

**THE STUDY FOR IMPROVEMENT PLAN OF LIVESTOCK
FARMING SYSTEM IN RURAL AREA
FINAL REPORT**

TABLE OF CONTENTS

Preface
 Letter of Transmittal
 Location Map
 Photographs of the Study Area
 Summary
 Table of Contents
 List of Tables and Figures
 Abbreviations

CHAPTER 1 INTRODUCTION

1.1	Background of the Study and Objectives of the Study.....	1 - 1
1.2	Method of the Study	1 - 1
1.3	Study Area	1 - 3
1.4	Report Presented through the Study	1 - 3

CHAPTER 2 ACTUAL CONDITION OF STUDY AREA

2.1	General Condition	2 - 1
2.2	Natural Conditions	2 - 2
2.2.1	Climate.....	2 - 2
2.2.2	Topography	2 - 2
2.2.3	Geology	2 - 3
2.2.4	Hydrogeology	2 - 5
2.2.5	Water Quality	2 - 10
2.2.6	Groundwater Potential Evaluation	2 - 15
2.3	Social and Economic Conditions	2 - 16
2.3.1	Population and Employment.....	2 - 16
2.3.2	Economic Activity	2 - 17
2.3.3	Livestock Farming.....	2 - 18
2.3.4	Social Infrastructure	2 - 20
2.4	Rural Society	2 - 21
2.4.1	Local Government Capacities.....	2 - 21
2.4.2	Economic Situation of herders.....	2 - 22
2.4.3	Herder Communities.....	2 - 25

2.5	Livestock Farming.....	2 - 27
2.5.1	Livestock Farming in the Study Area	2 - 27
2.5.2	Vegetation and Carrying Capacity	2 - 30
2.5.3	Water Supply Facilities for Livestock	2 - 46
2.5.4	Problem of Market, Transportation, and Livestock Processing.....	2 - 58
2.5.5	Livestock Facilities (Animal Shelter).....	2 - 60

CHAPTER 3 DIRECTION OF DEVELOPMENT IN LIVESTOCK FARMING SYSTEM IMPROVEMENT PLAN

3.1	Mechanism of <i>Dzud</i> Damage Occurrence and its Measures	3 - 1
3.2	Constraints and Potentials	3 - 3
3.2.1	Constraints Analysis	3 - 4
3.2.2	Development Potential	3 - 5
3.3	Direction of Development.....	3 - 7
3.4	Development Concept and Project (Development Framework).....	3 - 11
3.4.1	Pasture Utilization/Well Development and Management Component ...	3 - 12
3.4.2	Livestock Products Improvement Component	3 - 13
3.4.3	Herders Economic Stabilization Component.....	3 - 13
3.4.4	Human Resources Development Component.....	3 - 14
3.4.5	Relation between Development Component and Each Project	3 - 14
3.5	Priority of Development Component	3 - 15

CHAPTER 4 PILOT STUDY

4.1	Objective of Pilot Study	4 - 1
4.2	Selection of Study Area.....	4 - 1
4.3	Selection of <i>Soum</i>	4 - 4
4.4	Basic Implementing Policy of Pilot Study	4 - 5
4.4.1	Participatory Approach.....	4 - 5
4.4.2	Implementation Process of Pilot Project.....	4 - 5
4.5	Framework of Selected Pilot Projects and Improvement Livestock Farming System in Rural Areas and Their Relation	4 - 8
4.6	Contents of Pilot Project.....	4 - 9
4.6.1	Pasture Utilization and Well Development Project	4 - 9
4.6.2	Livestock Fund Project.....	4 - 26
4.6.3	Dairy Products Sale Project.....	4 - 39
4.6.4	Dairy Products Shipment and Sale Project.....	4 - 51
4.6.5	Wool Processing and Product Sales Projects.....	4 - 60
4.6.6	Traditional Well Campaign Project.....	4 - 78

4.7	Evaluation of Pilot Project	4 - 91
4.7.1	Evaluation of Pasture Utilization and Well Development Project.....	4 - 91
4.7.2	Evaluation of Livestock Fund Project	4 - 96
4.7.3	Evaluation of Dairy Products Sale Project	4 - 99
4.7.4	Evaluation of Dairy Products Shipment and Sale Project	4 -101
4.7.5	Evaluation of Wool Processing and Products Sales Project	4- 104
4.7.6	Evaluation of Traditional Well Campaign Project.....	4 -107
4.8	Review of the Feedback Obtained from Pilot Projects	4 -110
4.8.1	Planning in Terms of the Sustainability of Activity or Project	4 -111
4.8.2	Cautions Regarding Rule Making	4 -111
4.8.3	Capacity Development of Beneficiary and Administration (Especially <i>Soum</i> Government).....	4 -112

CHAPTER 5 LIVESTOCK FARMING SYSTEM IMPROVEMENT PLAN

5.1	Development Component and Project.....	5 - 1
5.2	Component of Pasture Utilization/Well Development and management	5 - 1
5.2.1	Basic Concepts in Plan Formulation.....	5 - 3
5.2.2	Pasture Use and Management.....	5 - 5
5.2.3	Implementation of Well Development.....	5 - 16
5.2.4	Well Operation and Maintenance	5 - 35
5.3	Livestock Products Improvement Component	5 - 43
5.3.1	Veterinary Service Improvement Project.....	5 - 43
5.3.2	Superior Livestock Breeding Project.....	5 - 45
5.3.3	Livestock Farming Technique Improvement Project.....	5 - 47
5.3.4	Capacity Building for Risk Management Project.....	5 - 49
5.4	Herders Economic Stabilization Component	5 - 51
5.4.1	Livestock Farming Improvement Project	5 - 51
5.4.2	Market and Distribution of Livestock Products Improvement Project...	5 - 54
5.5	Human Resources Development Component.....	5 - 57
5.6	Towards Realization of Small Scale Project	5 - 61
5.7	Action Plan of Project	5 - 62

CHAPTER 6 CONCLUSIONS AND RECOMMENDATIONS

ATTACHMENT

Attachment-A	Scope of Works and Minutes of Meeting for the Study
Attachment-B	Minutes of Meeting on Reports
Attachment-C	List of Members

LIST OF TABLES

Table 2.1.1	General Information of the Study Area	2 - 1
Table 2.1.2	Number of Livestock and Herder Households	2 - 1
Table 2.2.1	Climate Features in Study Area	2 - 2
Table 2.2.2	Actual Condition of Wells in Three <i>Aimags</i>	2 - 6
Table 2.2.3	Investigated Points and Its Possibility	2 - 7
Table 2.2.4	Distribution of Estimated Drilling Depth to Aquifer	2 - 8
Table 2.2.5	List of Estimated Drilling Depth to Aquifer	2 - 9
Table 2.2.6	TDS and Species Variation	2 - 11
Table 2.2.7	TDS Distribution in Each <i>Aimag</i>	2 - 11
Table 2.2.8	Results of Groundwater Quality Analysis in <i>Dornogobi Aimag</i>	2 - 14
Table 2.2.9	Groundwater Volume of Each <i>Aimag</i>	2 - 15
Table 2.3.1	Employment by Main Activities, 2002	2 - 16
Table 2.3.2	GDP by <i>Aimags</i> 2001	2 - 17
Table 2.3.3	Per Head Production of Meat, Wool and Milk in Mongolia	2 - 18
Table 2.3.4	Wealth Groups of Households with Livestock (2002)	2 - 19
Table 2.3.5	Fodder Supply in kg per Sheep Unit (2002)	2 - 19
Table 2.3.6	Number of Livestock and Poor Families	2 - 20
Table 2.3.7	Power Supply in the Study Area	2 - 21
Table 2.4.1	Budget by <i>Aimag</i>	2 - 21
Table 2.4.2	Structure of Budget Revenues of <i>Aimags</i> , 2002 (Tg. Million, 2002)	2 - 22
Table 2.4.3	Average Income per Household	2 - 23
Table 2.4.4	Average Expenditures per Household	2 - 24
Table 2.4.5	Average Production Expenditures per Household	2 - 24
Table 2.5.1	Proportion of Pasture Grade and Carrying Capacity in Whole Country	2 - 27
Table 2.5.2	Number of Livestock and Change Index	2 - 28
Table 2.5.3	Change in Number of Livestock	2 - 29
Table 2.5.4	Five Classes of Pasture Use	2 - 31
Table 2.5.5	Division of Vegetation	2 - 32
Table 2.5.6	Setting of Kind of Water Sources and Pasture Use Rate	2 - 36
Table 2.5.7	Present Conditions of Carrying Capacity (<i>Dundgobi</i>)	2 - 37
Table 2.5.8	Present Conditions of Carrying Capacity (<i>Dornogobi</i>)	2 - 37
Table 2.5.9	Present Conditions of Carrying Capacity (<i>Umnugobi</i>)	2 - 38
Table 2.5.10	Ratio of Water Supplying by each Traditionally Used Water Source	2 - 42
Table 2.5.11	Specification by Well Type in Mongolia	2 - 46
Table 2.5.12	Results of Well Maintenance Survey	2 - 53
Table 2.5.13	Fixed Cost for O & M (Annual Cost)	2 - 55
Table 2.5.14	Operation and Maintenance Cost of Pump without Payment for Operator	2 - 56
Table 2.5.15	Operation and Maintenance Cost of Pump with Payment for Operator	2 - 56
Table 2.5.16	Condition of Animal Shelters in <i>Dornogobi Aimag</i> (2003)	2 - 60

