# CHAPTER 6 WATER SOURCE DEVELOPMENT

#### 6. WATER SOURCE DEVELOPMENT

#### 6.1 General

This chapter discusses the potential water sources and their development for domestic water supply for the province of Sulu. More emphasis is given to the available groundwater because of its better quality and economical use as this can require minimal treatment or none at all. The potential of major rivers as possible water source were also considered.

A Groundwater Availability Map (also referred to as Hydrogeologic Map, Figure 6-1) for the province was prepared to identify areas or geologic formations with available groundwater. This was done through the correlation and evaluation of pump well and ground geology data to determine the groundwater potential of the different geologic units.

In its Rapid Assessment of Water Supply Sources, the National Water Resources Board (NWRB) classifies groundwater as shallow well, deep well, or difficult areas. Instead of using this classification, this study categorized groundwater availability in terms of the potentials and hydrogeologic properties of geologic units underlying the province.

Most of the data and information used in this study were obtained from the following sources:

- Mines and Geo-sciences Bureau (MGB),
- National Mapping and Resources Information Administration (NAMRIA),
- National Water Resources Board (NWRB),
- Local Waterworks Utilities Administration (LWUA),
- Local Government Units (LGUs),
- Provincial Planning and Development Office (PPDO), and
- Department of Public Works and Highways (DPWH).

Majority of the geologic reports and maps and some hydrogeologic reports were obtained from the MGB. Some water resources investigation reports and well data were gathered from the NWRB. These gathered data and information were supplemented by those gathered from field investigations and through questionnaires provided to the local government offices.

CHAPTER SIX

The Groundwater Availability Map may be used for provincial or even municipal level master plans and feasibility studies. However, certain investigations may have to be conducted prior to detailed design and implementation of the water supply work.

#### 6.2 Geology

#### 6.2.1 General Statement

Sulu Island consists of Pliocene to Quaternary volcanics and its erosional by-products. The volcanic mounds, lava domes, vents, cinder cones and other peaks are made up of Quaternary volcanic rocks (QV). The Quaternary Pyroclastics (QVP) overlies the Quaternary Volcanics

Recent deposits (R) include limited alluvial deposits, beach and swamp deposits, residual clays and corals.

The small islands are made up of either Quaternary Volcanics or limestone/corals.

Geologic information indicates that the Quaternary Volcanic Plains (QVP) can be considered as important groundwater reservoir in the area. The Quaternary Volcanics are generally hard and massive and therefore too tight to contain and yield significant amount of water.

Brackish or salt water is to be expected in some localities particularly those near the coast.

#### 6.2.2 Groundwater in the Geologic Units

The crystalline igneous rocks (QV) do not contain pumpable groundwater unless they are sufficiently fractured and/or weathered.

Groundwater in the Quaternary pyroclastic deposits (QVP) may occur both in unconfined and confined conditions.

Unconfined groundwater occurs within the sand and/or gravel.deposits of the recent alluvium (R).

The thickness of the fresh water lens in the different islands is governed by the island size, the hydraulic conductivity (permeability) of the aquifer materials and the amount and frequency of groundwater recharge. Larger islands will have thicker fresh groundwater than smaller islands. For small islands, fresh water is often the thickest in the middle or center part.

The following geologic units are present in the study area.

Recent Alluvium (R). This unit consists of limited alluvium, beach deposits, residual clays and corals. Sand, gravel, mud, and silt with some decayed organic matter are usually found along the river channels. Swamp deposits include organic matter, silt, fine sand and mud deposited along the shoreline. These deposits usually grade into reefs towards the shoreline.

·Well depths do not exceed 10m in most localities. Near the coast, the wells, mostly dug wells, are only a few meters deep. Only shallow hand-pumped wells and/or dug wells are recommended.

Saltwater intrusion is common in most of the wells near the coastline.

Quaternary Volcanics (QV). The volcanic cone central areas are reported to consist of Pliocene to Pleistocene hornblende andesite which is generally gray, massive and hard. The dacitic phases occur as lava flows. Agglomerates and ash flows also occur.

There are reported wells in this formation but springs are possible.

Pliocene to Recent Pyroclastics (QVP). This formation, consisting predominantly of tuffaceous sandstone, siltstone, shale, agglomerates and tuff, practically covers major portions of Sulu Island. The pyroclastic rocks are partly cemented to loosely compacted.

The aquifers occur as lenses and pods; of larger area when reworked. Groundwater occurs under water table (unconfined) and artesian (confined) conditions.

Several productive wells have been drilled in this formation. Available well records show well depths of less than 15 m to about 100 m. A 161 m deep well was reported in Barangay Tayungan in Panamao. Measured static water levels ranged from 3 m to about 46 m below ground surface. Reported actual capacities and actual specific capacities ranged from 0.32 to about 0.95 lps and 0.21 to more than 1.0 lps per meter of drawdown respectively. The low capacities of these wells can be attributed to improper well design and construction. In addition most of these wells are made of small diameter pipes. Properly designed and constructed wells will therefore be expected to give higher capacities.

Some springs with significant discharges may emanate from this formation.

#### 6.3 Groundwater Availability in the Province

The Groundwater Availability Map of the province is presented in Figure 6-1. Majority of the data used in the preparation of the map were obtained from the MGB and NWRB. The available well data by barangay are presented in Table 6-1 and the Well Location Map is shown in Figure 6-2.

On the map, each geologic unit is described separately as to their lithologic composition and their groundwater holding capability. The hydrogeologic properties are included in the explanation.

In general, the Quaternary Volcanics cannot be considered as dependable sources of pumpable groundwater. The Quaternary Pyroclastics (QVP) which underlie major portion of Sulu Island can be considered as potential sources of significant quantity of pumpable groundwater. The Quaternary Pyroclastics can be considered as both shallow and deep well area though most of the wells drilled in this formation are relatively deep.

The Recent deposits, which also include the young limestone/coral deposits, are shallow well areas.

