.2.1 Irrigation Systems

As discussed in Chapter 3, field investigations were carried out for the collection of information regarding the condition of the following facilities in order to evaluate the functional status of each irrigation system;

(a) Particular information (constructed and rehabilitated year, name of the river and catchment area at the location of the water resource

facilities),

- (b) Water resource facility (dam, headworks, free intake, pumping station),
- (c) Irrigation canals with related structures (main and secondary canals),
- (d) Drainage canals and related structures, and
- (e) Terminal facilities and on-farm

On the basis of the results of the investigation, the irrigation facilities were classified, by the scale of required rehabilitation, into the following four (4) groups:

- A: Facilities are functioning well, and no rehabilitation is needed,
- B: Facilities are partially damaged/deteriorated, and minor rehabilitation is needed,
- C: Facilities are not functioning well, i.e., operation of the system is difficult, and large-scale rehabilitation is needed, and
- D: Facilities are seriously damaged operationally, and replacement or reconstruction is needed.

In order to identify the particular causes of problems and constraints of the existing facilities, detailed evaluation of the facilities was made based on the investigation results as summarized hereinafter.

- (1) Water Resource Facilities of Each Scheme
 - 1) Existing conditions

Type of water resource facilities and their existing conditions are detailed in Table A-4.2.1, and summarized as shown below:

Type of Water Resource	Number	Condition of Facilities				
Facility	INUITIOCI	А	В	C	D	
Headworks	37*	0	14	14	9	
Free Intake	13	0	0	1	12	
Total	50	0	14	15	21	

Condition of Water Resource Facilities

Note: * Number of settling basins provided is 16.

Out of the 50 intake facilities listed above, 3 were out of service due to washed away of weir portion (Rantau Panjang scheme) and serious sedimentation problems with the free intake systems (Silau Bonto and Secanggang schemes) for a long time (more than 5 years).

2) Analysis of causes of problems and constraints

The causes of problems and constraints were analyzed for all the irrigation schemes as detailed in Table A-4.2.2, and summarized as shown below:

(a) Physical operation problem due to damage and deterioration of

structure,

- (b) Lowering of intake water level due to damage and deterioration of weir or degradation of river bed in case free intake,
- (c) Inflow of bed loads into canal due to sedimentation upstream of weir resulting in inadequate function of scouring sluice,
- (d) No provision of settling basin or inadequate function due to sedimentation, and
- (e) Operation and management problems with intake gate and introduction of bed loads and soils into canals.

Secanggang Free Intake

Bandar Sidoras Headworks

Sediments in front of Intake

No Function of Scouring Sluice Gate

- (2) Irrigation Canals and Related Structures
 - 1) Existing Conditions

The features of irrigation canals and related structures are detailed in Table A-4.2.3 to A-4.2.6 and summarized as shown below:

Canals	Length (km)			Condition (Scheme)			
Callais	Lined Canal*	Unlined (Earth)	Total	Α	В	С	D
Main Canal	115 (35.7%)	206 (64.3%)	321	0	9	17	24
Secondary Canal	223 (31.7%)	482 (68.3%)	705	0	3	12	35
Total	338 (33.0%)	688 (67.0%)	1,026	-	-	-	-

Note: * Masonry and concrete lining

Canals	Total Number of	Condition of Canals (%)			
Callais	Structures	А	В	C	D
Main Canal	1,372	0	66	31	3
Secondary Canal	2,790	0	60	34	6

Condition of Related Structures

2) Analysis of causes of problems and constraints

Analysis of causes of problems and constraints for all the schemes is detailed as shown in Table A-4.2.7, and summarized as shown below:

- (a) Sedimentation in canals and obstruction of water flow,
- (b) Damage and deterioration of canal lining and structures,
- (c) Leakage from unlined canals and defective lined canals,
- (d) Difficulty in maintenance of canals due to no provision and/or non-trafficable condition of inspection roads,
- (e) Difficulty in O&M due to poor/malfunctioning structures
- (f) Physical operation problem with regulating structures in water distribution due to deteriorated and/or damaged steel gates, and
- (g) Entering of eroded soil in the excavated canal portion due to no provision of drainage canal and facilities along the canal.

Sei Belutu Scheme

Bulung Ihit Scheme

No Canal Dike and Broken Structure

Broken Structure on Main Canal

- (3) Inspection Road along Canal
 - 1) Existing Conditions

The existing conditions of inspection roads are detailed as shown in Table A-4.2.3 and A-4.2.6, and summarized as follows:

Ratio of Inspection Road to Canal

Inspection Road	Total length of canals (km)	Inspection roads (km)	Ratio (%)
Along Main Canal	320	203	63
Along Secondary Canal	705	356	50
Total	1,025	559	55

Condition of Inspection Roads

Inspection Roads	Number of Schemes provided	Condition of Roads (scheme)			
hispection roads	with Inspection Roads	А	В	С	D
Along Main Canal	21	0	9	9	3
Along Secondary Canal	23	0	0	23	0

2) Analysis of causes of problems and constraints

As seen in the table above, the ratio between the length of irrigation canals with inspection roads and the total length of canals is approximately 50% for both main and secondary canals. In addition, more than 80% of the inspection roads are non-paved and/or damaged, and as a result, most of them are out of service, not only in the wet season but also in the dry season. Low density of inspection roads and their poor conditions give rise to serious problems in operation and maintenance of canals and related structures. They also affect farming practices, especially in conveying farming materials and agricultural products. (Problems and constraints are shown in Table A-4.2.7)

(4) Terminal Facilities and On-farm

The existing condition of terminal facilities and on-farm are detailed as shown in Table A-4.2.7, and summarized as follows:

Existing Condition of Terminal Facilities and On-farm

Terminal Facilities and On-farm	Condition of terminal facilities and on-farm (%)			
Average of 50 Schemes	А	В	С	D
Average of 50 Schemes	0	2	36	62

The existing conditions of terminal facilities and on-farm were found very poor due to low density of canals, farm roads and provision of their related facilities.

Bandar Sidoras Scheme

Less On-Farm Facility

4.2.2 Agriculture and Agro-economy

The agriculture and agro-economic investigations were primarily carried out through the Inventory Survey. However, some basic data and information such as crop yields, crop budget and farm economy were separately collected from statistic data and secondary data from agriculture services offices. The present agricultural conditions of the target irrigation schemes thus identified are presented in Table A- 4.2.8 and summarized as follows:

(1) Present Land Use

The scheme-wise present land uses of the target areas for development are shown in Table A-4.2.8. The overall provincial features are summarized in the followings:

Land Use Category			Area (ha)	Ratio (%)
1.	Potential Area for Irrigation	Irrigated Paddy Fields	72,620	74
		Rainfed Paddy Fields	10,536	11
		Non-paddy Fields	11,838	12
		- Upland Fields	2,297	-
		- Tree Crops Land *1	6,371	-
		- Uncultivated Land	3,170	-
2.	Non-potential Area for Irrigation	Rainfed Paddy Fields	810	1
		Non-paddy Fields	2,338	2
		- Upland Fields	593	-
		- Tree Crops Land	1,221	-
		- Uncultivated Land	524	-
3.	3. Target Area for Development		98 142	100
	(Potential Area + Non-potential Area)			100
4.	4. Non-subject Area for Development *2			-
5.	Registered Area $(3 + 4)$		107,183	-

Overall Present Land Uses of Target Schemes

Note: ^{*1}. Including fish ponds of 643ha, ^{*2}. Including other land use (alih fungsi)

As shown in the table, the potential area accounts for 97% of the target area for the development study and the non-potential area for 3%. The irrigated paddy fields, rainfed paddy fields and non-paddy fields represent 74%, 12% and 14% of the target area, respectively. Tree crop land is the largest land use category in the non-paddy fields representing 8% of the target area. The target area for development under the Study accounts for 92% of the registered area.

(2) Cropping Seasons and Pattern

The principal cropping seasons in the target schemes and in the province are composed of two (2) seasons; wet season and dry season. Although there are some area specific variations due to irrigation water supply schedule or availability, rainfall distribution, drainage/flooding etc., the principal cropping calendars are identified as follows:
Wet season:	November/December - February/March
Dry season:	April/June - July/September

In only one irrigation scheme, the 3rd cropping season for upland crop is reported as being from July to October.

The current cropping patterns introduced in the irrigated paddy fields in the target irrigation schemes are shown in Table A-4.2.8. As shown in the table, the prevailing cropping patterns in the irrigated fields are double cropping of paddy (paddy - paddy/fallow). Cultivation of palawija in irrigated fields is rather limited and a cropping pattern of paddy – paddy/palawija is practiced only in about 30% of schemes, mostly to a limited extent. The most common palawija in the target schemes and province is maize. The prevailing patterns in the target schemes are as summarized below.

Most common: Wet season - dry season: paddy – paddy or paddy/fallow Second common: Wet season - dry season: paddy - paddy/palawija/fallow

In the province the prevailing pattern in the rainfed paddy fields is paddy – fallow, while double cropping paddy is also practiced in areas with abundant rainfall distribution to a limited extent.

(3) Cropped Area and Cropping Intensity

The irrigation performances in the target schemes expressed by cropped area and cropping intensity to the irrigated area were examined based on the monitoring data of provincial and district irrigation agencies obtained through the Inventory Survey.

The results are shown in Table A-4.2.8. The overall cropped areas and cropping intensities of paddy and palawija in the wet and dry season in irrigated paddy fields are:

Saagan	Pa	Paddy		awija	Overall	
Season	Area (ha)	Intensity (%)	Area (ha)	Intensity (%)	Area (ha)	Intensity (%)
Wet Season	62,565	86	100	0.1	62,665	86
Dry Season	42,987	59	3,905	5	46,892	65
Annual	105,552	145	4,005	6	109,557	151

Overall Cropped Area & Cropping Intensity in Irrigated Fields in Target Schemes

As shown in the table, the overall cropped area and annual intensity is estimated respectively at some 109,600 ha and 151% of the total irrigated paddy fields of 72,620 ha.

Naturally, the annual cropping intensities vary largely depending on irrigation schemes due mainly to availability of irrigation water in the dry season. The

target irrigation schemes (50 schemes) are classified based on annual cropping intensities of irrigated paddy in irrigated paddy fields as follows:

Cropping Intensity of Paddy *1	No. of Schemes	Proportion (%)
≧ 180 %	9	18
\geq 150 \sim <180 %	17	34
\geq 120 \sim <150 %	7	14
\geq 100 \sim <120 %	7	14
< 100 %	10	20

Irrigation Schemes by Annual Cropping Intensity of Paddy

Note: *1. Cropping intensity in irrigated paddy fields

Further, there appear to be some differences in the intensities according to the technical level of irrigation schemes. The annual cropping intensities of irrigated paddy by the technical levels of the target irrigation schemes are:

Technical irrigation schemes (25 nos):	53% - 199%; average 153%
Semi-technical irrigation schemes (22 nos):	0% - 200%; average 127%
Non-technical irrigation schemes (3 nos):	total irrigated area only 20ha

In rainfed paddy fields, single cropping of paddy in the wet season is prevailing in the target irrigation schemes. Accordingly, under the present Study, the current cropping intensity in the rainfed paddy fields is assumed to be 100% of paddy in the wet season on the basis of the findings of the Inventory Survey and information provided by the Provincial Agriculture Services Office.

The overall cropped area and cropping intensity in the target area for development are shown in Table A-4.2.8.