Table 3.2.1	Problem Analysis on Improvement of Livestock Farming System in Rural Area	3 - 3
Table 3.3.1	Arrangement of Poverty Problem of Herders.....	3 - 9
Table 3.4.1	Framework of Improvement Plan of Livestock Farming System in Rural Area .	3 - 14
Table 4.3.1	Change in Number of Livestock in <i>Dornogobi Aimag</i>	4 - 4
Table 4.4.1	Selection Criteria of Proposals.....	4 - 7
Table 4.5.1	Selected Pilot Projects and its Purpose.....	4 - 8
Table 4.5.2	Relation between the Pilot Project and the Improvement Plan of Livestock Farming System in Rural Area	4 - 8
Table 4.6.1	Presented Proposals.....	4 - 10
Table 4.6.2	Adopted Proposal	4 - 11
Table 4.6.3	Results of Well Construction / Rehabilitation in the Pilot Project	4 - 13
Table 4.6.4	Herders Sharing Items Agreed at PO Workshop and its Implementation at Beginning of 2004	4 - 13
Table 4.6.5	Transition in a Number of the 17 Well Herders Groups (2003.11-2005.9)	4 - 19
Table 4.6.6	Information of Unused Wells	4 - 22
Table 4.6.7	Payment to <i>Soum</i> Well Fund	4 - 23
Table 4.6.8	Condition of Money Received and Loans in Each <i>Soum</i>	4 - 24
Table 4.6.9	List of Generators and Pumps Requested to Repair at Ulaanbaatar.....	4 - 24
Table 4.6.10	Repair in <i>Soum</i>	4 - 25
Table 4.6.11	Change of Number of Livestock of Loan Candidates	4 - 29
Table 4.6.12	Present Number of Livestock and Financed One by Herders.....	4 - 30
Table 4.6.13	Yearly Number of Refunded Livestock.....	4 - 31
Table 4.6.14	Livestock Procurement Cost	4 - 32
Table 4.6.15	Number of Refunded Livestock and Newly Loaned Herders	4 - 33
Table 4.6.16	Quantity of Procured Forage, Detail of Temporary Loan and its Repayment.....	4 - 34
Table 4.6.17	Wintering Rate and Fertility Rate.....	4 - 35
Table 4.6.18	Number of Consumed Livestock and Sold Livestock.....	4 - 36
Table 4.6.19	Estimated Income of Herders Families	4 - 36
Table 4.6.20	Change of Number of Livestock of New Candidates.....	4 - 38
Table 4.6.21	Number of Livestock before and after Loan	4 - 38
Table 4.6.22	Sale Result of Milk in 2003 and Planned Sale in 2004	4 - 40
Table 4.6.23	Number of Patients of <i>Burdene</i> Sanatorium in each Shift.....	4 - 44
Table 4.6.24	Financial Result of <i>Burdene</i> Sanatorium (2003-2005).....	4 - 47
Table 4.6.25	Number of Patients in each Shifts	4 - 49
Table 4.6.26	Targeted Items and Sales Quantities.....	4 - 52
Table 4.6.27	Total Livestock Number of 3 Households in Mr. <i>Galsan</i> 's Group (2004).....	4 - 53
Table 4.6.28	Expected Balance Sheet of the Group	4 - 55
Table 4.6.29	List of the Initial Input Equipment	4 - 56
Table 4.6.30	Prediction of Total Benefit of Milk & Dairy Products Selling Herder Group.....	4 - 56
Table 4.6.31	Repayment Schedule for the Dairy Products Shipment and Sale Project	4 - 59

Table 4.6.32	Financial Report of the Group Activity from 1 July to 15 September 2005.....	4 - 59
Table 4.6.33	Ger Felt Factories in <i>Dornogobi Aimag</i>	4 - 60
Table 4.6.34	Proposals Relating to Wool Processing.....	4 - 61
Table 4.6.35	Required Equipment and Price Related to Wool Processing.....	4 - 63
Table 4.6.36	Sales Plan	4 - 64
Table 4.6.37	Balance Sheet of Each Group.....	4 - 64
Table 4.6.38	Cost of the Start-up Working Capital of Each Group.....	4 - 65

Mongolian Term

<i>Aimag</i>	A following administrative unit of country : Province
<i>Soum</i>	A following administrative unit of <i>Aimag</i> : District
<i>Bag</i>	A following administrative unit of <i>Soum</i> , but it has only a governor as staff. : Village
<i>Dzud</i>	It means climatic condition issues lots of died livestock in winter or early spring by cold or snow. or it also means such situation, too.
<i>Khot Aile</i>	Minimum unit of pastoral farming in Mongolia, consist of a few families.
<i>Ger</i>	A tent house normally used in Mongolia. It consists of felt sheets in Gobi zone.
<i>Otor</i>	Migration. It means both one is long-term migration from winter/spring camp and the other is a short trip for several days to feeding.
<i>Negdel</i>	Agriculture cooperative in Socialist era.
<i>Khorshoo</i>	Genetic term of "Cooperative" at present.

CHAPTER 1 INTRODUCTION

1.1 BACKGROUND OF THE STUDY AND OBJECTIVES OF THE STUDY

In Mongolia, the Agricultural sector employed 40% of the labor force and contributed 21% to GDP as of 2004. Approximately 80% of agricultural production came from the livestock products sub-sector. In 2004, livestock products (mainly cashmere, wool, etc.) accounted for about 5 % of all exports.

The calamity of “*Dzud*” occurred continuously in the period 1999 and 2000, causing loss of about 10% of the livestock every year that died from hunger or frost. The total number of livestock that died from this calamity reached 5.75 million heads, and as a consequence, agricultural output dropped by about 30%.

In order to mitigate the damage from *Dzud*, the Government of Mongolia decided to implement “The National Programme To Protect the Livestock From Drought and *Dzud*” and intended to implement construction, rehabilitation and maintenance of wells. Various projects of these action plans have already been carried out by World Bank and/or UNDP.

Under these circumstances, the Government of Mongolia (hereinafter referred to as “GOM”) made a request to the Government of Japan (hereinafter referred to as “GOJ”) to extend its technical cooperation for the construction and rehabilitation of wells in order to improve the rural water supply in 7 *Aimags* (provinces) of Gobi and Steppe zone. GOJ, however, considered that the content of this request only for construction and rehabilitation of wells would not be adequate to mitigate the damage of *Dzud*. Therefore, GOJ proposed to modify the Study plan to suit a comprehensive study plan that was initiated for the purpose of pasture management system, with consideration of regulations for pastoral livestock and the improvement of well management system.

Basically GOM accepted this idea and made a request to GOJ for (i) the formulation of this comprehensive plan aiming at the establishment of a pasture management system incorporated with the construction, rehabilitation and management of wells, as well as (ii) technical skill transfer to counterparts and concerned personnel.

1.2 METHOD OF THE STUDY

First of all, methods and measures shall be clearly explained that are effective to contribute to ascertain the causal correlation of factors leading to *Dzud* and reduce the damage by *Dzud*. Then systematic pasture use plan and well improvement plan shall be studied so as to be effective to reduce damage by *Dzud*.

Effectiveness of the projects shall be confirmed through specific Pilot Projects. Therefore, selection of the Pilot Projects is very important in the Study. These Pilot Projects shall be

monitored and evaluated, and outcomes gained through this process shall be guidelines when similar projects would be carried out in Mongolia, which is an aim of the Study.

Since both of the Study to identify the projects effective to reduce the damage by *Dzud* and the Study to select the areas suitable for the Pilot Project to be implemented have to be studied in parallel to select the Pilot Project, the Study was carried out through the following three phases;

➤ Phase 1: Formulation of General Plan in the three *Aimags*

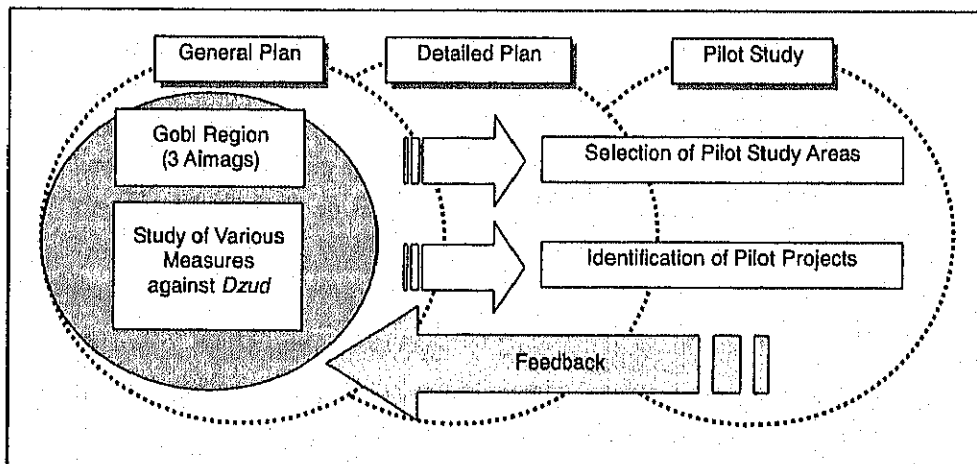

Formulation of the general plan for Improving the Livestock Farming System in rural areas was carried out for the Study area of the three *Aimags* of *Dundgobi*, *Dornogobi*, and *Umnugobi* which are located in the Gobi-Steppe region in the southern part of Mongolia. Through the Study, *Dornogobi Aimag* was selected for the detailed study area.

➤ Phase 2: Formulation of Detailed Plan for *Dornogobi Aimags*

Formulation of the detailed plan for Improving the Livestock Farming System in rural areas was carried out for *Dornogobi Aimag*. Through the Study, three *Soums* of *Erdene*, *Ulaanbadrakh* and *Khuvsgul* were selected as the Pilot Study areas. In addition, the Pilot Projects were identified and policy of implementing was planned.

