PREFACE

In response to a request from the Government of the Republic of Indonesia, the Government of Japan decided to conduct “The Study on Public-Private Partnership (PPP) Scheme for Trans Java Toll Road in the Republic of Indonesia” and entrusted it to the Japan International Cooperation Agency (JICA).

JICA selected and dispatched a Study Team headed by Dr. Hani Abdel-Halim of Katahira & Engineers International from April 2006 and January 2007. The team held discussions with the officials concerned of the Ministry of Public Works as well as other officials concerned, and conducted field surveys, data analysis and PPP financial scheme. Upon returning to Japan, the team prepared this final report to summarize the results of the study.

I hope that this report will contribute to development in the Republic of Indonesia, and to the enhancement of friendly relationship between our two countries.

Finally, I wish to express my sincere appreciation to the officials concerned of the Government of the Republic of Indonesia for their close cooperation extended to the Study Team.

January 2007,

Kazuhisa MATSUOKA,
Vice President
Japan International Cooperation Agency

Mr. Kazuhisa MATSUOKA,
Vice President
Japan International Cooperation Agency

January 2007

Dear Sir,

Letter of Transmittal

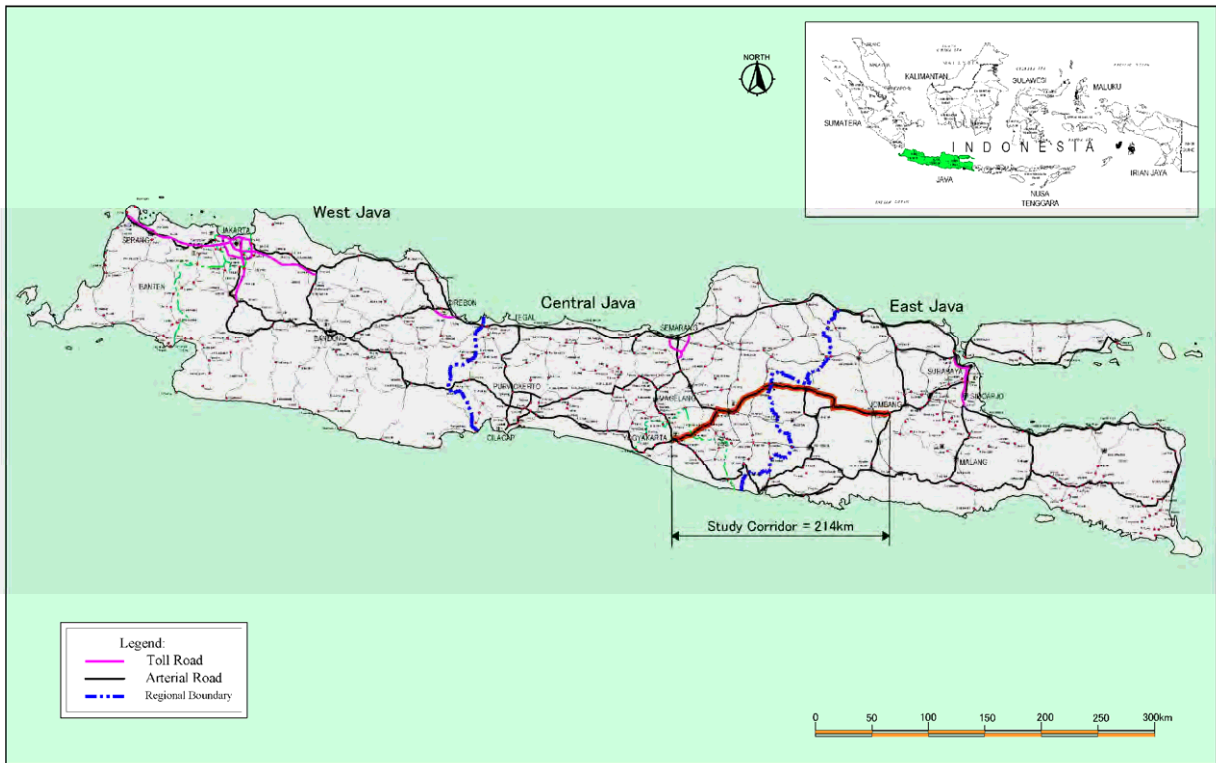

We are pleased to submit herewith the Final Report of "The Study on Public-Private Partnership (PPP) Scheme for Trans Java Toll Road in the Republic of Indonesia". The report compiles the results of the Study and includes the advices and suggestions of the authorities concerned of the Government of Japan and your agency as well as the comments made by the Ministry of Public Works and other authorities concerned in the Republic of Indonesia.

The report includes review of previous feasibility study on the study road, and analyses the present and future road network conditions and demand of transport in Java Island. Revised cost estimate and transport demand are applied for the economic evaluation and financial analysis of six established PPP options. An optimum PPP scheme is recommended based on a comprehensive evaluation and assessment process that takes into consideration the pros and cons of each option and the minimum financial requirements by the Government of Indonesia. In addition, bidding guidelines and implementation plan are included for the smooth and on-schedule implementation of the toll road project.

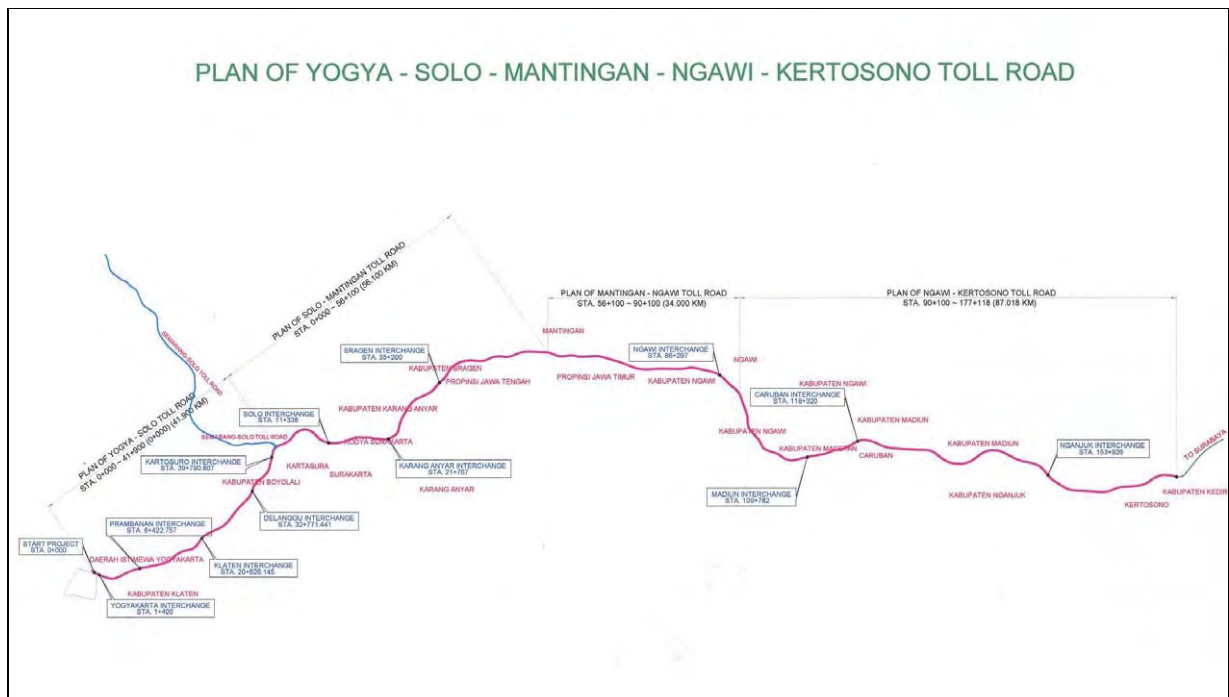

We wish to take this opportunity to express our sincere gratitude to your agency and the Ministry of Foreign Affairs. We also wish to express our deep gratitude to the Ministry of Public Works as well as other Governmental Agencies concerned in the Republic of Indonesia for the close cooperation and assistance extended to us during the Study. We hope this report will contribute to the development of the Republic of Indonesia.

Very truly yours,

Dr. Hani Abdel-Halim
Team Leader,
The Study on Public-Private Partnership (PPP) Scheme for
Trans Java Toll Road in the Republic of Indonesia

CHAPTER 1 INTRODUCTION

1.1	BACKGROUND.....	1-1
1.2	OBJECTIVES OF THE STUDY	1-2
1.3	STUDY CORRIDOR	1-2
1.4	SCOPE OF THE STUDY	1-2
1.5	SCHEDULE OF THE STUDY	1-4
1.6	ORGANIZATION OF THE STUDY	1-4

PART I: YOGYAKARTA – SOLO – KERTOSONO TOLL ROAD DEVELOPMENT

CHAPTER 2 DESCRIPTION OF THE PROJECT

2.1	BACKGROUND OF THE PROJECT	2-1
2.2	OBJECTIVE OF THE PROJECT	2-2
2.3	NECESSITY OF THE PROJECT	2-2
	2.3.1 National Mid-Term Development Plan	2-2
	2.3.2 Infrastructure Road Map	2-4
2.4	SOCIOECONOMIC CHARACTERISTICS IN PROJECT AREA	2-7
	2.4.1 Population	2-7
	2.4.2 Economy	2-7
	2.4.3 Socioeconomic Framework	2-9
2.5	ROAD NETWORK DEVELOPMENT	2-10
	2.5.1 Arterial Road Network Development	2-10
	2.5.2 Toll Road Development	2-11
	2.5.3 Indonesia Highway Corporation	2-15
2.6	TRANS JAVA TOLL ROAD	2-16
2.7	MAJOR COMPONENTS OF THE PROJECT	2-18
2.8	EFFECTS OF TOLL ROAD PROJECT	2-21
	2.8.1 Direct Effects	2-21
	2.8.2 Regional Effects	2-22

CHAPTER 3 TRAFFIC SURVEY AND DEMAND FORECAST

3.1	OBJECTIVES	3-1
3.2	TRAFFIC SURVEY	3-1
	3.2.1 Survey Method	3-1
	3.2.2 Results of Traffic Survey	3-3
3.3	DEMAND FORECAST	3-7
	3.3.1 Basic Policy	3-7
	3.3.2 OD Zoning System	3-7
	3.3.3 Present and Future Trip Pattern	3-8

3.4	FUTURE TRAFFIC VOLUMES	3-9
3.4.1	Basic Policy	3-9
3.4.2	Traffic Assignment Procedure	3-9
3.4.3	Future Traffic Volume	3-14

CHAPTER 4 COST ESTIMATION AND ECONOMIC ANALYSIS

4.1	REVIEW OF PROJECT COST	4-1
4.1.1	Construction Cost	4-2
4.1.2	Land Acquisition Cost	4-3
4.2	REVISED PROJECT COST	4-6
4.2.1	Major Items for Cost Estimate	4-6
4.2.2	Review of Bridge Construction Cost	4-8
4.3	ECONOMIC ANALYSIS	4-11
4.3.1	Review of F/S Economic Analysis	4-11
4.3.2	Revised Economic Analysis	4-14
4.3.3	Revised Economic Parameters	4-15

PART II: FORMULATION OF PPP SCHEME

CHAPTER 5 OVERVIEW OF PPP

5.1	BENEFITS OF PROMOTING PPP	5-1
5.1.1	Definitions of PPPs.....	5-1
5.1.2	Objectives of PPPs	5-3
5.1.3	Progress in PPPs	5-3
5.1.4	Survey of PPP Progress by Areas	5-7
5.1.5	Type of PPP	5-8
5.2	FACTORS FOR SUCCESS AND FAILURE FROM INTERNATIONAL EXPERIENCES	5-10
5.2.1	Road BOT Experiences in Asia	5-10
5.2.2	DBFO Road Experience in UK	5-12
5.2.3	Lessons Learned from International Experience: Main Factors for Successful and Failed PPPs	5-15

CHAPTER 6 REVIEW OF PPP ENVIRONMENT

6.1	REVIEW OF LEGISLATIVE FRAMEWORK	6-1
6.1.1	Stages of Toll Road Financing	6-1
6.1.2	Law and Regulation for Toll Road	6-1
6.1.3	Implementation Framework on Toll Road	6-3
6.2	REVIEW OF ISSUES OF PREVIOUS ROAD BOT SCHEMES	6-9
6.2.1	Recent Toll Road Development Program	6-9
6.2.2	Issues of Previous Road BOT Schemes	6-11

CHAPTER 7 STUDY ON PPP SCHEME

7.1	OPTIONS OF PROJECT SCHEME	7-1
	7.1.1 Objective to introduce PPP	7-1
	7.1.2 Options Considered	7-1
7.2	EVALUATION OF PPP OPTIONS	7-4
7.3	PROJECT FINANCIAL ANALYSIS	7-18
	7.3.1 Scenario Setting and Major Assumptions	7-18
	7.3.2 Results of Financial Study	7-20
7.4	SUMMARY OF RESULTS AND RECOMMENDATIONS	7-41
	7.4.1 Pros and Cons Options	7-41
	7.4.2 Financial Evaluation	7-41
	7.4.3 Sensitivity Analysis	7-42
	7.4.4 Recommendations	7-47

PART III: RECOMMENDED PPP SCHEME AND IMPLEMENTATION PLAN

CHAPTER 8 RECOMMENDED PPP SCHEME

8.1	PPP SCHEME UNDER OPTION 6	8-1
	8.1.1 Project Scheme	8-1
	8.1.2 Evaluation on Option 6	8-3
8.2	FINANCIAL ANALYSIS ON OPTION 6	8-4
	8.2.1 Scenario Setting and Major Assumptions	8-4
	8.2.2 Results of Financial Study	8-6
8.3	PAYMENT MECHANISM	8-9
	8.3.1 Upfront Payment	8-9
	8.3.2 Service Payment	8-9
	8.3.3 Required Subsidy Policy of MPW	8-11
8.4	SUBSIDY SCHEME	8-11
	8.4.1 Toll Road Investment Projects supported by Government	8-11
	8.4.2 Infrastructure Policy Package in Indonesia	8-12
8.5	MECHANISM OF PSO	8-13
	8.5.1 Governing Law in Indonesia Concerning Application of PSO	8-13
	8.5.2 Mechanism of PSO Application	8-13
	8.5.3 Implementation of PSO	8-14
	8.5.4 Aspects Required in regulating PSO	8-15
8.6	USE OF BLU	8-15
8.7	WORK AND RISK SHARING	8-15
	8.7.1 Illustrative Work Sharing for Java Toll Road	8-15
	8.7.2 Illustrative Risk Sharing for Java Toll Road	8-17
	8.7.3 General Risk Sharing	8-17

CHAPTER 9 IMPLEMENTATION PLAN

9.1	DETAILED PLAN OF PUBLIC SECTOR TASKS	9-1
	9.1.1 Feasibility Study	9-1
	9.1.2 Public Funding Arrangement	9-1
	9.1.3 Preparation of Tender Documents	9-1
	9.1.4 Selection of PPP Company	9-2
	9.1.5 Environmental Impact Assessment	9-2

9.1.6	Land Acquisition of ROW	9-2
9.1.7	Monitoring of Detailed Design and Construction	9-3
9.1.8	Confirmation of Construction Completion	9-3
9.2	DETAILED PLAN OF PRIVATE SECTOR TASKS	9-3
9.2.1	Preparation of Tender	9-3
9.2.2	Detailed Design of Toll Road	9-4
9.2.3	Construction of Toll Road	9-4
9.3	DETAILED DESIGN OF TOLL ROAD	9-4
9.3.1	Organization	9-5
9.3.2	Toll Roads to be designed	9-5
9.3.3	Design Standards and Criteria	9-6
9.3.4	Quality Assurance and Approval on Detailed Design	9-7
9.3.5	Change in Detailed Design	9-8
9.3.6	The Detailed Design Schedule	9-8
9.4	CONSTRUCTION OF TOLL ROAD	9-8
9.4.1	Organization	9-9
9.4.2	Scope of Construction Work	9-9
9.4.3	Construction Schedule	9-10
9.4.4	Stage-by-Stage Construction	9-10
9.4.5	Construction Supervision and Quality Assurance	9-10
9.4.6	Change of Scope of Works	9-11
9.4.7	Environmental Monitoring in Construction	9-11
9.5	OVERALL IMPLEMENTATION SCHEDULE	9-12

CHAPTER 10 MAINTENANCE AND OPERATION PLAN

10.1	MAINTENANCE PLAN	10-1
10.1.1	Maintenance System	10-1
10.1.2	Inspection	10-3
10.1.3	Maintenance Management	10-4
10.1.4	Maintenance Work	10-6
10.1.5	Maintenance Criteria and Specifications	10-7
10.1.6	Monitoring/Quality Assurance	10-8
10.2	OPERATION PLAN	10-8
10.2.1	Toll Collection Management	10-9
10.2.2	Traffic Management Service	10-10

CHAPTER 11 BIDDING GUIDELINES

11.1	OVERVIEW	11-1
11.2	ROLE OF PPP CONTRACTOR	11-1
11.3	ROLE OF GOVERNMENT	11-2
11.4	OVERVIEW OF PAYMENT MECHANISM	11-2
11.5	PROCUREMENT PROCESS	11-4
11.6	TENDER EVALUATION	11-5
11.7	DIFFERENCES FROM CURRENT BIDDING DOCUMENTS	11-5

CHAPTER 12 CONCLUSIONS AND RECOMMENDATIONS

12.1	CONCLUSIONS	12-1
12.2	RECOMMENDATIONS	12-5

CHAPTER 1

INTRODUCTION

CHAPTER 1

INTRODUCTION

1.1 BACKGROUND

Java Island is the mainstay of socioeconomic activities of Indonesia as well as the nucleus of prospective industrial development and diverse economic investment. Economic activities in Java Island have been boomed by domestic and international enterprises, which have inevitably induced remarkable development of road network in Java Island. Due to the rapid development of economic activities, however, the congestion level of trunk roads has reached to the critical limit in terms of physical capacity and network function, and thus emergent increment of road capacity is duly required. To cope with this situation and to support the booming socioeconomic activities and further development in Java Island, many road development projects are being implemented to attain substantial enhancement of the road transport system in the island.