(4) Crop Yields and Crop Production

The current paddy yield levels of the individual target schemes are estimated by analyzing yield data obtained through the Inventory Survey, BPS crop cutting survey results by sub-district, BPS statistic information by sub-district reported in *Kabupaten dalam Angka*, and statistic information on paddy yield by district reported by the Provincial Agriculture Services Office. The estimated paddy yields adopted in the present Study are shown in Table A-4.2.9. together with yield data used for the estimates. The estimated paddy yields are summarized as follows:

Cropping	Yield Range	Average	Cropping	Yield Range	Average	Annual
Season	(t/ha)	(t/ha)	Season	(t/ha)	(t/ha)	(t/ha)
Wet Season	3.0 - 5.0	3.8	Dry Season	3.0 - 4.5	4.1	3.9

The yield level of rainfed paddy and palawija is assumed based on the findings of the Inventory Survey and statistical information as follows:

Rainfed paddy:2.5 t/haPalawija (maize):2.5 t/ha (grain, composite maize assumed)

The current crop productions in the individual target schemes are estimated from the estimated cropped areas and crop yields as shown in Table A-4.2.8. The overall features are presented in the following table:

Commodity	Wet Season (ton)	Dry Season (ton)	Annual (ton)
Paddy	309,000	176,000	485,000
Palawija (maize)	10,013	6,725	16,738

Overall Crop Productions

(5) Crop Budget

Crop budgets for major commodities produced in the target irrigation schemes were studied based on the data collected through the Inventory Survey and crop budgets analyses made by the provincial and district food crops agriculture services agencies. Crop budgets for different yield levels of irrigated paddy, rainfed paddy and main palawija (represented by maize composite) thus estimated are shown in Table A-4.2.10 and summarized below:

Commodity	Yield (t/ha)	Net Return/ha (Rp.000)	Commodity	Yield (t/ha)	Net Return/ha (Rp.000)
Irrigated Paddy	3.5	2,570	Paddy (rainfed)	3.0	2,140
	4.0	3,030	Rainfed Paddy	2.5	1,750
	4.5	3,450	Palawija (maize)	2.5	1,840
	5.0	3.930		-	

Financial Net Return per ha Assumed

(6) Farm Economy

The primary objective of the farm economic analysis under the present Study is to examine capacity-to-pays or possible contribution of O&M costs by beneficiary farmers after the project. Further, the limited accessibility to reliable data on land holding and tenure conditions and farm household incomes and expenditures prevent setting typical farms in individual schemes and examining farm economic conditions. Accordingly, the present farm economic analysis has been made on 1ha of irrigated paddy field or rainfed paddy field or upland field depending on the present land use of individual schemes by estimating net farm income from the field. The results of the farm economic analysis thus made is presented in Table A-4.2.11 and summarized below:

Land Liza Catagory	Net Farm Income from Paddy Field (Rp.000)				
Land Use Category	Range	Average			
Irrigated Paddy Fields	1,750 - 6,815	4,558			
Rainfed Paddy Fields	only 3 schemes	1,811			
Upland Fields	only 2 schemes	1,656			

Estimated Net Farm Income from 1ha of Field

(7) Agricultural Support Services and Marketing

The present status of agricultural institutions, support services and food crops marketing in the individual schemes identified through the Inventory Survey are presented in Table A-4.2.12. The major or prevailing issues on the subjects in the province and the target schemes are as follows:

- (a) Almost all the target schemes are served by field extension workers(PPL) posted in or around the scheme. The number of PPLs assigned basically depends on the size of the schemes.
- (b) Accessibility to farm credits depends on irrigation schemes and varies from "no difficulty to receive" to "almost no access to credits".
- (c) No difficulties for procurement of farm inputs and quality seeds are reported in most of the target schemes.
- (d) The most prevailing marketing practice for paddy is "sold after harvest at field" followed by "sold paddy after drying".
- (e) The most prevailing marketing channel for paddy is "paddy to collector or middlemen" followed by "paddy to rice mill".
- (f) Palawija production in and around the target schemes is extremely limited. The reported most prevailing marketing channel is "sold at local market".
- (g) In most schemes, sufficient availability of rice mills is reported under the current marketing practices for paddy.
- (8) Development Constraints

The primary constraint for irrigation agriculture in most of the target schemes is insufficient water availability at on-farm level, specifically in the dry season, due to malfunctioning or destruction of irrigation facilities, decrease of water resources, degradation of river bed and poor O&M of irrigation facilities and systems.

The agricultural development constraints in the individual schemes identified through the Inventory Survey are presented in Table A-4.2.12. The major or prevailing issues in the target schemes are enumerated as follows:

Engineering Issues

"Water shortage in dry season" and "poor O&M at main & 2ndry canals" is the main constraints reported.

Agronomic Issues

"Farmers not following recommended farming practices" and "rat attack" are the agronomic constraints prevailing in the target schemes.

Paddy Marketing Issues

"Low marketing prices" is the most prevailing constraint in paddy marketing followed by "limited bargaining power of farmers".

Farmer Organization (KT) Issues

"Most members are not active", "economic activities are limited" and "managerial capability of KTs are limited" are the main constraints reported.

Extension Services Issues

Constraints reported differ among the target schemes. The prevailing ones are "implementation of extension programs is limited" and "extension activities of PPLs are limited".

4.2.3 Water Users' Associations (WUAs)

The WUA establish target set up by PWRS North Sumatra is 574 in 50 irrigation schemes. The average working area of one WUA is 188 ha with a wide range from 47 ha at the minimum to 1,616 ha at the maximum.

Up to now, 337 WUA have been established in 48 irrigation schemes, while no WUA has been organized yet in the remaining 2 irrigation schemes. At present, the WUA establishment target ratio is 100% in 18 irrigation schemes, 50% to less than 100% in irrigation schemes and less than 50% in 19 irrigation schemes.

Regarding performance of WUA, regular monitoring and evaluation (M&E) is uniformly made in each Provincial Government taking into account organization, water allocation and distribution, irrigation maintenance, financing, physical condition of irrigation and related facilities, and Government program on WUA promotion and development. According to the evaluation result of PWRS North Sumatra, 11 WUA are classified into "Developed", while 201 are "Under developing" and 125 are "Not yet developed". Due to slow progress of legal arrangement, however, only 57 WUA have been legitimized in the local court of justice.

The present condition of WUA as mentioned above is shown in Table A-4.2.13 and summarized as shown below.

WUA Establishment	No. of	No. of	Pe	Performance and Legal Status of Existing WUA				
Target Realization	Scheme	Existing	Devel	oped	Under Dev	reloping	Not Yet D	eveloped
Ratio	Schenic	WUA	L	N	L	N	L	N
75% and more	24	250	8	0	20	115	5	102
50% to 74%	7	44	0	1	5	31	2	5
25% to 49%	6	9	1	0	1	5	0	2
Less than 25%	13	34	1	0	14	10	0	9
Total	50	337	10	1	40	161	7	118

Present Condition of WUA in North Sumatra

Note : L ; Legitimated in local court

N; Not yet legitimated in local court

4.3 Database for Existing Condition of Irrigation Scheme

Existing conditions of irrigation schemes of North Sumatra Province are prepared and presented in ANNEX-II (1/3). (Title: Priority List of Irrigation Schemes for Rehabilitation)

CHAPTER 5 REHABILITATION PLAN

5.1 Basic Concepts

5.1.1 Rehabilitation Plan

For the proper management of irrigation schemes, it is necessary to carry out improvement of irrigation infrastructures, to operate and maintain the systems appropriately, and to upgrade the organization of management of water resources and water supply, farming technology, etc. as well as to recognize the significance of irrigated agriculture. For this, important items to be considered are (i) preparation of a rehabilitation plan in due consideration of both aspects of agriculture and organization, (ii) improvement of crop productivity which can be capable of paying the irrigation management fee, and (iii) strengthening of water users' associations.

The basic concepts for the formulation of rehabilitation of facilities to recover the irrigation system are itemized as follows:

- (a) Provision of appropriate irrigation infrastructures with sufficient sustainability, which does not require heavy rehabilitation works during the service life of the systems as far as routine O&M are practiced,
- (b) Securing of design discharge throughout the irrigation system and equitable distribution of canals in order to remove constraints of O&M,
- (c) Provision of user-friendly and easy-operation and maintenance canal structures with sufficient water level at each outlet to irrigate farmlands,
- (d) Proper arrangement of measuring devices and outlets (diversion structure/turnout), considering water distribution methods and easy O&M,
- (e) Provision of inspection roads along main and secondary canals for O&M and farm machinery,
- (f) Provision of farm roads in on-farm level connecting with inspection roads and villages, and
- (g) Provision or renewal of irrigation offices and gate-keeper houses at water resource facilities and canals with transportation equipment.

5.1.2 Agriculture Plan

The basic concepts applied for the formulation of the agriculture plans for the present Study are as enumerated below.

- (a) The formulation of agriculture plans placing emphasis on paddy production envisaging contribution to food security in Indonesia and setting a double cropping of paddy as a basic cropping pattern,
- (b) The irrigation agriculture performances and experiences in the advanced schemes among the target schemes of the Study in each province have been to be fully taken into consideration in the formulation of agriculture plans,
- (c) The plans envisage improvement of crop productivity and realization of an increase of cropping intensity through the efficient use of irrigation water,
- (d) The current agricultural status including crop selection, cropping schedule, cropping pattern and cropping intensity in the target schemes should dully be assessed and taken into planning so that the formulated plans will be sustainable in accordance with beneficiaries intentions and capabilities,
- (e) The rational utilization of irrigation water resources is to be emphasized. In this regard, the increase of cropping intensity with the available water in the 3rd cropping season (cropping season following or between the double crops of paddy) to a possible extent is envisaged. The consensus of beneficiaries should be sought at the project detail design stage for this, and
- (f) It is assumed that there will be no constraints on farm labor availability as almost all the target areas for development are existing paddy fields.

5.1.3 Institutional Aspects

(1) New Irrigation Management Policy

In line with the irrigation substance of the draft Law of Water Resources, all irrigation management activities of main and secondary systems of irrigation schemes are under the full responsibility of the Government and/or Regional Governments. Based on the participatory irrigation management policy that is a new concept in the draft Law of Water Resources, farmers can participate in any activities related to the above systems as long as they have established WUA and their willingness, capacity and capability are sufficient to do.

Operation and maintenance works of tertiary irrigation systems including fund arrangement are the full responsibility of WUA. Although the Government, in its Bill of Law on Water Resources, proposed the House of Representatives (DPR) that tertiary irrigation system development cost shall be shouldered by WUA, DPR has made several counter proposals to share fully or partly the said cost by the Government. This issue is under deliberation in DPR at moment.

(2) Regional Government Capacity Building on Irrigation Management

In North Sumatra, Balai PSDA as branch offices of PWRS is responsible for water resources management and technical assistance to district/municipal government which is principally responsible for irrigation water usage management. At present, the respective district/municipal governments allocate 1,676 staff as a whole to manage 770 public irrigation schemes throughout the province, but actual number of staff is only 317. In other words, 80.5% of positions are vacant. Considering the necessary manpower requirements for covering a series of irrigation management activities, therefore, the concept of district/municipal government capacity building in this study is to improve the existing staff capability and also to fill up the vacancies of key positions.

(3) WUA Establishment Acceleration

In the participatory irrigation management policy, WUA is considered the fundamental body of irrigation water users. In connection with this, the target of WUA establishment set up by PWRS North Sumatra should be fully realized in parallel with recovery of function of irrigation system. At moment, 237 WUA in 32 irrigation schemes have not been established yet. In institutional planning to accelerate WUA establishment, therefore, primary attention is to be paid to these irrigation schemes.

(4) WUA Strengthening

Out of 337 WUA already established in 48 irrigation schemes, the current performance of 140 WUA is evaluated as "Under developing" and 87 as "Not yet developed". This monitoring and evaluation record clearly reveals that most WUA needs to improve their capacity to manage organization, capability to collect and expense member's fee, and activities to conduct operation and maintenance of tertiary irrigation system.

The focal point in formulating institutional plan, therefore, is to be technical assistance to "Under developing" and "Not yet developed" WUA to overcome its weakness.