➤ Phase3: Pilot Study in *Soums*

The Pilot Study has been carried out over about two years. Outcome of the Pilot Study gained through a sequence of these studies was fed back to the General Plan, and this report summarizes the results of these outcomes.

1.3 STUDY AREA

The Study area consists of the three *Aimags* of *Dornogobi*, *Dundgobi*, and *Umnugobi*, that are located in the Gobi and Steppe zone of the southern part of Mongolia.

1.4 REPORTS DELIVERED THROUGH THE STUDY

No.	Title	Submittal Time	Contents
1	Inception Report	March, 2003	Description of Policy of the Study
2	Interim Report (1)	August, 2003	General Plan
3	Progress Report (1)	December, 2004	Description of Policy of the Detailed Plan
4	Interim Report (2)	January, 2004	Detailed Plan
5	Progress Report (2)	July, 2004	Description of Start-up plan of the Pilot Study
6	Progress Report (3)	December, 2004	Description of Midterm Evaluation (1) and Monitoring of the Pilot Study
7	Progress Report (4)	September, 2005	Description of Midterm Evaluation (2) and Monitoring of the Pilot Study
8	Draft Final Report	January, 2006	Description summarized based on the result of the above mentioned studies

CHAPTER 2 ACTUAL CONDITION OF STUDY AREA

2.1 GENERAL CONDITION

The Study area consists of the three *Aimags* (provinces) of *Dornogobi*, *Dundgobi*, and *Umnugobi*, where are located in the Gobi and Steppe zone of the southern part of Mongolia, with area of 349,600 km² and population of about 150,000. The outline of the area is as follows:

- Low population density

The population density of Mongolia is extremely low. *Umnugobi* has the lowest density for a populated *Aimag* in Mongolia, with one family living in an area of 3.6 km on average.

Table 2.1.1 General Information of the Study Area

Name of <i>Aimag</i>	Name of <i>Aimag</i> Center	Number of <i>Soum</i>	Number of <i>Bag</i>	Area (1,000 km ²)	Population (1,000)	Density (person /km ²)	Number of Household (1,000)	Distance from Capital (km)
<i>Dornogobi</i>	<i>Sainshand</i>	14	57	109.5	52.5	0.48	13.3	450
<i>Dundgobi</i>	<i>Mandagobi</i>	15	64	74.7	49.9	0.67	12.5	275
<i>Umnugobi</i>	<i>Dalanzadgad</i>	15	53	165.4	46.8	0.28	12.5	575
Country		340	1,662	1,564.1	2,533.1	1.62	596.4	-

Source: Mongolian Statistical Yearbook 2004

- Extremely severe weather conditions

Because the temperature varies widely from 25°C or more in summer, to -20°C in winter, the yearly average temperature is about 0°C. Although the amount of the rainfall is relatively low as an inland area, it rains in proportion to the altitude of the region, so that there is about 300 mm a year in the northern part of Mongolia and about 100 mm in the Study Area.

- Number of livestock per household exceeded the country average and smaller number of herder households

The average number of livestock owned by one household was about 214 heads in 2004, one of the largest in the country which was more than the country average of about 166 heads. On the other hand, the number of herder households of the *Khot Aile* 2 to 3 in the Gobi region, which is fewer than the country average of 3 to 4 households.

Table 2.1.2 Number of Livestock and Herder Households

2004	Number of Livestock (1000 heads)	Number of herder Households	Livestock per Household (head)
<i>Dundgobi</i>	1,781	7,803	228
<i>Dornogobi</i>	1,019	3,936	259
<i>Umnugobi</i>	1,070	6,313	169
Country	28,028	169,024	166

Source: Mongolian Statistical Yearbook 2004

2.2 NATURAL CONDITIONS

2.2.1 CLIMATE

The difference between maximum temperature in summer and minimum temperature in winter in three *Aimags* is as large as 80°C. As for precipitation, the annual value is so related to elevation that it reaches more than 200 mm/year in a limited area of the Altai Mountains; however, it is about 120 to 160 mm in the other areas. Precipitation is 70 to 120 mm in summer which is roughly equivalent to 80% of annual precipitation.

Table 2.2.1 Climate Features in Study Area

	Annual Average Precipitation (mm)	Max. Temperature °C	Min. Temperature °C	Annual Average Temperature in Jan. °C	Annual Average Temperature in Jul. °C
<i>Dundgobi</i>	156.0	35.6	-38.3	-17.5	18.7
<i>Dornogobi</i>	116.7	40.8	-41.8	-17.8	22.8
<i>Umnugobi</i>	127.1	37.5	-36.5	-14.9	21.1

Source: Mongolian Statistical Yearbook 2001

Based on the trend of annual precipitation in each station (shown in Fig. 2.2.1) there is no common trend; however, all values were markedly low after 1999, so it may be guessed that large *Duzd* disaster occurred because of low pasture production.

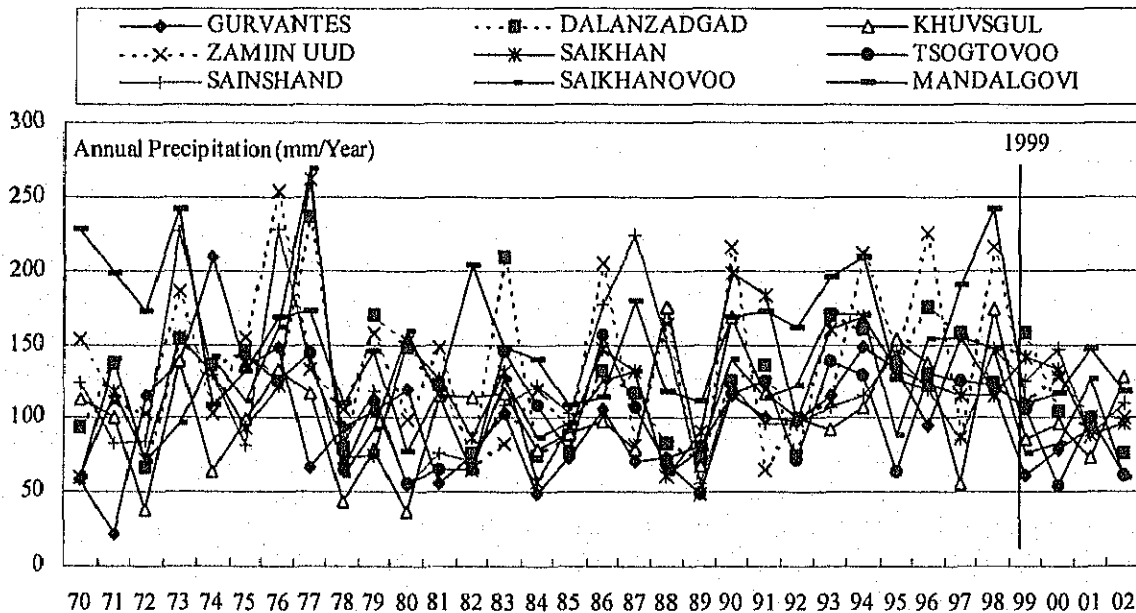

Fig. 2.2.1 Annual Precipitation in the Study Area

2.2.2 TOPOGRAPHY

Mongolia is entirely a mountainous country. The elevation range is from 4,374 m A.S.L of the Altai Mountains to 552 m A.S.L in the southern part of the Gobi, with the average 1,580 m. Nine big rivers are located in the northern part of Mongolia, but there is no rivers in the Gobi. Topography of the Study Area is illustrated in Fig.2.2.2.

Mountain areas or plateaus in three *Aimags* consist of igneous rocks mainly composed of granitic rocks or well consolidated Paleozoic sedimentary rocks and metamorphic rocks, and flat-lowlands are composed of cretaceous or quaternary non-marine sedimentary rocks formed in the continental basin. The figure which presents the distribution of faults and springs implies that many springs have fissure type groundwater because of their alignment. Concentration of springs around the Altai Mountains in *Umnugobi* seems to originate in considerably plentiful rainfall and melting snow.