Previous toll road projects in Indonesia have been implemented by government finance, foreign funds, Jasa Marga fund, BOT schemes and so forth. However, the current economic conditions and financial uncertainty in Indonesia induce certain constraints in project finance by the government, and conventional BOT schemes has been depressed mainly due to intolerable risk for the private sector in terms of demand, tariff, land acquisition and taxes. With the existing financial constraints, new and stable sources of fund are required. This financial gap is expected to be filled by the private sector that is also expected to be capable of improving the quality of transport infrastructure services. The development of private sector involvement in the provision of public services can be achieved through insuring private as well as public benefits. The benefits through private sector participation will be greater when the government clarifies the responsibilities of involved governmental agencies, optimizes risk and work sharing between both public and private sectors and develops supporting policies on competition and regulations.

The approach of applying PPP schemes in financing toll road projects is currently applied in different countries. In Indonesia, however, it is still new financing mechanism that requires to be carefully studied in order to successfully apply. Applying PPP scheme on the study road has many objectives and is expected to generate many benefits, including:

- To provide a pilot PPP project that will open the market for more private sector participation in financing public infrastructure projects.
- To develop, strengthen and open more business opportunities for the private sector to carry out more roles in future.
- To reduce the life-cycle governmental burden in financing public infrastructure projects which will support the national budget on the long term.
- To allow the utilization of private sector experience, efficiency, flexibility and advanced technology in implementing and operating public projects.
- To deliver better and less expensive services to road users.

In response to the request of the Government of the Republic of Indonesia (GOI), the Government of Japan (GOJ) has decided to conduct “The Study on Public-Private Partnership (PPP) Scheme for Trans Java Toll Road in the Republic of Indonesia”. Accordingly, JICA organized and dispatched a Study Team, from Katahira & Engineers International (KEI) and PwC Advisory Co., Ltd. (PwC), a member firm of PricewaterhouseCoopers, to Indonesia to commence the Study on April 2006. The Final Report is scheduled to be submitted to the Government of the Republic of Indonesia on January 2007.

1.2 OBJECTIVES OF THE STUDY

The objectives of the Study are:

1. To propose financially viable PPP scheme for the selected section of Trans Java Toll Road based on the proposed PPP scheme; and
2. To transfer a set of PPP related knowledge and know how to the counterparts during the course of the Study.

1.3 STUDY CORRIDOR

The road corridor under this Study is the section of “Yogyakarta ~ Surakarta (Solo) ~ Ngawi ~ Mantingan ~ Kertosono” with a total length of 219 km of Trans Java Toll Road.

1.4 SCOPE OF THE STUDY

In order to achieve the objectives mentioned above, the Study will cover the following items:

1. Collection and Review of Basic Information

- Laws and regulations related to PPP road projects
 - Status and progress of other donors' activities related to the project
2. Review and Analysis of Relevant Data and Reports
 - Central and provincial development plans by Sector
 - Socioeconomic data and information (population, GDP, employment, etc.)
 - Land use and ownership
 - Natural conditions in the Study Area
 - Environmental conditions
 - Trend of other donors and NDOs activities
 3. Review of Results of the Feasibility Study on the Study Road Section
 - Present conditions
 - Traffic and road network conditions
 - Results of traffic demand forecast
 - Engineering aspects
 - Estimated cost
 - Environmental conditions
 - Economic viability
 - Implementation strategy and plan
 4. Traffic Surveys and Demand Forecast
 - Field survey
 - Supplementary traffic count surveys
 - Willingness-to-Pay interview survey
 - Review of demand forecast
 - Simulation of toll levels and revenues
 - Review of cost estimate
 5. Formulation of Optimum PPP Scheme for Yogyakarta – Kertosono Section
 - Information on pre-conditions PPP projects
 - Interview with related government agencies, prospective operators/investors and financial institutions.
 - Optimum PPP scheme
 6. Project Implementation Plan
 - Proposed implementation plan based on work sharing between public and private sectors
 - Review of existing tender procedures and proposed procedures for the PPP road project

- Proposed evaluation points of the proposals

7. Effective Utilization of PPP Scheme

- Review existing BOT projects and identify problems
- Proposed improvements for implementation plans of PPP projects
- Identifying legislative hurdles which hamper PPP operations

8. Conclusions and Recommendations

1.5 SCHEDULE OF THE STUDY

The Study is commenced in April 2006 and the Final Report is scheduled to be submitted by January 2007. Figure 1.5-1 shows the Study Flow Diagram.

1.6 ORGANIZATION OF THE STUDY

The Study is carried out by JICA Study Team which is composed of the following experts:

Dr. Hani ABDEL-HALIM	Team Leader / PPP Scheme
Mrs. Yumiko NODA	PPP Structure
Ms. Mariko OGAWA	PPP Maintenance and Operation Plan
Mr. Soemu OSHITA	PPP Construction Plan
Mr. Jon SIVERTSON	Bidding Procedure (1)
Mr. Munehiko ETO	Bidding Procedure (2)
Mr. Hiroo TAKEDA	Toll Road Legislation
Dr. Shingo GOSE	Toll Road Plan
Mr. Tatsuyuki SAKURAI	Toll Road Policy Advisor

An Implementing Committee is set up to steer the Study effectively under the initiative of the Ministry of Public Works. The committee is consisted of the following:

Mrs. Sri Apriatini Soekardi	Chairman; Director of General Planning, Directorate General of highways, MPW
Mr. Soebagiono	Secretary; Head of Sub Directorate of Freeways and Toll Road Development, Directorate of Freeways and Urban Road, Directorate General of Highways, MPW

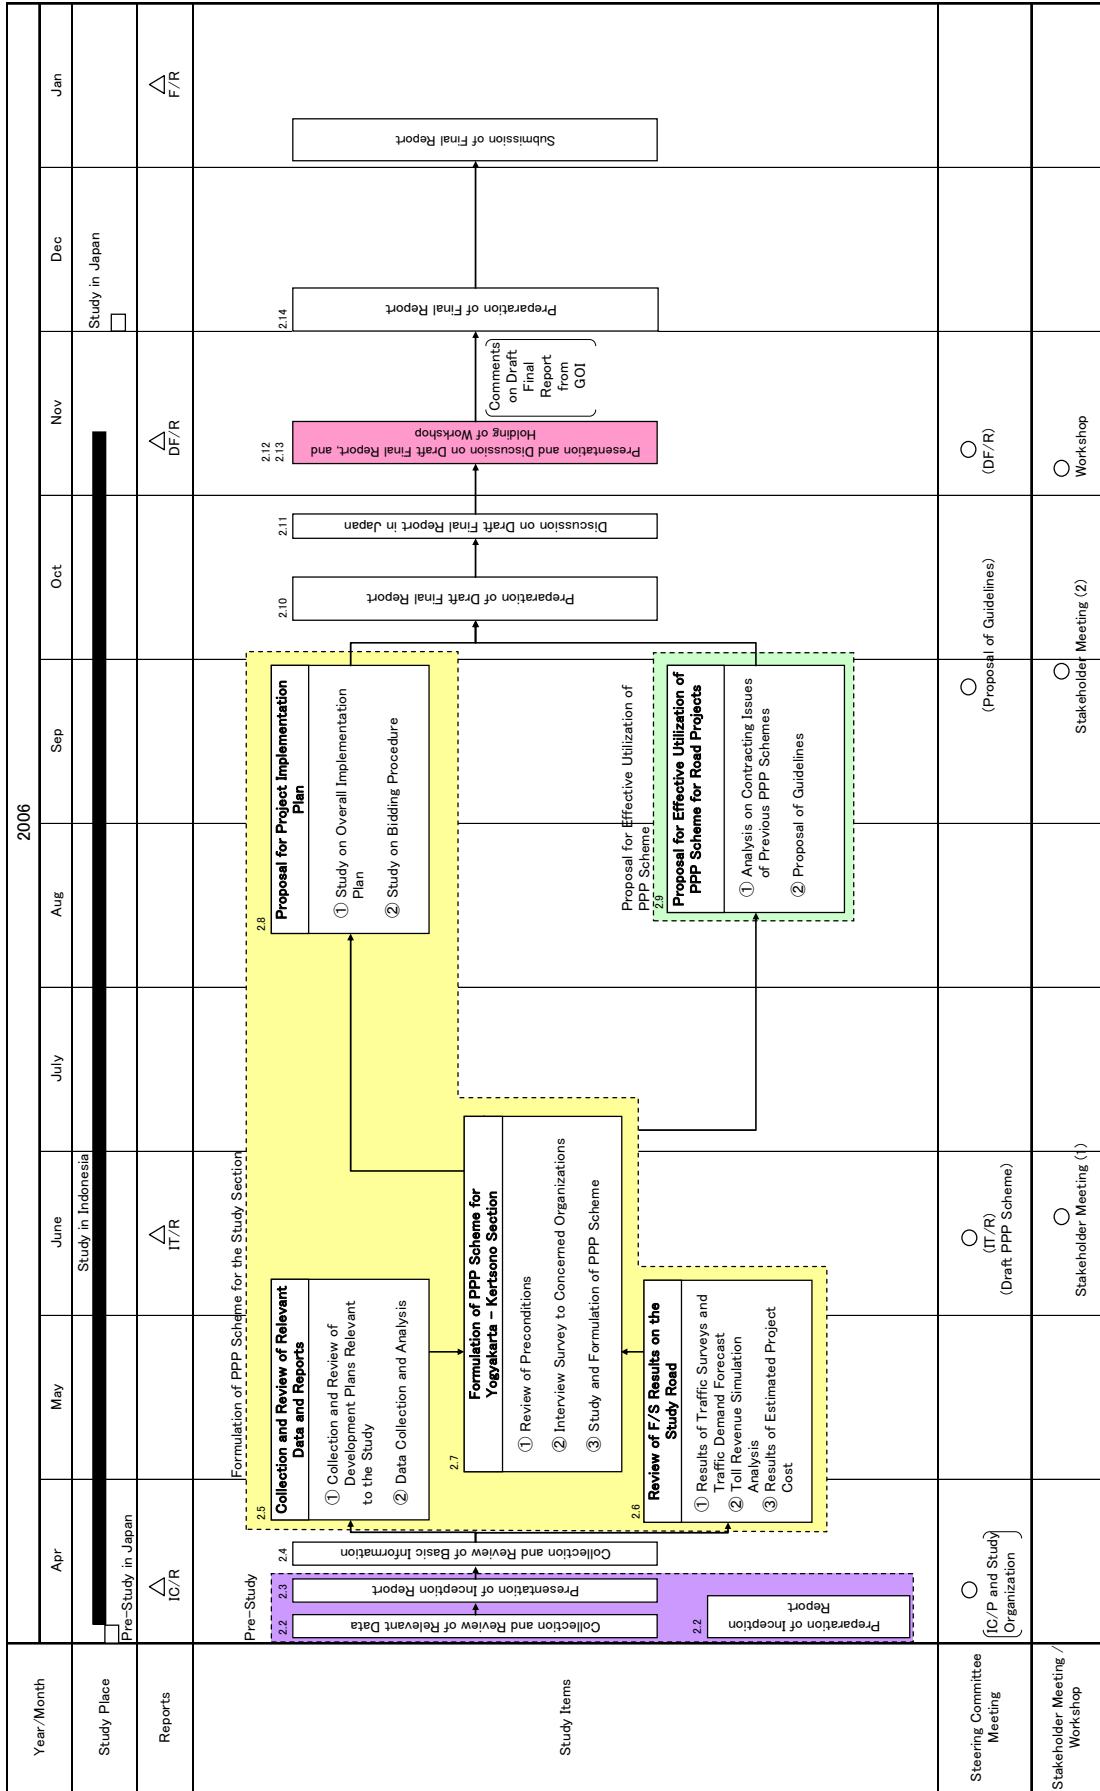

Figure 1.5-1 Study Flow Diagram

Mr. Nurdin Manurung	Member; Director of Freeways and Urban Road, Directorate General of Highways, MPW
Mr. Muhammad Irian	Member; Secretary of BPJT, MPW
Ms. U. Hayati Triastuti,	Member; Director of Transportation, Bappenas
Mr. Imron Bulkin	Member; Director of PPP Development, Bappenas
Mr. Ceppie Kurniadi Sumadilaga	Member; Director of Bilateral Funding, Bappenas
Mr. Agus Suprijanto	Member; Director of Loan and Grant Management, Ministry of Finance

The Study is supposed to be conducted in a manner of a joint work of Indonesian and Japanese sides. In this context, the Ministry of Public Works allocated the Counterpart Personnel as follows:

Mr. Herry Trisaputra Zuna	Sub Directorate of Freeways and Toll Road Development
Mr. Dedy Gunawan	Sub Directorate of Freeways and Toll Road Development
Mr. Rahman Arief	Sub Directorate of Planning
Mr. Hardi Siahaan	Toll Road Regulatory Board (BPJT)

The Organization Chart of the Study is shown in Figure 1.6-1.

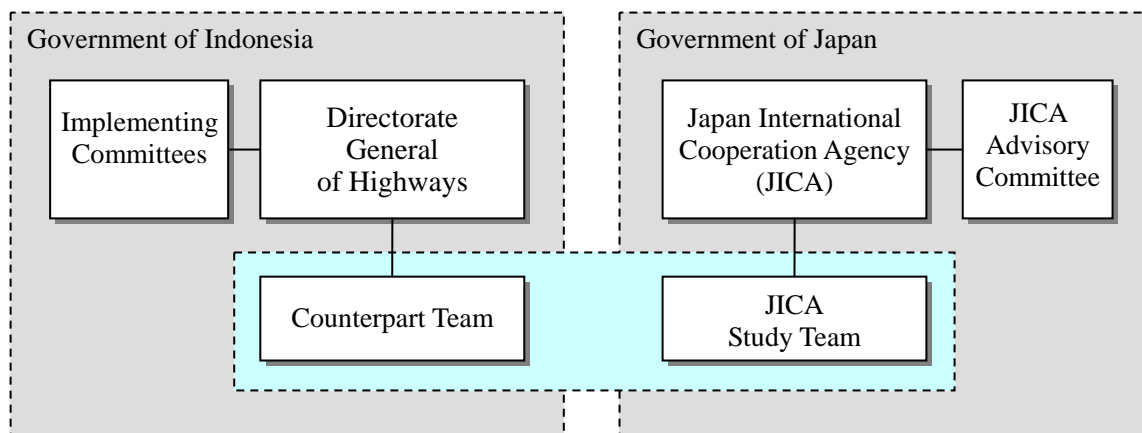

Figure 1.6-1 Organization Chart

PART I

YOGYAKARTA – SOLO – KERTOSONO TOLL ROAD DEVELOPMENT

CHAPTER 2

DESCRIPTION OF THE PROJECT

CHAPTER 2

DESCRIPTION OF THE PROJECT

2.1 BACKGROUND OF THE PROJECT

Compared with other ASEAN countries, Indonesia has a low density of road networks, which give a density of 0.02 km per sq. km of land area. The road is rapidly getting crowded as the number of motor vehicles increased more rapidly than the growth of road network, particularly in Java Island, which accommodates the highest population density and economic activities in the country.

The rapid socioeconomic growth at the southern and eastern areas of Java Island is increasing the demand for better transportation facilities including road infrastructure. Such areas are varying in terms of regional capacity, characteristics and potential. Yogyakarta is known as a tourism area and the centre of education. Solo city has also the same characteristics. Meanwhile, other cities along the corridor have potential as centres of agriculture production and some tourism spots.

The Project Road is a section of Trans Java Toll Road, located in Central and East Java that connects East Java and Central Java heading to Jakarta. The distribution of goods from production areas to markets and the movement of people require higher travel speed and shorter travel time to decrease travel cost with higher safety levels. The development of a toll road will overcome the existing problems regarding the growth in transport demand due to development in socioeconomic sectors.

The project's main purpose is to provide an efficient road transport network in Java Island in order to promote its rapid socioeconomic development. Java Island, with its highest population density, is the mainstay of socioeconomic activities in Indonesia. Due to the rapid development of economic activities, the congestion level of trunk roads is expected to reach critical limits in the near future in terms of physical capacity and network function. The proposed sections are critical components of Trans Java Toll Road.

The current economic conditions and financial uncertainty in Indonesia induce certain constraints in financial viability of projects. With the existing financial difficulties, new and stable sources of fund are required through PPP schemes. In order to attract the private sector participation, which is expected to improve the quality of the transport services, the appropriate public sector's support under PPP schemes will be

required to lower financial requirements of the private sector down to the level affordable by toll revenues.