For planning purposes, the different rock units in the province can be classified into the following in terms of groundwater availability. It should be noted that there are rock units wherein groundwater occur both in unconfined and confined conditions and can be classified as both shallow and deep well areas like those underlain by the pyroclastics (QVP).

- ♦ Shallow well areas. By definition these are areas having water-bearing formations where water can be withdrawn up to the depth of not more than 20 m from the ground surface. These are the areas underlain mostly by Recent Alluvium, Recent limestone/corals and Pliocene to Recent Pyroclastics (QVP).
- ◆ Deep well areas. In deep well areas, the aquifers exist to depth of more than 20 m from the ground surface. These can be found in areas underlain by QVP.
- ◆ Difficult areas. These are areas not suitable for well development. In the province the areas under this category are underlain by the Quaternary Volcanics (QV).

#### 6.3.1 Groundwater Quality

High EC or TDS levels are expected in wells completed close to the shorelines. Chloride concentrations followed a pattern similar to that of EC levels and were also expected to be highest near the shore/coast. On the smaller islands (<5km2), most of the wells may show brackish to saline EC levels. Spring and surface water sources generally have low total dissolved solid (TDS) levels.

Coliform bacteria are expected in most of the open dugwells currently used for drinking and washing. The construction of these wells provides no protection of the well from surface water contamination.

#### 6.4 Surface Water Sources

Because of the relatively small sizes of the islands comprising the province of Sulu, the bodies of fresh surface water here are limited to some perennial small rivers and creeks.

#### 6.5 Future Development Potential of Water Sources

#### 6.5.1 Groundwater

Based on the study of existing water sources, groundwater is considered as the safer and more economical source for future water supply requirements of the province.

Shallow hand-pumped and/or dug wells are possible source for Level I service and also for Level II in some places. Potential aquifers for shallow wells occur from less than 3 to 20 mbgs. One disadvantage of shallow well is its high susceptibility to direct infiltration of surface pollutants.

In general deep wells have better quality and invariable yields when developed with appropriate technology. It reduces the hazards of groundwater pollution. In this province the QVP have fair to good aquifers from 20m to less than 100m, may be more in some localities.

#### 6.5.2 Spring

Although their yields of springs in this province may be minimal, they are viable water supply sources particularly in areas with difficulty in getting water from wells.

#### 6.5.3 Surface Water

In areas where there are difficulty in getting potable water both from wells and springs the small perennial rivers and creeks can be considered as alternative sources for water supply.

# CHAPTER 7 FUTURE REQUIREMENTS IN WATER SUPPLY AND SANITATION

### 7. FUTURE REQUIREMENTS IN WATER SUPPLY AND SANITATION

#### 7.1 GENERAL

The future requirements of each Municipality was evaluated base on its current condition of existing water supply system and sanitation facilities. The proposed development was also based on respective LGU's priority service areas, water source(s) availability, and service area population. For other LGUs with no data generated, evaluation was made from extrapolated data from other LGUs with similar case and profile.

#### 7.2 Targets of Provincial Sector Plan

The master plan aims to provide a ten year design period for water and sanitation project in the Province of Sulu. Implementation of the project is assumed to be undertaken in two phases, Phase I will cover the needs of the province from year 2005 to 2010, and the second Phase from 2010 to 2015. Table 7-1 summarizes the target for the water and sanitation projects.

Table 7-1 Provincial Sector Targets

	65%	15	100%	16	100%	17

The projected service coverage was calculated based on the 2003 existing facilities and on-going as well as planned projects. Considering the condition of existing water system(s), the water sector targets were classified as urban and rural area (as determined by NSO). Tables 7-2, 7-3, and 7-4 shows the base year coverage of water supply and sanitation facilities.

#### 7.3 Projection of Frame Values

#### 7.3.1 Population Projection

Future population for all municipalities was projected for the target year 2005, 2010, and 2015. The references used in the projection were the census data for the year 1980, 1990, 1995, and 2000. The NSO 1995 to 2005 population projection was also used as reference and was integrated with the past trends. Population projections for the municipalities comprising the Province of Sulu as classified into urban and rural are shown in Table 7-5

Table 7-5 Future population by Urban and Rural Area by Municipality

**CHAPTER SEVEN** 

Future Requirements in Water Supply and Sanitation

#### 7.3.2 Public Schools and Public Utilities

Projection of the number of public schools was made using available data on provincial total number of students and number of schools per municipality. Thus, the ratio of the number of students to total number of schools was correlated to come up with the projected number of students and schools per municipality. Projection of the number of public utilities per municipality was made based on its annual population growth rate.

#### 7.4 Types of Facilities and Implementation Criteria

#### 7.4.1 Water Supply

#### A. Urban Water Supply

#### Service Level

The levels of water service for each municipality were determined based on the different considerations as mentioned in section 7.1. Generally, level III water system is appropriate for urban areas. However, levels II and I facilities do not mean to exclude from being implemented in urban areas in the future as individual cases.

#### Utilization of existing facilities

The existing Level I and II facilities are considered to be utilized during Phase I period. However, the population served by these facilities are assumed to be absorbed by level III service in Phase II.

#### <u>Water Source</u>

Most of the existing level III systems are utilizing deep wells. In this context, deep well source is used as the primary source in the project development plan, wherever applicable.

#### Number of System

Generally, there is one Level III system considered for each municipality. Whenever Level III system exist in the municipality, the future requirements are considered as an expansion of the existing system, otherwise a new system was considered.

#### Rehabilitation

Rehabilitation of existing and future facilities is assumed to be undertaken by the operating organization or individual.

#### B Rural Water Supply

#### Service Level

The level I systems are generally planned for rural areas where houses are scattered. Service level standards are set at 15 households per source for level I and 5 households per communal faucet for level II. Application of level III in rural areas may be considered base on actual needs during implementation phase.

#### Utilization of existing facilities

The existing facilities of all water system levels will be use and integrated in the future development plan.