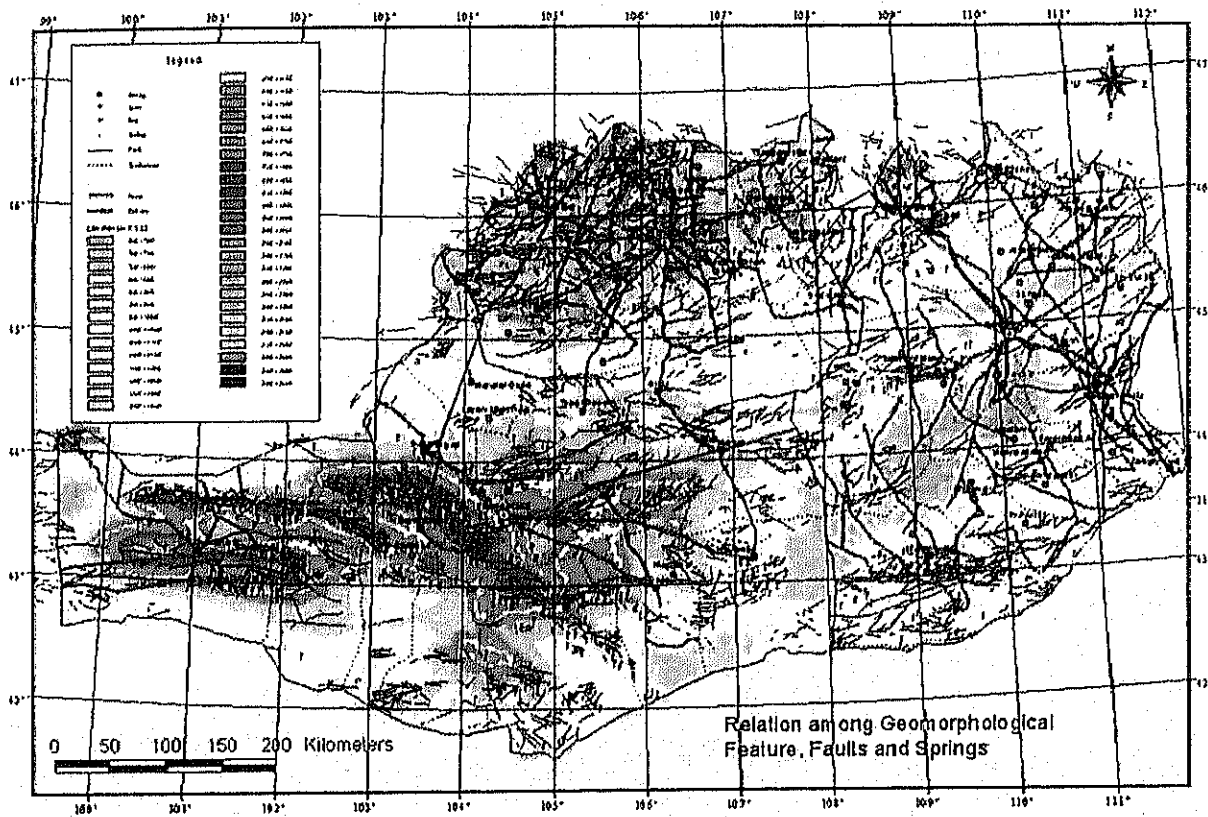

Fig. 2.2.2 Relation among Geomorphological Feature, Faults and Springs
(Source: USGS, Geological Map of Mongolia)

2.2.3 GEOLOGY

(1) Outline of Geology

The basic geological structure of Mongolia was formed in the Paleo-Asian Sea that was situated between the Siberian Platform in the north and Tarim-North China Block in the south from the late Precambrian to the early Mesozoic by the gathering and scattering of micro continents (small mass of continental crust) and sedimentation and igneous activity coming up with it. (Tseden et al.(1992))

Fig.2.2.3 Geological Structure of Mongolia

The geological structure of Mongolia which consists of the North Block and the South Block is divided by the geological tectonic line called Ural-Mongolia Lineament (UML) or Mongolia Main Lineament (MML) as shown in Fig. 2.2.3. The most of the Study Area belongs to the South Block, the northern part of *Dornogobi* and almost of *Dundgobi* belong to the North Block.

(2) Geology in the Study Area

The geology of *Dornogobi Aimag* is illustrated in Fig.2.2.4 as editing of the Geological Map of Mongolia (1:1,000,000). The Cretaceous distributes in the Study Area which belongs to the South Block including the studied Precambrian to Paleozoic formations. On the other hand, igneous rocks mainly composed of granitic rocks are widely outcropped in northern part of *Dundgobi* and the southern part of *Dornogobi*. The Carboniferous and Devonian in the Paleozoic are distributed in the Altai Mountains in *Umnugobi*, the northeastern part of *Umnugobi* and the western part of the central *Dornogobi*. The faults in them nearly run along MML. The younger formations after the Cretaceous which are regarded as the main aquifer the Study Area cover the flat lowlands in three *Aimag*. In particular, the Quaternary is widely developed in *Umnugobi*.

Fig. 2.2.4 Geological Map of the Study Area

Source: Modified 1:1,000,000 Geological Map of Mongolia(1999)

2.2.4 HYDROGEOLOGY

(1) Outline of Hydrogeology

In general, groundwater aquifers can be divided into two types: Granular Aquifer and Fissure Aquifer. The former coincides with the Cretaceous distributed in the low lands of the Study Area and the latter coincides with the Paleozoic or igneous rocks in various geological ages in mountainous or hilly area. The Quaternary beds along wadis are also important as the Granular Aquifer as well as the Cretaceous.

The aquifer types in the Study Area are categorized below.

Granular Type

- 1) Fluvial deposits, mountain basin deposits, fan deposits
- 2) Weathered surface deposits on plains
- 3) Cretaceous sandstone and conglomerate

Fissure Type

- 4) Fissures and weathered part of Paleozoic sedimentary rocks and igneous rocks

Total number of wells in the Study Area in 2000 amounts to more than 10,000. Traditional Wells which account for approximately 75% of them were mainly dug into aquifer types 1) or 2). According to the Hydrogeological Map of Mongolia (1996), an artesian zone of aquifer type 3) is distributed in *Dornogobi*.

In general, the water quality in three *Aimags* of the Study Area is bad; average TDS of each *Aimag* is 710 mg/l in *Ummugobi*, 1,373 mg/l in *Dornogobi* 2,240 mg/l in *Dundgobi* by water resource database obtained by Institute of Geoecology. Most exceed the WHO's Drinking Water Standard of 1,500 mg/l except for *Ummugobi*. On the other hand, Average withdrawal volume is 2.48 l/sec in *Ummugobi*, 2.43 l/sec in *Dornogobi* and 1.5 l/sec in *Dundgobi*. *Ummugobi* has more than 500 springs which is different from other *Aimags* that have more or less only 100 springs.

(2) Hydrogeological Features of Study Area

The well database of whole Mongolia was created in 1996 by UNDP. JICA improved the well database of three *Aimags* adding new data in 2000. Hydrogeological analysis in this study was done on the basis of this database.

Table 2.2.2 shows actual conditions of the well in three *Aimags* and Fig.2.2.5 shows range of drilling depth by well type. For two types of engineering wells (Production Wells and Shallow Wells), rate of usable wells is low (7% - 24%); moreover, well construction has recently stopped. In general, the aquifer of Shallow Wells is unconfined shallow aquifer that belongs mainly to the Quaternary and the aquifer of deep wells is confined deep aquifer that belongs to the Cretaceous or igneous rocks in variable geological ages.

Table 2.2.2 Actual Condition of Wells in Three Aimags

		<i>Dundgobi</i>	<i>Umnugobi</i>	<i>Dornogobi</i>
Total number of wells		About 3,700	About 3,700	About 2,800
Area covered by one well (km ²)		20.3	44.5	39.1
Production Well	Number	437	357	321
	Usable rate	16.2% (71)	23.8% (85)	18.1% (58)
	Rate possible to rehabilitate	36.6%	35.6%	About 60%
	Construction date	Mainly 70's to 80's	Mainly 70's to 80's	Mainly 70's to 80's
Shallow Well	Number	285	469	85
	Usable rate	7.4%	23.2%	7.4%
	Rate possible to rehabilitate	61.4%	31.3%	64.7%
	Construction date	Mainly 70's to 80's	About 70% in 80's	Starting from 60's and concentrating in 80's
Shaft Well	Number	About 1,500	About 900	1,068
	Usable rate	About 80%	17.7%	36.4%
	Rate possible to rehabilitate		About 60%	About 60%
	Construction date	Continuously from 60's to 90's	Continuously from 60's to 90's	Continuously till 80's. More than 100 wells even in 90's.
Traditional Well	Number	About 1,500	About 2,000	About 1,300
	Water quality (Salinity)	Salinity is probably high in 33% of wells.	Salinity is probably high in 37% of wells.	Salinity is probably high in 37% of wells.

(*Structure and its features by each well type are referred to "2.5.3 Water Supply Facilities for Livestock")

Fig. 2.2.5 Range of Drilling Depth by Well Type

Source: "Technical Report on the Distribution of Livestock and the Pastureland Capacity," JICA, 2000

(3) Investigation of Water Resources

In order to investigate water resources, the time domain electromagnetic method (also called Transient Electromagnetic Method or TEM) was introduced to measure the underground resistivity. Then data to describe the geological and hydro-geological structure was obtained.

TEM method has several advantages over convenient electrical and electromagnetic methods as follows:

- i) Sensitive to the difference of underground resistivity.
- ii) No need to increase the transmitter-receiver separation for the deep sounding.
- iii) For the deeper sounding, it is necessary to measure over a period of time, and this can be done through the increase of the transmitter currents and increase the number of the averaging time to improve the S/N ratio.
- iv) The influence of the near surface structures and the terrain are not significant for the deeper sounding.
- v) The measurements are carried out without direct contact to the earth, and can be used in the desert and in the area covered with rocks where the set up of the electrodes is difficult.
- vi) Measurement is rapid and efficient.

Summary of the 215 investigated points and its location are shown in Table 2.2.3 and Fig. 2.2.6. List of estimated drilling depth to aquifer of 215 points is shown in Table 2.2.5. The investigated points, which are 215 in the whole *Aimag*, were selected in consideration of request from each *Soum*, points to supplement blank of the present data among the unused pasture, and confirmation of the well depth dug in the Pilot Study.

Out of 215 points, the drilling depth to the aquifer of 159 points (74%) could be estimated and the distribution of the depth is shown in Table 2.2.4. Range of the depth of 70 to 140 meter occupies 75% and the one below 60 meter occupies only 16%, which implies that drilling depth of the well should be deeper in the future.

Table 2.2.3 Investigated Points and Its Possibility

2.2.5 WATER QUALITY

(1) Groundwater Quality

The total dissolved solids (TDS) as a representative of water quality is an important factor for water quality standard, treatment cost for drinking water, productivity of livestock and agricultural crops, and so on. WHO prescribes TDS standard for drinking water is less than 1,000 mg/l (ppm). Table 2.2.6 serves as a useful reference for livestock water standards.