2.2 OBJECTIVE OF THE PROJECT

The objectives of implementing the road project, between Yogyakarta – Solo – Kertosono to Surabaya as a part of Trans Java Toll Road, are as follows:

- To improve accessibility and capacity of road networks for the movement of people and freight on this important transport corridor.
- To promote national and regional socioeconomic development in corridor-impact areas and cities along the road in eastern parts of Java Island
- To increase productivity with repression of distributional cost and giving access to regional and international markets
- To provide an efficient road transport network in Java Island to promote its rapid socioeconomic development

2.3 NECESSITY OF THE PROJECT

The economic growth and increase of social, economic and tourism activities within the project area and along its corridor as well as the need to enhance the regional development in central and eastern areas in Java Island, as per the targets of national development plans, it can be said that this toll road project is the optimum alternative to meet these requirements and conditions.

The Project Road has been declared in the RPJM (Mid-Term Development Plan 2005-2009) and also has been stated in the following:

- Strategic Plan of the Ministry of Public Works, 2005-2009
- Minister of Public Works Decree No. 369/KPTS/M/2005 on National Road Network Master Plan to include toll road network master plan.
- GOI has launched the Toll Road Acceleration Development Program through Indonesia Infrastructure Summit I, January 2005.

2.3.1 National Mid-Term Development Plan

National road infrastructure in the National Mid-Term Development Plan of 2005 - 2009 represents an important sector that requires approximately Rp 25 trillion for maintenance and upgrading, while the expected available fund is only Rp 15 trillion. The needs for the development of strategic national road network including shortcut

roads, roads in isolated areas and in small islands and long span bridges is approximately Rp. 50 trillion. The development of about 1,600 km of the highway network in the three main islands of Java, Sumatra and Sulawesi requires a budget of Rp 89 trillion in the five year plan. The Plan also states that the length of the national road network will be expanded from 26,853 km to 34,828 km. To overcome this financing gap, the funding scheme includes the involvement of the public sector together with both domestic and foreign private sector.

The general policy of the plan includes the following major points:

- Harmonizing the road network system with the policy of national spatial planning to support regional development and integrate with other infrastructure network systems.
- Maintaining the performance of road infrastructure by optimizing the handling of road network development to meet the transportation needs.
- Improving the accessibility of regional development in the framework of a unified nation of the Republic of Indonesia.
- Promoting professional attitudes and institutional efficiency with human resources independency in handling the road sector development.
- Encouraging the involvement of private sector and business circles to participate with the public sector in developing the road network.

The following points are stated under the operational policy of the Plan:

- Prioritization in handling the development of strategic national roads has the criteria of supporting the national economy as well as the completion of road segments for optimum function in supporting developing areas, state-bordering areas and isolated areas.
- Maintaining the existing road network in good operational conditions
- Increasing the strength of structures and capacity of roads in line with the increase in demand for cargo movement and growth in traffic volumes.
- Establishing standards, guidelines and manuals on road development to support regional autonomy as well as to optimize road operation and management.
- Providing information to stakeholders on road infrastructure operation and encouraging investment for the acceleration of road development.

Goals of the Plan include the creation of reliable national road network with strategic and collaborated interconnections to increase the accessibility and mobility for goods and services from production centres to marketing areas. It has also the objective of opening opportunities in road operation for the involvement of stakeholders including

regional governments, private partners and the public sector.

Three scenarios; limited, moderate and ideal, are developed with different levels of road network performance targets, as presented in Table 2.3-1. Based on each performance target, road network improvement tasks are established regarding lengths of roads under maintenance, rehabilitation, widening and construction. In addition, required funds for national roads are estimated as Rp 30.0 trillion for the limited, Rp 45.0 trillion for moderate and Rp 75.0 for the ideal scenario. In addition, a fund of Rp 89.4 trillion is required to improve other roads under any of the three scenarios.

Table 2.3-1 Performance Targets of National Road Development Scenarios

Item		Limited Scenario	Moderate Scenario	Ideal Scenario
Average Speed		Decrease: 44 km/hr to 42 km/hr	Increase: 44 km/hr to 48 km/hr	Increase: 44 km/hr to 55 km/hr
Road Condition	Good	From 37 % to 28%	From 37 to 31%	From 37 to 40%
	Moderate	From 44% to 42%	From 44% to 50%	From 44% to 60%
	Bad	From 8% to 24%	From 8% to 11%	From 8% to 0%
	Very Bad	From 11% to 6%	From 11% to 8%	From 11% to 0%

2.3.2 Infrastructure Road Map

The Infrastructure Summit of January 2005 in Jakarta confirmed the Indonesian Government intention to launch an extremely huge amount of new investments for the development of infrastructure projects, including 38 toll road projects with investment of about USD 9.5 billion in total. Such projects are now left to the investors, as Jasa Marga is no longer the single operator and regulator assigned by the Government.

Infrastructure development is now a pillar for the 5-year development strategy under which the growth of GDP has the target of increasing from 4.9% in 2003 to 7.2% by 2009, reducing unemployment from 9% to 5.1% and the income poverty rate from 16.6% to 8.2% of Indonesia's population. The targeted macroeconomic indicators are presented in Table 2.3-2 for the years 2009 – 2009.

The Infrastructure Road Map established under the Strategic Initiatives to Accelerate Infrastructure Development in Indonesia, Bappenas, addresses the private sector participation with the following three policy initiatives:

1. General Policy Environment: Appropriate Guarantee for reducing uncertainty
 - a) Ensure predictability in rules and policies (including tariff and market arrangement)

Table 2.3-2 Annual Macroeconomic Indicators 2005 – 2009

Macro Indicators	2005	2006	2007	2008	2009
Inflation, CPI (%)	7.0	5.5	5.0	4.0	3.0
Nom. Exchange Rate (Rp/US\$)	8,900	8,800	8,800	8,700	8,700
GDP Growth by Expenditure (%)	5.5	6.1	6.7	7.2	7.6
Current Account/GDP (%)	1.6	0.5	0.1	-0.2	-0.5
Foreign Reserves (US\$ billion)	36.8	36.0	35.6	35.2	35.9
GDP/Capita (Rp thousand)	7,946	8,333	8,791	9,317	9,914
Budget Deficit/GDP (%)	-0.7	-0.6	-0.3	0.0	
Tax Revenue/GDP (%)	11.6	11.6	11.9	12.6	13.6
Debt Stock/GDP (%)	48.0	43.9	39.5	35.4	31.8
Open Unemployment (%)	9.5	8.9	7.9	6.6	5.1

- b) Introduce enforceable contractual agreements, essential for mitigating non-commercial investor risks
 - c) Policy certainty that can be offered, not a blanket “comfort letter”.
 - d) Commitment to accelerate infrastructure development and consistency with the latest progress in other policy reform.
 - e) Policy direction for the management and mitigation of non-commercial risks, such as political, economic, project, legal and other risks
2. Entry Policies: Reduced regulatory obstacles and facilitate fair competition
- a) Reducing regulatory obstacles by facilitating reforms to remove obstacles for private participation
 - b) Unbundling/liberalization of infrastructure sectors
 - c) Establishing fair competition, with models of competition such as deregulation, BOT schemes and concessions for delegated management.
3. Pricing Policy: Reliable procedure and institutional setup for price determination
- a) A simplified procedure for tariff setting
 - b) Strengthening/establishing regulatory body to oversee fair process of tariff determination

Supportive Policies

1. Infrastructure Development Fund
- a) Developing infrastructure development fund to tap domestic savings, by creating an institutional framework/mechanism to raise funds from public and institutional investors to support infrastructure development on a medium to long term basis.

- b) Potential use of infrastructure development fund
- 2. Consolidate Indonesia Infrastructure Forum as a strategic partner of government and as a conduit for private sector.

The issues and challenges in the transport sector are expressed as degradation in the level-of-services as follows:

- Low quality and quantity of transportation services and un-integrated inter-modal network services
- Inadequate government spending in transportation sectors needed to support economic growth, to attain higher quality of welfare, and to facilitate regional development
- Inadequate regulatory frameworks for fruitful public-private partnership in transportation investment

The policy direction for the transportation sector has the targets of:

- Higher level-of-service: by rehabilitating and maintaining the existing infrastructure to increase the quality of services to an acceptable level and by enforcing law to attain safety.
- Greater integration: by developing a network of transportation that facilitates inter-modal function, focusing along commercially viable corridors (demand driven) while facilitating new investments for opening under-developed areas (supply-driven).
- Better regulatory frameworks: for private participation and develop Blue Print of national transportation system and roadmap strategy.
- Increasing mobility: by improving road quality performance to reduce road user cost along national important corridors, e.g., Sumatra East Corridor and North Java Corridor.
- Developing high grade network: along North-Coast Java and attracting private investment
- Addressing bottleneck issues: in toll road industry, such as land acquisition, tariff setting, government guarantee such as subsidy for low economic tariff and low occupancy for pioneer transport services set by the government, etc.

2.4 SOCIOECONOMIC CHARACTERISTICS IN PROJECT AREA

2.4.1 Population

Population data are based on the national census that is conducted every 10 years, with the last one on the year 2000 and predictions of 2004. As presented in Table 2.4-1, the average growth rate of population in Indonesia had decreased from 1.97% in the 1980s to 1.43% in recent years, while it is increasing in Java Island from 1.3% to 1.5% in the same period. Most of Indonesia population is concentrated in Java Island, which occupies only an area of 7% of the total country and accommodates about 60% of the population, without a well balanced regional distribution.

Table 2.4-1 Population and Growth Rate

Region	Area (km ²)	Population ('000)			Annual Growth Rate (%)		
		1990	2000	2004	1980-90	1990-00	2000-04
DKI Jakarta	740	8,228	8,361	8,750	2.38	0.17	1.14
Java Barat	36,925	29,414	35,724	38,611	2.57	2.03	1.96

* Was formed in 2000

Source: Statistical Yearbook of Indonesia – 2004, June 2005

2.4.2 Economy

For the year 2004, growth rate of Indonesian economy showed a better performance than that of 2003. Based on GDP at 2000 constant prices, growth of Indonesian economy in 2004 was 5.13 percent, as presented in Table 2.4-2. Almost all of the sectors of economy, which compose the GDP, produced a positive growth in 2004, except mining and quarrying sector.

The highest growth was reached by transportation and communication sector at 12.7 percent. Per capita national income at current prices increased from Rp 8.3 million in 2003 to Rp 9.5 million in 2004. At 2000 constant prices, the growth rate on the per capita national income was 5.87% in 2004 compared with only 1.51% in 2003.

Table 2.4-2 Trend of Economic Indicators

Indicator	Year				Annual Growth Rate (%)

Source: Statistical Yearbook of Indonesia – 2004, June 2005

Among all the provinces of Indonesia, DKI Jakarta has the highest GRDP with about 16.6% of total 30 provinces at 2003 current prices. The second and third ranks were Java Timur (East Java) and Java Barat (West Java) with 14.9% and 13.7% of total 30 provinces, respectively.

2.4.3 Socioeconomic Framework

Socioeconomic growth parameters of Java Island applied in the future socioeconomic frameworks of the related studies of Java Arterial Road Network Study, JARNS 2001, Heavy Loaded Improvement Project II, HLIRP 2001 and the Feasibility Study on Yogyakarta – Solo – Kertsono Toll Road, F/S 2006 are reviewed in relation to the national and regional future growth rates. Applied growth of population shows the same rates of 1.12% to the year 2010 and 1.09 to the year 2020.

Economic growth rates are developed under the 3 scenarios of high, medium and low growth of GDP, in which the medium scenario is adopted in JARNS and HLIRP with slightly different rates. This scenario is the base of estimating the expenditures on roads in Java Island as a percentage of total roads expenditures and is utilized in the forecast process of future OD matrices of JARNS. The HLIRP adopted also the moderate scenario with a lower growth rate between 2005 and 2010.

The Feasibility Study on the project road applied adjustment factors to adjust the framework based on the recent economic performance and the realization of existing economic growth to reach the targets of the Government, as shown in Table 2.4-3. This adjusted scenario is applied in the demand forecast process of this study as the most newly developed scenario that reflects the latest developments in the Indonesian economy and meets the established economic development targets produced under the Infrastructure summit.

Table 2.4-3 Future Socioeconomic Growth Rates

Study	Area	2005 - 2010	2010 - 2015	2015 – 2020
HLIRP-F/S	Indonesia Population	1.33%	1.30%	1.30%
HLIRP-F/S	Java Island Population	1.12%	1.09%	1.09%
JARNS	Indonesia GDP – Moderate	5.40%	5.50%	5.60%
HLIRP	Indonesia GDP – Moderate	5.10%	5.50%	5.50%
HLIRP	Java Island GRDP – Moderate	3.78%	4.90%	5.34%
F/S	Indonesia GDP – Adjusted	6.60%	7.12%	7.12%
F/S	Java Island GRDP – Adjusted	6.34%	6.91%	6.91%

2.5 ROAD NETWORK DEVELOPMENT

2.5.1 Arterial Road Network Development

In 2001, a comprehensive study on the development Java Arterial Road Network (JARNS) was completed with the objectives of establishing a 20-year road network development plan that indicates the most economically feasible means of providing future capacity and access needs, and formulating a series of 5-year implementation plans indicating the forecast optimal timing of successive additions to and improvements of the network. The initial stimulus for the study derived from a number of different issues and concerns:

- The realization of the need for future road capacity expansion in Java
- The belief that there was a need for toll roads which would be provided through a high degree of private sector participation
- The absence of an overall road network development plan that would coordinate and prioritise government's investment programs in arterial road network capacity provision in Java Island, and
- The relative disarray in the planning and coordination of emerging a program for toll road schemes available to the private sector.

A Road Network Development Plan with staged Implementation Programs for the whole of Java Island were established for the strategic network that includes all inter-urban roads of strategic significance in Java for a period of 20 years.

Under the Main Trunk Network, the creation of a major "backbone" for the Java network has been formed as essential as a continuation of the strategy that has been pursued by several other programs, including the North Java corridor program. The overall objective here is to create a high-quality high-capacity route between the western and eastern ends of Java, connecting the major cities and provincial capitals and promoting the flow of long distance traffic through the economic heart of Java and Indonesia.

Identification of the future need for toll roads in Java and their staged development priorities was one of the original motivations of JARNS study. It was found that with the exception of a number or predominantly urban or urban-fringe toll road schemes, inter-urban traffic volumes are generally low to achieve financial viability roads based on traditional BOT schemes for private sector financing.

2.5.2 Toll Road Development

The urban development in Indonesia had been increasing ever since the First Five Year Development. This fact led to the increase of social and economic activities which caused high growth in traffic volumes. Arterial roads, which were to be used for long distance traffic had been confuse not only with collector roads but also local roads. These situations caused traffic congestion and obstruction for targeted growth in economic sectors.

Developing arterial road network requires a large amount of fund, while the national budget was very limited. Although the basic principal is that a public road is free-of-charge to use, the urgency of, and the insufficiency in the fund for, road network development necessitate the governments to adopt toll road systems. Collecting toll is justified by the beneficiary-pay principal for the new service provided by expressways as long as free alternatives exist. Figures 2.5-1 and 2.5-2 shows the short-term and long-term development plans of toll roads in Java Island

The first toll road built in Indonesia was the “Jagorawi Toll Road” with a length of 46 km linking Jakarta to the outer suburbs of Bogor and Ciawi in March 1978. The Government funded it through offshore loans and the issuance of Indonesia Highway Corporation (Jasa Marga) bonds. Having been founded to operate the toll road on March 1st, 1978 based on the Government Regulation No. 4 of 1978, later based on Presidential Decree no. 38 of 1981, PT Jasa Marga (Persero) was appointed to operate nine toll roads/bridges in Indonesia. At the end of 1980s, the Government invited the private sector to take part in the development of the toll road network through Build, Operate and Transfer (BOT) schemes. As of the beginning of 2006, 649.12 km of toll roads are in operation in Indonesia, of which and 165 km are managed by private operators.