#### Water Source

Generally, shallow/deep wells are recommended for level I and deepwell for level II wherever applicable, in view of safety against possible contamination and sustainable water supply. Conventional construction method (driven well) may be employed under the favorable substrata or hydrogeological conditions. Standard specification of shallow and deep wells are summarized in Table 7-6.

Table 7-6 Standard Specification of Level I Wells

Specification	Shallow Well	Deep Well
Construction Method	Open-hole	drilling and gravel pack
Casing Diameter	50 mm	100 mm
Borehole Diameter	150 mm	200 mm
Ranges of well Depth	20 m	<20 m

Spring development is also considered in level I and II specifically for municipalities where groundwater potential are very limited. However, the distance of the proposed spring that will be developed should be located within economic distance from the proposed service area. As an

initial basis, potential spring source(s) must be located within 2 km. to 3 km form proposed service area.

#### Number of System/ Facilities

The number of level I shallow wells and the number stand faucets for level II.were estimated using the service level standard set.

#### 7.4.2 Sanitation

The type of toilet facilities depends on the service level of water supply within the community. However, a typical pour-flush type will be considered for general use.

#### 7.5 Service Coverage by Target Year

#### 7.5.1 Water Supply

The service coverage in terms of population to be served by target year was estimated by urban and rural area by municipality. Additional service coverage for Level II and/or III are considered as expansion of the existing systems. Rehabilitation and improvement shall be shouldered by the water service provider.

Every Poblacion of all municipalities with existing Level I shall be upgraded to Level II. Other barangays shall be served with Level I. Existing and additional service coverage through Phases I and II is based on the following assumptions:

Existing Coverage:

System	Present Coverage
Level I	40% of service population
Level II	50% of service population, unless actual number of connection is available
Level III	50% of service population, unless actual number of connection is available

Additional Service Coverage:

System	Addit	ional Coverage
	Phase I (Year 2005-2010)	Phase II (Year 2010-2015)
Level I	50%	60%
Level II	50%	60%
Level III	50%	60%

Table 7-7 shows the population to be served by target years. For the Phase I period, a total of 160,315 persons in the province will served by additional water supply services, of which 38,555 persons or 24% of the total will be urban population and 121,760 persons or 76% will be for rural population. For Phase II a total of 101,114 additional persons will be served. From this total, 31,991 will come from the urban population and 69,123 will be for rural population (corresponding to 32 % and 68% respectively of the total additional population to be served.

#### 7.5.2 Sanitation

#### Household toilets:

The household to be served by different types of sanitary facilities is estimated by urban and rural area by municipality.

Existing service coverage was assumed at an average of 40% of the number of households based on provincial data on sanitation. Additional service coverage based on provincial targets shall be 80% of households for Phase I and II.

The succeeding Table 7-8 shows the additional number of households by target years. For both Phases, pour flush type toilets shall be utilized in areas with proposed or existing Level I and II systems while automatic flush type shall be used in areas with Level III systems.

The projected number of served households at the end of Phase I period is 50,257. Additional number of households to be served totaled to 27,667, of which 13,287 or 34% are urban households and 14,028 or 51% are rural households. At the end of the Phase II period, the projected number of served households is 54,100 with an additional household to be served of 31,226.

Anadditional Population to be served         Total         Total         Total           803         4,898         7,949         13,650         60,912           90         0         1,501         1,501         7,091           90         0         1,501         1,501         7,091           90         0         1,501         1,501         7,091           90         0         0         1,501         1,201         0           90         0         0         0         0         0         0           1,130         0         0         0         0         0         0         0           0 </th <th>Phase I (2005-2010)</th> <th>005-2010)</th> <th></th> <th></th> <th></th> <th></th> <th></th> <th>Phase II</th> <th>Phase II (2010-2015)</th> <th>5)</th> <th></th> <th></th>	Phase I (2005-2010)	005-2010)						Phase II	Phase II (2010-2015)	5)

#### Public School and Public Toilet Facilities

The additional number of public school toilets are based on the present number of schools with toilet facilities and projected based on the increase in the number of students by municipality.

Public toilet facilities are projected based on existing number of public utilities with sanitary toilet facilities. Table 7-9 shows the corresponding projections, where the additional number of public schools and public utilities is equal to the number of additional toilet facilities:

#### 7.6 Facilities and Equipment to Meet the Target Services

#### 7.6.1 Water Supply

The required facilities for each water level service were estimated based on the existing condition and the projected served population for all service areas and broken down into two(2) phases of implementation. The number of service connections (Level III), public faucets (Level III), and shallow/deepwells as point source (Level I) are presented in Table 7-10, and shown in Figure 7-1 and 7-2 for Phase I and II respectively.

#### 7.6.2 Sanitation

Future requirements on the number of household toilets were estimated based on the additional number of households to be served both for urban and rural population by municipality. Likewise the future requirements for public school and public toilets were estimated based on the projected increase in the number of public school and public utilities. Table 7-11 presents the required sanitary household facilities, and is shown in Figure 7-3 and 7-4 for Phase I and II respectively.

## CHAPTER 8 INSTITUTIONAL STRENGTHENING PLAN

### 8. INSTITUTIONAL STRENGTHENING PLAN

### 8.1 General

This Chapter recommends the initial mechanisms, processes and structures needed to achieve the goals and targets of the sector.