(5) Setting-up of WUA Federation

Since the Government Regulation No. 77/2001 on Irrigation was enacted, it was promoted to organize higher-level institutional bodies of irrigation water users, i.e. federation of WUA (FWUA) on secondary canal basis and main federation of WUA (MWUA) on apex scheme-level basis. Although the core of these

higher-level bodies should be WUA and irrigation water users themselves should act as the main player in organizing such bodies, actual promotion activities for FWUA/MWUA establishment in North Sumatra seem to depend on top-down procedures through the channel from the Ministry of Home Affairs to district/municipal governments following the above regulation and the previous Irrigation Management Policy Reform (PKPI) backed up by the World Bank. Such top-down activities result in that there has been less opportunity of consulting with WUA representatives about FWUA/MWUA establishment.

In institutional planning under this study, therefore, the basic concept is to be set up in such way that the role of reasonable FWUA/MWUA is to coordinate member WUA concerning common rule of water allocation to each WUA as well as to collect ideas and data from WUA as input materials to district/municipal governments.

(6) WUA Activity in Operation and Maintenance Stage

After completion of rehabilitation work, WUA is responsible for operation and maintenance of tertiary system of irrigation scheme. In this regard, WUA's members should master necessary skills required for optimum operation and maintenance of related irrigation facilities to practice irrigation water distribution plan.

In formulating WUA activity plan to meet such requirements, attention is paid to provide WUA's members with on-the-job training on operation and maintenance of tertiary irrigation system once irrigation water can be distributed to the concerned tertiary block. Further activity is considered to be guidance on collection and expenses of WUA member's fee as well as preparation of annual financial report.

5.2 Irrigation Facility

5.2.1 Criteria for Rehabilitation

(1) Classification of rehabilitation in estimating cost

Classification of rehabilitation is based on the degree of defectiveness and deterioration as follows:

- (a) Class A: Facilities are functioning well: In this case, no rehabilitation cost is incurred.
- (b) Class B: Facilities are partially damaged/deteriorated, and minor rehabilitation is needed. In this case, rehabilitation cost is

estimated to be 30% of the new construction cost.

- (c) Class C: Facilities are not functioning well, i.e., operation of the system is difficult and large-scale rehabilitation is needed. In this case, the rehabilitation cost is estimated to be 50% of the new construction cost.
- (d) Class D: Facilities are seriously damaged with respect to operation. In this case, the rehabilitation cost is estimated to be equivalent to the replacement and new reconstruction cost.
- (2) Headworks

2)

1) Design criteria for rehabilitation of civil works

(a) More than 50 years:	Class D is applied,			
(b) From 30 to 50 years:	Class C is applied,			
(c) From 20 to 30 years:	Classes B to D are applied depending on the			
	condition, and			
(d) Less than 20 years:	Classes B to D are applied depending on the			
	condition.			
Design criteria for rehabilitation of steel gates and other metal works				

- (a) More than 20 years: Class D is applied, and
- (b) Less than 20 years: Class C to D are applied depending on the condition.
- 3) Other design criteria
 - (a) Provision of a settling basin with a sand flush function
 - (b) Provision of a device for measuring discharge,
 - (c) Provision of an operation bridge, and
 - (d) Provision of a water level gauging staff.
- (3) Canals and related structures
- 1) Proposed ratio of canals and structures

The proposed ratio of the canal length and number of related structures to the original design is determined as shown in the following table:

Canal works	Classification of canal	Technical	Semi-technical	Non-technical
Canal length	Main canal	1.0	1.1	1.2
Canal lengui	Secondary canal	1.0	1.2	1.5
No. of structures	Main canal	1.1	1.2	1.3
	Secondary canal	1.2	1.35	1.5

Proposed Ratio of Canals and Structures

 Standardization of canals based on discharge in m³/sec (refer to the Irrigation Design Standard prepared by DGWRD in 1986)

Construction costs for lining canals have been estimated based on the following classified standards:

	Standar	(Unit: m ³ /sec)			
0 - 0.5	0.5 - 1.0	1.0 - 1.5	1.5 - 2.0	2 - 4	4 - 6	6 - 8
8 - 10	10 - 15	15 - 20	20 - 25	25 - 30	30 - 35	more than 35

Notes: Canal; lined with concrete, side slope; 1:1.25, longitudinal slope; 1/5,000, n = 0.017

3) Design criteria for inspection roads

It is proposed to provide inspection roads with gravel metaling along the main and secondary canals. The total width of the inspection road is 5.0 m and the effective width is 3.0 m both main and secondary canals. The thickness of gravel metalling is 0.20 m.

4) Standard canal section

For the standard canal section including inspection road, refer to the Irrigation Design Standard prepared by DGWRD in 1986. Typical canal sections for cost estimation are as follows:

- (a) Type A: New construction,
- (b) Type B: Main canal without existing inspection road,
- (c) Type C: Main canal with existing inspection road,
- (d) Type D: Main and secondary canals along existing provincial road,
- (e) Type E: Secondary canal without inspection road, and
- (f) Type F: Secondary canal with existing inspection road.
- 5) Design criteria for rehabilitation of canals

Cost estimation for rehabilitation of canals is based on the typical canal section and the degree of defectiveness and deterioration as follows:

- (a) Based on the above type of canal section, cost is estimated at the assumption of concrete lining reinforced with PVC fiber mesh,
- (b) More than 20 years: Class D is applied,
- (c) From 10 to 20 years: Class C is applied, and
- (d) Less than 10 years: Classes B to D are applied depending on the condition.
- 6) Related canal structures

Cost estimates for rehabilitation of related structures have been based on the same standards as headworks, both for civil and metal works.

- 7) Other design criteria
 - (a) Provision of a watercourse section to prevent inflow from outside of the canal during rainfall,
 - (b) Provision of discharge measuring devices for appropriate water management,
 - (c) Replacement or renewal of bridges or crossing structures with required design loads (T-10 to T-20 class),
 - (d) Provision of hectometer, kilometer posts and name plates for structures for operation and maintenance, and
 - (f) Provision of safety facilities for traffic and humans (safety rope, handrail, etc.).
- (4) Terminal facilities and on-farm

A design criterion for terminal facility and on-farm is as follows:

- (a) Provision of tertiary and quaternary (feeder) canals and related structures with appropriate density,
- (b) Provision of farm roads with appropriate density, and
- (c) Provision of field drains with appropriate density.
- (5) Project facilities

It is proposed that gate-keeper houses at major diversion structures with an area of 50 m^2 be provided.

- (a) From 1,000 ha to 2,000 ha: 2 gate-keeper houses,
- (b) From 2,000 ha to 5,000 ha: 4 gate-keeper houses,
- (c) From 5,000 ha to 10,000 ha: 8 gate-keeper houses, and
- (d) More than 10,000 ha: 10 gate-keeper houses.
- (6) Office equipment

It is proposed that field cars (4WD, 3,000cc class), motor cycles (125cc class), and computers, copy machines and consumables as office equipment be provided.

For field cars,

- (a) From 1,000 ha to 5,000ha: 2 field cars,
- (b) From 5,000 ha to 10,000 ha: 5 field cars, and
- (c) More than 10,000 ha: 7 field cars.

For motor cycles

- (a) From 1,000 ha to 2,000 ha: 10 motor cycles,
- (b) From 2,000 ha to 5,000 ha: 20 motor cycles,
- (c) From 5,000 ha to 10,000 ha: 30 motor cycles, and

(d) More than 10,000 ha: 40 motor cycles.

For computer, copy machine and consumables

- (a) From 1,000 ha to 2,000 ha: Rp. 100 million,
- (b) From 2,000 ha to 5,000 ha: Rp. 150 million,
- (c) From 5,000 ha to 10,000 ha: Rp. 250 million, and
- (d) More than 10,000 ha: Rp. 400 million.

5.2.2 Availability of Water Resources

It is understood that the cropping intensity of some irrigation schemes in North Sumatra Province is not necessarily 200%. In other words, cropping intensity in the rainy season is more or less 100% in any schemes, whereas cropping intensity in the dry season is sometimes less than 100% due mainly to the shortage of river runoff.

It is a common practice in the planning stage to determine the irrigation area in the wet and dry season by means of a water balance study between the water demand of the proposed cropping pattern and the availability of water resources. As such information is not available, it is not possible to review the cropping intensity through previous study reports.

The Ministry of Settlement and Regional Infrastructure has been preparing the database for water resources and irrigation systems called "WRDC". The WRDC was established in the year 2001. However, the autonomy, accountability and responsibility are still unclear. It is also understood that discharge measurement of river runoff is not being done systematically in this country. As a result the database on water resources has not been prepared by WRDC, and consequently it was not possible to collect information necessary for carrying out a water balance study.

Consequently, information on water resources and irrigable area of the schemes furnished by the Dinas PSDA/project offices have been adopted for the determination of the possibility for water supply for the schemes in Pre-F/S stage.

5.2.3 Development Plan

(1) Countermeasures for recovery of function

The existing condition of irrigation systems from the water resource facilities to the terminal facilities and on-farm has been examined and analyzed for the establishment of a rehabilitation plan. Problems and constraints are detailed in Section 4.2.1 and its countermeasures for the recovery of function of the facilities are proposed as summarized below:

	Causes of Problems and Constraints	Countermeasures for Recovery
Wa	ter resource facility	
1.	Weir, flood way, scouring sluices: civil works	
	- Crack or damage on weir crest	Repair by chemical/cement grouting or fillin concrete
	- Leakage from foundation, settlement of weir	Grouting or adding concrete on weir crest
	- Inclination, settlement and deflection of pier	Reconstruction
	- Settlement and washed away apron and/or stilling basin	Reconstruction
	- Fallen down, inclined, or washed away retaining wall	Reconstruction
	- Washed away riprap, concrete block	Provision of additional protection works
	- Physical O&M problems due to deterioration	Replacement and reconstruction
2.	Weir, flood way, scouring sluices: gate and metal w	orks
	- Leakage from guide frame	Repair or replacement of guide frames seal rubber and other members
	- Lower strength against design requirement	Replace or strengthen with additional steel members
	- Physical operation problem due to deflection, breakage, deterioration	Replacement of parts, replacement of all, paint, oil t hoist gear
3.	Intake, free intake: civil works	
	- Insufficient diversion water due to sedimentation at and around intake	Removal of sediments through proper maintenanc and operation of scouring sluices and intake gate during flood
	- Physical operation problems due to breakage of structure	Repair or replace with new construction
	- Inflow of bed loads into canal	Proper operation of scouring sluice, provision of settling basin
4.	Intake: gate and metal works	
	- Leakage from gates and guide frames	Repair or replace guide frames and other members
	- Physical operation problems due to breakage or deterioration	Replace or strengthen with additional steel members
5.	Others	
	- Difficulty in water distribution/water management	Provision of measuring devices, water level gaugin staff, and proper operation of intake gate
	- Difficulty in O&M	Provision of access road, operation house, inspectio bridge and necessary facilities/equipment for O&M
Irr	igation Canal and Related Structure	
1.	General	
	- Sedimentation and/or obstruction of flow	Removal of sediment/water plants by periodica maintenance
	- Leakage	Replacement of embankment material by imperviou

Countermeasures for Recovery of Function

(to be continued)

	- Collapse	Provision of drainage ditch along canal, provision of cross drain, redesign of canal slope
	- General O&M problems	Provision of inspection roads, kilometer and hectometer posts, name plate of respective structures
2.	Canal Works	
	- Leakage, cracks, collapse	Replace with concrete canal lining with provision of under and side drains
	- Physical O&M problems due to deterioration, unlined	Provision of concrete lining, inspection roads
3.	Related Structures	
	- Poor function of discharge control facilities (diversion structure, off-take) due to deterioration of structure both civil and gate works	Repair or reconstruct structure with water management facilities such as measuring devices, staff, gauge
	- Poor function of water conveyance facilities (siphon, aqueduct, drop) due to deterioration, breakage, leakage	Repair, replace, provide protection facilities, maintenance facilities (blow-off for siphon)
	- Poor function of canal crossing structures (bridge, culvert, cross drain) due to deterioration, clogging by foreign materials, narrow width for traffic	Reconstruct bridge based on actual traffic load, remove clogged materials/sediments, reconstruct cross drain based on actual site condition
4.	O&M Matters	
	 Difficulty in O&M due to no or less density of inspection roads 	Provision of inspection roads with all weather type design, execution of periodical maintenance of canal and roads
	- Difficulty in water distribution and management	Review of irrigation area, irrigation diagram and field water requirement and redesign of canal, if required
	- Physical operation problems due to breakage of structure	Repair or replace with new construction
Dra	iinage Canal	
Nat	ural River/Drainage Canal	
	- Inundation of paddy fields during rainy season due to drainage problem	Provision of drainage canals and sluices
	- Physical drainage problem due to sediments, water plants and obstructive materials inside drainage canal	Periodical maintenance
	- Physical operation problems due to insufficient number of related structures	Provision of sluices, bridges, culverts, protection works, etc.
Ter	minal Facilities and On-farm	
Fac	ilities/Water Management	
	- Physical operation problems due to low density of irrigation and drainage canals in a tertiary block	Provision of sufficient irrigation and drainage canals with related structures
	- Physical operation problems during planting and harvesting	Provision of farm roads for operation of farm machinery, conveyance of harvested paddy
	- Physical operation problems of water management due to poor land leveling	Execution of land leveling and re-layout of irrigation and drainage canals

(2) Rehabilitation plan

1) Basic Concept for Rehabilitation Plan

Rehabilitation plans are to be designed for all the schemes in accordance with the rehabilitation criteria discussed in Section 5.2.1. For the rehabilitation plans the following measures were considered and applied.