In general, toll roads form part of the road infrastructure network. They were deemed to be implemented in a self-sufficient context without straining the Government’s budget. In order to give further strength to that investment concept, the regulatory status of toll roads was alerted by the Road Law No. 38/2004. The government tends to finance future toll roads through both approaches of fully private funds and Public-Private Partnership (PPP) programs. In order to attract private sector, there are steps that are done or being considered by the Government:

- Strengthening the institutional and regulatory framework for toll roads
- Establishing the Indonesian Toll Road Authority (BPJT) which will be responsible for investment regulations on toll roads to replace Jasa Marga regulatory role

SHORT TERM DEVELOPMENT PLAN 2005 - 2010

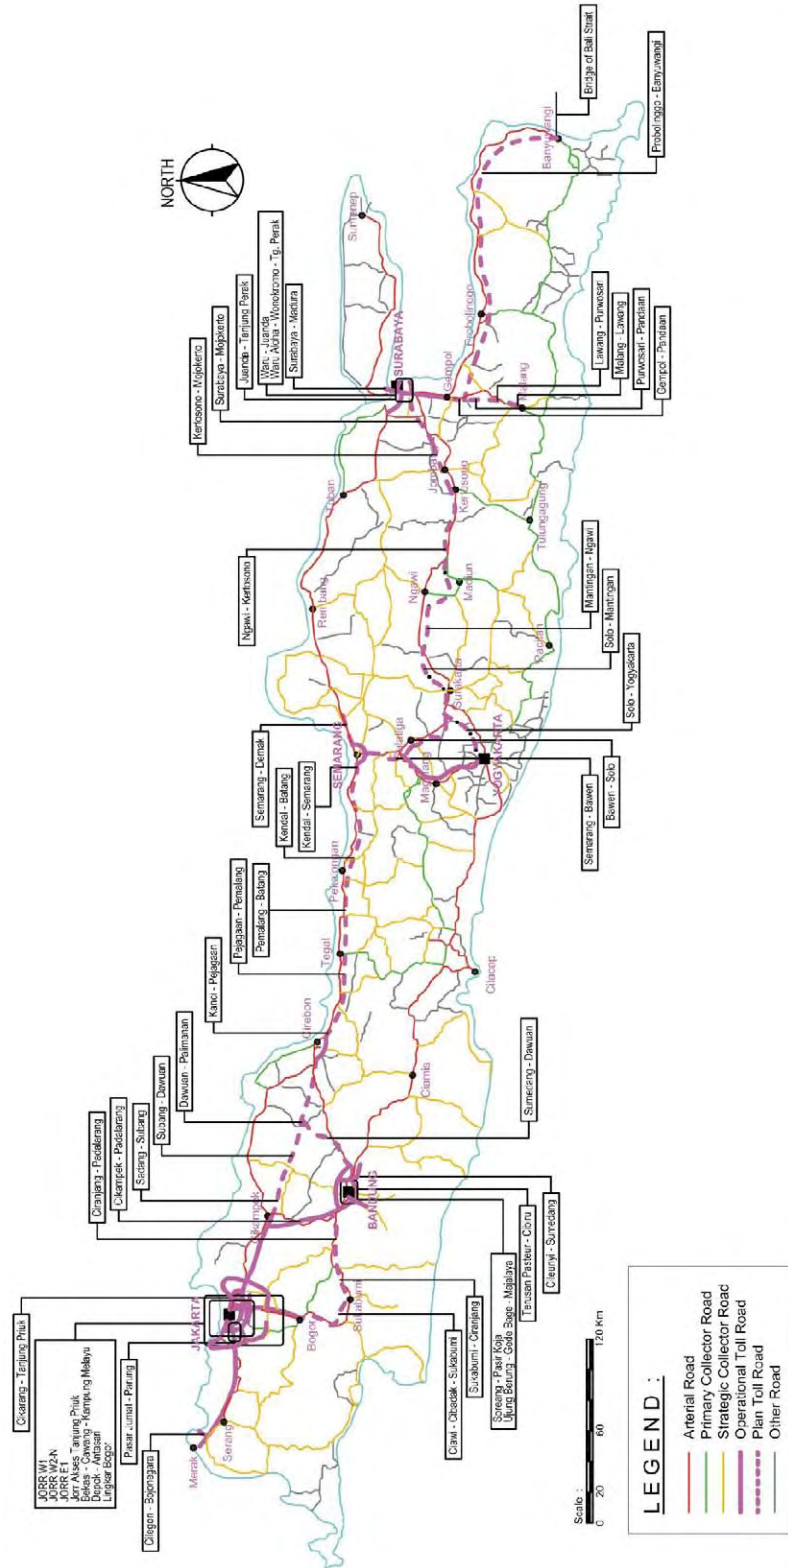

Figure 2.5-1 Toll Roads Short-Term Plan

Source: Ministerial Decree 369, August 2005

LONG TERM DEVELOPMENT PLAN 2005 - 2024

Figure 2.5-2 Toll Roads Long-Term Plan

- Formulating appropriate structure for the automatic adjustment of toll rates
- Applying transparent and competitive process
- Addressing issues on land acquisition and rights
- Establishing clear and sound policies to determine the proper conditions under which Government support should be extended
- Formulating a road master plan including toll road master plan

Article 43(2) of the Road Law No. 38/2004 gives the new policy of the Government regarding the development of toll roads, and the Government Regulation No. 15/2005 on toll roads, article 19-23 shows that for the toll road sections that indicate positive economical viability but not financially viable, the Government will finance or construct the respective toll road. After constructing the toll road, the Government will practice contract management for the operation and maintenance of the facility.

For toll road sections with indications for positive economic viability but marginal financial viability, they can be implemented by the Government and an enterprise in which finance and construction can be conducted through a partnership scheme. For toll roads having good economic and financial viability, they will be offered through open and transparent investment tender process.

The Road Law No. 38/2004 encompasses the following regulations:

Indonesian Toll Road Authority (BPJT)

- Indonesian Toll Road Authority (BPJT) established by, and is responsible to the Minister of Public Works.
- The Authority includes participants from the Government, stakeholders and the public.
- BPJT's basic responsibilities encompass the implementation of regulations and the supervision of toll road operators in accordance with the policies and regulations specified in Law No. 38 of 2004 and Government Regulation No. 15 of 2005.
- Major tasks to be carried out by the Government/BPJT include: project preparation, invitation to pre-qualification (PQ & bidding), pre-bid conference, evaluation of bids, appointment of successful bidder, contract signing and contract implantation.

Toll Rates

- Initial toll rates and subsequent toll rate adjustments are proposed by the investor through BPJT and approved by the Minister of Public Works.
- The rates are calculated by taking into consideration the willingness-to-pay of toll road users, savings in vehicle operating cost and the feasibility of the investment.
- Tariffs are regulated under a toll road authorization agreement; however, their

application is subject to the official announcement of the toll road operation.

- Tariffs are subject to be reviewed and adjusted every two years with a coefficient based on the inflation rate.

Land Acquisition

- The Government is responsible for the acquisition of land through the Ministry of Public Works.
- Land Acquisition is funded either by the Government, State Owned Company or Private Sector.
- The budget for land acquisition is determined by the Government.
- The toll road and the land on which it is built are the property of the Government.
- In case of land acquisition funds emanating from private parties if the cost exceeds the approved budget, the shortfall will be compensated by an adjustment of the concession or through other acceptable methods.

To cope with the problem of land speculation that has caused project-cost inflation and uncertainty, it is expected that the Government will issue a regulation banning the use of land designated for turnpike projects for other purposes. With this regulation, land that has been earmarked for turnpike projects can not be sold except to the local government at a price that is slightly higher than the market value. This will be a part of the Government's efforts to encourage investors to participate in future toll road projects and to reduce the length of the land acquisition process.

2.5.3 Indonesia Highway Corporation

On March 1978, Indonesia Highway Corporation, PT Jasa Marga (Persero), was established to operate the first section of toll roads in Indonesia. It was established as a state-owned corporation whose business includes the construction, management and maintenance of toll roads based on the Government's Rules No. 4 and the Decision of the Minister of Finance of No. 90/KMK.06/1978, about the capital of PT Jasa Marga (Persero), dated February 27, 1978. The official document for establishment had been legalized by The Minister of Justice by the Decision No.YA5/130/I, dated February 22, 1982. It had been registered at the Office of the Court of First Instance in Jakarta No. 767 dated March 2, 1982 and had been announced in the State News of The Republic of Indonesia, No. 73 dated September 10, 1982, addition number 1138.

March 9, 1978, the operation of first Toll Road in Indonesia was officially opened, called Jagorawi Toll Road that covers Cawang-Cibinong for about 27 km. This Toll road was operated right after it was officially opened. Until 1987, Jasa Marga was the only toll road operator in Indonesia. As of the beginning of 2006, a total of 649.12 km

of toll roads, or 74.6% of the whole toll roads in Indonesia, are operated by Jasa Marga. At present, there are private sector operators who manage a total of about 165 of toll roads under BOT schemes.

With the establishment of BPJT that have the responsibilities of the implementation of regulations and the supervision of toll road operators and the new roles of the Directorate General of Highways (Bina Marga), the role of Indonesia Highway Corporation became as an operator for toll roads. For private sector finance project, Bina Marga activities include the preparation of business plans, technical and environmental feasibility studies, detailed engineering design, construction development, routine and periodic maintenance and traffic operation services.

At present, Jasa Marga is offering bonds and after several delays caused by regulatory uncertainties, it is expected that it will go public via an initial public offering and will sell some of its stock to raise funds required to finance new toll road projects.

2.6 TRANS JAVA TOLL ROAD

The Study Road between Yogyakarta and Kertsono is a part of Trans Java Toll Road which connects Merak to the west with Surabaya to the east, with a total length of 863.7 km, of connecting the centres of social and economic activities in Java Island. This road, which was called Pantura Road, has been pioneered in 1660s as the first version of Trans Java Road to connect Banten in west Java with Banyuwangi in the east with a length of 1400 km. Until now the road condition is far from satisfactory with only small sections that served by toll road and most parts are still marked as bad condition road.

The Trans Java Toll Road is essential for Java Island from the social, economic and commercial points of view. It is the artery of land transportation in the island used by 50-70 thousand units of vehicles every day and more important than rail and sea transport. Figure 2.6-1 shows the major national activity centres in Java Island that are served by Trans Java Toll Road. Figure 2.6-2 shows the status of each section of Trans Java Toll Roads as of the beginning of 2006.

Trans Java Toll Road has been a dream for decades. A notable connection between Jakarta and West Tangirang, as a segment of the road, was completed in 1984. In East Java, another segment was completed in 1986, connecting Surabaya and Gempol. Jakarta Cikampek Toll Road, going eastward from Jakarta, was completed in 1988 to be a busy road along the northern coast of Java.

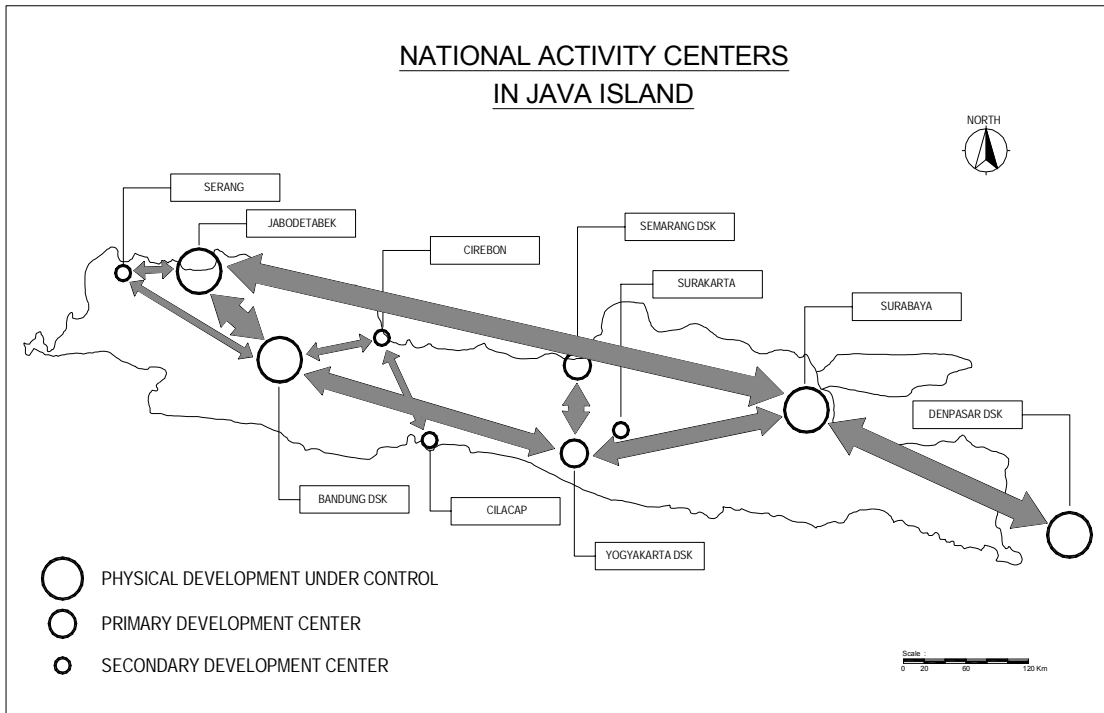

Figure 2.6-1 National Activity Centres in Java Island

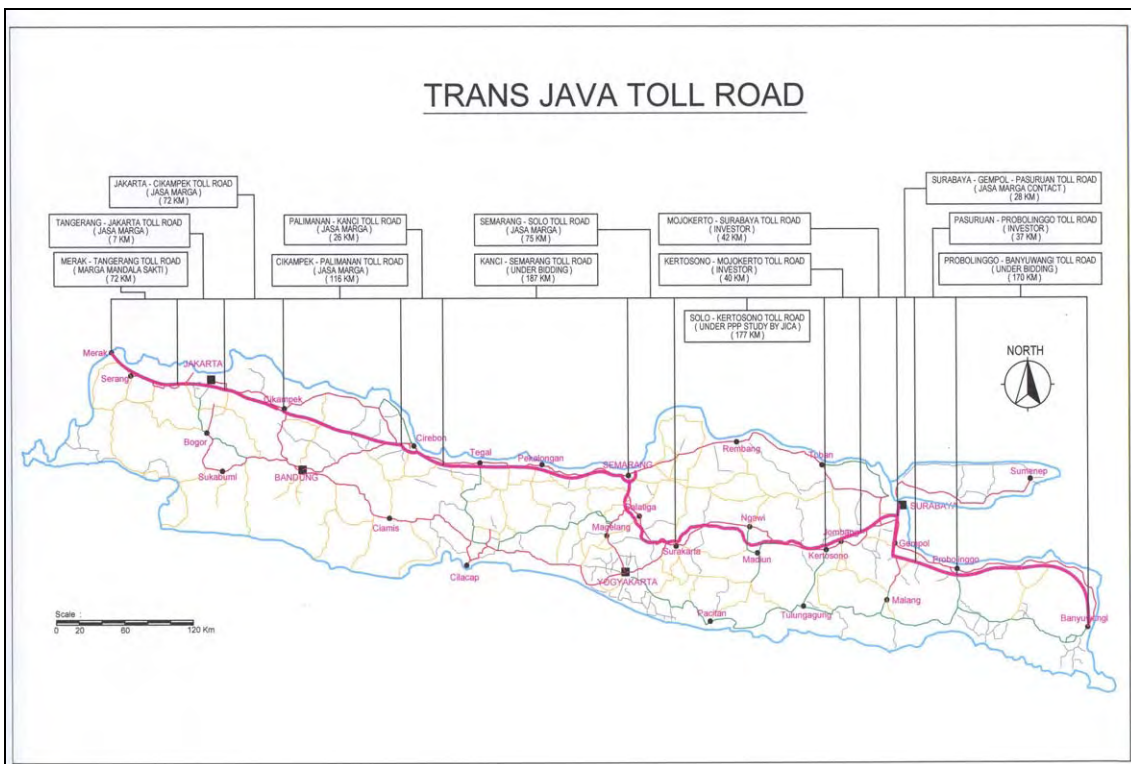

Figure 2.6-2 Trans Java Toll Road Development Plan

2.7 MAJOR COMPONENTS OF THE PROJECT

Tasks of the project under this study involve all the works required for the new construction of a toll road facility between Yogyakarta and Kertosono with a total length of 219.018 kilometres. The Study Road is divided into 12 segments between interchanges with the lengths shown in Table 2.7-1. It contains 13 interchanges and one junction at its connection with Semarang – Kartosuro section of Trans Java Toll Road. The road is planned to be constructed as divided with two lanes in each direction that will require a right of way of 60 – 70 meters. During the feasibility study stage, it was basically divided into the following four sections:

Section I: Yogyakarta – Surakarta (Solo)

Yogyakarta is characterised as a student and tourism city that is always busy with domestic and foreign tourism. More than the cultural heritage, the city has beautiful natural panorama. The existing road between the two cities, passing through 4 districts with high agricultural productivity, was widened to 2 lanes in each direction; however, the road is still characterized by traffic congestions due to the high traffic volumes and traffic friction at built-up areas. In line with the increase of economic activities in the area, the new toll road connection between the two cities is required.

Section II: Surakarta (Solo) – Mantingan

Surakarta is one of the big cities in Central Java and is the centre of trade, industry and other services in the region. The limited-capacity road network in this heavily built-up area with concentration of population density is handling high traffic volumes of heavy vehicles that transport heavy commodity vehicles.

Section III: Mantingan – Ngawi

Ngawi, neighboring with Kapupaten Sragen, is expected to practice rapid development in the near future. With Mantigan, being a growth center in the district, traffic volumes are rapidly growing. Meanwhile, the capacities of the existing road networks, which need improvement works, can not be well operated as distributed by mixed traffic and heavy side friction.

Table 2.7-1 Length of Study Road Segments

Interchange		Yogyakarta	Prambanan	Klaten	Delanggu	Kartosuro (Junction-I/C)			
Kilometer	0+000	3+413	8+423	20+626	32+274	39+791	41+900		
Length, km	3.413	5.010	12.203	11.648	7.517	2.109			
Interchange	Kartosuro (I/C)	Solo	Karanganyar	Sragen	Ngawi	Madiun	Caruban	Nganujuk	Kertosono
Kilometer	41+900/0+000	11+338	21+787	35+543	86+297	109+782	118+320	153+925	177+118
Length, km	11.338	10.449	13.756	50.754	23.485	8.538	35.605	23.193	

Section IV: Mantingan - Kertosono

The corridor in this area region consists of built up and densely populated areas and traffic is characterized with large volumes of heavy-duty vehicles transporting natural products like oil, oil palms, tea and rubber destined for Kertosono.