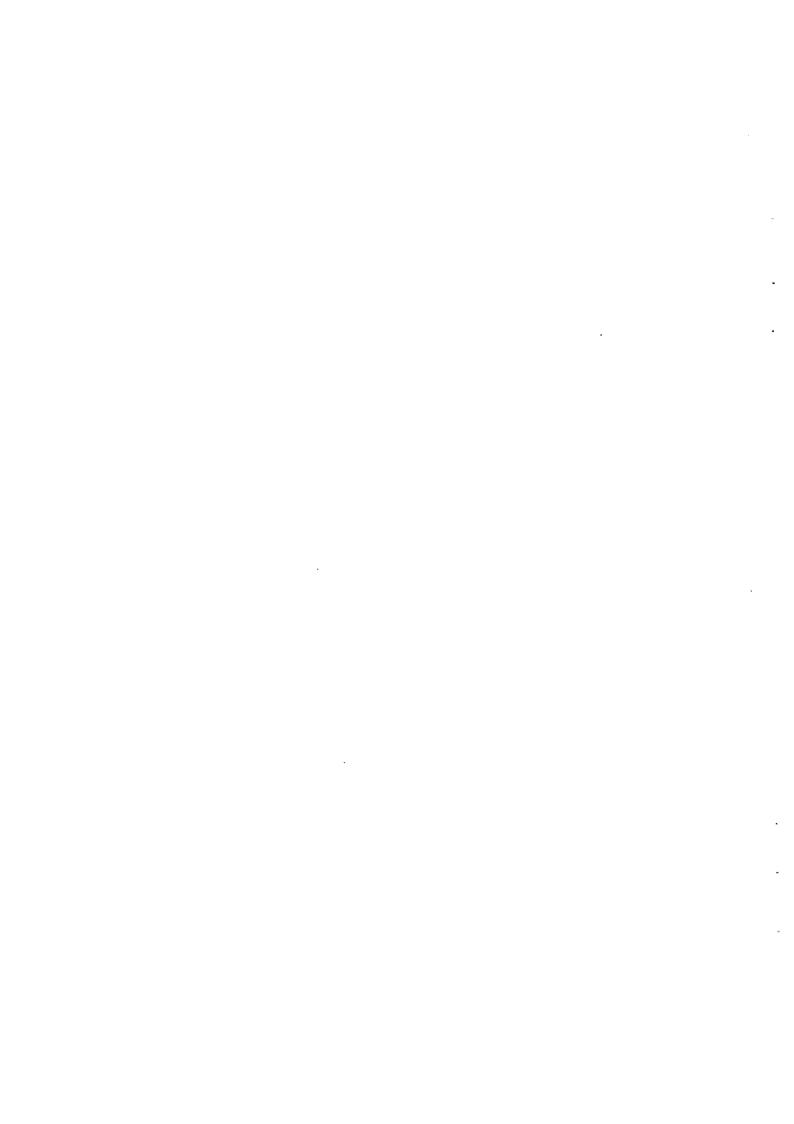

### 8.1.1 - Development Framework for the Sector

One basic institutional deficiency at the local level is the absence of a common goal and strategy for the sector. The Province has to set the specific goals, objectives/targets and strategy for the sector. While the province has a Physical Framework Plan, this is not sufficient to establish sector priorities and considering the problems besetting the sector, the province needs identify priority activities that must be funded.

### 8.1.2 Operating Policies

The following general policy and strategy statements as established already in the PW4SP could form the initial policy set for sector for adoption and approval by the Provincial Government:

- Sustainability shall be promoted through community-based organizing, training and information dissemination to increase willingness to organize, willingness to pay and willingness to learn O&M of facility;
- Criteria for selection and prioritizing projects to the community should consider sustainability factors and should be based on the demonstrated commitment of the beneficiaries to participate in the project, the current needs for water and sanitation and overall health conditions, potentials for growth and costs;
- Appropriate service level shall be determined based on sustainability parameters, goals
  and purposes of the Province, the needs of the community based on demographics and
  demonstrated capacity and willingness to participate in the project by the communities;
- Technology to be used for the projects shall be appropriate to the local conditions and resources. Upgrading of existing systems and facilities will be promoted based on needs of the community. In urban areas, a range of technologies may be needed integrating wastewater collection and treatment, as well as drainage;

- All projects developed by the LGU must involve an integrated approach to the provision of potable water supply, sanitation and hygiene education;
- ♦ Cost Recovery and Cost Sharing (Subsidy Policies). The LGU shall enforce a rational and consistent policy on the application of subsidies and loans for water supply and sanitation;
- Private Sector Participation policies and incentives shall be primarily encouraged, but regulated by the LGU. The LGU should take measures to institutionalize its regulatory functions in order to regulate private water service providers;
- In terms of financing, capital costs generally used to construct water supply projects shall be financed mainly out of the concerned LGU's own resources given that in ARMM, non-devolved services provide the LGUs with surplus funds;
- Concerns for environmental protection and management including water pollution control, conservation and proper utilization of water and land resources should be part of the LGU's programs;

Policies to be formulated should be gender-responsive. The different aspects of the sector project – technical, economic, financial, institutional and community participation – should provide for equal participation of women and men in the beneficiary community.

### 8.1.3 Regulatory Policies

In coordination with appropriate national and local agencies, the LGU shall endeavor to set up a coordinated regulatory framework on the following:

- Water allocation and water rights policies and rate review, which are within the mandate of the National Water Resources Board.
- Water Service Providers Registration/Accreditation The LGU shall adopt a registration and franchising system for water service associations/ providers. Annual reporting requirements will have to be established for monitoring and auditing purposes.

• Water Quality - The LGU will have to establish a viable mechanism, including water testing and standards enforcement, to ensure that water delivered meet the potability standards set by the National Drinking Water Standards. The DOH currently has the responsibility and the regulatory power to stop the operations of water systems not delivering potable water. The LGU shall establish Water Surveillance Program thru the creation of a Local Drinking Water Quality Monitoring Committee (per Implementing Rules and Regulations of Chapter II, Water Supply, of the Code of Sanitation of the Philippines, P.D.856).

### 8.2 Institutional Arrangements

In the medium-term, a full-time Provincial (WATSAN) Sector Team (PST) to provide a focal point in the Province shall be set up for coordination, monitoring and institution-building. The LGU should ensure that adequate logistics and incentives are provided. This may be replicated at the municipal and barangay level of the LGU.