Table 2.2.6 TDS and Species Variation

Species	Total Dissolved Solids (ppm)				
	Excellent	Good	Fair	Poor	Limit
Humans	0-800	800-1,600	1,600-2,500	2,500-4,000	5,000
Horses, Working	0-1,000	1,000-2,000	2,000-3,000	3,000-5,000	6,000
Horses, Others	0-1,000	1,000-2,000	2,000-4,000	4,000-6,000	10,000
Cattle	0-1,000	1,000-2,000	2,000-4,000	4,000-6,000	10,000
Sheep	0-1,000	1,000-3,000	3,000-6,000	6,000-10,000	15,000
Chicken & Poultry	0-1,000	1,000-2,000	2,000-3,000	3,000-5,000	6,000
Swine	(Young pigs and marked pigs appear to tolerate less than cattle)				

Source: "Analysis of Water Quality for Livestock" (Utah State University, 1997)

Table 2.2.7 shows TDS extracted from the database of the three *Aimags*, which is controlled by Institute of Geoecology. More than about half water resources are beyond the standard of portable water. Data over 15,000 mg/l (ppm), which is limit value for sheep, is almost nil.

Table 2.2.7 TDS Distribution in Each *Aimag*

TDS (mg/l)	<1000	<3000	<6000	<10000	<15000	Over 15000	Total
Evaluation	Excellent	Good	Fair	Poor	Limit		
<i>Dornogobi</i>	272	166	28	6	2		474
<i>Dundgobi</i>	280	570	68	6			924
<i>Umnugobi</i>	186	102	12	3	2	1	306
Grand Total	738	838	108	15	4	1	1704

Since there is more chloride data than TDS data stored in the existing database, chloride was used for analysis of each aquifer. The standard of chloride for drinking water is less than 250mg/l in WHO's standards. According to the standards of groundwater quality for livestock in Wyoming (US), chloride should be less than 2,000 mg/l and TDS should be less than 5,000mg/l.

1) Shallow Aquifer

The areas where water quality is above 250 mg/l of the standard are spread over the central region of *Dundgobi Aimag*, and also found at the southeastern part of *Dornogobi Aimag* and the northern part of *Umnugobi Aimag*. On the other hand, better areas less than 50 mg/l are spread over the southwestern part of *Dornogobi Aimag* and the western part of *Umnugobi Aimag*.

2) Deep Aquifer

In general, water quality of the deep aquifer is worse than the shallow aquifer. Comparatively better quality areas are spread over the northeastern part of *Dundgobi Aimag*, the central lower part of *Dornogobi Aimag*, and around the *Gurvan Sayhan* mountains and *Huren Hanang* mountains, located in the central part of *Dornogobi Aimag* and the central part of *Umnugobi Aimag*; on the other hand, worse areas extend from the northeastern part *Dundgobi Aimag* to the southern part of *Dornogobi Aimag*.

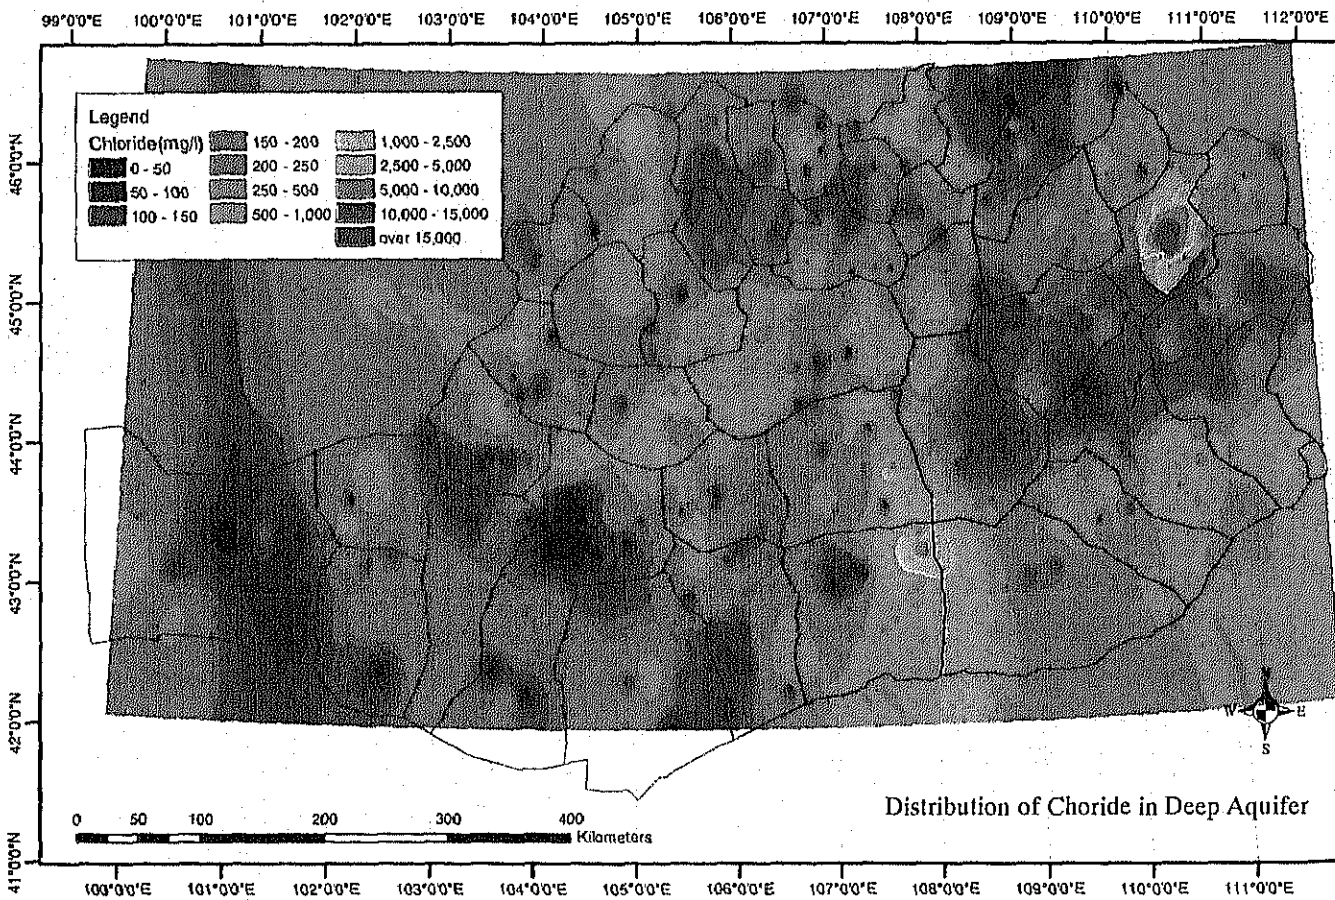

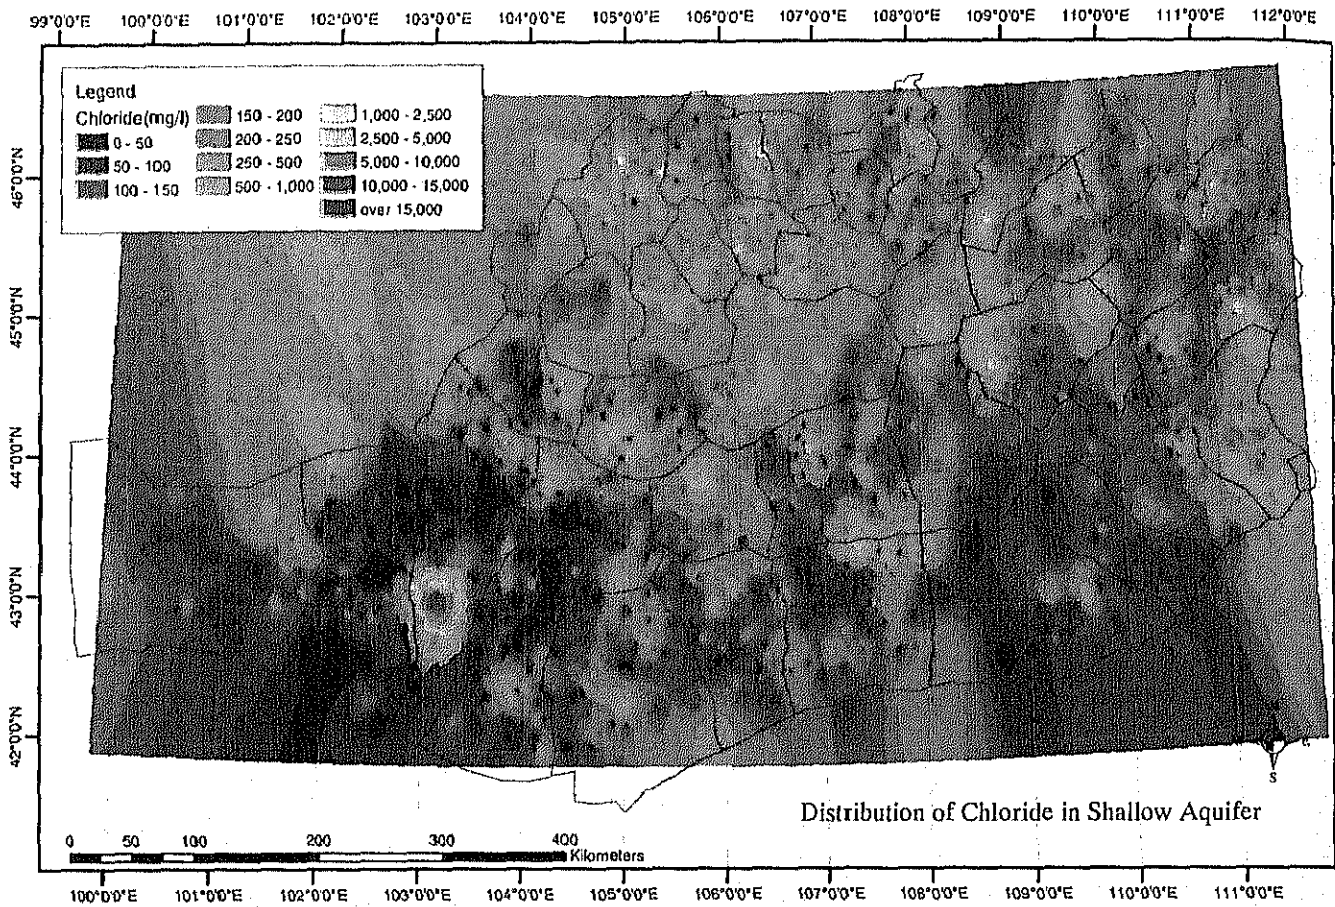

Fig. 2.2.7 Result of Water Quality Analysis

(2) Results of Groundwater Quality Analysis

Total of 127 groundwater samples, of which are 92 samples for the shallow aquifer and 35 samples for the deep aquifer were collected from the whole *Dornogobi Aimag*, including the wells constructed/rehabilitated in the Pilot Study. 29 items were selected to evaluate groundwater quality. At first water quality analysis was carried out at Chemistry & Chemical Technology Institute, Science Academy of Mongolia; however, abnormal values were recognized there. Although it was again analyzed at the other institute in Mongolia, the degree of accuracy was still low, so finally analysis of all samples was carried out again in Japan. The detailed results of water quality analysis are shown in Annex E.