To realize the Project, major tasks which are expected to be carried out by either the Government or private sector based on the formulated work sharing program can be setup as follows:

- Fund Arrangement: based on the formulated PPP scheme and the sharing in the financial responsibilities between both the Government and PPP entities of the private sector, arrangements should be done to secure both public and private funds for different steps of project implementation
- Selection of Consultant: with the utilization of public funds under the PPP scheme, consultants should be selected under the Governmental roles and those of the financing agencies involved in providing funds for the Government.
- Detailed Engineering Design: Due to the large volume and nature of works of the Project, which composes of the construction of a large number of structures including interchanges and bridges as well as the construction of the toll road carriageway, the Project should be divided into several packages, to be designed and implemented simultaneously.
- Land Acquisition: as this task composes a high risk toward the implementation of the project on schedule and it usually requires long time to finalize, it should be started at earliest possible stages.
- Environmental Impact Assessment: although high negative environmental impacts are not expected, acquiring environmental clearance based on EIA with mitigating measures for any expected impacts is necessary for such large-scale project.
- Tender Documents: The ordinary procedure for the tendering stage is to be conducted after the completion of the detailed engineering design stage which includes the preparation of the tender documents; however, with the adoption of a PPP scheme, early tendering stage is required to select the private sector partner that will handle designated tasks under the scheme. This task includes the sub-tasks of: Advertisement - Prequalification - Bidding – Contracting.
- Construction: based on the source of utilized funds and the contracting agreement, construction activities are defined under the work sharing concept. With the limited time-frame for construction, the issue of land acquisition should be completely cleared in advance.
- Operation and Maintenance: are the two tasks that are completely carried out by the private sector partner under any of the proposed PPP schemes of the Study.

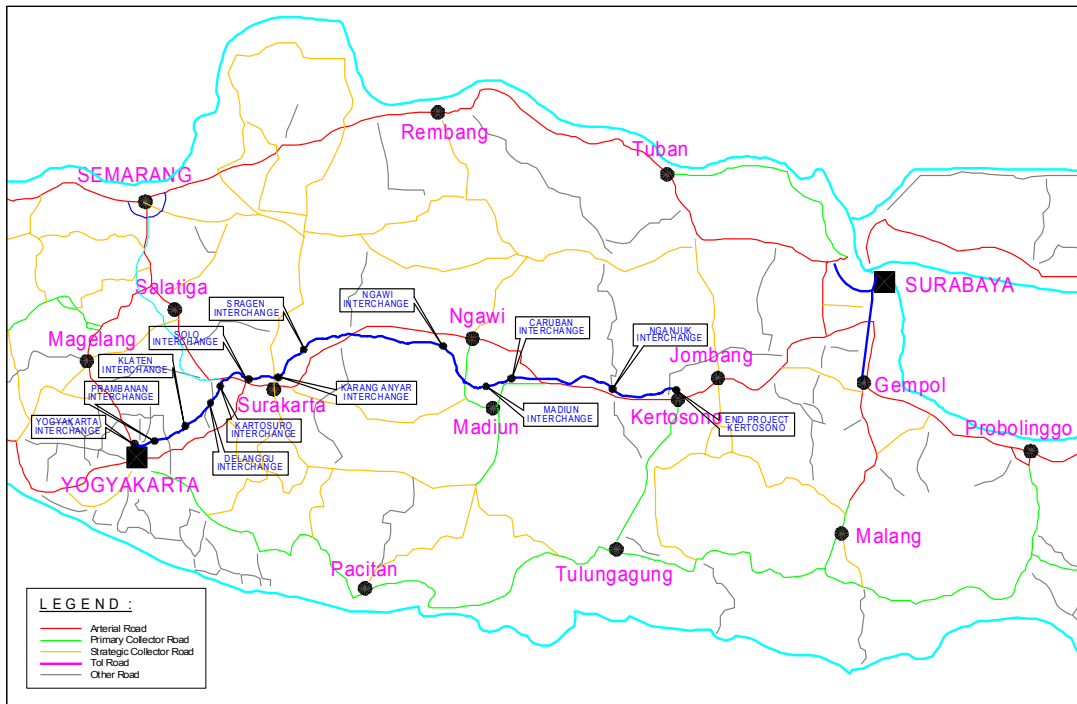

Figure 2.7-1 Yogyakarta – Solo – Kertosono Toll Road

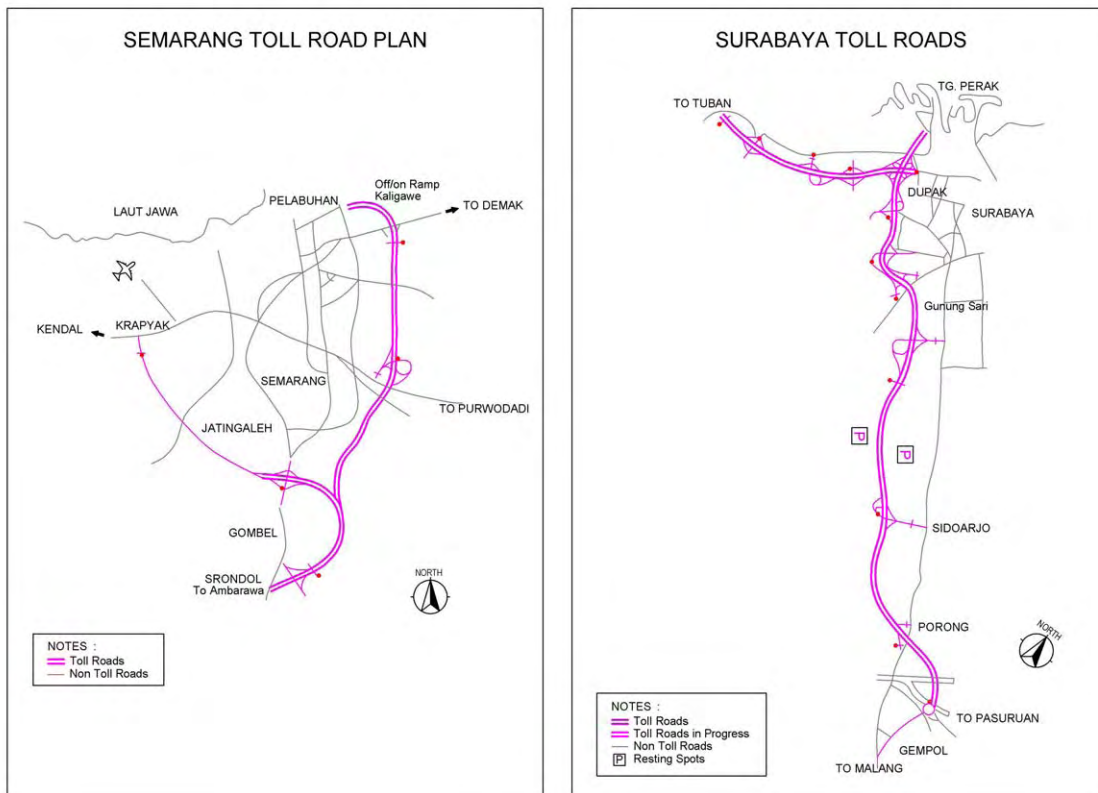

Figure 2.7-2 Semarang and Surabaya Toll Road Connections

2.8 EFFECTS OF TOLL ROAD PROJECT

Fully access control roads, such as the Toll Road Project, have various and far reaching effects on a variety of economic sectors and individuals as well, not only on their areas of construction but also on other parts of the whole region or country. Socioeconomic effects gained by the construction of fully access control roads can be usually classified in two major categories; direct effects and indirect effects. Direct effects are those benefits which road users directly receive by using the road as savings in travel time and cost and can be basically evaluated on monetary basis to some extent, while the indirect effects that are mostly represented as regional and national development effects.

Since Indonesia aims to further nationwide and regional development, greater focus should be placed on the regional development, or indirect, effects rather than the direct effect and the profitability of applying toll on the road. Regional development will bring a variety of benefits to the whole nation, and if adequate policies and investment schemes accompany road development, regional development can be set efficiently and equitably.

2.8.1 Direct Effects

- 1) Savings in Travel Time: This is the most important effect of the new road gained through the reduction in trip distance and time due to its higher speed and level-of-service compared with other ordinary roads.
- 2) Savings in Vehicle Operating Cost: Contribution to energy savings including fuel and lubricant consumption as well as other savings in vehicle tyres, parts, maintenance and capital consumption provide benefits on individual base as well as on national level.
- 3) Improvement in Traffic safety: Higher safety for road traffic is a major benefit to the road users as well as to the whole society. This benefit can be partially expressed in monetary basis; however, the social impact has more effect.
- 4) More comfortable and safe driving: With the high level-of-service facility and non-interrupted traffic, it is expected that travel on the road will be more comfortable and safe for road users with reduced driver's fatigue and other related effects.
- 5) Decreasing congestion on ordinary roads: This benefit is not for the users of the new facility but for drivers on the existing ordinary roads. By diverting a portion of the traffic volume from ordinary roads to the new high level-of-service facility, it is expected that congestions on the ordinary roads will be alleviated. In addition, as new road facilities have the bypass function at built-up areas, through traffic

moves outside centre of cities and towns along the road.

- 6) Improvement in punctuality: Toll roads with access control enable punctual arrival at destinations, which help production centres to perform detailed scheduling of transport for products and efficient logistic systems for different activities distributed between different locations.
- 7) Betterment of environment: The better energy efficiency of vehicles on high level-of-service roads will lead to reducing emission of exhausted gases and improvement in air quality. In addition, less traffic on ordinary roads at city centres and populated areas will result in better urban environment.
- 8) Promotion of mobility (long-distance bus service): With toll roads that provide higher travel speeds than ordinary roads, inter-urban high-speed bus services can be provided for long-distance public transport trips in shorter travel times.

2.8.2 Regional Effects

- 1) Betterment of nationwide development: Promotion of economic activities in rural and local, including; industry, manufacturing, agriculture, tourism and commercial activities, is an important task in the national development planning process. The toll road plays an important role toward this end, which will result redistributing excess agglomerated activities in metropolitan areas. This will consequently result in creating demand by road investments, higher productivity, betterment of economic activities distribution, increase in tax revenues, increase in exports, increase in population and income in rural areas and enhanced national identity.
- 2) Improvement in living conditions: Better road infrastructure facilities will result in widening life and employment opportunities, providing region-wide services such as medical care and education as well as efficient recovery systems in case of natural disasters.

CHAPTER 3

TRAFFIC SURVEY AND DEMAND FORECAST

CHAPTER 3

TRAFFIC SURVEY AND DEMAND FORECAST

3.1 OBJECTIVES

The purpose of this chapter is to review the future traffic volume of the F/S conducted for the study section by GOI in February of 2006 in order to ensure the precision of PPP scheme study. The following tasks were carried out for the review.

- Conducting traffic surveys including traffic volume count survey, road side OD survey and willingness-to-pay (WTP) survey.
- Collecting and reviewing the trends of the past traffic volume and growth, and the present toll rates of the existing toll roads to support the traffic analysis in interpretation of its results and setting the socially acceptable level of toll rate.
- Reviewing procedure and factors for traffic demand forecast used in the F/S to identify the issues for this study.
- Forecasting future traffic demand and assignment with JICA STRADA.

3.2 TRAFFIC SURVEY

3.2.1 Survey Method

Traffic survey was conducted on both May 2 (Tuesday) and May 3 (Wednesday) of 2006, which consists of the following surveys;

(1) Traffic Volume Count Survey for 24-hour and 12-hour

- Survey Location: Eight (8) locations for each as shown in Figure 3.2-1 that are near the locations where the survey was conducted in the F/S.
- Survey Time: 6:00 AM to 6:00 AM of the next day for 24-hour.
6:00 AM to 6:00 PM for 12-hour.
- Survey Method: Manual count by direction and vehicle type, data of which was recorded at every 15 minutes.

(2) Roadside Origin and Destination (OD) Interview Survey for 12-hour.

- Survey Location: Eight (8) locations shown in Figure 3.2-1.
- Survey Time: 6:00 AM to 6:00 AM
- Survey Method: Around 20% out of the traffic were stopped at random, drivers being interviewed.

(3) Willingness-To-Pay (WTP) Survey

- Survey Location: Eight (8) locations including gas stations.
- Survey Time: 6:00 AM to 6:00 AM
- Survey Method: Interview with vehicle owners.
- Survey Format: Some examples shown in Table 3.2-1. Note that in order to avoid the bias of individuals, five (5) kinds of questionnaire sheets with various toll rates were prepared - one sheet is for one interviewee.

3.2.2 Results of Traffic Survey

(1) Grouping of Vehicles

There are ten (10) types of vehicles surveyed in the study. They can be categorized into three (3) groups following regulation in Indonesia except for such small vehicles as motorcycles, etc. which are usually not allowed to use toll roads.

Grouping of Vehicles is as follows (refer to Figure 3.2-2):

Group-I

- Utility (sedan, jeep, etc.), Small public and cargo transport (oplet, pick-up, micro truck, small bus, etc.).

Group-IIA

- Big bus, Truck with 2-axle

Group-IIB

- Truck with 3-axle or more

Figure 3.2-2 Grouping of Vehicles

(2) Traffic Volume along the Study Section and Its Interpretation

The result of traffic volume count survey is shown in Table 3.2-2 and Figure 3.2-3 with comparing to the F/S. The result has the following tendency.

- Traffic volume counted in the study is smaller than that in the F/S. Difference in total traffic volume between them is 10 to 30%.

The tendency of difference in traffic volume between both surveys is interpreted as follows.

- Seasonal fluctuation as shown in Table 3.2-3
 - The study's survey was in early May of 2006, the F/S's survey in September of 2005. While traffic volume in April and May when the study's survey was conducted is constantly smaller than in other months, traffic volume in September is larger than in other months
- Influence of gasoline price hike as shown in Table 3.2-3
 - Gasoline price has been almost double since November of 2005; the F/S's survey and the study's survey conducted before and after gasoline price hike, respectively.
 - According to the table, traffic volume in 2006 is almost the same as that in 2004.

Since seasonal factor for traffic on toll roads has been prepared, average annual traffic volume may be estimated to be smaller than that of the F/S but larger than that of the

study. As for the influence of gasoline price hike, decrease of the traffic volume is considered to be temporary phenomenon according to Figure 3.2-4, which shows the past trend of the traffic growth after/before Asian Monetary Crisis in 1998. In several years after 1998, the traffic growth has tendency to get back on the past growth trend line. These trends seem to be true of the traffic on the arterial road where the traffic survey was conducted.

(3) Roadside OD Survey

OD survey data were used for revising OD table established in the study conducted in October of 2001 by the IBRD – “FINAL REPORT OF JAVA ARTERIAL NETWORK STUDY (JARNS)”. The OD table was not prepared in the F/S, as the F/S forecasted the future traffic volume on the toll road by using a theoretical method, the method of

which doesn't require road network in the study regions.

(4) Willingness - To - Pay (WTP) Survey

The main purpose of WTP survey is to reflect its data to prediction of diversion rate. An example of simplified summary table of WTP survey result is shown below for reference (Table 3.2-4).

Table 3.2-4 Part of Summary Table of WTP Survey Result

No. Sample	Time Difference x 60	Toll Rate x 1000	Toll Rate/Time difference

3.3 DEMAND FORECAST

3.3.1 Basic Policy

In the study the demand forecast of the F/S was reviewed following the procedure below.

- Present and future OD matrix tables of the IBRD study- “FINAL REPORT OF JAVA ARTERIAL NETWORK STUDY (JARNS), 2001”- were utilized as the basis of the study.
- Since OD table of the IBRD study covers entire Java Island, the scale of which was simplified focusing on the regions where the study section is located.
- The present OD table was revised based on the roadside OD survey results conducted by the study. As for the present traffic volume, adjustment was made targeting around traffic volume obtained from both the F/S and the study from the reasons described in Section 3.2.2(2).

3.3.2 OD Zoning System

OD zoning system applied in the study is shown in Figure 3.3-1 and in Appendix 3-1.

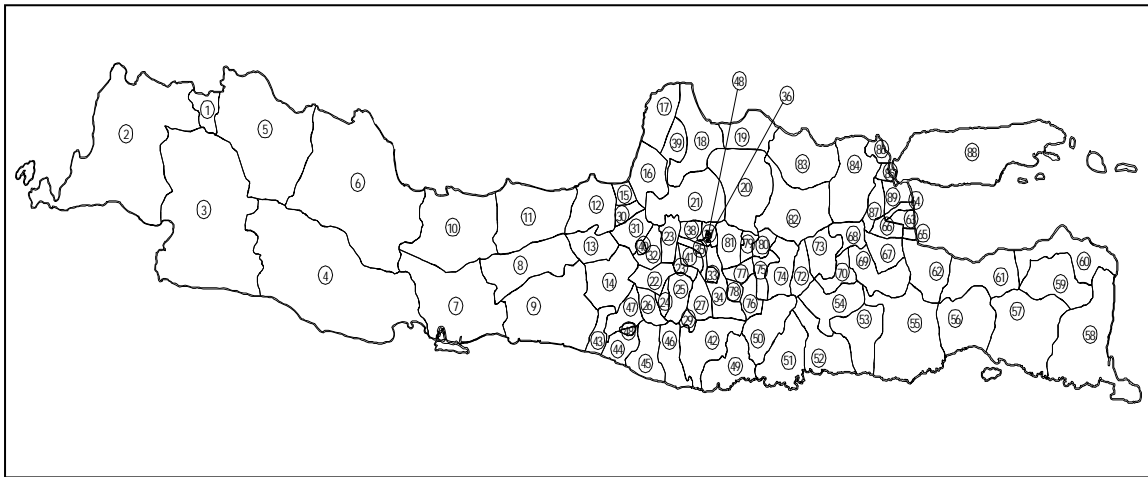

Figure 3.3-1 Study Area Zone Plan

3.3.3 Present and Future Trip Pattern

Figure 3.3-2 shows that high trip growth is expected in the future due to the rapid socio-economic development in Java Island.