In the long term, the PST may be formed as a Provincial Water and Sanitation Office (PWSO) under the office of the Chief Executive of the LGU. For LGU-run water systems, this would be the office of the economic enterprise within the LGU with duties and functions beyond coordination and monitoring. It would become the focal point of WATSAN activities of the Province and coordination and monitoring of all WATSAN activities would emanate from that office. It would also be the regulating arm of the Province for all WATSAN activities within its provincial jurisdiction. This should be replicated at the municipal level. A PMO for water supply and sanitation at the DILG-ARMM to provide technical and managerial assistance in the formative years of the PST/PWSO is highly recommended to be set up.

Both the Province and Municipality may set up such a Team (for the medium-term) or Office (for the long-term) in their respective LGUs.

With the devolution of water supply and sanitation to the LGU, the DPWH-DEO-ARMM may still provide technical services at cost and in competition with other private contractors. Sharing of resources (equipment and staff) with the LGU at cost may be looked into subject to policy decision and guidelines approved at the national level.

The initial professional-level staffing of the PST/PWSO is estimated, as follows:

<b>\$</b>	Provincial Water Supply & Sanitation Coordinator	1
<b>♦</b>	Community Development, Gender & Training Specialist	2
<b>\</b>	Water Supply & Sanitation Engineer	2
<b>\$</b>	Monitoring and Evaluation Specialist	1
<b>*</b>	Total Personnel Required	6

The recommended roles for the various staff positions are as follows:

- ◆ The Provincial Waterworks & Sanitation Coordinator shall lead an interdisciplinary Provincial Sector Team, shall be responsible for coordination and supervision of all development planning, implementation, monitoring and evaluation, database development and progress reporting of all activities in the water supply and sanitation sector, shall also liaise with all project implementers and key players in the sector and shall be the key contact person of the DILG for WATSAN concerns.
- ♦ The Community Development, Gender and Training Specialist shall be responsible for implementing community organizing and community participation aspects of the sector with a gender-responsive approach, shall be responsible for developing and implementing community-based programs and activities for the sector in the various barangays and municipalities, including criteria for community and site selection, conducting regular dialogues and disseminating information among local leaders on water supply, sanitation and health and hygiene education program province-wide, shall oversee accreditation of community-based organizations responsible for the water supply and sanitation facilities, and shall annually review past training programs and develop and implement the province's training programs for water supply and sanitation, hygiene and sanitation education, and community organization and development, including any manuals or other training materials used.
- The Water Supply and Sanitation Engineer shall be responsible for all the technical aspects of the project including feasibility studies, design, construction, operation and maintenance, review of the existing technical and environmental situation relating to WSS facilities, proper construction supervision and monitoring in coordination with the municipal liaison, adequate maintenance of LGU equipment and tools for water and sanitation facilities, including drilling rigs and vehicles supervise major repair or

rehabilitation work beyond the capacity of communities to undertake and implement, in coordination with the IPHO, the water quality surveillance system.

The Monitoring and Evaluation Specialist shall assist the Coordinator in all monitoring and evaluation activities including development of database and data processing and reporting for baseline, monitoring and evaluation data.

The same can be done at the municipal level, with the Municipal Waterworks and Sanitation Coordinator also acting as Sector Liaison for the municipality to the Province.

At the barangay level, the Barangay Councils will continue to play a major role in fulfilling the community's aspirations for improved water and sanitation services. It will play a key role particularly in the preparatory stages before the organization of the association (or the appointment of the responsible group). By default, many of the previously failed systems have ended up as responsibilities of the barangay councils. Although the Councils will not have any supervisory role over the associations operating the water systems, it is important that they monitor the performance of the associations.

### 8.3 Project Management Arrangements

### 8.3.1 Levels I and II

The Project Selection. A community-responsive approach should be used as primary process for project selection. The initiative of the community should be encouraged. All barangays should be properly and consistently informed about sector opportunities and policies by the Provincial through its municipal LGUs. The barangays should take the first step by assessing their needs, deciding that they want to improve their water and sanitation above all other needs and express this needs to the Municipal LGU's WATSAN Unit. The barangay should also decide on desired service levels, with a full understanding of the cost recovery aspects and other responsibilities.

Organization of associations. More flexibility is needed in order to tap into local community resources. The basic principle is for the community to agree on what type of organization, association, community-based organization, cooperative, etc. they want to form in preparation for accepting the responsibility for the facilities. Existing community-based groups with an active track record and with leaders and members who are ready, willing and able to take on the

O&M functions may be tasked with the responsibility for the facilities. LGUs will assess the readiness of the communities and approve the arrangements and accredit the organization. Failure of community-based organizations to live up to their responsibilities can be grounds for removing their accreditation and giving the responsibility to another accredited group. The organization can decide how to organize itself internally in coordination with the municipal liaison ensuring that roles, responsibilities and accountabilities are adhered.

Technology and Technical Design Standards. The former Rural Waterworks Development Corporation (whose functions were absorbed by LWUA) and the DPWH have developed a simplified procedure for conducting the initial data gathering. The format used is recommended for adaptation by the LGUs. These forms can also be revised to suit the specific needs of the LGU.

For Level II systems, technical standards have been in use by LWUA for RWSAs and by DPWH. As these are considered as national standards, their adoption is recommended.

### 8.4 Community-Based Organizations

The traditional view of communities as mere beneficiaries and recipients of projects has been undergoing changes and transformation in recent years through the policy reforms and transition in the sector. Communities are now provided avenues for more participation in terms of decision-making and initiation of resolution of issues in critical aspects of the sector's project management and implementation.

This implies the need for the LGU to establish an institutional mechanism at the provincial and municipal levels to enhance trust and confidence of communities on its ability for provision of such basic services as water supply and sanitation. Communities will be encouraged to collectively take stock of their resources and constraints and agree on a development program appropriate for their needs.