Water Resource Facilities

(a) Type of water resource facilities

The existing intake method of free intake is replaced by the headworks type to prevent inflow of sediment loads into the canal and to provide a measure for the bed river degradation in the future. (12 schemes)

(b) Provision of settling basin to all the headworks

As analyzed in the previous section, the major problems of operation and maintenance of irrigation canals is caused by sediments that flow into the canal from the river not only during the flood time but also under the normal flow condition of the river. To prevent sediment loads flowing into the irrigation canal, it is proposed to provide settling basin structures for all the headworks except where the intake method is direct from the dam reservoir. (34 schemes)

(c) Provision of integrated headworks

In order to supply irrigation water throughout the year from adequate and stable water resources, the following existing intake structures (free intake system) in the Asahan District are to be combined and designed as an integrated headworks. The source of irrigation water is R. Silau with a catchment area of 150 km^2 at the proposed headworks sites.

Silau Irrigation System: Sungai Silau, Sijambi

Bunut Irrigation System: Panca Agra, Serbangan, Silau Bonto

(d) Replacement of steel gates for scouring sluice and intake

One of the major causes of sedimentation in front of the intake and of inflow into the irrigation canal is judged to be the physical operation problems of both steel gates due to damage and deterioration. To remove this major cause, replacement and/or large scale repair of gates is to be executed.

(e) Provision of inspection bridge and measuring devices

The following facilities are to be provided with appropriate operation and maintenance as well as discharge control structures:

- Inspection bridge having effective width not less than 3.5 m.
- Measuring devices such as gauging staff, measuring devices with instruments.

Canals and Related Structures

(a) Provision of concrete lining

In order to make provision for proper water management and to decrease O&M costs, including repairing works, it is proposed to provide concrete lining for both the main and secondary canals for rehabilitation of non-lined canals.

(b) Provision of inspection road

In order to carry out proper O&M and to contribute to the agricultural activities and distribution of products, the inspection roads along the canals are to be rehabilitated or newly provided. The road design should be all-weather type with pavement (effective width: 3.5 m in minimum).

(c) Rehabilitation and provision of related structures

In order to execute proper water management and O&M, the related structures are to be rehabilitated and/or newly provided. Steel gates associated with the control structures (diversion and off-take structures) are to be replaced by new ones in cases where they have deteriorated (over the age of their service design) and/or physically damaged/not functioning.

Terminal Facility and On-Farm

In order to support proper water management and post harvest activities, the terminal facilities including canals, farm roads and related structures are to be rehabilitated or provided new.

2) Features of rehabilitation plan

Based on the basic rehabilitation plan mentioned above in 1), rehabilitation designs at the pre-feasibility study level were made for the irrigation systems from the water resource facilities to terminal facilities including on farm development. The features of the rehabilitation plan for each scheme are shown in Tables A-5.2.1 and Figure A-5.2.1, respectively.

5.2.4 Cost Estimates

Cost estimates for the rehabilitation works have been made for the following five items:

- (1) Direct construction cost for rehabilitation
 - (a) Water resource facilities
 - (b) Irrigation canals and related facilities
 - (c) Drainage canals and related facilities
 - (d) Terminal facilities and on-farm
 - (e) Project facilities (Field office and office equipment)
- (2) Work quantities

Work quantities for the rehabilitation including reconstruction and/or new construction have been estimated based on the field investigation and the rehabilitation design described in Section 5.2.1.

(3) Unit prices

Material costs, labor wages, and unit prices of respective construction items have been collected through the field investigation. In addition to the survey results, the actual engineer's cost estimates were collected from similar projects under MOSRI. After examination of the costs, all the costs were found to be the same or similar. Therefore, the same unit prices have been applied for the cost estimates.

(4) Cost estimates

Costs for the rehabilitation works for 50 schemes have been estimated and the results are shown in Tables A-5.2.2. Figures shown in the table below indicate the rehabilitation cost per hectare at a maximum of 5,428 US\$/ha (or 43.4 million Rp.) and a minimum of 1,164 US\$/ha (or 9.64 million Rp.).

Number of Schemes	Unit	Minimum	Maximum	Average
50	US\$/ha	1,164	5,428	2,644
50	million Rp./ha	9.64	43.4	21.9

Rehabilitation Cost per Hectare

Note: Conversion rate US\$ 1.00 = Rp. 8,279 as of May 2003.

5.3 Agriculture Plans

5.3.1 Agriculture Land Use Plans

The approaches employed in the planning of future land uses under the Study are as follows:

- (a) The subject areas for the present agriculture land use plans are the irrigation development areas determined through the irrigation development study,
- (b) Basic principles applied for the land use planning of the subject areas are:

Present Land Use	Land Use Plan
Irrigated Paddy Fields	Irrigated Paddy Fields
Rainfed Paddy Fields	Irrigated Paddy Fields (converted)
Non-paddy Fields	
- Upland Fields	Irrigated Paddy Fields (converted)
- Uncultivated Land	(net area: 70% x gross area)
- Tree Crops Land	Not converted

Basic Principles for Land Use Planning

- (c) As shown in the table, tree crops lands have been excluded from the subject area for the rehabilitation plans because of farmers general reluctance towards the conversion of tree crops lands to paddy fields identified through the Inventory Survey.
- (d) No changes in areas have been assumed in the existing paddy fields.

The agricultural land use plans of the subject areas in the individual target schemes are shown in Table A-5.3.1. The overall features by province are as follows:

Land Use Category	Present/Be	fore Project	Future Plan		
Land Use Category	Area (ha)	Ratio (%)	Area (ha)	Ratio (%)	
Irrigated Paddy Fields	72,620	80	88,576	98	
Rainfed Paddy Fields	11,346	13	0	-	
Upland Fields	2,890	3	0	-	
Uncultivated Land	3,694	4	0	-	
Non-irrigable Land *1	-	-	1,974	2	
Total	90 550	100	90 550	100	

Overall Land Use Plans of Subject Areas

Note: *1 Non-paddy fields (gross) - Converted paddy fields (net)

As shown in the table, the increase of irrigated paddy fields of some 16,000 ha (increase of 22% from the present level) is planned as a whole under the Study.

5.3.2 Planned Cropping Pattern and Schedule

Under the present Study, the selection of crops to be introduced in the planned cropping patterns in the target irrigation schemes has been made basically observing the current cropping patterns prevailing in the target schemes, which represent farmers intention and capabilities to a certain extent. In addition, the availability of irrigation water and the rational use of irrigation water among beneficiaries and area specific needs for selection of crops, if any, have been taken into consideration. The crop selection has been made as follows:

(a) The introduction of double cropping of paddy is envisaged in all the target schemes based on the farmers' preferences for crops and the volume of market demands, and

(b) Maize is selected as a representative palawija to be introduced in the planned cropping pattern since it is the most common palawiaja currently cropped in and around the target schemes. Further, from the demand/supply conditions and profitability of crops, hybrid maize appears to be the most promising crop among palawija. Similarly, maize is the most promising palawija in terms of the national economy.

The two basic cropping patterns (Pattern A & B) have been formulated on the basis of: (i) study of the current irrigation performances in the target areas and (ii) inapplicability of a cropping pattern of continuous triple cropping of paddy (paddy-paddy-paddy) because of the danger for serious infestation of pests & diseases and because of the time required for periodical O&M of irrigation facilities; as explained in the following table:

Basic Cropping Patterns

Dottorm	Plan	ned Cropping Patte	Subject		
Pattern	Wet Season	Dry Season I	Dry Season II	Irrigation Schemes	
Pattern A	Paddy (100%)	Palawija	Paddy (100%)	Sufficient water in dry II	
Pattern B Paddy (100%) Fallow Paddy/palawija Insufficient water in dry II					
Note: *1 Wat gaggan: Oot/Nov, Jan/Eah: Dry I: Eah/Mar, Apr/May, Dry II: May/Jung, Aug/San					

e: ¹Wet season: Oct/Nov-Jan/Feb; Dry I: Feb/Mar-Apr/May; Dry II: May/June-Aug/Sep.

*² (%): cropping intensity in the season

A cropping pattern of paddy (intensity 100%) - fallow - paddy (intensity <100%) in irrigation schemes with insufficient water supply in the dry season II has not been planned. The plans aim at efficient use of irrigation water as stated in the basic concepts (Section 5.1.2). The planned cropping patterns for the individual target schemes are presented in Table A-5.3.2.

5.3.3 Planned Cropped Area and Cropping Intensity

In accordance with the planned cropping pattern and the selected crops discussed earlier, the target cropped areas and cropping intensities in the target schemes under the present Study have been planned in accordance with the following manners.

- (a) Target cropped areas and cropping intensities have been determined on the basis of current and past cropped areas and cropping intensities in individual schemes and by setting a minimum target for the intensity of paddy and an envisaged target for the overall intensity,
- (b) The minimum target intensity of paddy is set to 150% and an increase of more than 20% of the overall intensity from the current level is targeted,
- (c) In addition, the introduction of palawija (represented by maize) to the minimum extent of 5 to 10% in all schemes is envisaged, and

(d) In accordance with the above points, the target cropping intensities for individual schemes have been determined as presented in Table A-5.3.3.

In accordance with the planned cropping pattern and the selected crops discussed earlier and the target cropping intensities, the cropped areas in the target schemes have been planned as presented in Table A-5.3.2 and summarized in the following table:

Cron		Cropped.	Cropping Intensity (%)			
Стор	Wet	Dry I	Dry II	Annual	Range	Overall
Paddy	88,576	0	69,061	157,637	150 - 200	178
Palawija	0	3,396	6,123	9,519	5 - 30	11
Total	88,576	3,194	74,598	166,368	155 - 200	189

Overall Features of Cropped Area & Cropping Intensity

The overall increase of annual cropped area of some 32,900 ha of paddy and 2,500 ha of palawija from the present level is planned under the Study. Further, an overall increase of paddy cropping intensity of 33% and of palawija intensity of 5% in irrigated fields is envisaged.