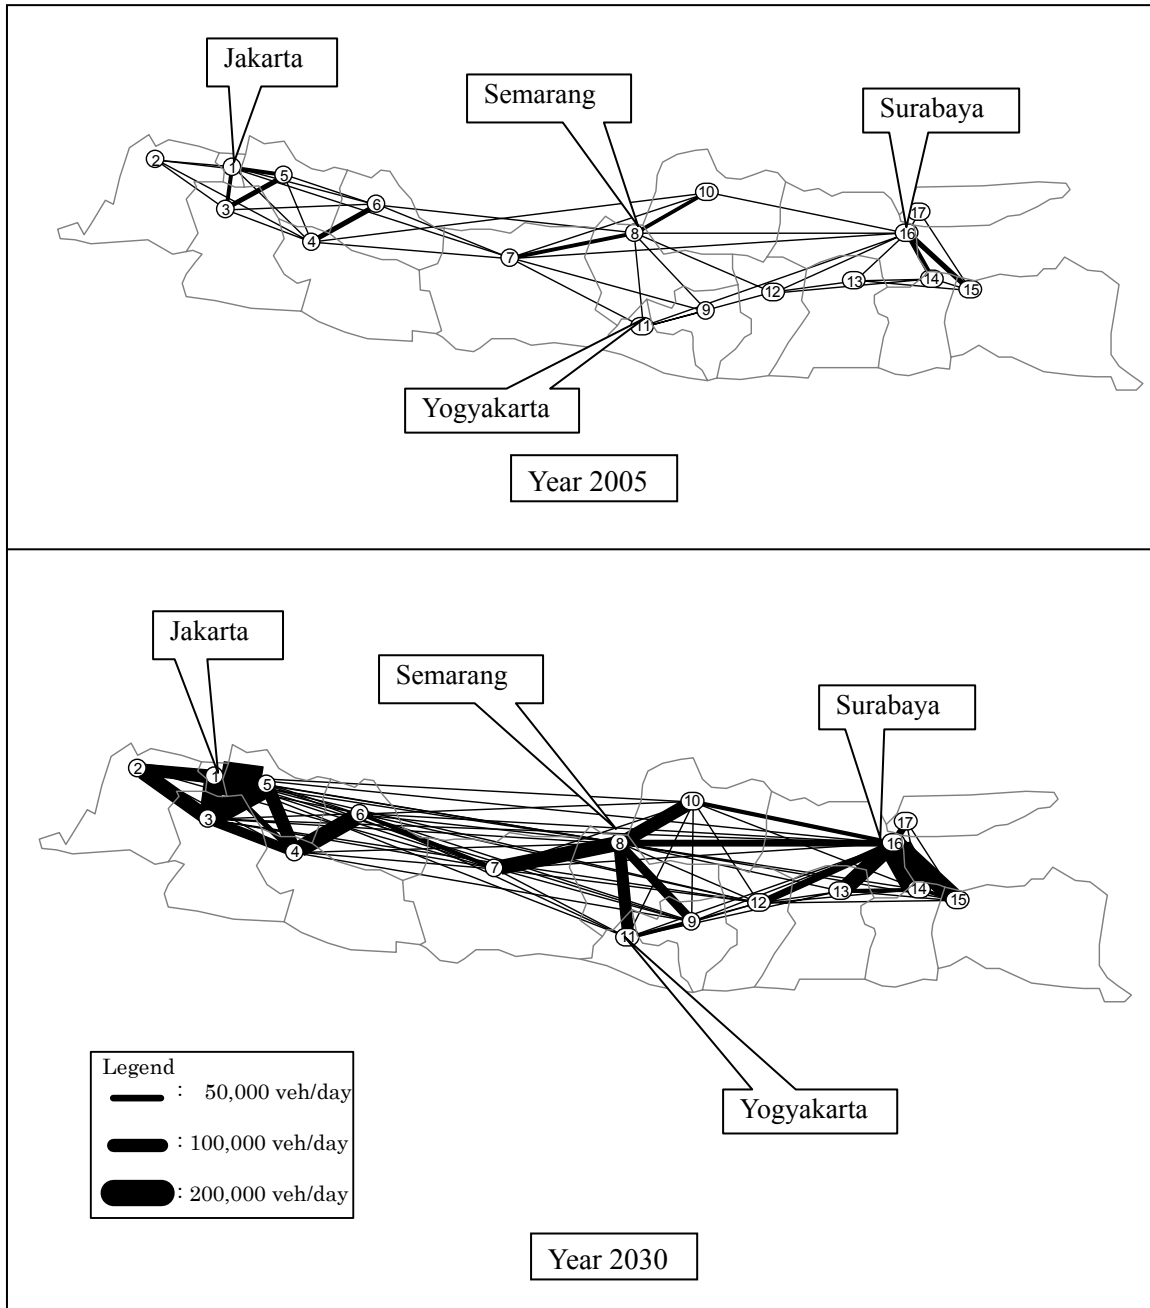

Figure 3.3-2 Future Desire Lines

3.4 FUTURE TRAFFIC VOLUMES

3.4.1 Basic Policy

The future traffic volume on the study section was reviewed following the policies below.

- Present and future road network for the study regions established in the study of IBRD (refer to Section 3.2.2(3)) is basically applicable.
- By adding toll roads of study section, Semarang - Solo section and Surabaya - Kertosono section, to the above road network, basic road network for the traffic assignment analysis is to be established.
- Toll roads of Semarang-Solo and Surabaya-Kertosono are to be constructed before construction of whole/part of the study section.
- The national road in the north corridor is to be widened to 4-lane road in 2020.

Forecasting of future traffic volume on the study toll road in the F/S was carried out without considering the road network by using theoretical method. However, for the section between Solo and Kertosono, diversion traffic from national road in the north corridor between Semarang and Surabaya shall be highly expected, since two toll roads, one is from Semarang and the other is from Surabaya, to be connected with the study section will be constructed earlier than construction of the study section according to the Status of Land Acquisition for Toll Road, 7 April 2006, MPW.

3.4.2 Traffic Assignment Procedure

(1) Assignment Procedure

In the study, the capacity restraint assignment method was used, the method of which is the most straightforward technique among the network models, and the most efficient one, particularly where the number of the trip matrix is relatively large. This assignment is based on the speed-flow relationship. The traffic assignment procedure is shown in Figure 3.4-1 as a flow chart.

In this assignment technique, and calculating the required travel time for each link according to its travel time and road conditions, the program determines the fastest routes between each origin and destination by evaluating the travel time on links, and assigns the trips between the given origins and destinations to these routes starting at the destinations and getting back to the origins. As congestion increases to a certain level as traffic volume increases, alternative routes are introduced to handle the unassigned traffic. Zone-to-zone routing is built, which is the fastest path from each zone to any other, all trips are assigned to these optimum routes.

Computer software of the JICA STRADA (System for Traffic Demand Analysis) was utilized for the traffic assignment, which has all necessary tools for transportation planning and was developed to analyze transportation problems, model demand forecast and develop project proposals.

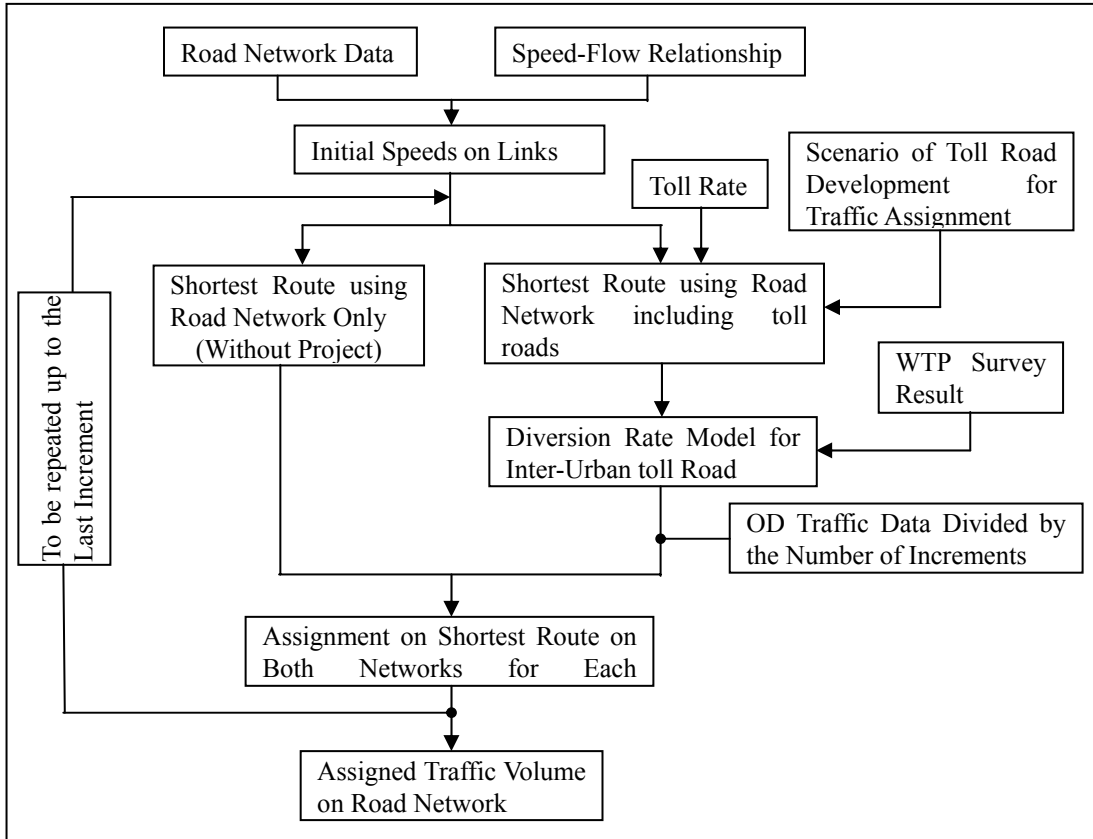

Figure 3.4-1 Traffic Assignment for the Road Network in the Study Regions

(2) Speed-Flow Relationship

The speed-flow relationship used in the course of the traffic assignment analysis is shown in Figure 3.4-2. With the traffic volume increasing in traffic volume in excess of $0.3 Q_{max}$, the travel speed begins to decrease gradually up to V_{min} which is about $0.10 \times V_{max}$ at Q_{max} . After reaching V_{min} , the travel speed of V_{min} is assumed to be kept constantly in order to avoid unrealistic assignments in the assignment applications.

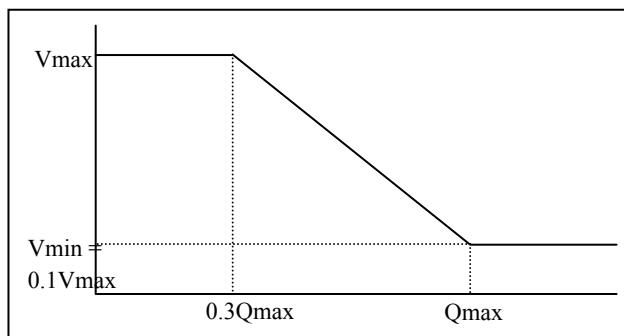

Figure 3.4-2 Speed-Flow Relationship

(3) Time Evaluation Value

The time evaluation Value (TEV) is applied to evaluate the travel time on links of road network in use for persons, either passenger or assistants in trucks , in all vehicle categories. The TEV prepared in the F/S as shown in Table 3.4-1 was utilize as the basis of estimating the TEV for the study. As for present and future TEV, it was estimated by considering the inflation rate of 7.2%.

Table 3.4-1 Time Evaluation Value (Rp/hour)

Vehicle Category	<i>Java</i>	Sumatra	Kalimantan	Sulawesi
Light Vehicle	15,437	14,105	18,448	11,560
Mini Bus	17,159	15,679	20,506	12,850
Medium Vehicle	35,022	32,001	41,853	26,226
Big Bus	72,104	65,884	86,167	53,996

Source : Studi HLRIP, Ditjen Prasarana Wilayah 2001

(4) Incremental Assignment with Diversion Rate Method

This assignment incorporates the diversion rate method with the formula 3.4.2(1), developed by the Japan Highway Public Corporation for inter-urban expressway, into incremental assignment which divides the input OD traffic data into certain increments and assigns each increment to the minimum route.

$$P = \frac{1}{1 + \alpha(X/S)^\beta} \times 100 \text{-----3.4.2(1)}$$

- Where, P : Diversion Rate (%)
- X : Toll Rate (Rp) / Time Difference (minutes)
 $= C / (t_1 - t_2)$
- t_1 : Travel Time when passing a Non-Toll Road (minutes)
- t_2 : Travel Time when passing a Toll Road (minutes)
- S : Future Shift Ratio
- α, β : Local Factors

The diversion rate method is applied to estimate the proportion of traffic volumes diverted from the future ordinary road network to the newly developed toll roads. The factors having the greatest influence on the routes taken by drivers are the comparative travel time and distance. Several diversion rate models have been developed for toll roads within urban areas and for inter-urban toll roads. Since having been developed for inter-urban toll roads such as the study section, the formula 3.4.2(1) was utilised for the study.

The steps of assignment per increment are shown in Figure 3.4-3.

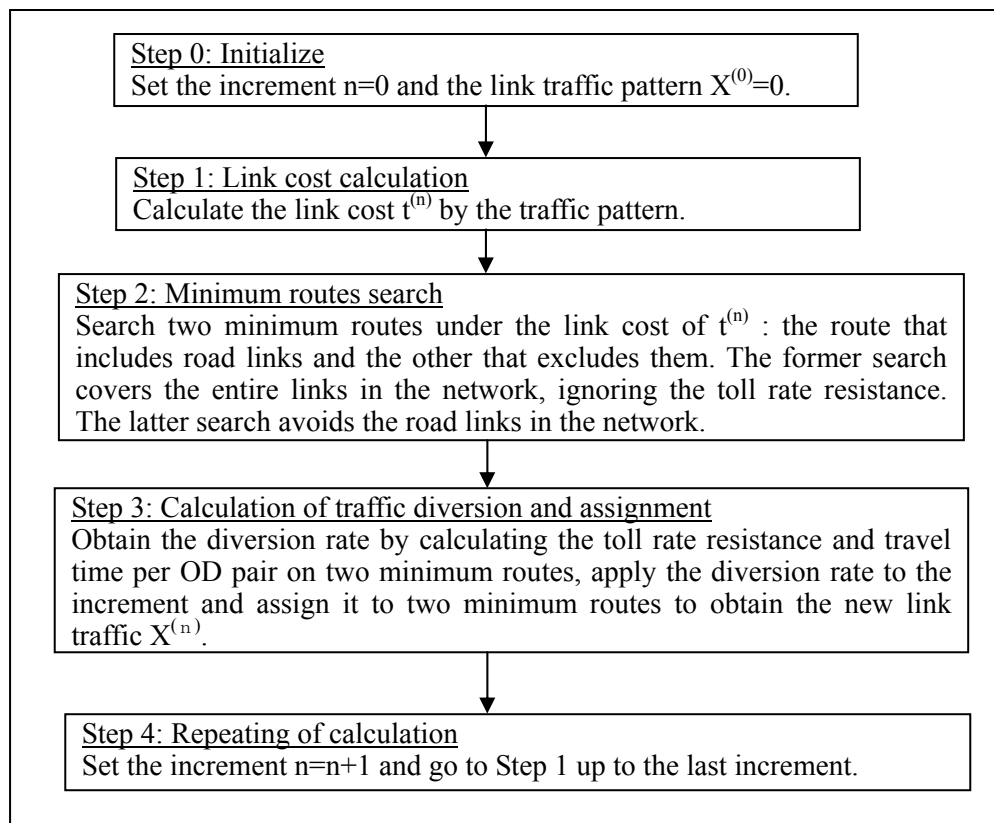

Figure 3.4 -3 Assignment Steps per Increment

Table 3.4-2 and Figure 3.4-4 presents the results of traffic assignment verification process on observed and assignment traffic volumes with a correlation factor of 0.91.

Table 3.4-2 Observed and Assigned Traffic Volumes

Location	Section	Observed(a)	Assigned(b)	(c=b-a)	(d=c/a)
TC 01 Wates	Yogyakarta - Wates	9,940	10,448	508	5%
TC 02 Tempel	Yogyakarta - Magelang	15,987	14,668	-1,319	-8%

TC OD7 Nganjuk	Kediri - Kertosono	9,235	12,406	3,171	34%
TC OD8 Nganjuk	Kertosono - Nganjuk	11,676	9,330	-2,346	-20%

Figure 3.4-4 Traffic Assignment Verification

Local factors of α , β of the formula 3.4.2(1) were determined with the least square method based on the WTP survey result as shown in Figure 3.4 -5 and Table 3.4-3.