The number and percentage of the samples which don't meet the water quality standard are listed in the below table. To evaluate groundwater quality of each aquifer, data of Shallow Well, Shaft Well and Traditional Well for shallow aquifer and the data of Production Well for deep aquifer were used.

Shallow Aquifer

The ratio of Fluorine and Evaporated Residue are notably bad being 78.8% and 30.3% respectively, and Arsenic was detected at three points. However, this aquifer is somewhat better than the following deep aquifer except for the three heavy minerals.

Deep Aquifer

The ratio of Hardness, Evaporated Residue, Chloride, Magnesium and Fluoride are also notably bad being 28.6%, 53.6%, 50.0%, 46.4%, and 64.3% respectively in the deep aquifer. As for other items, this aquifer is somewhat worse than the shallow aquifer.

As above mentioned, there are some problems of groundwater quality for drinking water use in *Dornogobi Aimag*. Therefore, some kind of water purification is necessary to supply safe water to the rural people.

Especially concentration of Fluorine is high throughout the whole area, so some measures are necessary. There are many practical methods of water purification now. In general, "Reverse Osmosis Membrane" is the best way to totally resolve problems so far because the groundwater quality of this *Aimag* tends to be below drinking water Quality standards in terms of not only heavy minerals but some general items, for example Hardness, Chloride, and so on. In the Pilot Study, small water purification of Reverse Osmosis Membrane was introduced, and its ability was proven. However, it had insufficient capability to purify water because the iron- rich water oxidized and heightened its turbidity and consequently the pre-filter clogged frequently. Further study is necessary to find a suitable water purification method for the local conditions.

Table 2.2.8 Results of Groundwater Quality Analysis in Dornogobi Aimag

Aquifer	Item	pH	Hardness	Evaporated Residue	Nitrate	Ammonium	Chloride	Sulfate	Calcium	Magnesium	Copper	Iron

2.2.6 GROUNDWATER POTENTIAL EVALUATION - AVAILABLE GROUNDWATER VOLUME

According to the macro water balance in Mongolia, 90% of total precipitation is lost by evapo-transpiration and the balance 10% is divided into surface water (6.3%) and groundwater (3.7%). 95% of the surface water flow out of the country and only 0.3% of total precipitation is retained in Mongolia. Meanwhile, groundwater's share in it is only 3.7%.

Total available groundwater volumes in three *Aimags* were estimated by Ministry of Food and Agriculture as shown in Table 2.2.9. Since the values are equivalent to the following ratios of total precipitation (2.3% for *Umnugobi*, 1.0% for *Dundgobi* and 1.3% for *Dornogobi*), it is a reasonable estimation of the recharge volume or development volume in these areas considering that the precipitation is less than the average of Mongolia and temperature should be higher than that for active evapo-transpiration. Seasonal division is set up so that winter volume is half of summer.

Table 2.2.9 Groundwater Volume of Each *Aimag*

<i>Aimag</i>	Area (10 ³ km ²)	Groundwater			
		Total Resources (million m ³ /year)	Not Available (million m ³ /year)	Available in Summer (million m ³ /year)	Available in Winter (million m ³ /year)
<i>Dornogobi</i>	109.5	167.2	50.2	78.0	39.0
<i>Dundgobi</i>	74.7	284.0	0	189.3	94.7
<i>Umnugobi</i>	165.4	211.2	0	140.8	70.4

Source: Ministry of Food and Agriculture

Daily average of available groundwater development per unit area is estimated from above mentioned groundwater volume as shown below.

- (a) *Dornogobi* 4,200 liter/day/km²
- (b) *Dundgobi* 10,400 liter/day/km²
- (c) *Umnugobi* 3,500 liter/day/km²

Assuming that the average pasture capacity in Gobi Area is 3 ha/sheep/year and unit water demand is 5.0 liter/sheep/day, daily water demand for livestock per unit area is as follows:

$$\text{Unit Daily Water Demand} = 100 \text{ ha} / 3 \text{ ha} \times 5.0 = \underline{167 \text{ liter/day/km}^2}$$

In consideration of water demand for herder family (25~50 liter/day/family), the groundwater volume seems to be sufficient; however, it is noteworthy that groundwater is not stored everywhere evenly and its potential is not so high in terms of quality and cost of exploitation.

2.3 SOCIAL AND ECONOMIC CONDITIONS

2.3.1 POPULATION AND EMPLOYMENT

Because of the traditional dominance of pastoral livestock herding, the majority of people live in rural areas. The portion of rural population in *Soums* ranges between 40.4% and 85.2% in *Dundgobi Aimag*, 29.1% and 81.0% in *Dornogobi Aimag*, and 65.1% and 85.7% in *Umnugobi Aimag*. (Note: residents in *Soum* centers are included in the urban population in the *Soums*.) On the other hand, the share of urban population is 35.9% in *Dundgobi Aimag*, 70.1% in *Dornogobi Aimag* and 45.1% in *Umnugobi Aimag*.

The relatively high portion of urban population in *Dornogobi Aimag* is related to comparatively high development of infrastructure and service sectors associated with the Trans-Siberian railway that cuts longitudinally the *Aimag*. *Soums* that are located along the railway have relatively high portion of non-herding population who provide services to the railway.

According to the employment by main activities, agriculture, primarily livestock farming are the dominant economic activity. The only exceptions are transport, storage and communication activities in *Dornogobi Aimag*, which accounts for 12.8% of the total employment. Again this can be reasonably explained by the presence of main railway in the *Aimag* that brought development of associated infrastructure and services along the railway. In addition, the share of mining and manufacturing activities is also high in this *Aimag* (3.5% and 2.8% respectively) against 0.3% and 1% respectively in the both *Dundgobi* and *Umnugobi Aimags*. Relatively high percentage of 'Public administration, defense and compulsory social security' in *Dornogobi* and *Umnugobi Aimags* is largely due to the military and border guards presence in these *Aimags* because of the long border with China.

Table 2.3.1 Employment by Main Activities, 2002

	Dundgobi		Dornogobi		Umnugobi		Country %
	Number	%	Number	%	Number	%

Source: *Aimag of Dundgobi, Dornogobi, Umnugobi* : 2001

2.3.2 ECONOMIC ACTIVITY

Comparing the general structure of the economy in the three *Aimags* with the national average, *Dundgobi* and *Umnugobi* *Aimags* are dominated by the agricultural or livestock sector with share of 45.3% to 53.4% in GDP respectively. The economy in *Dornogobi* *Aimag* is dominated by the industry sector with share of 43.4% in GDP. The share of the agricultural sector is around twice as much as the national average in *Dundgobi* and *Umnugobi* *Aimags*, and the same for the industry sector in *Dornogobi* *Aimag*.

The bulk of the industry sector in *Dornogobi* *Aimag* belongs to manufacturing which accounts for 33.8% of GDP. The share of the construction of 15% is also much higher than the national average in this *Aimag*. The share of the manufacturing is also marginally higher than the national average in *Dundgobi* *Aimag*. The share of the energy sector is higher than the national average in *Dornogobi* and *Umnugobi* *Aimags*. Because of the presence of a comparatively big power station, *Umnugobi* *Aimag* shows the highest portion of the energy sector in GDP.

As for the service sector, all three *Aimags* are much lower than the national average. In contrast, the share of budget-supported activities is higher than the national average in all three *Aimags*.

Table 2.3.2 GDP by *Aimags* 2001 (Tg million)

* Mining included in the manufacturing sector.

Source: Country Figures of 2001

As for Per Capita GDP in three *Aimags*, *Umnugobi* is the most labor productive *Aimag*; it varied between Tg 413,000 and Tg 484,000 in 1999-2001 against the national average of Tg 392,000 and Tg 478,000 for the same period. *Dundgobi* *Aimag's* labor productivity was hit hardest by the *Dzud* declining from Tg 511,000 in 1999 to Tg 162,000 in 2000. A similar situation is shown in case of *Dornogobi* *Aimag* from 2000 to 2001.