5.3.4 Target Crop Yields and Crop Production Plans

Target crop yields have been estimated by assuming that all the target irrigation schemes will be developed or upgraded to the level of the existing advanced irrigation schemes and that intensification of the farming practices will be carried out by beneficiary farmers. Target yields of paddy have been assumed for individual schemes based on the current yield levels in the schemes and the yield levels in advanced irrigation schemes as shown in Table A-5.3.2 and are summarized below:

Cropping Season/Crops	Target Yield		
	Range	Overall Average	
Wet Season Paddy (GKG)	4.5 - 5.5 ton/ha	5.1 ton/ha	
Dry Season Paddy (GKG)	4.5 - 5.5 ton/ha	5.1 ton/ha	
Maize (hybrid; grain)	-	5.0 ton/ha	

Target Yields under the Study

The overall average target yield level of 5.1 t/ha is an increase of 1.2 t/ha from the present overall average yield of 3.9 t/ha (including rainfed paddy).

On the basis of the target crops yields and the planned cropping pattern, the with-project crop production plans have been formulated for individual target schemes as shown in Table A-5.3.2. As shown in the table, the production increase of 312,000 tons of paddy as a whole is estimated under the with-project condition.

5.3.5 Crop Budgets

The planned crop budgets estimated based on the planned farming practices of paddy and palawija are detailed in Table 4.2.10 and summarized in the following table:

Crong	Return (Rp.000)		Crong	Return (Rp.000)	
Crops	Gross	Net	Crops	Gross	Net
Paddy			Maize (hybrid)		
- Yield 5.5 t/ha	7,150	4,420	- Yield 5.0 t/ha	5,500	3,490
- Yield 5.0 t/ha	6,500	3,930			
- Yield 4.5 t/ha	5,850	3,450			

Planned Crop Budget per ha

5.3.6 Farm Economy

The farm economic analyses under the present Study have been made to examine capacity-to-pays or possible contribution of O&M costs by beneficiary farmers after the project. The analysis was made on 1 ha of irrigated paddy fields or rainfed paddy fields depending on the present land use of individual schemes by estimating net farm income from the fields as discussed earlier in Section 4.2.2.

The results of the farm economic analysis made on the individual schemes are presented in Table A-5.3.4 and summarized below:

	Net Farm	Incremental		
Land Use Category	With-Pro	ject	Present	Net Income (Rp.000)
	Range	Average	Average	Average
Irrigated Paddy Fields	5,484 - 9,767	7,341	4,558	2,783
Rainfed Paddy Fields	only 3 schemes	5,599	1,811	3,789
Overall		7,170	4,278	2,892

Estimated Net Farm Income from 1ha of Field

5.4 Institutional Capacity Building

(1) District/Municipal Government Capacity Building Plan

The focal point of capacity building of district/municipal district government staff in charge of irrigation management is to make staff understand fully the new participatory irrigation management policy and also the difference from the previous irrigation management policy reform based on hand-over of authority to water users. For this purpose, technical guidance seminar will be held in each capital town/city by facilitators consisting of PWRS task force team, consultant and if necessary staff of central line ministries. Materials to be distributed to all attendants are outline papers of new Law on Water resources, Amendment of Government Regulation on Irrigation (Regulation No.77/2001 to be modified) and relevant ministerial decrees of Ministry of Settlement and Regional Infrastructure, Ministry of Home Affairs and Ministry of Finance.

Following this technical guidance seminar, workshop is to be held to review and modify decrees of Regent/Mayor related to water resources and irrigation as well as job descriptions of officials concerned of district/municipal government about irrigation management in line with the spirit of new Law on Water Resources. In this workshop, discussion should be made among facilitators and attendants regarding how to put the priority over fulfillment of vacant posts taking into account salient features of irrigation schemes located in the concerned district/municipality.

Such seminar and workshop for the technical guidance need to be held in all districts and municipalities in the province. To ensure effective and efficient dissemination of the new irrigation management policy, however, the technical guidance should be carried out with more compact scale. Considering the availability of capable facilitators for technical guidance, therefore, the technical guidance is to be started from the following districts and municipalities where the selected 141 irrigation schemes are located:

Mandaling Natal, Tapanuli Selatan, Tapanuli Tengah, Toba Samosir, Labuhan Batu, Asahan, Simalunggun, Langkat Districts and Binjai Municipality.

(2) WUA Strengthening Plan

The main objective of WUA strengthening is to make all member farmers be aware of role of WUA and responsibility of its membership in the concerned irrigation scheme. In this connection, the basic concept of WUA strengthening plan is to identify weak points of WUA activities by members themselves on the participatory basis by recapturing monitoring and evaluation record of WUA performance focusing on administrative, financial and operational aspects.

The main targets of WUA strengthening plan are WUA's board of directors and member farmers. The plan consists of WUA awareness raising workshop and technical assistance to WUA concerning capacity to manage organization, capability to collect and expense member's fee, and activities to conduct operation and maintenance of tertiary irrigation system. As for technical assistance, class room training, on-the-job training and mass guidance will be combined in on package program to meet technical assistant requirements of the respective WUA. Although the target of this plan is 201 "Under developing" WUA and 125 "Not yet developed" WUA, the package program should be implemented for 140 "Under developing" WUA and 87 "Not yet developed" WUA.

(3) WUA Federation Setting-up Plan

In the irrigation scheme where WUA federation has been organized, its role and function are to be confirmed through review of its article from the viewpoint of new participatory irrigation management policy. Also hearing is to be made to representatives of the federation focusing on who took an initiative to establish the federation and whether or not the establishment of federation was backed up by the general will of WUA in the concerned irrigation scheme. If the article is based on Government Regulation No. 77/2001 on Irrigation and relevant ministerial decrees as well as less connection and coordination with member WUA are found, it is confirmed whether the representatives of federation need technical support from Regional (provincial/district) Government for modification of its article and resetting-up of FWUA/MWUA.

For the case of new establishment of FWUA/MWUA, socialization workshop is to be held by the Provincial task force team aiming in order to make WUA and its members understand fully the necessity as well as the role and function of FWUA/MWUA in line with the irrigation substance of new Law on Water Resources. To support WUA for smooth establishment and initial setting-up of FWUA/MWUA, the Provincial task force team is to act as a facilitator.

Although WUA federation setting-up plan needs cover 50 irrigation schemes, the first priority should be given over 18 irrigation schemes.

(4) WUA Establishment Acceleration Plan

The main target of WUA establishment acceleration plan is farmers group in each tertiary block where no WUA has been established although irrigation water can be distributed to the concerned block. For this purpose, Provincial task force team is to invite representatives and members of Farmers Group to socialization meeting and workshop aiming at confirmation of their awareness to establishment of and participation to WUA as well as their needs for general guidance about procedure and practice of WUA establishment.

Although this plan has to cover 137 WUA not yet established in 32 irrigation schemes, its implementation should be commenced from 9 candidate schemes in which there remain 40 WUA not yet established.

(5) On-the-job O&M Training and Management Guidance

As O&M of tertiary irrigation system is the responsibility of WUA, training programs are to be implemented during the implementation period of rehabilitation works in the respective irrigation schemes in order to enable WUA member farmers to carry out physical activities smoothly and non-physical

activities properly. The main menu is on-the-job training program on O&M of irrigation facilities at tertiary level and management guidance program on collection and expense of WUA member's fee.

(6) Strengthening of Extension Services

To strengthen extension services based on the area specific concept in order to accommodate farmer's needs, promote farmer/farmers group participation and to take initiatives in the execution of extension services in the irrigation scheme, the main activities are to include farmer/farmers' group empowerment, staff empowerment, field demonstration, technical development/trial, class room training, field school, study tour, workshop and mass guidance.

(7) Cost Estimate for Institutional Capacity Building

The unit cost of each institutional capacity building plan is estimated at preliminary level as follows:

District/municipal government capacity building	plan Rp.10,000,000/time
WUA strengthening plan	Rp.40,000/ha
WUA Federation Setting-up Plan	Rp.20,000/ha
WUA Establishment Acceleration Plan	Rp.20,000/ha
On-the-job O&M Training	Rp.100,000/ha
WUA Management Guidance	Rp.20,000/ha
Strengthening of Extension Services	1% of rehabilitation cost

Taking into account the above unit cost, target and established numbers of WUA, and subject area of irrigation scheme, institutional capacity building cost has been estimated and the result is as shown in Table A-5.4.1.

5.5 Economic Evaluation

5.5.1 General

The economic evaluation of the present Study has been made to assess the economic viability by comparing the project costs and the incremental project benefits between the present/before project conditions and the with-project conditions as the reliable prediction or estimation of the without-project conditions was not possible and impractical. The approaches or assumptions applied for the economic evaluation are as follows;

- (a) Economic evaluation has been made by estimating project benefits between the present/before project and the with-project conditions,
- (b) For economic evaluation, economic internal rate of return (EIRR), financial gross return per ha have been examined,

- (c) Project benefits are estimated based on crop production benefits and indirect or intangible benefits have not been counted,
- (d) The useful life of the Project was taken as 30 years from project implementation,
- (e) Exchange rate of Indonesian Rupiah (Rp.) to US. Dollar (US\$) was taken to be Rp. 8,279 equivalent to US\$ 1.00 (as of May 2003);
- (f) Constant prices at 2003 level were used in the economic evaluation, and

5.5.2 Project Costs

The project costs of the individual rehabilitation plans consist of initial investment costs, replacement costs and O&M costs. The economic project costs were calculated from the financial project costs by applying standard conversion factor of 0.90 as shown in Table A-5.5.1.

5.5.3 Project Benefits

(1) Economic Prices of Farm Inputs and Outputs

Economic prices of farm inputs and outputs were estimated in order to evaluate the expected project benefits. Economic prices of trade goods such as rice, maize, soybeans, groundnuts and fertilizers were estimated on the basis of the projected world market prices of these commodities forecast by the World Bank. Non-trade goods were valued at financial prices which were estimated on the basis of current market or farm gate prices. Farm labor was valued at the shadow wage rate of 0.80. The economic prices of farm inputs and outputs applied for the economic evaluation are presented in Table B-6.2.2 and B-6.2.3.

(2) Project Benefits

Only the crop production benefits are assessed as the project benefits as stated earlier. The net project benefits are defined as the difference in net return from crop production between the with-project and the present/before project conditions. The economic crop budgets applied for the estimation of the net return under the Study are as presented in Table A-5.5.2. The project benefits expressed as the incremental net return form crop production in the individual schemes are estimated as shown in Table A-5.5.3.

5.5.4 Results of Economic Evaluation

The results of the economic evaluation (EIRR, B/C, B - C & incremental gross return per ha) are presented in Table A-5.5.4 and as summarized below.

EIRR	No. of Schemes	Ratio (%)
$\geq 20\%$	3	6
15 - 19%	7	14
10 - 14%	25	50
< 10%	15	30

Economic Internal Rate of Return (EIRR)

EIRRs of the target schemes are in the range of 3.1% to 26.2% and the rates of 35 schemes (70%) out of 50 schemes are calculated at higher than 10%.

B/C	No. of Schemes	Ratio (%)
≧ 1.0	35	70
< 1.0	15	30

B/C at Discount Rate of 10%

The incremental gross returns per ha of the subject area under the with-project conditions are shown in Table A-5.5.4 and summarized in the following table.

Incremental Gross Return per ha (Financial Value)

Incremental Return (million Rp /ha)	No. of Schemes	Ratio (%)
≥ 6.0	9	18
3.0 - < 6.0	41	82
< 3.0	0	_

Overall average gross returns per ha and incremental gross returns per ha are estimated as shown in the following table.

Average Incremental	Gross Return p	per ha of Sub	ject Area
---------------------	----------------	---------------	-----------

Gross Return per ha (Rp.000)		
Before Project	With-project	Increment
7,169	12,026	4,857

The overall average incremental gross returns per ha of the subject area under the with-project conditions is estimated at Rp. 4,857,000 respectively as shown above.

5.6 Database for Rehabilitation Plan

The databases for the rehabilitation plan of 50 irrigation schemes are shown in Volume 5, ANNEX-II (1/3).