The LGU shall promote the participation of NGOs, people's organizations (POs), and community-based organizations (CBOs) to catalyze the involvement of women, youth, people's organizations (POs) and other segments of the community in project decision-making and management. It will focus on the role of women in the context of the design of institutional arrangements at all levels. Towards increasing community involvement, the LGU shall develop

a community-based implementation strategy and delivery mechanism to ensure the sustainability of sector projects. It shall review the roles and responsibilities of central and local government, NGOs, the private sector and communities themselves. It shall assess the community participation activities and related institutional arrangements of past community projects and recommend workable community participation approaches.

### 8.5 Human Resource Development

The main objective for training human resources is to improve individual competence, organizational effectiveness and efficiency, and espouse national development. Training is a function and a responsibility of every leader. It ensures the availability of qualified and able manpower, the shortage of which is considered as one of the major obstacles to improvements in the water supply and sanitation sector.

Training shall be designed and implemented for implementers, planners from national level to regional to LGUs and down to the community level. Needs Assessments will be conducted as the basis for the design of the courses. Participants will be selected based on the their tasks and responsibilities. The PST/PWSO shall establish and maintain a reference library and information/documentation center and shall include training materials and equipment to service needs of the municipalities. The DILG-ARMM shall provide inputs to these training activities.

The LGU role is not to run courses but to ensure that training programs take place and are effective. Actual training activities may be organized or contracted out to well-functioning water districts and government-accredited training, technical and vocational schools. Training may cover but should not be limited to the following areas: source development principally for deep wells, shallow wells, spring development and surface water intake structures, operation and maintenance, plumbing and pipe-laying and basic hydraulics, bookkeeping and management and special courses for water and sanitation caretakers.

### 8.6 Health and Hygiene Education

The LGUs shall establish an on-going hygiene education program through appropriate methods and channels. These shall include immediate short-run programs: information campaigns; as well as, long-term value formation interventions, possibly through the formal school system. Household and individual hygiene practices, such as hand washing, in house water storage, etc.,

are part of benefit assessment since these are part of improvement in lifestyle and practices. Three approaches are recommended:

- Community-based Approach: Direct house-to-house campaigns can be implemented through the Rural Health Units as part of their current functions. Special presentations can also be done during the regular meetings of community-based socio-civic clubs. Multi-media presentations may be developed and prepared for information dissemination and campaign.
- School-based Approach: Students are the main targets of this approach, either directly or through their teachers. Special focus activities, such as Water and Sanitation Week or Nutrition Week can be introduced with programs or convocations to make the student aware of the issues and solutions. Posters, flip charts, and other audio-visual materials would be helpful.
- Media-based Approach: This approach utilizes radio and print media to introduce and reinforce health messages. Many NGOs and the Philippines Information Agency (in coordination with the DOH) have developed interesting and attractive materials.

The community development specialist at the PST/PWSO shall be given the responsibility for the health and hygiene education function. The CDS will formulate an action plan; implementation will be done with the municipal liaison staff and other local officials. At the barangay level, its implementation will involve the close coordination among the midwives, the barangay health workers and the Committee on Health of the barangay council. Materials for this efforts have been previously developed and can be found with the various PHOs and RHUs. UNICEF has provided strong support in the preparation of these materials.

A continuous health and hygiene education program will be launched by the LGU. Simple, clear messages and approaches will have to be defined. These messages may include the following: Relationship among health, water supply and sanitation; sector opportunities; services available at the rural health units. For Levels I and II systems, the protection of household storage containers from contamination; hand washing; conservation; pay bills/fees on time; etc. The relevance of these, or other messages will have to be determined by the PST/PWSO.