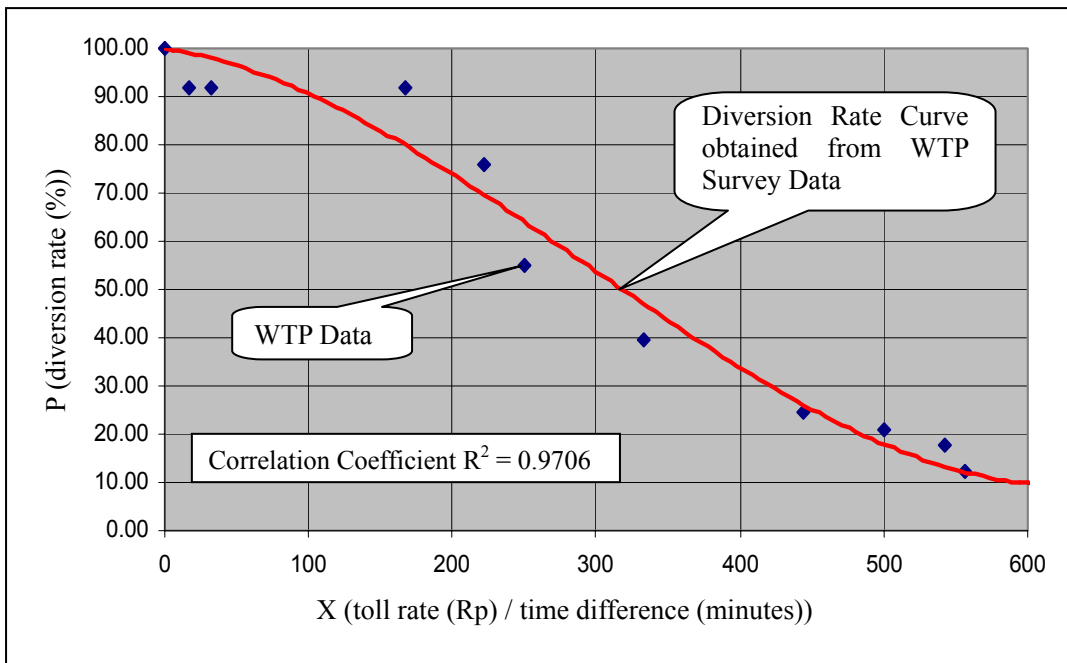

Figure 3.4 -5 Determination of α and β from WTP Survey Result

Table 3.4-3 α and β for Diversion Rate

Vehicle Group	α	β
Group- I*	7.220×10^{-6}	2.095
Group- IIA**	3.088×10^{-6}	2.095
Group- IIB**	1.690×10^{-6}	2.095

* : obtained from Figure 3.4-4
 **: obtained by following the F/S method; toll rates of Group-IIA and Group-IIB are 1.5 times and twice that of Group-I, respectively.

As for the Shift Ratio (S), it was determined based on the growth of GRDP per capita of Java Island as shown in Table 3.4-4. The S after year 2020 was extended.

Table 3.4 -4 Growth of GRDP per Capita in Java Island (per year)

	2005-2010	2010-2020
Growth of GRDP (%)	6.34	6.91
Growth of Population (%)	1.12	1.09
Growth of GRDP per Capita (%)	5.16	5.76
Shift Ratio S (Year 2006; S=1.0)	1.29 (2010)	2.26 (2020)

Source of GRDP and Population (2005-2020): F/S Report

3.4.3 Future Traffic Volume

(1) Scenario of Toll Road Development

As described in Section 3.4.1, the scenario of toll road development was presumed as follows:

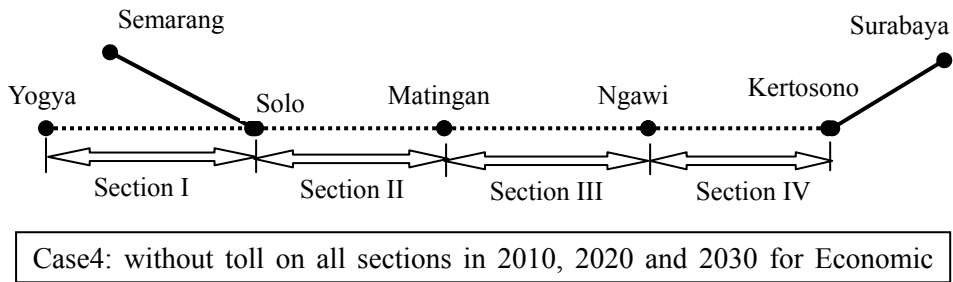

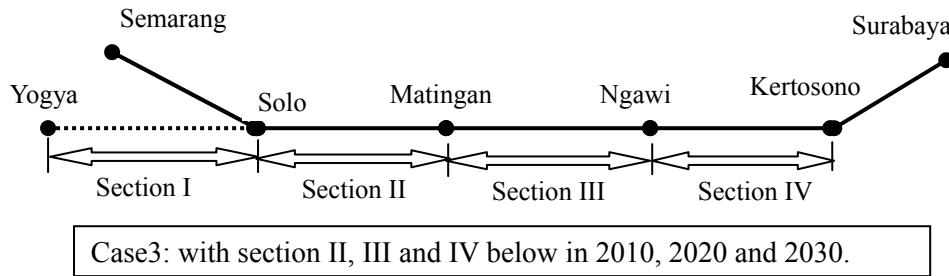

- Toll roads between Semarang and Solo, and between Surabaya and Kertosono are to be developed earlier than the study section.
- Either case that Yogya-Solo section only is constructed or that Solo-Kertosono section only is constructed is considered.
- Operation of the study section will be opened from 2010.

(2) Assignment Cases

The following cases for traffic assignment were analyzed.

Case1: with all sections in 2010, 2020 and 2030.

(3) Study on Maximum Revenue Level

In order to search the maximum revenue level for the study section, the calculation varying toll rates from Rp100/km to Rp 1,000/km as shown in Figure 3.4-6 was carried out in Group-I with case 1 in 2010. From the calculated results, the maximum revenue level of Group-I is presumed to be about Rp 400/km.

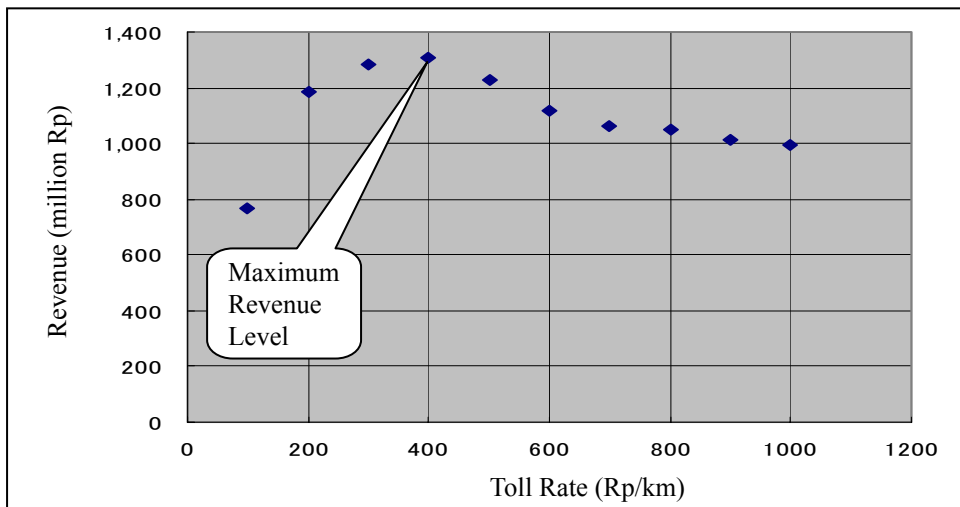

Figure 3.4-6 Searching the Maximum Revenue for the Study Section

(4) Study on Toll Rate of Socially Acceptable Level

Table 3.4-5 shows the toll rates of existing toll roads by toll road type - inter-urban type and urban type. According to the Table, toll rates of existing toll roads in inter-urban toll roads vary from around Rp100/km to around Rp354/km.

Table 3.4-5 Toll Rates of Existing Toll Roads

NO.	Toll Road	LENGTH (KM)	TOLL RATE (Rp)						Opening Year	
			GROUP I		GROUP IIA		GROUP IIB			
			Toll Rate	Per Km	Toll Rate	Per Km	Toll Rate	Per Km		
Interurban Toll Roads	1	Tangerang - Merak	72	15,000	208	21,000	292	26,000	361	1996
	2	Surabaya - Gempol	42	4,500	107	7,000	167	9,000	214	1986

	7	Prof. Dr. Ir. Sedyatmo	13.5	5,000	370	6,000	444	7,000	519	1985
	8	Padalarang - Cileunyi	46.6	4,500	97	7,500	161	9,000	193	1991

Source: No. 309/KPTS/M/2005, No.374/KPTS/M/2005 No.165/KPTS/M/2006 from WPT

Figure 3.4-7 shows the relationship between toll rate and diversion rate based on the WTP survey for Group-I in case that difference in travel speeds between vehicles using toll-road and non-toll road is assumed to be 60km/hour. It can be anticipated that more than 70 % of users will accept a toll rate of Rp200/km according to the Figure.

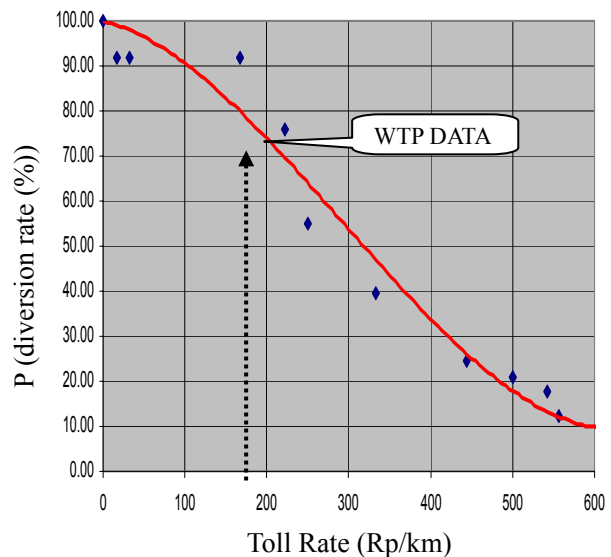

Figure 3.4-7 Relationship between Toll Rate and WTP Data

From both the Table and the Figure, a toll rate of Rp200/km for Group-I could be regarded as socially acceptable level in the study.

(5) Future Traffic Volume

Calculation Cases for Traffic Assignment

Future traffic volume on the study section was forecast for the cases shown in Table 3.4-6 considering the convenience for cash flow analysis, economic benefit analysis and review of the F/S results. Regarding assignment cases in the Table, refer to Section 3.4.3(2).

Table 3.4-6 Calculation Cases

Assignment Case		Year					
		10		20		30	
		S.A.L	M.R.L	S.A.L	M.R.L	S.A.L	M.R.L
Case 1	Toll Rate (Rp/km)	200	400	400	800	800	1,000
	Case Name	Case1-10S	Case1-10M	Case1-20S	Case1-20M	Case1-30S	Case1-30M
Case 2	Toll Rate (Rp/km)	200	400	400	800	800	1,000
	Case Name	Case2-10S	Case2-10M	Case2-20S	Case2-20M	Case2-30S	Case2-30M
Case 3	Toll Rate (Rp/km)	200	400	400	800	800	1,000

Case 4	-	-	-	-	-	-	-
	Case Name	Case4-1		Case4-2		Case4-3	
Remarks		<ul style="list-style-type: none"> • Toll Rates of Group-I are presented here. Toll rates of Group-IIA and Group-IIB were to be 1.5 times and twice those of Group-I, respectively. • S.A.L: Socially Acceptable Revenue Level. • M.R.L: Maximum Revenue Level. • Toll rates of S.A.L and M.R.L after 2010 were estimated at a inflation rate of 7.2% 					

Comparison with the F/S Results

Figure 3.4-8 shows the future total traffic volume on the toll road by segment in 2010 with the F/S results. The segment means a section between two interchanges (regarding relationship between segment numbers and interchange names, refer to Table 3.4-7). Traffic volume at the case1-10S in 2010 forecast by this study is approximately corresponding to the F/S, the toll rate of which is Rp450/km for Group-I. Traffic volumes forecast by the study in 2020 and 2030 are shown in case of the toll rate of the socially acceptable level as shown in Figure 3.4-9. With respect to the case numbers, refer to Table 3.4-6.

Traffic volume on Segment 1 (Yogay-Prambanan) obtained from the study is expected to be much less than the results of the F/S. As the reasons for this, the following are pointed out.

- There are many alternative routes in the area.
- The arterial road running parallel with the toll road has been widened to 4-lane.

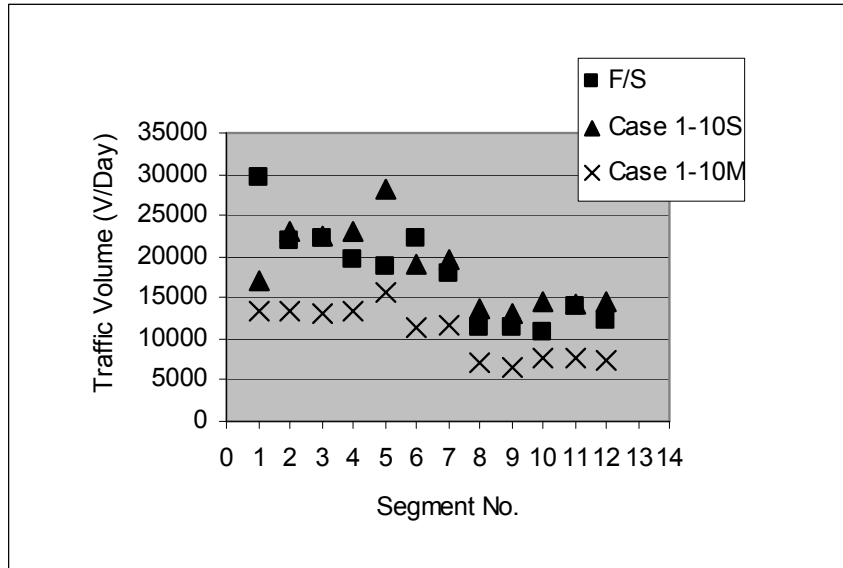

Figure 3.4-8 Traffic Volume in 2010

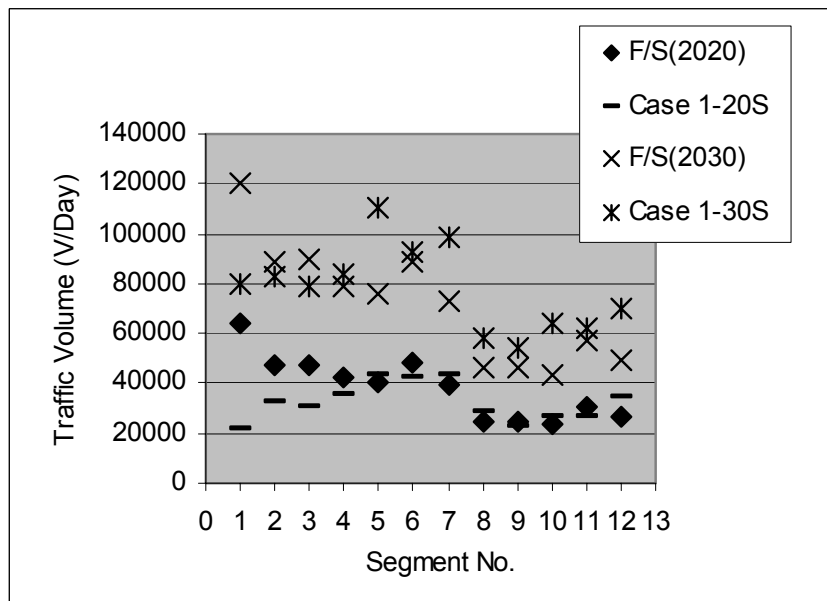

Figure 3.4-9 Traffic Volume in 2020 and 2030

Assigned Traffic Volume

Tables 3.4-7, 3.4 -8 and 3.4-9 show traffic volume of all calculation cases by vehicle group except for case 4 and cases of maximum revenue level. Figures 3.4-10 and 3.4-11 show the distribution of the assigned traffic volumes with VCR (Vehicle Capacity Ratio) - the former is for 2006 and 2010, the latter for 2020 and 2030.

Table 3.4-7 Future Traffic Volume of Case 1

CHAPTER 4

COST ESTIMATION AND ECONOMIC ANALYSIS

CHAPTER 4

COST ESTIMATION AND ECONOMIC ANALYSIS

4.1 REVIEW OF PROJECT COST

To recognize the required investments for project implementation and to conduct both the economic and financial analysis, the project costs should be accurately estimated. The investment cost is estimated based on the engineering design of the different project components and the payment for main construction equipment required for earth works and structure works. The unit price for each item and component are based on latest data received from the local government's Basic Prices Guidelines and from the Journal of Building Construction and Interior Material Prices. These obtained unit prices are first compared with unit prices applied in the Feasibility Study reports for each section of the toll road, then they were checked by the market prices of similar projects considering the difference between supplier, dealer and distributor. In addition, the cost for both routine and periodic maintenance works and that of toll road operation is considered in this study based on information obtained from different toll road operators, especially those applied by Jasa Marga as the biggest toll road operator in Indonesia.

The other main component, beside construction, maintenance and operation costs, is land acquisition cost which plays very significant role in supporting the project construction. This cost is determined and evaluated based on various external factors including applied laws and regulation, biro crates experiences, socio community culture, agrarian aspects etc.

In general, the applied unit costs in the Feasibility Study reports are reasonable when compared with collected and analyzed unit costs of other resources. In addition, quantities estimated based on the preliminary design of the Feasibility Study to be used in constructing the project are accepted for the carriageway road sections only. As for the structures along the toll road, including bridges and interchanges, information in the preliminary design are not enough to accept their estimated costs as many items and soil characteristics are not considered or underestimated.

It should be noted here that the project cost is estimated in the Feasibility Study for two stages; an initial stage in which the toll road has a carriage way of two lanes for each direction, while in the final stage the carriageway is composed of three lanes in each direction.