CHAPTER 6 PRIORITIZATION FOR IMPLEMENTATION OF REHABILITATION

6.1 Flow of Criteria for Prioritization

6.1.1 Flow of Prioritization

The general flow for prioritization of Rehabilitation Projects is shown in Figure A-6.1.1.

The procedure for the prioritization is described as below:

First Screening

Step-1

- 1.1 Collection of data on existing irrigation schemes with a registered area of more than 1,000 ha.
- 1.2 If the area of both the registered area and the estimated area were more than 1,000 ha proceeded to Step-2. If an estimated area was less than 1,000 ha, such scheme has been categorized into Group-VI.

Step-2

- 2.1 Evaluation of capacities of WUA of each irrigation schemes and related district governments.
- 2.2 If more than 50% against target number of WUAs has been already established as well as the post of head of water resources and irrigation service office has been fulfilled by the third or higher rank officer, proceeded to Step-3 (1). On the other hand, if more than 50% against target number of WUAs has not been established or the said post has been vacant or fulfilled by the fourth rank officer, the scheme has been categorized into Group-V.

Step-3

- 3.1 Information on water resources and irrigable area of the scheme furnished by the Dinas PSDA/project office has been adopted for the determination of the possibility for water supply for the scheme.
- 3.2 If the water resources was considered to be sufficient for the scheme according to such information, an inventory survey and pre-F/S have been carried out.
- 3.3 If the water resources were considered to be insufficient for the scheme according to the information, proceeded to Step-3 (2).
- 3.4 In case that there was a possibility of reformulation of water resources development plan, the scheme has been categorized into Group-IV. On the

other hand, if there was no possibility of reformulation of water resources development plan, the scheme has been categorized into Group-VI.

Second Screening

Step-4

4.1 If there are such problems as low technical sustainability (high construction cost and low economic feasibility) and less contribution to the society, such scheme shall be categorized into Group-VI.

Step-5

- 5.1 Evaluation indicators for prioritization consist of issues of: (a) irrigation,(b) agricultural productivity, (c) society, and (d) economic and financial impacts.
- 5.2 Based on the comprehensive examination of the above evaluation indicators in pre-F/S, priority of the schemes to be rehabilitated shall be determined and listed.

Priority

Based on the priority list thus prepared, recommendation of implementation procedure is made as follows:

Group-I:	Recommended as the first priority
Group-II:	Recommended as the second priority
Group-III:	Recommended as the third priority
Group-IV:	Recommended to reformulate water resources development
	plan
Group-V:	Recommended to accelerate WUA establishment and to
	empower district government officials concerned
Group-VI:	Recommended to formulate development method by other
	categories

6.1.2 Criteria for Prioritization

Prioritization of rehabilitation works has been based on following four major evaluation indicators:

- (a) Rehabilitation of irrigation system impact
- (b) Agriculture productivity impact
- (c) Social impact
- (d) Economic and financial impacts

It should be noted that the status of water users' association has not been included in the evaluation indicators due to the reasons stated in the box in the next stage. (1) Rehabilitation of irrigation system impact

Rehabilitation of irrigation system impact consists of following three items:

- (a) Utilization of resources potential
- (b) Urgency of rehabilitation
- (c) Sustainability

"Utilization of resources potential" means that actual intake of water vs. designed capacity of intake structure. It is necessary to evaluate increment of intake of water by improving or repairing intake structure, and as a result how much irrigation area can be increased.

"Urgency of rehabilitation" means recovery of function of irrigation scheme, which was not functioning due to disorders of the facilities, by means of rehabilitation. For instance, intake structure or main canal is heavily damaged by some reasons, all the system may not function at all. In such case, evaluation should be made in such a manner that how much function of the system recovers with limited investments.

"Sustainability" does not necessarily depend on structure stability, but it is one of the most important indicators of the effect of rehabilitation. Evaluation of sustainability should be based on the extension of project life.

(2) Agriculture productivity impact

Agriculture productivity impact consists of following three items:

- (a) Increase of irrigation area
- (b) Cropping intensity
- (c) Crop yield

Evaluation of agriculture productivity impact shall be made in terms of increments of irrigation area, crop yield and cropping area.

(3) Social impact

Social impact consists of following two items:

(a) Increase of beneficiaries

(b) Improvement of rural infrastructures

Evaluation of social impact shall be made both aspects of alleviation of poverty and improvement and newly provision of rural infrastructures.

(4) Economic and financial impacts

Evaluation of economic feasibility shall be carried out based on Economic Internal Rate of Return (EIRR) and evaluation of financial viability shall be based on analysis of agriculture return.

6.2 Weights of Evaluation Indicators

Distribution of weighted score for four respective indicators is determined as below and details are shown in Table A-6.2.1.

	Evaluation Indicator	Weighted Score
1.	Issue of Irrigation Indicator	50
1.1	Utilization of irrigation potential	(10)
1.2	Urgency of rehabilitation	(25)
1.3	Sustainability	(15)
2.	Issue of Agriculture Productivity	20
2.1	Current cropping intensity	(10)
2.2	Current unit yield of paddy	(10)
3.	Issue of Society	15
3.1	Number of beneficiaries	(7.5)
3.2	Provision of social infrastructure	(7.5)
4.	Issue of Economic and Financial Impact	15
4.1	Feasibility (EIRR)	(7.5)
4.2	Agriculture return per hectare	(7.5)

Evaluation Indicators for Prioritization of Rehabilitation Work

6.3 Evaluation Results

The evaluation was made for 50 schemes and the evaluation results are finally classified into Group I, II, III, IV, V and VI as shown in Table A-6.2.2 and summarized below, and high priority is given in the schemes classified into from Groups I to III.

Summary	of	P rio	ritiza	tion
---------	----	-------	--------	------

		Pr	iority Gro	up		
Ι	II	III	IV	V	VI	Total
7	7	5	3	13	15	50

The database for the prioritization in each scheme is presented in Volume 5, ANNEX-II (1/3).

6.4 Selection of Model Scheme for the Feasibility Study

Selection of model scheme to be taken up for the feasibility study has been comprehensively made considering not only the evaluation results of prioritization but also the following factors:

- (a) The scheme of which irrigation area is more or less the same as the average area of the 50 schemes,
- (b) The scheme of which condition of topography, situation of agriculture

and agro-economy, type of irrigation system/facilities, etc. represents the subject schemes,

- (c) The scheme of which rehabilitation brings about immediate effects on the recovery of the system (such as damages on the primary canal)
- (d) The scheme of which rehabilitation gives rise to a great impact on a regional community/economy (schemes located suburbs of a city or at large market)

A few proposed irrigation schemes were selected by the Team in due consideration of the above factors. This proposal was further examined in the meetings with the counterpart personnel and the representatives of Dinas PSDA. Finally, Padang Mahondang Scheme was selected and determined to be taken up fro the model schemes. The general features of Padang Mahondang Scheme are as follows:

Irrigation Scheme	Padang Mahondang	
District	Asahan	
Sub-district	Pulo Rakyat	
Existing Condit	ion	
Registered area (ha)	3,231	
Technical level	Semi Technical	
Completion year of system	1981	
Water resources river	S. Asahan	
Type of water resources facility	Free Intake	
Settling basin	Not provided	
Max. intake discharge (m ³ /s)	0.6	
Length of main canal (km)	3.6	
Length of secondary canal (km)	9.2	
Number of WUAs (Target/Established)	2/1	
Number of farmers	Not available	
Development Plan		
Subject area (ha)	2,905	
Water resources facility	Free Intake (New construction)	
Settling basin	Newly provide	
Length of main canal (km)	3.5	
Length of secondary canal (km)	10.0	
Rehabilitation cost: Total (million Rp.)	42,036	
Rehabilitation cost: Per hectare (million Rp.)	14.5 (US\$1,748/ha)	
Economic internal rate of return (%)	19.4	

Features of Selected Areas

CHAPTER 7 PREPARATION OF ACTION PLAN

7.1 Action Plan

The priority ranking has been made for each irrigation scheme in the preliminary feasibility study. The action plan for rehabilitation work after the prioritization should be prepared with following contents:

- (a) Organization plan,
- (b) Action plan for recovering function of irrigation facilities,
- (c) Action plan for institutional strengthening,
- (d) Action plan for extension services strengthening, and
- (e) Action plan for budgeting.

7.2 Organization Plan

(1) Precondition

The organization for the recovery program is proposed as illustrated below:

Proposed Organization for Recovery Program of Irrigation Agriculture

The organization is to be formed of "Forum" as a decision making body and "Project Office" as an implementation body. These bodies are to be newly established at provincial level, which are responsible for implementing the comprehensive recovery program of irrigation agriculture from the initiation phase to the final phase on the basis of participatory irrigation management concept.

The Project Office is attached to provincial water resources service as one of functional units and under the control of the chief in charge of water resources management and utilization.

(2) Function Recovery Forum

The Forum is to play facilitator's role in collecting ideas and inputs to the function recovery program at the respective Phases from water users and other stakeholders. The Forum is also responsible for getting final approval from the Governor about its decisions on implementation of the program including budgeting and budget implementation plans. The Forum will be composed of the following members:

Chairman of Forum:	Provincial governor
Vice chairman of Forum:	Chief of BAPPEDA
Secretary of Forum:	Chief of Provincial Water Resources
	Services (PSDA)
Member of Forum:	District Regent, Municipal Mayor, Chief of
	District BAPPEDA, Chief of District Water
	Resources Services, Chief of Agriculture
	Services at provincial and district level,
	Chief of relevant services at provincial and
	district level, Representative of Water Users'
	Association, University and NGO

(3) Function Recovery Project Office

As discussed in the precondition, "Function Recovery Project Office (tentative name)" will be established under PSDA or Public Services (PU) and take full responsibility of implementation and management of all activities in each phase of the recovery program. The Project Office will be composed of about six (6) Sections such as (a) Irrigation Assets Management Section, (b) Investigation Section, (c) Irrigation Planning Section, (d) Design Section, (e) Construction Section, and (f) Agriculture and Farmers' Organization Support Section.

The Project Office has to (i) maintain close relationship with the stakeholders of water user side, (ii) clarify, utilize and manage their ideas and inputs, and (iii) has a right of influence on their demands for the successful completion of the project. The Project Office will organize various task force teams to carry out specific activities under the direction of the Forum.

In implementing and managing the recovery program, the project manager is a leader of the working group, and his leadership has to be displayed in any activity of the program. He is expected to have skills as communicator, negotiator and problem solver.

Major activities of the respective sections stated above are as follows:

Project	1. The person in charge of implementation of the project.
Manager	2. Responsible for negotiation with related agencies, and obtaining
	consensus.
	3. Responsible for implementation schedule.
	4. Responsible for drawing up and expending budget for the
	implementation of the project.
Irrigation assets	1. Responsible for managing/safekeeping and updating of irrigation
management	facilities account book
section	2 Collection and assessment of information of irrigation facilities from
500000	the subordinate agencies (Kabunaten)
Investigation	1 Confirmation of consistency of the account book and the existing
section	status of irrigation facilities
section	2 Supervision of observation and collection/classification of
	2. Supervision of observation and concerton classification of meteorological and hydrological (river runoff) data
	2 Deriodical investigation on the status of irrigation facilities and
	5. Feriodical investigation on the status of imigation facilities and
	A Conducting inventory survey of the original facilities, which are
	4. Conducting inventory survey of the existing facilities, which are
T ' '	necessary for formulating the renabilitation program.
Irrigation	1. Analysis of data on meteorology and hydrology (river runoff).
planning section	2. Formulation of rehabilitation plan based on the investigation results.
	3. Prioritization of irrigation schemes based on the rehabilitation plan
	and the construction cost.
	4. Preparation of manual of water management and O&M, and guidance
	of the manual
	5. Conducting investigation on environmental impact assessment, and
	obtaining permits for implementation of the project.
Design section	1. Preparation of design report and bill of quantities, and tender
	documents including drawings.
	2. Conducting design modification during the construction of irrigation
	facilities.
Construction	1. Selection of contractors (from tendering to contract signing).
section	2. Supervision of construction works.
	3. Inspecting completion of work, and supervising the project works
	during the guarantee period.
Agriculture and	1 Collection and classification of information on the WUA and related
farmers'	organizations
organization	2 Collection and classification of information on agriculture and
support section	agro-economy required for formulating rehabilitation program
support section	3 Establishment and support of the program on agriculture and
	agro-economy
	4 Establishment and support of the program on the ampowerment of
	4. Establishment and support of the program on the empowerment of
1	institutonal organization.