### 8.7 Gender and Development

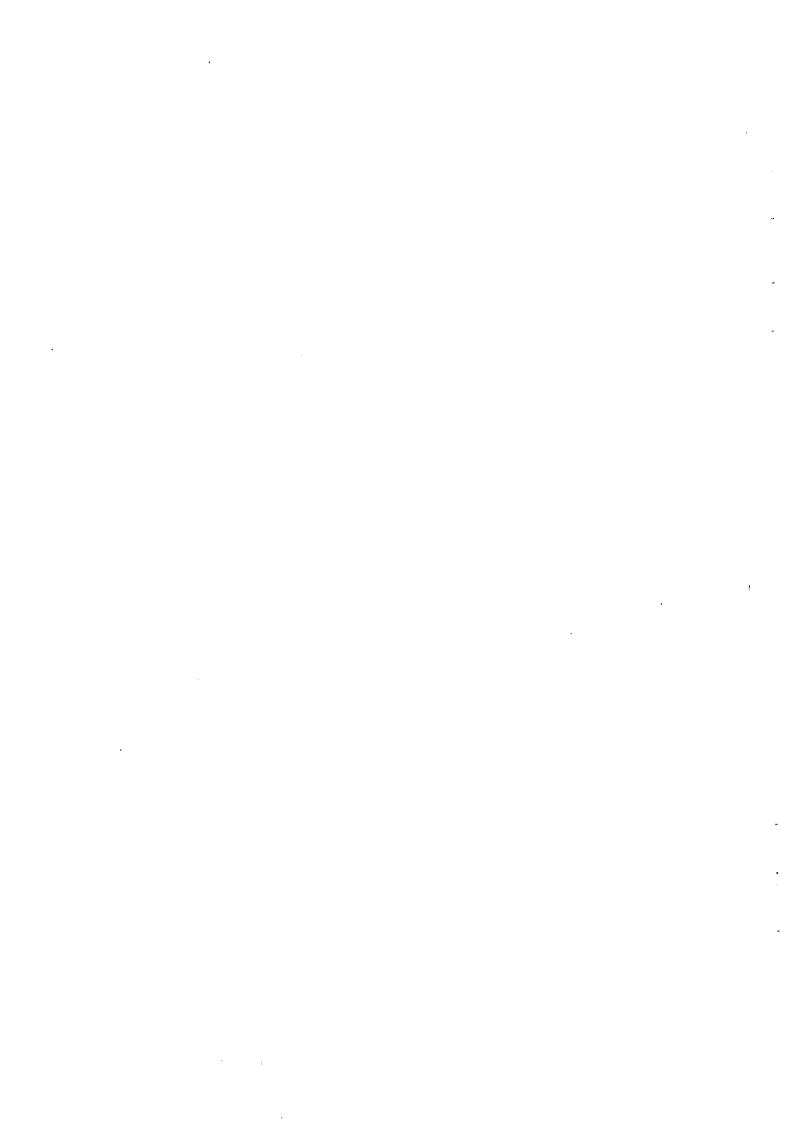

Consistent with the national policy of fundamental equality of men and women before the law, as well as of providing equal opportunities to both genders, the water supply and sanitation sector shall promote the full participation of men and women in all the phases of the project development cycle. Sustainability of the WATSAN facilities shall be achieved through the partnership of men and women, and their total involvement in its management, operation and maintenance. The socio-cultural norms and practices in the Province, however, should be taken into consideration in conceptualizing gender-responsive influences in the WATSAN institutional set-up in the Province. Nevertheless, women should be encouraged to participate in all aspects and phases of the project cycle.

A gender-responsive approach should consider the following:

- The training of the LGU officials and employees from the regional, provincial, municipal and barangay levels on gender and development.
- ♦ The conscious integration of gender concerns in all aspects of project development, that is, from project identification, planning, design and implementation, where the unique needs and requirements of both genders are recognized.
- The equal representation and distribution of responsibilities to the men and women of the beneficiary community, particularly in sharing work, making decisions, cooperation and control of activities such as but not limited to institutional and CD structures and processes, the organization and management of the WATSAN facilities, the training of managers, operators and maintenance personnel.

To provide the LGU insight on how to conceptualize gender-responsive approaches in the Province, it shall conduct a provincial survey to review the role of women in the context of the design of the community participation structure of the project. The review shall include: brief overview of women's socio-economic situation and their role in water and sanitation; gender analysis; analysis of relevant NGOs, women's groups and private agencies that will support community and women's activities; assessment of support action for women's participation essential for project sustainability; and proposed steps to enhance women's role and participation in the project.

CHAPTER 9
COST ESTIMATES FOR FUTURE
SECTOR DEVELOPMENT

## 9. COST ESTIMATES FOR FUTURE SECTOR DEVELOPMENT

### 9.1 General

The total investment cost required for the two phased implementation as identified in Chapters 7 and 8 is defined to include direct costs for construction of required facilities and sector management, as well as physical and price contingencies. Cost requirements for the equipment and vehicle are considered for O& M and long-term development.

Conditions and assumptions used to come up with investment costs covering all sub-sector components were established in coordination with concerned provincial and municipal LGUs and to current standards of relevant sector agencies like the DILG, LWUA, DOH and DPWH.

With regards to construction cost, unit costs per person/household facility were prepared under contract-out basis for respective sub-sector component facilities in current 2003 price levels.

### 9.2 Assumptions for Cost Estimates

### 9.2.1 Unit Construction Cost

Unit construction cost per person (household or facility) of each sector component was established based on current standard unit cost of relevant sector agencies and typical standards developed for previous PW4SP as contract-out basis in 2003 level. Referred cost data are from DILG (urban/rural water supply and sanitation), LWUA (urban water supply) and DOH (sanitation). For price adjustment of price indices, the DTI price index for 2003 was referred to.

Unit construction costs consist of direct cost (mobilization/demobilization, material and labor), indirect cost (profit and inclusive taxes) and government expenses (detailed engineering and institutional development.

Freight cost of construction materials, excluding locally available materials such as sand and gravel, was considered for sanitation and water supply facilities in consideration of the hauling distance from Manila. The cost is estimated as fixed percentage (11%) based on the standard practice being adopted by other agencies. Table 9.1 shows a summary of unit construction costs and their descriptions are given in the succeeding paragraph, and detailed costs estimates per facility component are shown in Appendix 9.2.1 to 9.2.13.

Table 9-1 Unit Cost of Facilities by Type and Service Level

		Unit Construction	Service Co	overage	Unit	Cost

— ınit			***************************************	1	N/A	653
Sa	Public School Toilet	271,000	N/A	N/A	N/A	0
L	Public Toilet	342,000	N/A	N/A	N/A	0

### Urban water supply

- Unit cost for two sizes of Level III system covering served population of 5,000 and 10,000.
- Unit cost for Level III was estimated utilizing deep well sources. In case of spring source, it is desirable to confirm transmission lengths during the implementation stage.

### Rural water supply

- Unit cost for five types of Level I wells (shallow wells at 10 and 20m depths and deep wells at 30, 50 and 70m depths).
- Unit cost for deep well was estimated using open-hole gravel packed method. Natural gravel pack wells may be considered only after initial implementation when soil formation in prospective sites shall have been established and identified. Facilities requiring appropriate Iron Removal System, and its cost, will be identified during the detailed study.
- ♦ Unit cost for Level II system covers 600 served population.

### Sanitation

- Unit cost for two types of sanitary toilets, the flush and the pour flush to accommodate
  one served household in urban and rural areas. Cost of toilet includes only the cost of
  toilet bowls or water closet.
- Public School Toilet: unit cost includes the whole structure, septic tank and facilities. One toilet is designed with three squat type and two sit type toilet bowls to cover 250 served students. The structure is made of concrete materials, GI roofing, tiled floor and walls (part) and painted. The unit cost also includes one shallow well.
- ♦ The Public toilet unit cost includes the whole structure, septic tank and facilities: One toilet is designed with six toilet bowls and three urinals. The structure is made of concrete materials, GI roofing, tiled floor and walls (part) and painted.

### Price Escalation

♦ PW4SP price level in 1999 was escalated to current 2003 prices at 2% per annum.

### Unit Cost of Equipment

The unit cost of equipment shown below was prepared based on current standard procurement cost.