4.1.1 Construction Cost

Under the Feasibility Study estimations, the quantities of major construction items are calculated based on the design data, which are presented in the preliminary engineering design drawings, including the existing road conditions. The main work items for quantity calculation, among others, are described as follows:

- Clearing the working site:

This work covers clearing, demolished, banishment of bushes and burns clearance of the working site, undertaken within ROW.

- Drainage Works

This work's quantity is generally calculated based on its types, lengths and the type of works.

- Asphalt Pavement

The asphalt treated base, asphalt concrete binder course and the asphalt concrete wearing course pavement are used and calculated in *ton* unit weight. The quantity is computed by width of cross section and the length time's thickness of the design pavement.

- Concrete Pavement

The volumes is calculated by multiplying width of cross sections time the distance between those two cross sections, thickness 27 cm and 10 cm for lean concrete comply with the typical cross section drawing.

- Structure Works

The concrete quantities are calculated based on the dimension and the structure component forms the drawings design and the pay items.

- Toll Plaza and Toll Facility

At entrance and exit approach of interchange, toll plaza and toll facility are planned.

A summary of the construction cost estimated by the Feasibility Study for each of the main items is presented in Table 4.1-1 for the 4 sections of the toll road.

4.1.2 Land Acquisition Cost

(1) Method

A land value and prices survey is conducted to obtain the land value based on the land use, through out the entire planned toll road and the adjacent area (if needed), with the purpose of estimating the present value of land to be acquired for the construction of the toll road. Coverage of the work for this task of the land price survey is a compilation of land use price data, i.e.:

- Inventory and building investigation
- Mapping the land use value.
- Inventory of plantation and others goods

The working methods of the surveys can be grouped as follows:

- Collection of secondary data
- Survey of land use and land prices.

(2) Price Estimation of land Procurement

Analysis and calculation made based on seconded and field surveyed data were for the price estimate of the lands, building, plantation and other goods that will be acquired. These analytical results were put in the Land Value Map, which presents the information regarding the land-use, and photo's presenting actual land-use. The above price estimates was presented in table form classified "Estimasi NJOP" (Tax Object Selling Value Estimate) and "Estimasi Pasar" (Market Price Estimate).

Table 4.1-2 presents a summary for the estimated land acquisition costs for the four sections of the toll road based on the four major items of land-use activities of lands, buildings, trees/plants and utilities. It should be noticed that the estimated cost is the same as the market price except for lands which is treated differently with an estimated cost as the average of market price and estimated tax rate.

4.2 REVISED PROJECT COST

4.2.1 Major Items for Cost Estimate

(1) Work Items

The revised project costs under this study on the toll road are estimated basically based on reviewing F/S cost estimation. In order to support the construction of the toll road project under the formulated different options of PPP schemes, the project cost is aggregated by new groups of works coinciding options of PPP schemes and on intervals or segments between interchanges. The work groups are roughly divided into structure works such as interchanges and bridges or other works related to the road sections such as sub-base, base, pavement and the rest of works for the main road.

1) Bridge

The bridge is further divided into two types; the bridge of the main toll road, mainly over river as shown in Figure 4.2-1, and flyover for crossing roads, as shown in Figure 4.2-2. Bridges are counted separately for main road and flyover for each segment. The cost is estimated in such an aggregated in term of bridge area in square-meters for every segment, and multiplied by the average unit cost of Rp 7.5 million/m², which is the average value derived from currently constructed bridges works in the project regions in Java Island. The following Section 4.2.2 provides detailed information on the bridge issue regarding the preliminary design and cost estimate.

Figure 4.2-1 Typical Bridge over River

Figure 4.2-2 Typical Bridge over Toll Road

2) Pavement

The pavement includes all components of works above sub-grade, such as pavement of 27 m thickness concrete, 10cm lean concrete and aggregate base at shoulder. Standard Cross Section is shown in Figure 4.2-3.

Figure 4.2-3 Standard Cross Section

3) Interchange

The interchange includes over bridges, tollbooths and toll facility. A typical interchange is shown in Figure 4.2-4.

Figure 4.2-4 Typical Interchange

4) Works for main road

For the main road construction works, the rest of items in the cost estimation in Table 4.1-1, such as General, Earth Works and Lighting are aggregated. The construction costs are also segregated by segment. The estimated land acquisition cost in the F/S is calculated as average for NJOP and the market price.

5) Total Cost

The revised cost estimation results are summarized as shown in Table 4.2-4. The estimated total cost is Rp 5,777,985 million, which is 12.4% higher than the cost of Rp 5,141,811 million that was obtained in the F/S. The reason may be attributed to duplication items in estimating construction cost. The bridge unit cost of Rp 7.5 million /m² includes all works pertaining bridge construction, such as mobilization and traffic control during construction period, there must be some duplication in those items which are included in the works for main road. These items can not be separated for main works and bridge construction.

The results are adopted as construction cost for our further study with a difference of 12.4% in the total construction cost.

4.2.2 Review of Bridge Construction Cost

In the review of bridge construction costs, as presented in Figure 4.2-5, a unit cost of Rp 7.5 million per square meter was taken based on the construction cost experiences of the same type bridges in Indonesia as bridges of this study from the following reasons.

- It is very difficult for the review to identify the construction costs for bridges, since there are no descriptions on the construction costs one by one in the report.
- There are a few borehole drilling data comparing to the number of the bridges, as shown in Table 4.2-5. Construction cost estimate without enough soil investigation data tends to be under estimation for the bridge foundation costs.
- According to the bridge list in Appendix 4-1, many of piers do not have pile foundations. Piers without piles especially in river areas tend to be easily damaged due to scouring during flood even in relatively good ground conditions.
- With the depths of bearing strata indicated in Table 4.2-5, bridge substructures usually require pile foundations.
- Bridge construction costs per square meter for bridges with PCI-Girder in Figure 4.2-5 are scattered around Rp 7.5 million /m² level, costs of which shall be taken from the conservative side view point because of the above situations.

Details of the bridges along the toll road, with a total of 67 bridges as components of the toll road and another required 302 bridges for road crossings over the toll road, are presented in Appendix 4-1 of the Bridge List.

4.3 ECONOMIC ANALYSIS

4.3.1 Review of F/S Economic Analysis

The Feasibility Study estimated the economic parameters of Benefit/Cost ratio (B/C), Economic Internal Rate of Return % (EIRR) and Net Present Value (NPV) based on the costs estimated as presented in Section 4.1 of this Chapter and the benefits expected to be gained by the implementation of the toll road project, as presented in the following sections.

(1) Cost

1) Construction Cost

Construction cost summarized in the previous section and land acquisition cost were included in the toll road construction cost.

2) Engineering cost for design and construction supervision is not included

3) Operation and Maintenance Cost

Operation and maintenance cost covering the operation and the runtime and the periodic maintenance works.

- The runtime maintenance cost was used for clearing the area, cutting plantation, and overlay and for the similar types works. The cost amount was estimated 5% from the construction cost.
- Operation and periodic maintenance cost such as structure rehabilitation works (overlay), and the similar types, and its implementation once in ten (10) years, 10% of construction cost.
- Road upgrading cost was a cost for toll roads widening works to final stage.

(2) Benefit

1) Reduction of Vehicle Operation Cost

Economic benefit, which can be derived by toll roads construction, is increasing efficiency of vehicle operation cost. VOC on the arterial roads for different vehicle categories are follows:

- Passenger car (Group I): Rp 1,294/km with a speed of 30 km/hour
- Class IIA vehicle: Rp 5,678/km with a speed of 25 km/hour
- Class IIB vehicle: Rp 4,189/km with a speed of 25 km/hour

Whiles the VOC on the toll roads are as follows:

- Passenger car (Group I) : Rp 1,000/km with a speed of 80 km/hour
- Class IIA vehicle: Rp 5,348/km with a speed of 65 km/hour

- Class IIB vehicle: Rp 3,675/km with a speed of 60 km/hour

2) Travel Time Cost Saving

By using toll road, travel time can be saved. The saved travel times were converted to monetary value using time evaluation. This is Travel Time Cost (TTC) saving merit. The time evaluation is estimated as follows:

- Passenger car (Group I): time value is Rp 21,002/hour
- Class IIA vehicle: time value is Rp 98,097/hour
- Class IIB vehicle: time value is Rp 19,604/hour

The adopted time values are those of “Heavy Loaded Road Improvement Project Master Plan Review Study” by Bina Marga in 2001, for Bus and Passenger Car and JARNS (Java Arterial Road Network Study) in 2001 for trucks. The values are adjusted to 2005 price based on the latest five (5) years average inflation rate, 8% per annum.

3) The assumption

The assumption used for the evaluation is as follows:

- Basic Year Operation: 2009
- Observation time period: 35 years
- Price level: 2005
- Alternatives of Discount Rate : 12.75%, 15%, and 20%

(3) Result of Economic Analysis

The three economic parameters of B/C Ratio, NPV and EIRR are summarized in Table 4.3-1.

discount rate	Yogya - Solo	Solo - Mantingan	Mantingan- Ngawi	Ngawi - Kertosono
B/C Ratio				
12.75%	2.04	2.45	2.21	2.60
15.00%	1.87	2.03	1.83	2.15
20.00%	1.53	1.43	1.29	1.52
NVP				
12.75%	3,822,547	3,638,136	1,452,214	4,767,380
15.00%	2,712,618	1,200,091	931,964	3,210,856
20.00%	1,279,644	896,761	293,031	1,289,254
IRR	32.98%	26.74%	24.69%	27.62%

Table 4.3-1 Economic Parameters of Economic Analysis

(4) Examination of the Analysis

The above analysis is examined by checking O&M cost, VOC benefit and TTC benefit for the years of 2010, 2025 and 2040. The result is shown in Table 4.3-2.

Table 4.3-2 Main Items Applied in Economic Analysis

Item	Yogya - Solo		Solo - Mantingan		Mantingan- Ngawi		Ngawi - Kertosono	
Traffic Volume (million)								
2010	402	v-km	339	v-km	144	v-km	355	v-km
2025	1,213	v-km	1,019	v-km	435	v-km	1,071	v-km
2040	2,778	v-km	2,335	v-km	995	v-km	2,090	v-km
O&M (Rp million)		/v-km		/v-km		/v-km		/v-km
2010	97,498	243	73,640	217	37,706	262	93,137	262
2025	415,582	343	103,618	102	53,056	122	131,053	122
2040	1,318,296	475	138,858	59	71,100	71	175,624	84
Benefit VOC (Rp million)		/v-km		/v-km		/v-km		/v-km
2010	381,196	948	231,696	683	118,327	822	350,599	988
2025	1,126,069	928	694,468	682	356,448	819	1,055,374	985
2040	2,198,864	792	1,590,474	681	816,348	820	2,417,009	1,156
Benefit TTC Rp million)		/v-km		/v-km		/v-km		/v-km
2010	230,735	574	261,889	773	94,173	654	270,155	761
2025	685,935	565	779,520	765	279,896	643	803,729	750
2040	1,339,408	482	1,785,315	765	641,040	644	1,840,723	881

These three components are considered to be interrelated to traffic volume in terms of vehicle-kilometer. For O&M cost the coefficients are decreasing for future years, except Yogya – Solo section. Therefore, for this section O&M cost is inflated using 8% per annum.

Including the section the average cost for O&M is Rp 196.8 /v-km. This is considered as a unit cost for O&M, proportional to traffic volume (v-km).

VOC benefit figures are not so fluctuated, as they must be related closely to traffic volume (v-km), but it varies by section. Solo – Mantingan section is the lowest with 682 and Ngawi – Kertosono section is highest of 988.

As for TTC benefit, the figures are also not fluctuated. But, the tendency is rather different. The lowest figure is that of Yogya – Solo section and it suddenly reduced to 482. The highest is for Solo – Mantingan section followed by Ngawi – Kertosono section. For the latter section it raised up to 881 in 2040.

The examination shows those figures are favorable for Ngawi – Kertosono section and adverse for Yogya – Solo section. If the figures were same as the other sections the economic indices will become higher for this section.

In addition, the engineering cost for the detailed design of the project and construction supervision is not considered in the economic analysis, which can be estimated as about 4% for detailed design and 4% for construction supervision.

4.3.2 Revised Economic Analysis

(1) Case set up

Three cases are set up for economic analysis in order to compare economic viability of the section of toll road under operation. It is assumed that The Trans Java Toll Road outside of the Study Area will be operated by traffic by the year when the study Toll Road will be open. The sections of Semarang – Solo and Kertosono – Surabaya will be connected to the Study Toll Road to complete the Trans Java Toll Road. A section of toll road in the Study area between Yogya and Solo is branched outside of Trans Java Toll Road. Therefore, in addition to the case of constructed the whole of the Study Road between Yogyakarta and Kertosono, the two sections of the Study Road Yogyakarta – Solo and Solo – Kertosono sections are considered independently, as presented in Table 4.3-3.

Table 4.3-3 Case Set Up

Case	Yogyakarta – Solo	Solo – Kertosono
1	Open	Open
2	Open	-
3	-	Open

(2) Cost

1) Construction cost

The construction cost summarized in Table 4.2-4 is used, but land acquisition cost is not included.

2) Operation and maintenance cost

Routine maintenance works such as cleaning of roadway; bush cutting and toll road operation cost are considered to be proportional to traffic volume (vehicle-km). A coefficient of 196.8 derived from F/S is used. For major maintenance and repair works, 5% of construction cost for every 5 year is included.

3) Engineering Cost

The engineering cost for the detailed design of the project and construction supervision is considered as about 4% for detailed design and 4% for construction supervision.

(3) Benefit

Traffic flow diverted to toll expressway can enjoy benefit by improved traffic flow. The remaining traffic on ordinary roads can also enjoy merit by improved traffic flow due to reduction of traffic volume attained by diversion to toll expressway. To simulate such a situation traffic assignment procedure is employed. Traffic volume along the study road is obtained by traffic assignment procedure using OD tables, road network. Changes of traffic condition through out study area is compared by “with and without” the project road basis. Quantitative amount of vehicle-km (v-km) and vehicle-hour (v-hr) are accumulated during assignment process.

1) VOC reduction

To obtain VOC reduction merit, unit VOC cost as used in F/S is applied to average speed calculated v-km divided by v-hr for toll road and non toll road for 3 vehicle categories, with and without cases.

2) TTC savings

Total accumulated amount of veh-hr for without case subtracted by with each case is a total save travel time within study area. This amount of saved time multiplied by time evaluation of each vehicle categories is monetary conversion of saved time. This is a procedure to get the savings in TTC.

4.3.3 Revised Economic Parameters

(1) Presumptions for Economic Analysis

The applied values of veh-km and veh-hr as well traffic parameters for each of the three cases are estimated through the traffic assignments applying JICA STRADA programs. The following presumptions are applied for the economic analysis:

- Implementation Schedule

Year 2007:	Land acquisition and detailed engineering design
Year 2008:	Construction of 40% of the project
Year 2009:	Construction of 60% of the project
Year 2010:	Operation

- Evaluation Period

This period is considered as 30 years of operation from the year 2010 to 2039.

- Widening Cost

Additional widening cost is added to increase the number of lanes from 2 lanes in each direction to 3 lanes when the traffic volumes reach the level of 64,100 veh/day.

Widening costs are:

Yogyakarta – Solo: Rp 352,528 million in year 2027

Solo – Kertosono: Rp 1,272,416 million in year 2031

(2) Results of Economic Analysis

Tables 4.3-4, 4.3-5 and 4.3-6 present the estimated economic parameters for the cases of:

Case 1: Yogyakarta - Kertosono

Case 2: Yogyakarta – Solo

Case 3: Solo - Kertosono

Table 4.3-4 Economic Parameters (Yogyakarta – Kertosono)

Discount Rate	12.75%	15.00%	20.00%
B/C	2.161	1.887	1.437
NPV (Rp million)	10,491,465	7,1562,916	2,907,368
EIRR %	28.18	28.18	28.18

Table 4.3-5 Economic Parameters (Yogyakarta – Solo)

Discount Rate	12.75%	15.00%	20.00%
B/C	2.038	1.779	1.353
NPV (Rp million)	2,122,829	1,418,426	531,195
EIRR %	26.73	26.73	26.73

Table 4.3-6 Economic Parameters (Solo - Kertosono)

Discount Rate	12.75%	15.00%	20.00%
B/C	1.904	1.655	1.246
NPV (Rp million)	6,047,488	3,917,406	1,223,617
EIRR %	24.51	24.51	24.51

The results show that Case 1 of implementing the whole Study Road from Yogyakarta to Kertosono gives the highest economic parameters compared with implementing only a section of the road.

(3) Sensitivity Analysis

A sensitivity analysis is carried out on the three cases of project implementation to take into account the uncertainty of assumptions and to determine the potential of each project road for unexpected increase in construction costs or decrease in benefits.

The cases considered in this sensitivity analysis are those of unexpected increase or decrease in the project costs or benefits by 10% and 20% under the three applied discount rates of 12.75%, 15% and 20%.

Results of the sensitivity analysis are presented in Tables 4.3-7, 4.3-8 and 4.3-9 for the different three cases of project implementation of:

1. Yogyakarta – Kertosono
2. Yogyakarta – Solo
3. Solo - Kertosono

The results show that the Project is economically feasible and give the indication that, from the economic point of view, the whole road should be implemented from Yogyakarta to Kertosono, which is the case that gives higher economic parameters.