The activities stated above will change in accordance with the implementation progress of activities in each phase of the program. It will become necessary to
employ specialized and qualified consultants (Indonesian and/or international) as required.

7.3 Action Plan for Recovering Function of Irrigation Facilities

7.3.1 Action Plan based on the Priority Group

Recommendations based on the evaluation results for the six (6) groups from Groups I to VI are as follows

- Group I: High priority schemes (Recommended making F/S)
- Group II: Second high priority schemes (Recommended making F/S)
- Group III: Third high priority schemes (Recommended making F/S)
- Group IV: Schemes that require reexamination of availability of water resources before making F/S
- Group V: Schemes that require empowerment of WUA or district government before making F/S
- Group VI: Schemes that require reexamination of development methodology before making F/S

Of the above classification, action plan for Groups I to III is more or less the same, though timing of initiation of implementation is different, whereas action plan for Groups IV to VI is not the same due to different constraints. Action plan for each group is as follows:

Groups I to III:

- Procurement of consultants for making F/S,
- Execution of F/S,
- Preparation of implementation program for each scheme,
- Appropriation of funds for the rehabilitation,
- Procurement of consultants for detailed design and construction supervision,
- Field investigation and topographic survey, etc., for detailed design, and preparation of detailed design,
- Preparation of tender documents including drawings,
- Selection of contractor(s),
- Supervision of construction, and
- Final inspection for completion delivery and O/M of the system.

Group IV:

- Procurement of consultants for field survey and study on development plan,

- Preparation of alternative development plan,
- Execution of F/S based on the alternative plan, and
- Activities to be followed are the same as Groups I to III stated above.

Group V:

- Promotion of the organization of WUA to the required level,
- Promotion of the organization of district government to the required level,
- Classification of schemes to Groups I to III or Group VI, and
- Activities to be followed are the same as Groups I to III stated above.

Group VI:

- Procurement of consultants for field survey and study on development plan,
- Preparation of alternative development plan (If the registered area is less too small, integration of plural schemes or exclusion from the list are to be considered.),
- Execution of F/S based on the alternative plan, and
- Activities to be followed are the same as Groups I to III stated above.

7.3.2 Evaluation of Each Scheme and Confirmation of Development Plan

Evaluation of each scheme in terms of issues/problems and their countermeasures are summarized as follows:

Group	Priority of Rehabilitation	Issues and Problems	Countermeasures
Ι	High priority	- Poor function of basic	- Recovery of function by R/U of
	(Recommend F/S)	structures	basic structures.
		- No problem in water	
		resources facilities	
II	Second priority	- Poor function of the	- 30-50% of facilities needs R/U.
	(Recommend F/S)	system due to deterioration	- Replacement or repairing of
		- Malfunction of terminal	gates is necessary.
		system	- New construction or
		- No problem in water	rehabilitation of inspection road
		resources facilities	is necessary.
III	Third priority	- Malfunction of the system	- More than 50% of facilities
	(Recommend F/S)	due to deterioration	need R/U.
		- No function of terminal	- Rehabilitation of terminal
		system	system is urgent.
		- No problems in water	
		resources facilities	
IV	Re-examination	- Water is not distributed to	- Development of new water
		the terminal system due to	resources
		shortage of river runoff.	- Integration of schemes
		- Paddy field is converted to	- Conversion of crops to be
		upland field or orchard due	cultivated to meet irrigable
		to shortage of water.	area.

Priority of Rehabilitation of the Schemes, Issues/ Problems and Countermeasures

V	Re-examination	- Poor functions and activities of WUA or district government (on the condition that there is no problem in water supply).	- Establishment and empowerment of WUA or empowerment of district government is urgent (on the condition that there is no problem in water supply).
VI	Re-examination	 Registered area with less than 1,000 ha (recommended by JICA Study Team) Absolute shortage of water resources Low effect on investment Low motivation of farmers in practicing farming 	 Development of new water resources Conversion of crops to meet irrigation area

7.3.3 Packaging of Field Survey and Construction Works

(1) Field Investigation for F/S

In order to maintain the uniformity of field survey results, number of package of F/S is one (1) regardless of the scale of the schemes. The study period ranges from 6-18 months depending on size of the schemes.

(2) Construction Works

Packaging of the construction works is made on the basis of monetary terms that are the decisive factors. The approximate construction cost is Rp. 50,000 million (approximately \$ 700 million) per package. The construction period of one scheme is determined to be 2 years in principle, however, that of large area is 3 years.

7.3.4 Implementation Schedule

The irrigation schemes in the province are classified based on the evaluation of rehabilitation priority as shown below:

Group	Ι	II	III	IV	V	VI	Total
Number	6	7	5	3	14	15	50

Number of Schemes classified based on Priority of Rehabilitation

Based on the priority group and major features of the schemes stated in the above table, the implementation schedule together with the said information are summarized in Table A-7.3.1 and Figure A-7.3.1. It should be noted that the implementation schedules of the F/S and construction works of the schemes classified into Groups IV, V and VI are not presented in the report because various kinds of survey and study are required before commencing F/S.

7.3.5 Status of Basic Information on the Irrigation Schemes

In commencing the Study on the Comprehensive Recovery Program of Irrigated Agriculture, basic information such as irrigation area, irrigation diagram, dimension of canals and related structures, intake water record, meteorological and hydrological data. Needless to say, the Study largely depends on the availability of such basic data and their accuracy.

One of the most important tasks of the Study is to collect the basic information. However, many schemes are equipped with neither basic information nor detailed information. To cope with this situation, it was necessary to visit the branch offices of the Provincial Water Resources Management Services Office (Dinas PSDA), nonetheless plenty of documents have been scattered and lost.

The comprehensive recovery project is expected to be certain that the function of facilities can be easily recovered, as most of the existing schemes.

In order to complete successfully the project, the "processing of basic information and preparation of the updated book" is prerequisite condition. For the implementation of the project, necessary information can be collected through such updated book, and if further information is required, additional field survey would be necessary, which is to be added to the book.

It is recommended that the Dinas PSDA should supervise such activities and be responsible for keeping book. In other words, it is urgently necessary for Dinas PSDA to update the information regarding meteorology, hydrology, conditions of irrigation facilities, irrigated area, crop production, etc., which can be furnished for the formulation of rehabilitation plan.

7.4 Action Plan for Institutional Strengthening

7.4.1 Type of Plan

Action plan for institutional strengthening consists of the following two program groups:

- The one is to be conducted in either initial or midterm phase prior to the implementation of rehabilitation works of irrigation system. Action plan for this group includes institutional capacity building and staff capability improvement program, WUA strengthening program, FWUA and MWUA initial setting-up program, and WUA establishment acceleration program; and
- The other is to be carried out in final stage as one of the project

components in parallel with rehabilitation works of irrigation system. Action plan for this group covers training program on operation and maintenance of tertiary irrigation system, and guidance program for collection and expense of irrigation water service charge.

The overall implementation schedule of action plan for institutional strengthening is included in Figure 4.6.1.

7.4.2 Formulation of Task Force Team for Institutional Strengthening

For conducting the action plan of the first group, a Task Force Team will be established by the Provincial Government. In principle, this Task Force Team is responsible for providing initial ideas/needs and making decision to take necessary arrangement for the program implementation. This Task Force Team is therefore formed of the following members:

- Chief is to be appointed from Provincial Water Resources Service Office;
- Secretary is to be appointed from Provincial Water Resources Service Office; and
- Members are to be appointed from Provincial and District/Municipal Water Resources Service Offices as well as representatives of WUA, FWUA/MWUA if already organized and Farmers Group in non-WUA.

For carrying out the action plan of the second group, a working group will be organized under the control of the rehabilitation project manager and led by a senior project staff in charge. As members of this working group, experts are also invited from NGO and universities in addition to representatives of WUA and FWUA/MWUA if available. This working group is responsible for providing necessary inputs and making decision and necessary arrangement for the program implementation.

7.4.3 Elements of Action Plans for Institutional Strengthening

(1) Institutional Capacity Building and Staff Capability Improvement Program

This program contains two (2) components. One is to enable irrigation officials at regional level to understand and practice the new irrigation management policy. The other is to improve the capacity of organization units of district/municipality government involved in irrigation management and those staff capability in line with the new irrigation management policy.

The first component will be done through undertaking a series of seminar and workshop to be facilitated by the central government after the legal framework of

water resources and irrigation management is completed. Its program formulation and budget arrangement will be also made by the central government.

The second component should reflect to the above nationwide dissemination of the new irrigation policy by the central government. This component will be done by the Task Force Team at provincial level and consultants as follows:

- To evaluate the capacity of district/municipal government authorities and the capability of those staff, both involved in irrigation management activities;
- To identify needs for improving institutional capacity and staff capability to cope with the new irrigation management policy as well as supporting requirements for fulfillment of such needs through technical assistance by central/provincial government; and
- To formulate implementation programs on institutional capacity building and staff capability improvement for the respective district/municipal government authorities involved in irrigation management.

Regarding the budget arrangement for these implementation programs, the main source is district/municipal government budget to cover the cost for institutional capacity building and staff capability improvement, while the supplemental source is provincial government budget to cover the cost for implementation of the supporting menus.

In implementing the institutional capacity building and staff capability improvement program, a group of trainers will be organized by inviting well experienced specialists from consultant, NGO and universities. Monitoring and supervision of the program implementation should be carried out continuously by relevant organization units at provincial level throughout the program implementation stage with periodical reporting on performance and impact of the program implementation.

(2) WUA Strengthening Program

The background of this program is the existence of many irrigation schemes where majority of WUA have yet shown good performance in terms of organization management and financing aspects other than physical aspects like irrigation facility condition and water allocation utilization. From the initial stage of irrigation system rehabilitation, farmers' participation is prerequisite so that the capability of WUA is one of important key factors for successful implementation of the comprehensive recovery program of irrigation agriculture.

The Task Force Team should be responsible for making necessary arrangement to formulate and implement WUA strengthening program by recruiting consultant as technical assistant. The Task Force Team and its consultants shall:

- hold WUA' awareness raising workshop to reconfirm weak points elaborated from recapitulated the latest monitoring and evaluation (M & E) record on WUA's performance;
- confirm establishment of WUA Federation (FWUA) at secondary level and federations group at primary level (MWUA) as well as non-WUA tertiary system within the irrigation scheme;
- carry out interview survey to WUA' representatives of all WUA in the irrigation scheme if the latest M&E record shows the condition of more than three years ago, and update M&E record;
- identify technical assistant requirements for improving WUA's capacity to manage organization, capability to conduct operation and maintenance of tertiary irrigation system, and/or activities to collect and expense WUA members' fee;
- formulate a technical assistant menu list and make a package program of technical assistance menus according to WUA's needs to improve its capacity, capability and/or activities; and
- estimate unit cost of each technical assistant menu and total cost of package program.

Budget for implementing package program for strengthening WUA is to be arranged by Regional Government according to its jurisdiction.

In implementing the WUA strengthening program before starting rehabilitation works, the Task Force Team shall make necessary arrangement to recruit consultant, NGO and/or universities as facilitators and implementers in the irrigation scheme area.