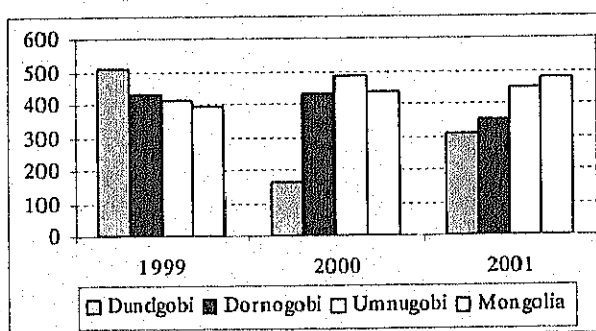

Fig. 2.3.1 GDP per Capita (1999-2001, Tg 1000)

Source: *Aimag of Dundgobi, Dornogobi and Umnugobi*

The national Per Capita GDP would have increased much more if not depressed by declines in the livestock sector caused by serious *Dzud* in 1999-2001.

2.3.3 LIVESTOCK FARMING

The livestock sector is the primary economic activity in all three *Aimags* in terms of employment share and in *Dundgobi* and *Umnugobi Aimags* in terms of both employment and GDP share.

The livestock sector in three *Aimags* faces the same common problems with the other *Aimags* in Mongolia. The most prominent challenges include: low productivity of the animals, dependency on and low protection against natural calamities, existing fragmentation of the industry by too small household economies scattered over enormous territory with poor infrastructure, and certain difficulties with introducing some elements of modern society because of the mobile/nomadic nature of herder lifestyle.

Because of ecological constraints, the extensive livestock industry in Mongolia is characterized by low and basically constant yields of meat, milk and wool per animal over time. The productivity of major livestock products per animal is shown in Table 2.3.3.

Table 2.3.3 Per Head Production of Meat, Wool and Milk in Mongolia

	1960	1980	1991
Average live weight sold to the state (kg)			
-Cattle	248	217	245
-Sheep	36	33	39
-Goat	28	26	33
Wool yield (g)			
-Sheep	1,186	1,390	1,243
-Camel	4,104	5,034	4,365
-Cow milk (l)	344	292	323

Source: Central Statistical Board of the Mongolian People's Republic (1970, 1981 and 1992 editions)

For 30 years up to 1990, the centrally planned system of agriculture moved towards intensification of production by providing shelter structures and veterinary services for livestock, making supplementary fodder and concentrates and supplying water to natural pasture. The intensification process was claimed to be one of the successes of the communist system in the agricultural area, in the sense that it could decrease the mortality rate and increase the birth rate of pastoral animals, although it could not much change the biological productivity per animal.

Due to consecutive years of *Dzud* from 1999, in 2001, 87.5% of all households with livestock have less than 200 animals and 67.5% have less than 100 animals nationwide.

A similar situation exists in *Dornogobi*, *Dundgobi* and *Umnugobi Aimags*, although the herd size is a little higher in all three *Aimags* compared with national average. The share of households with less than 200 livestock in *Dornogobi*, *Dundgobi* and *Umnugobi Aimags* is 76.17%, 74.47% and 76.72% respectively, compared with 83.6% of the nationwide average (2001).

Table 2.3.4 Wealth Groups of Households with Livestock (2002)

<i>Aimags</i>	Up to 50	51 to 100	101 to 200	201 to 500	More than 501	Total No. of households	% households up to 50	% households up to 100	% households up to 200
<i>Dornogobi</i>	1,732	1,176	1,339	1,143	186	5,576	31.06	52.15	76.17
<i>Dundgobi</i>	2,227	2,246	2,510	2,042	352	9,377	23.75	47.70	74.47
<i>Umnugobi</i>	1,855	1,855	2,614	1,765	154	8,243	22.50	45.01	76.72

(Source: *Dornogobi, Dundgobi, Umnugobi*)

Although the total number of livestock is crucial in herder livelihood, it is not the only indicator; the composition of animal species such as portion cashmere goat and draft animals, and marketing conditions are also important.

As logically acknowledged by *Aimag* governments, a lack of fodder is one of the main reasons for mass losses of animals during the *Dzud*. Because of ecological constraints, the *Aimags* have very limited potentials for preparing fodder locally. The volume of locally prepared fodder is shown in Table 2.3.5.

The total volume of fodder prepared per sheep unit in kg of feed units is only 0.81, 1.27 and 1.41 respectively in *Dornogobi, Dundgobi* and *Umnugobi Aimags*. The relatively high production of fodder in *Umnugobi Aimag* can be explained, at least partly, better self-initiatives of herders in the *Aimag* to prepare fodder using local potentials.

Table 2.3.5 Fodder Supply in kg per Sheep Unit (2002)

<i>Aimags</i>	Hay	Hand fodder	Concentrate	Total in feed unit	Average for 1999-2001
<i>Dornogobi</i>	1.37	0.07	0.18	0.89	0.81
<i>Dundgobi</i>	0.00	1.42	0.00	1.42	1.27
<i>Umnugobi</i>	2.69	0.47	0.27	1.98	1.41

(Source: *Dornogobi, Dundgobi, Umnugobi*)

Although all three *Aimags* largely belong to the Gobi region, the ecological conditions, consequently possibilities for producing fodder are likely to differ across *Soums* in each *Aimag*. These differences together with *Soum*-specific traditions and weather conditions in 1999-2001 have shaped the differences in the level of fodder production in the three *Aimags*.

Lots of herders lost livestock due to *Dzud* that continued for three years from 1999 to 2001 in three *Aimags*, and which has increased poverty in the rural and substantially worsened the livelihood of herders. Thus, there was the strong inverse correlation between the number of owned livestock and the number of poor families. As shown in Table 2.3.6, the number of poor families was reduced until 1999 in *Dornogobi*, 1998 in *Dundgobi* and 1997 in *Umnugobi* respectively, due to increase of the number of livestock. However, the number of poor families has rapidly increased due to loss of livestock since then.

Table 2.3.6 Number of Livestock and Poor Families

2.3.4 SOCIAL INFRASTRUCTURE

(1) Railway and Road Network

The railway is the artery of the Mongolian economy and it passes through *Dornogobi*. It connects *Ulaanbaatar*, the Capital of Mongolia, to *Saninshand*, capital of *Dornogobi*, and then passes *Zamiin Uud*, the land-port to China. Moreover, a branch line expands from *Sainshand* to *Zuunbayan*, and it is planned to extend to *Umnugobi*.

There is pavement road from *Ulaanbaatar* to *Choir*. The road between *Choir* and *Zamiin Uud* is 442 km and unpaved in present, but pavement road construction is scheduled after 2006. In the plan, the construction of "Car park (a rest area)" in *Erdene Soum* is also included. The Railway and road network in the Study are summarized below in Fig. 2.3.2.

Source: JICA Study Team Fig.2.3.2 Railway and Road Network in the Study Area

(2) Power Supply

3 *Soums* are not connected to the central power grid in *Dornogobi* and 2 *Soums* in *Dundgobi*. In these unconnected *Soums*, there is no full-time power supply; it is limited only 3 to 6

hours per day. The whole *Umnugobi Aimag* is not connected to central power grid, and *Dalanzadgad, Aimag* center of *Umnugobi*, is generating electricity and supplying it to surrounding *Soums*; the other *Soums* have generators by themselves.

2.4 RURAL SOCIETY

2.4.1 LOCAL GOVERNMENT CAPACITIES

Rural Mongolia is divided administratively into *Aimags*, *Soums* and *Bags*. One *Aimag* consists of 12 to 25 *Soums* and one *Soum* consists of 3 to 7 *Bags*. The average size of *Soum* is around 300,000 ha and 500 to 1,300 families. The average size of *Bag* is 60,000 ha and more than 100 families.

Because enormous territory and low population density, the delivery of state services to herders is primarily focused on *Soum* and *Bag* levels. Because of low capacities of the *Soum* economy to generate revenues for local budget, the *Soums* are dependent on subsidies from *Aimags*.

Table 2.4.1 shows the revenues and expenditures by *Soums* in three *Aimags* and the dependency ratio (revenues divided by expenditures).

Table 2.4.1 Budget by *Aimag* (Tg. Million)

<i>Aimag</i>	Revenues (A)	Expenditures (B)	% (A/B)
<i>Dundgobi</i>	1,148.5	3,312.8	34.7
<i>Dornogobi</i>	2,607.6	4,825.50	54.0
<i>Umnugobi</i>	1,555.3	3,969.5	39.2

(Source: *Dundgobi, Dornogobi, Umnugobi*)

The rural *Soums* in *Umnugobi Aimag* are dependent on subsidies from the *Aimag* for 73% to 86% and the *Aimag* is dependent on state subsidies for 61%. *Dornogobi Aimag* has relatively less dependence on subsidies because of comparatively developed industry and service sectors.

As for structure for local revenues the share of herder taxes constitutes only a small portion.

Table 2.4.2 Structure of Budget Revenues of *Aimags*, 2002 (Tg. Million, 2002)

	<i>Dundgobi</i>	<i>Dornogobi</i>	<i>Umnugobi</i>
Total revenue	1,148.50	2,607.62	1,555.28
Tax revenue	1,099.57	2,120.87	532.29
Out of which tax revenues from herders	83.53	77.43	93.67
% herders' taxes in total revenue	7.27	2.97	6.02
Non-tax revenue	112.82	415.68	253.75
Capital revenue	0.00	71.07	10.44
Others	0.00	0.00	758.81

(Source: *Dundgobi, Dornogobi, Umnugobi*)

Dependency of local budgets on subsidies from the above has serious implications for both efficiency and effectiveness of the delivery of social services to rural population. Lack of material and financial resources and professional staff combined with poor infrastructure seriously erode the quality and coverage of basic social services in *Soums*, especially in remote *Bags*. Since the market economic system has spread across Mongolia, the distribution and quality of social services has declined due to serious budget deficiencies. The rural population has suffered the most under this new situation.