Name of EquipmentUnit Cost (Pesos 1,000)Truck-mounted rotary drilling machine34,978Truck-mounted percussion drilling machine27,691Well rehabilitation equipment303Service truck with crane1,299Support vehicle (Pick-up with winch)1,485

Table 9-2 Unit Cost of Equipment and Vehicle

### Sector Management Cost

Sector management cost consists of: the following:

- Engineering studies (F/S, D/D and construction supervision) for water supply, public toilet and school toilet facilities. Community development and training including health and hygiene education and logistic support.
- Cost of engineering studies was estimated based on fixed percentages of 9% for F/S and
   D/D and 4% for construction supervision of the total direct cost
- Community development and training with logistic support was also estimated at 12% of
   respective construction costs for rural water supply and sanitation and 3% of construction cost for urban water supply and sanitation.
- Contingency cost covers both physical and price contingencies for water and sanitation facilities. Physical contingency is assumed to be 15% of the direct construction cost.
   Price contingency is assumed to be 10% of the direct cost and physical contingency.

## 9.3 Cost of Required Facilities and Equipment

The total construction cost of required facilities as public investment of LGUs are shown in Table 9-3 and 9-4, tabulated investment cost for Phase I and Phase II respectively.

During the 2005 Medium Term Development period, a total of (PhP) 981.985 million will be required for construction of required water supply and sanitation facilities. Of the requirements, the total required cost will be distributed at 19% for urban water supply and 74% for rural water supply and the remaining 7% will be required for urban and rural sanitation.

Details of development cost per facility as broken down in municipalities are shown in Appendix 9.3.1 to 9.3.15 and Appendix 9.4.1 to 9.4.15, for Phase I & II respectively.

The number of sets of equipment required was estimated based on the town clustering of the province. In the province of Sulu, two (2) clusters of Municipalities were made. Cluster I consists of the municipalities within the mainland Sulu (10 municipalities) four (4) sets of equipment are allocated. Cluster II are the island municipalities (8 in all) three (3) sets of equipment is allocated. The total cost of equipment to be procured by the province is shown in Table 9-3.

Table 9-5 Equipment Requirement/Cost (P x 1,000)

Name of Equipment	Quantity	Unit	Unit Cost	Total Cost
Truck-mounted rotary drilling machine	7	set	34,978	244,846
Truck-mounted percussion drilling machine	7	set	27,691	193,837
Well rehabilitation equipment	7	set	303	2,121
Service truck with crane	7	set	1,299	9,093
Support vehicle (4-wheel drive Pick-up)	7	set	1,485	10,395
Total Equipment Cost				460,292

CHAPTER 10
INVESTMENT PLAN AND FINANCIAL
ARRANGEMENTS

## 10. INVESTMENT PLAN AND FINANCIAL ARRANGEMENTS

### 10.1 Criteria for Selecting Projects/Areas

In the province of Sulu, majority of the municipalities are in need of assistance for the improvement of their respective water supply and sanitation facilities. The prioritization and selection, however, depends on various factors. Tables 10-1 to 10-3 respectively list the technical, socio-economic, and financial criteria established and considered during the course of this study. The criteria, however, were not fully used primarily due to lack of data and information for making the selection. These criteria may be used by JICA in its future project selection.

Table 10-1 Technical Criteria for Project/Area Prioritization

PARAMETERS	INDICATORS	CRITERIA	POINTS
Water system existing level of service	Presence of existing Level III service	With less existing level 3 service	No existing Level III: 5.0; With existing Level III: 1.0
Availability of water source	With available water sources	Have abundant water sources	=>2 abundant sources: 5.0; < 2 abundant sources: 1.0

Note: Point System: High Priority = 5.0, Low Priority = 1.0

Table 10-2 Socio-economic Criteria for Project/Area Prioritization

PARAMETERS	INDICATORS	CRITERIA	POINTS
Capacity to Pay	Average Income, Average Water Rate	Ratio of Income to Water Rate (3% or less)	3%: 5.0; >3%: 1.0
Peace and Order . Situation	Crime Rate	With Low Rate in the area	10/1000 population: 5.0 >10/1000 population: 1.0
Health	Water-Borne Diseases Morbidity and Mortality Rates	With highest rates	10/1000 population: 5.0 >10/1000 population: 1.0
Access by the Poor	Number/percentage of poor in the area, Poverty Incidence, Average Household Monthly Income	Highest percentage of poor in the area	Ave. HH Income=< Poverty Level Income: 5.0;  Ave. HH Income > Poverty Level Income: 1.0
Served vs. Unserved Population	Percentage of Unserved population in the area	With highest % of unserved in the area	=>50% unserved: 5.0 <50% unserved: 1.0

Note: Point System: High Priority = 5.0, Low Priority = 1.0

Table 10-3 Institutional/Financial Criteria for Project/Area Prioritization

PARAMETERS	INDICATORS	CRITERIA	POINTS
	Collection Efficiency (%)	Highest Collection Efficiency	80%: 5.0 <80%: 1.0
Willingness to Organize	Number of Functioning Community Organizations	With 2 or more functioning organizations	=>2: 5.0 <2.0:1.0
Willingness to Learn and to O&M Facilities	Level of Educational Attainment and Training of Population	Population has Mostly College Graduates	=>60% of population are college graduates: 5.0; <60%: 1.0

Note: Point System: High Priority = 5.0, Low Priority = 1.0

## 10.2 Identification of Priority Projects for Medium-Term Development Plan

In the province of Sulu, almost all towns are in need of assistance for water and sanitation improvement. Likewise, potential water sources are also available in each locality. Based on the investment cost presented in Chapter 9, the viability of each town shall depend on its financial evaluation.

The towns of Sulu were ranked based on the aspects of accessibility of the project area, type of proposed water service, and number of potential served population. The ranking of municipalities are shown below.

From these identified potential projects, a feasibility study shall be conducted to evaluate the priority projects in terms of its requirements and viability. Basically, first level of priority is given to projects with positive feasibility indicator.

**APPENDICES**