(3) FWUA and MWUA Initial Setting-up Program

The background of this program is the current change in the operation and maintenance responsibility of primary and secondary irrigation system in line with the draft of Law on Water Resources. These two groups will represent those member WUA so that they should build up transparent channel and good cooperation among WUA, FWUA and MWUA in implementing irrigation management activities. In order to secure appropriate role and function of WUA' groups in conformity with the participatory irrigation management policy, therefore, it is necessitated to support initial setting-up of FWUA and MFUA.

The same Task Force Team and its consultant shall:

- collect list of FWUA/MWUA, list of member WUA, legal documents;
- review and confirm role and function of FWUA/MWUA compared with the participatory irrigation management policy;

- socialize the necessity of setting up representative groups to WUA to cope with the participatory irrigation management policy if FWUA/MWUA has not been established;
- formulate a guidance menu list and make a package program of guidance menus to support initial setting-up of FWUA/MWUA according to the current situation in the irrigation scheme; and
- estimate unit cost of each guidance menu and total cost of package program.

Budget for implementing package program for initial setting-up of FWUA and MWUA is to be arranged by Regional Government according to its jurisdiction.

In implementing the initial setting-up of FWUA and MWUA program before starting rehabilitation works, the Task Force Team shall make necessary arrangement to recruit consultant, NGO and/or universities as facilitators and supporters in the irrigation scheme area.

(4) WUA Establishment Acceleration Program

The background of this program is the existence of tertiary blocks where no WUA has yet established within one irrigation system resulting in that the realization of full-scale management of irrigation system is still impossible. In such case, any irrigation scheme with WUA establishment target realization ration of less than 50% is to be dropped from Master List according to the criteria. Further, there are candidate irrigation schemes which have tertiary blocks without WUA. As long as irrigation water is distributed to the concerned tertiary block, WUA should be established as a terminal body of water users. Therefore, it is indispensable for accelerating WUA establishment up to the target level in each irrigation scheme in order to ensure participatory irrigation management in the whole tertiary blocks of one irrigation system in an integrated manner.

The same Task Force Team and its consultant shall:

- hold socialization meeting and workshop to invite representatives and members of farmers groups which are available in non-WUA tertiary blocks provided with irrigation water, for the purpose of accelerating WUA establishment and promoting participatory irrigation management;
- confirm farmers' awareness to establishment of and participation to WUA as well as their needs for guidance about procedure and practice of WUA establishment;
- formulate a guidance menu list and make a package program of guidance menus to accelerate WUA establishment in non-WUA tertiary blocks to which irrigation water is distributed; and
- estimate unit cost of each guidance menu and total cost of package program.

Budget for implementing package program for WUA establishment acceleration is to be arranged by Regional Government according to its jurisdiction.

In implementing the WUA establishment acceleration program before starting rehabilitation works, the Task Force Team shall make necessary arrangement to recruit consultant, NGO and/or universities as facilitators and supporters in the irrigation scheme area.

(5) Training Program on Operation and Maintenance of Tertiary Irrigation System

This training program will be done after completing the rehabilitation works of irrigation system. For this purpose, however, preparation of training manual and program should be done in parallel with the final stage of rehabilitation works. Also the concept of training program should synchronize irrigation water allocation plan to tertiary blocks as well as cropping pattern and planting schedule in the irrigation scheme.

As this training will be done as one of rehabilitation project components, consultant under the project manager is responsible for preparing training manuals, formulating training program estimating training cost and implementing training program. To ensure effective and efficient implementation of training on operation and maintenance of tertiary irrigation system, NGO and other volunteers will be encouraged to involve in training activities at field level in addition to the project staff, Regional Government officials and consultant.

Budget arrangement based on consultant's cost estimate is the responsibility of the project manager.

(6) Guidance Program for Collection and Expense of Irrigation Water Service Charge

The background of this program is the reconfirmation of WUA's obligation to operate and maintain tertiary irrigation system in the draft of new Law on Water Resources. Since 1984, farmers have been responsible for paying irrigation service fee to cover the cost for operation and maintenance of tertiary irrigation system as well as management cost of WUA. Due to uncertain realization of irrigation water allocation plan to each tertiary block of the irrigation system, however, many WUA members put lower priority over their irrigation service fees among annual expenses from their income. As irrigation water supply can be guaranteed as planned after the rehabilitation works completed, therefore, it is needed for reluctant farmers to remind their obligation and to encourage them to fulfill their obligation.

In parallel with preparation of training manual on operation and maintenance of tertiary irrigation system, the project consultant shall:

- identify issues on book keeping system, fee determination method, payment form, fee collection system and payment schedule;
- identify issues fee allocation system to cover administration, operation, maintenance and other miscellaneous cost;
- identify incentives to members;
- formulate a guidance menu list and a package program of guidance menus for collection and expenses of irrigation water service fee; and
- estimate unit cost of each guidance menu and total cost of package program.

Budget arrangement based on consultant's cost estimate is the responsibility of the project manager.

In formulating and implementing the guidance program for collection and expense of irrigation water service charge, the project manager should pay his due attention to recruit a consultant with specific experiences matching with the above terms.

7.5 Action Plan for Extension Services Strengthening

7.5.1 Formulation of Action Plan

The goal of strengthening extension services is to mitigate individual or plural constraints to agricultural development based on farmer-to-farmer approaches. To reach the goal, it is prerequisite to formulate a strategic action plan tailored to area specific needs. Therefore, the action plan has to include a series of program menus aiming at farmer/farmers group and staff empowerment. Formulation of the action plan for strengthening extension services also has to be well synchronized with the implementation schedule of rehabilitation works of the irrigation scheme. Key program menus are field demonstration, technical trial, classroom and field school training, study tour, workshop, mass guidance, and so on.

7.5.2 Formulation of Task Force Team for Extension Services Strengthening

For implementing the action plan, a Regional Task Force Team for strengthening extension services will be established by Regional Government. This Task Force Team is formed of the following members:

Chief	Regional agriculture services agencies
Secretary	Regional agriculture services agencies
Member	Irrigation services agencies

Water users' associations (farmers)

Technical guidance team Agriculture & irrigation agencies of higher jurisdiction; BPTP

7.5.3 Formulation of Implementation Program

An implementation program of the action plan for strengthening extension services will be formulated stepwise as below:

Constraints for development will be identified by the following means:

- Investigation on the present agriculture conditions and identification of constraints to be mitigated for the attainment of the targets set in the agriculture plan; and
- Field confirmation of the constraints by the research-extension dialog team.

Approaches and countermeasures or technologies will be introduced by establishment of:

- Approaches for the mitigation of the constraints identified;
- Countermeasures for the mitigation of the constraints identified; and
- Agriculture technologies for the mitigation of the constraints identified.

Based on the extension system employed in a district, the modified system accommodating area specific conditions and needs should better be worked out by emphasizing promotion of farmer/farmers' group's participation and initiatives in the execution of extension services in the irrigation scheme.

Element extension programs will be formulated for the mitigation of individual or plural development constraints by emphasizing farmer-to-farmer approaches. Element extension programs should be area specific ones tailored to area specific needs and will include farmer/farmers' group empowerment program, staffs empowerment program, field demonstration program, technical development or trial program, training program in class and in field (field school), study tour, workshop, mass guidance and so on.

For implementing extension services strengthening program, a certain period from 3 to 5 years will be required as shown in Figure A-7.3.1, based on the time series for implementation schedule of element programs, budget requirement and availability as well as staff availability and capability.

7.5.4 Implementation of Extension Services Strengthening Program

The extension services strengthening program will be implemented as follows:

- Formulation of annual work program for the strengthening of extension services in individual irrigation schemes based on the action plan for

strengthening of extension services and through participatory approach;

- Budget arrangement on the basis of the annual work program formulated above;
- Preparation of detail agreed plan of operation for the implementation of strengthening programs accommodated in the budgets through participatory approaches of stakeholders involved in the implementation of the programs;
- Extension materials or materials required for the implementation of the programs accommodated in APO should be prepared in time for the execution of the programs;
- Based on the establishment or development of agriculture technologies to be introduced, simple extension materials to be distributed to farmer/farmers' group should be prepared;
- Implementation of the programs for the strengthening of extension services should better be carried out by a working Team organized for the implementation of the programs in individual irrigation schemes. The Working Team should be composed of: staffs of district agriculture services office, field agriculture & irrigation staffs, representatives of WUAs and representatives of participants of the programs;
- Monitoring & supervision of the program implementation by the Task Force Team should be carried out continuously throughout the program implementation stage; and
- Monitoring of the program implementation and impacts should be made by the Working Team under the supervision of the Task Force Team. Periodical reporting of the results and findings of such monitoring activities should be institutionalized.

7.6 Action Plan for Budgeting and Budget Implementation

In discussing the preparation of budget proposals and implementing of budget to be allocated to the function recovery program, special attention has to be paid to the following key issues related to the modified irrigation management policy in line with the draft of new Law on Water Resources:

- Arrangement of irrigation management responsibility between irrigation water suppliers and water users;
- Arrangement of irrigation management responsibility among government authorities;
- Funding criteria; and
- Mechanism of budget arrangement and utilization

Among irrigation management activities, the responsibility of planning and design works for development, rehabilitation and upgrading purposes is arranged to governments at central and provincial level to assure quality of outputs from these works. Regarding implementation of physical works, it can be considered that the budget availability, staff capability and contractor capacity are crucial factors at district/municipal level. Therefore, it can be considered rational that irrigation schemes commanding more than 1,000 ha are to be handled by provincial governments in a sense of participatory irrigation management.

Although irrigation schemes covering 500 to 1,000 ha are to be dropped from the function recovery program, rehabilitation and upgrading works of such schemes needs to be implemented by district/municipal government with financial support by the Special Allocation Fund to district/municipal government (*DAK*) and technical assistance from provincial government, if necessary.

Budgeting for activities in the initiation and midterm phase of the function recovery program for the irrigation scheme with the scale of more than 1,000 ha is recommended to be made at central level. For allocating APBN of Ministry of Settlement and Regional Infrastructure, therefore, it is required to make a package of the initiation phase activities on provincial basis. It is also recommended that, after budget is allocated, provincial government is to execute initiation phase package plans through assistant task.

In the midterm phase of the function recovery program, it is recommended that Ministry of Settlement and Regional Infrastructure takes an initiative for budgeting after scrutinizing provincial governments' proposals for undertaking F/S and packaging priority schemes. Similar procedures of budgeting and budget implementation are also recommended.

Budgeting for implementing rehabilitation works of irrigation schemes will be basically made according to the jurisdiction of irrigation management stipulated in the daft of new Law on Water Resources if internal budget source is considered. If external funding sources are targeted, it is recommended to consider the scale of proposed project matching with the financing standard of the donor agencies. In other words, central government is to prepare an implementation program (I/P) by packaging irrigation schemes proposed by Regional Governments.

Table A-1.4.1 Agro-demographic Conditions by Project District and Province: North Sumatra

1/: No. of farmer households by size of farmlands under control (luas lahan yang dikuasai)
 2/: Estimated --- proportion (%) of farm households to total households in 1993 x total households in 2001

3/: Total farm land or paddy field in province or project districts (source: Table 3.1.5 Agricultural Land Use) 4/: Total farm land /No. of farm households estimated or total paddy field /No. of farm households estimated

5/: Proportion (%) to total farm households

Source: Sensus Pertanian 1993, BPS, Propinsi Sumatera Utara

Table A-4.2.2 Problems and Constraints of Irrigation Scheme : 1. Water Resources Facility: North Sumatra

Remarks: T : Technical ST : Semi Technical NT : Non Technical

AT - 16

 Condition of Facility:
 Reader

 A : Function well/no rehabilitation is needed.
 B

 B : Partially deteriorated, minor rehabilitation is needed.
 C

 C : Not functioning well and affecting the operation, large scale of rehabilitation is needed.
 D

 D : Serious condition for operation, replace and reconstruction is needed.
 D

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 5 575                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Dry II