Lack of resources especially hits the *Bags* hard. The *Bag* is lowest administrative unit, and therefore the closest to herders. In practice, the *Bag* staff consists of only a *Bag* governor, who is usually one of the better-educated herders, and in some cases an assistant doctor or nurse is added. The *Bag* budget funds only salaries with social and health insurance funds for staff, limited funds for fuel/petrol to be used for the motorbike of the Governor and small fund for stationery. In many cases *Bags* do not have offices and *Bag* governors use their *Gers* as offices. This means that *Bag* has no permanent location since the *Bag* governor also makes seasonal migrations just as any other herder.

2.4.2 ECONOMIC SITUATION OF HERDERS

To demonstrate the economic situation of a typical herder household with 5 members, the following income and expenditure tables were developed using the data collected during the fieldwork as well as the relevant averages for some indicators. (See Table 2.4.3). The averages used may slightly differ if compared with individual cases of families and *Soums*; however, they are a good representation of the reality. To see the variability of incomes and expenditures, a model was calculated for households with 100 and 200 animals.

As shown in Table 2.4.3, the total sales revenue is a Tg 666,400 for household with 100 animals and Tg 1,263,720 for household with 200 animals. Including the value of animals consumed for food, the figure increases to Tg 950,400 and 1,675,720 respectively. However, the number of animals decreases by one horse with the value of Tg 60,000 for the household with 100 animals and increases by 2 animals with the total value change of minus Tg 16,000 for the household with 200 animals.

Table 2.4.3 Average Income per Household

	Household with 100 Animals						Household with 200 Animals					
	Camel	Horse	Cattle	Sheep	Goat	Total	Camel	Horse	Cattle	Sheep	Goat	Total
Livestock at the beginning of year	1	10	10	40	39	100	3	17	14	88	78	200
Share of reproductive female	28.5	29.1	37.7	45.1	43.8		28.5	29.1	37.7	45.1	43.8	184
Number of reproductive female	0	3	4	18	17	42	1	5	5	40	34	85

(Source: JICA Study Team)

The following averages were used to estimate annual consumption and expenditures per capita:

- Meat: 131.8 kg, Milk: 270 liter, Flour : 75 kg, Rice : 20 kg, Sugar : 10.3 kg
- Health /per family/ Tg 29,000
 - Tg 24,000 for health insurance
 - Tg 5,000 for medicines
- Transport /per family/ Tg 35,000
 - Tg 20,000 within *Soum*
 - Tg 35,000 within *Aimag*
 - Tg 30,000 outside *Aimag*
- Meat yield of animals, kg
 - Camel 256.5, Horse 145.3, Cattle 139.4
 - Sheep 19.1, Goat 12.9

Household expenditures include items for *Ger* and other household needs such as *Ger* covers, candle and matches. Clothing consumption is based on the average need for clothing for each member of family and minimum market prices. Education of schools children involves basic costs for bags, books, notebooks, clothing and sanitary items. Holiday preparation costs include largely those associated with *tsagaan sar*, lunar new year celebration in February, the most costly and widely celebrated holiday among herders.

The total expenditure is Tg 1,360,730 and Tg 1,617,950 respectively for households with 100 and 200 animals. The biggest portion of expenditures goes to food and clothing, which is characteristic of any poor family.

The revenues and expenditures are roughly equal for the family with 200 animals suggesting that at this herd size, a herder's family may sustain a very basic livelihood. However,

sustaining a basic livelihood is a relative concept. If one of the children of a household goes to university this will entail costs up to Tg 1 million including around Tg 260,000 of university fee and living expenses. In other words, the household cannot afford high education for any children.

The revenues of the family with 100 animals fall Tg 410,330 (950,400-1,360,730) short of expenditures. This means that a household needs revenues from alternative sources or has to decrease expenditures.

In practice priority ranking of expenditure or consumption items varies across households. For example, if a household does not have a quality drinking water source, it may sacrifice some other consumption item in order to pay for the quality water.

Table 2.4.4 Average Expenditures per Household (Tg 1,000)

Expenditures by type	Household with 100 animals	Household with 200 animals
Production	140.03	269.25
Food	210.1	210.1
Value of animals consumed	284.0	412.0
Household	63.6	63.6
Holiday preparation	135.0	135.0
Transportation	85.0	85.0
Sanitary	30.0	30.0
Health	29.0	29.0
Clothing	317.0	317.0
Education of school children	67.0	67.0
Total	1,360.73	1,617.95

Source: JICA Study Team

Table 2.4.5 Average Production Expenditures per Household (Tg 1,000)

	Household with 100 animals	Household with 200 animals
Livestock in sheep units for inputs	207	372
Livestock in sheep units for taxation	204	390
Number of livestock taxed	104	290
Fodder for sheep unit, Tg	130	130
Tax per sheep unit, Tg	75	75
Number of migrations per year	5	7
Costs per migration, Tg	12000	12000
Veterinary costs per animal, Tg	226	226
Expenditures incurred, '000 Tg		
Taxes*	7.76	21.75
Fodder, Tg	26.39	48.75
Migration**	60.00	84.00
Veterinary services	45.88	84.75
Fuel	0.00	30.00
Total	140.03	269.25

*20 animals per a member of family or 100 animals per 5 member family are free from taxes

**One migration costs around one young sheep value.

2.4.3 HERDER COMMUNITIES

(1) Informal Communities of Herders

In Mongolia, 2 -10 households which cooperate in everyday herding activities; these are local neighborhood communities (*neg nutgiinhan*, "people of one place") formed of *Khot Ailes* which use the same pastoral resources for at least part of each year. *Khot Aile* is a group of households camping together and sharing labor. It also plays a social role as the smallest local community. It has a loose internal structure and flexible composition from year to year. In the *Khot Aile* many family functions become shared between families within the *Khot Aile* irrespective of whether they are related or not. These families cooperate in day to day herding activities, but the animal and other assets owned separately by households.

It is common that *Khot Aile* member families are related to each other on a kinship basis. However, it is also not rare that families are not related but camp together on friends or *nutgiin aile* (family from native place) basis. In the *Khot Aile* that consists of families with non-kinship relationships, it is not rare that the poorer families joined the wealthier families to get help and better accesses to key resources, and the wealthier families to help the poorer relatives in return for primarily labor inputs and thus safeguard their reputation among the society. Often, the poor families look after animals of the wealthier families together with own animals and the wealthier families assist the poor families in buying clothing and schooling equipment for their children. However, these kinds of help usually are only of a short-term survival nature, and have no long-term vision to get the poor out of poverty.

As the number of animals per camp depends on the carrying capacity of pastures, the number of families within the *Khot Aile* has clear tendency to decline in drier steppe and Gobi regions. While in productive *Khangai* regions, the *Khot Aile* consisting of 4 and more families is not rare. In the Gobi region the *Khot Aile* size tends to not exceed 2-3 families..

The second and bigger neighborhood group/community of herders is *neg nutgiinhan*, (people of one place) which is based on the neighborhood a relationship of several *Khot Ailes*. Since a key natural resource plays a crucial role in forming such groups, they are formed primarily around the water point in the Gobi region and in some places called *neg usniihan* (people of one water source). The degree and scope of relationships between families are usually weak compared with that within the *Khot Aile*.

(2) Life Situation of Herders

Mongolian herders depend on their livestock for subsistence mainly, obtaining much of their food from meat and dairy products; using wool, hair, and hides for domestic purposes; burning dung for fuel; selling or bartering livestock and livestock products for cash or goods; and using camels, horses and cattle for transportation and draft purposes.

In early 1990s, as a result of the collapse of the *Negdel* system, the livestock sector shifted to small household economic units. In the process of the privatization of the livestock, there

was no appropriate supporting services; therefore, not only responsibility for production and marketing fell to herding families who had no experience of running businesses in a market economy, but also all of the risks related to weather and prices were neglected. Herders responded rationally to these risks by increasing the herd size to the detriment of free state-owned pasturelands, and by decreasing the utilization of purchased inputs. Following this strategy, the bulk of herders did not succeed much because of limits in the carrying capacity of pastures. In addition, it eroded the quality of pastures, the basis for pastoral livestock production, causing overgrazing and degradation, especially in areas near water points and urban settlements.

Poor and new herders were hit hardest by the *Dzud*. After *Dzud* these people looked for job opportunities elsewhere because they thought that livestock herding was not a reliable business. Herders who have lost animals in the *Dzud* mostly migrated to the *Soums* center in search of jobs. However, it is very difficult to find jobs there.

Because of lack of transportation means, the small herder families have poor capabilities to access better markets and organize seasonal migrations, thus are more vulnerable to natural calamities. Marketing capability and bargaining power of small herder households are weak because of lack of cooperative action. Price of livestock products decreases and consumer goods increases as the distance to central markets increase; especially herders do not have proper access to markets, so barter trade is dominant and the level of raw material processing is low. Herders often have the same source of water for drinking and livestock purposes. Most herders consume unhealthy water from springs, snow, and ice.

Because of limitations in fodder production and high transportation costs, the price of fodder was comparatively high in all three *Aimags*, thus preventing the herders from buying fodder in a sufficient quantity.

Delivery of appropriate social services is one of the still unsolved problems for herders. Particularly, there is limited access to the achievements of modern civilization. As of 2001, herder households with electricity sources accounted for 18.2% in *Dornogobi Aimag*, 15.4% in *Dundgobi* and 33.7% in *Umnugobi Aimag*; households with TV sets accounted for 17.6%, 13.3% and 19.2% respectively in the *Aimags*.

Herders are scattered across vast territories, which causes significant logistical problems for the delivery of social services. In addition, because of the constraints caused by the transition to a market economy, budget resources allocated for rural education and health have been reduced, so rural people, especially people in remote regions have poor access to quality health service.

School dropout, especially among rural boys is more common among poor, small size families and women headed families. The coverage of social insurance is very low among rural population, seriously jeopardizing the social security of herders in the future.
