Ap.1 (2) Sample location map of Batouba Center Area

Ap.2 Microscopic observatiom of thin section

TS-01: Muscovite-biotite-granodiorite

Intersertal texture, medium grained. Columnar plagioclase is abundant in this rock. Most of plagioclase shows some alteration especially in the core parts with dusty clay minerals. Space of plagioclase is occupied by fine grained aggregate of quartz and platy biotite. Biotite is partly replaced by chlorite.

TS-02: Muscovite-biotite-granite

Medium grained, equigranular texture. Major constituent minerals are quartz, albite, and K-feldspar. K-feldspar shows microcline twinning and perthitic texture. Small amounts of muscovite occur along the grain boundary of quartz and feldspar. Some are included in albite crystals as fine grained flakes. Biotite, greenish brown, is partly altered to chlorite.

TS-03: Hornblende-biotite-granodiorite

Medium grained, granular texture. Quartz, albite and K-feldspar are major constituents. K-feldspar shows microcline twinning and perthitic texture. Hornblende is greenish brown, and partly replaced by aggregate of biotite. Biotite has two modes of occurrence; clots of biotite aggregate, isolated crystals and replacing hornblende.

TS-04: Biotite-muscovite-granite

Medium grained, granular texture. Quartz, albite and K-feldspar are major constituents. Plagioclase is anhedral dusty crystals especially in the core parts and partly myrmekite texture. K-feldspar shows microcline twinning and perthitic texture. Small amount of biotite occur along feldspar grains and is partly changed to chlorite.

TS-05: Two pyroxene gabbro

Subophitic, medium grained texture. Major mafic minerals are orthopyroxene and clinopyroxene with and biotite. Orthopyroxene is abundant, including subhedral plagioclase. Serpentine after anhedral olivine occur in orthopyroxene. Clinopyroxene and pale brown hornblende are partly replaced by biotite flakes. Micrographic intergrowth of quartz and feldspar occurs interstitially.

TS-06: Highly weathered silica rock

Main constituents are quartz and fine grained, brown colored Fe-, Al-hydroxides. Thin vein of quartz is also observed. Original texture remains. Sample probably located at the higher horizon of weathering crusts, where Fe, Al hydroxides tend to concentrate compared with alkali earth elements.

TS-07: Biotite-hornblende-granodiorite

Granular, coarse grained. Plagioclase shows oscillatory zoning in the core part and myrmekite texture occurs along the border of plagioclase crystals. Hornblende, greenish brown is partly replaced by biotite. Some biotite crystals changes to chlorite. Muscovite flakes tend to occur inside of dusty albite crystals.

TS-08: Granodiorite, Biotite-hornblende-granodiorite

Granular, coarse grained. Myrmekite texture occurs along the border of plagioclase crystals. Hornblende, greenish brown is partly replaced by biotite. Some biotite crystals changes to chlorite.

TS-09: Tourmaline quartz rock

Fine grained. Tourmaline is golden brown, columnar in shape, surrounded by fine grained quartz. Metasomatic product.

TS-10: Aplite

Mafic minerals contain low in amounts. Quartz crystals are strained and cataclastic. Pale yellow biotite, includes dusty Ti minerals. Muscovite occurs as vein filling minerals and as secondary products in plagioclase crystals. K-feldspar shows microcline twinning and perthitic texture.

Ap. 4 Microscopic Observation of Polished Sections

P1: Au-bearing quartz vein

This polished section is composed of pyrite (40 vol. %), goethite (30 %), hematite (20 %) and small amounts of chalcopyrite, covellite and electrum as opaque minerals. Pyrite occurs as euhedral to subhedral, isolated grains up to 0.1 mm in size. Goethite occurs as aggregates of tiny anhedral grains and as anhedral, intersticial fillings with hematite, probably as secondary products. Hematite occurs as aggregates of anhedral grains up to 20 μm with goethite. Chalcopyrite occurs as anhedral grains forming veinlets of several μm wide and 0.15 mm long in quartz with covellite. Electrum occurs as anhedral, isolated grains up to 20 μm near open spaces in quartz grains.

P2: Au-mineralized granitoid

The polished section consists goethite and small amounts of pyrite, hematite, ilmenite and electrum. Goethite occurs as anhedral grains up to 0.1 mm in size, especially near pyrite and mafic minerals. Goethite might be decompositional products of pyrite and mafic minerals. Pyrite occurs as euhedral to subhedral grains up to 10 μm in size. Hematite occurs as anhedral grains up to 10 μm in size. Ilmenite occurs as euhedral grains of 40 μm in size. electrum occurs as anhedral grains up to 10 μm within grain boundaries and cleavages of constituent minerals of the granitoid.

P3: granitoid

The polished section is composed ofgoethite and a small amount of pyrite. goethite occurs as anhedral grains up to 0.1 mm in size filling cracks or replacing pyrite. Pyrite occurs as subhedral to euhedral grains up to 20 μm in size.

P4: felsic rock

The polished section consists of goethite and small amounts of hematite and ilmenite. Goethite occurs as aggregates of tiny anhedral grains or as framboidal grains forming concentric, rhythmic banding in open spaces. Hematite occurs as anhedral grains up to 20 μm in size with goethite. Ilmenite occurs as euhedral grains of 40 μm x 20 μm.

P5: quartz vein

The polished section is composed of goethite and a small amountpyrite. Goethite occurs as veinlets and networks. Pyrite occurs subhedral to euhedral grains altering to goethite up to 40 μm in size.

Ap. 18 List of the RAB Drilling Equipment and Amount of Consumed Materials

(Equipment)

Denomination	Model
Drilling machine	KL/150 RAB Rig
Compressor	250psi/600cfm compressor mount on 6 x 6 truck
Rod	ϕ 4"3/8
Truck	A 6 wheel drive support/water/fuel truck

(Consumed Materials)

Article	unit	Quantity
RAB hammer Tungusten cemented bit(110mm)	Pcs	4
RAB bit(110mm)	Pcs	15
Diesel	L	15000
Oil for rod	kg	6

LEGEND

REGORITH and LANDFORM

Depositional regime
- Fal Alluvial deposits
- GSfe Ferricrete

Erosional regime
- FPsp Deposits in flat plain
- GSsp Deposits in gegntle slope
- SSsp Deposits in steep slope or in breakaway

Erosional-Residual regime
- HRdu Duricrust on hill
- GSdu Duricrust in flat plain
- FPrk Saprolite

BEDROCK GEOLOGY
- G Medium grained muscovite biotite granite
- Ap Aplite
- Ga Hornblend gabbro
- road
- Pit
