Tabel 8.6.1 Evaluasi Alternatif Penanganan Endapan Sedimen dan Sampah di Intake

Alternatives	Feature	Facility Plan	Cost	Evaluation
1) Modification of intake	<ul style="list-style-type: none"> Intake tower with selective intake gate is to be constructed on the existing intake to raise foundation height of Inlet. This method aims at avoiding the intake from being buried by sedimentation and to prevent garbage from entering the inlet. 	<p>i) Intake Tower</p> <p>Height H=26.0 m</p> <p>Gates H5.0m x B12.6m x 2nos.</p> <p>Elevation of bottom of inlet EL. 127.0 m</p>	<p>i) Construction Cost \$3,160,000</p> <p>ii) O&M Cost \$53,000/year</p>	<ul style="list-style-type: none"> Water supply should be suspended during construction. Strong load bearing capacity of foundation shall be needed to support the superstructure. Sedimentation would be accelerated due to heightening of inlet foundation from EL. 116.0 m to 127.0 m.
2) Relocation of intake	<ul style="list-style-type: none"> Relocation of the existing intake to 300m upstream on the left bank where less sedimentation is expected Intake tower with selective intake with gates is to be constructed. Waterway tunnel is constructed to connect the existing conduit to the power station. 	<p>i) Intake Tower</p> <p>Height H=26.0 m</p> <p>Gates H5.0m x B12.6m x 2nos.</p> <p>Elevation of bottom of inlet EL. 127.0 m</p> <p>ii) Transmission Tunnel</p> <p>Diameter D=5.5 m</p> <p>Length L=570 m</p>	<p>i) Construction Cost \$8,800,000</p> <p>ii) O&M Cost \$140,000/year</p>	<ul style="list-style-type: none"> Construction cost is the highest Sedimentation has already been occurred around the proposed site. So effectiveness and reliability against sedimentation is very low. Water supply should be suspended during connection work with the existing conduit.
3) Garbage trapping structure at intake	<ul style="list-style-type: none"> Overflow weir is to be constructed around the existing intake. Trash racks are to be installed on the overflow weir to block garbage entering into the intake. Approaching deck is to be installed over the trash racks to connect the dam crest and this structure. These deck and trash rack are designed to be submergeable to minimize construction cost. Garbage on trash rack shall be removed by back hoe to minimize maintenance works. 	<p>i) Double Screen</p> <p>H26.0m x L111.2m</p> <p>Area A=890 m²</p> <p>ii) Approach Deck</p> <p>Length L=106 m</p> <p>Width B=7.0 m</p> <p>Area A=740 m²</p> <p>iii) Steel Pile</p> <p>φ1,000 mm x H9.0 m x 34 nos.</p>	<p>i) Construction Cost \$3,670,000</p> <p>ii) O&M Cost \$65,000/year</p>	<ul style="list-style-type: none"> Garbage removal work become easy by this method. Water supply should be suspended during construction. Certainty and effectiveness are very high among countermeasures.
4) Dredging by Hydro-suction method	<ul style="list-style-type: none"> Hydro-suction system is to be installed to remove the sediment and garbage at intake. 	<p>i) Hydro-suction system</p>	<p>i) Construction Cost \$2,875,000</p> <p>ii) O&M Cost \$99,000/year</p>	<ul style="list-style-type: none"> This method is considered to reduce operational cost with normal hydraulic dredging. Certainty of this method is a little inferior to hydraulic dredging, however effectiveness of this method for both sediment and garbage were confirmed. There are operational constraints depending on the reservoir water levels.
5) Hydraulic dredging	<ul style="list-style-type: none"> Remove the sediment and garbage at intake by pump dredger. 	<p>i) Dredger</p> <p>Suction dredger, 600PS x 1 unit</p>	<p>i) Construction Cost \$4,456,700</p> <p>ii) O&M Cost \$320,200/year</p>	<ul style="list-style-type: none"> This method is common countermeasure against reservoir sedimentation. Reliability of sediment removing performance is highest among the alternative countermeasures. Running cost is highest. And spoil bank is required.
6) Garbage trapping structure in the Keduang River	<ul style="list-style-type: none"> Overflow weir with steel pipes is to be constructed on the Keduang River before entering the reservoir. Sabo dam with steel-pipe type trapping structure is common in Japan to trap and remove garbage. Garbage removal works will be carried out periodically. 	<p>i) Concrete Weir</p> <p>Dam width W=56.3 m</p> <p>Dam height H= 9.3 m</p> <p>Design discharge Q= 1,370 m³/s</p> <p>Crest width Bc= 70 m</p> <p>Overflow depth Hw=4.9m</p> <p>ii) Steel material</p> <p>Width B=25.0 m</p> <p>Height H=4.0 m</p>	<p>i) Construction Cost \$1,370,000</p> <p>ii) O&M Cost \$21,000/year</p>	<ul style="list-style-type: none"> This method is to reduce garbage entering into the reservoir. Periodical garbage removal works are needed.

Table 8.6.2 Evaluasi Alternatif Penanganan Aliran Sedimen dari Sungai Keduang

Alternatives	Alternatives	Feature and Sediment Balance	Facility Plan	Cost	Evaluation
1) Keduang River Sediment bypass		<ul style="list-style-type: none"> This method is to reduce the sediment inflow from the Keduang River into the reservoir by diverting the sediment inflow with high concentration into the bypass tunnel to the downstream river. Target sediment is the wash loads because attractive force is small due to gentle bypass tunnel (channel) gradient of 1/1,000. This method is usually effective in case that it would be difficult to lower the water level for sediment flushing and the reservoir is relatively small. Efficiency of Sediment Removal <ul style="list-style-type: none"> Volume 757,000 m³ (wet year) Concentration 2,789 ppm (wet year) * wet year 1998-1999 	<ul style="list-style-type: none"> Bypass tunnel <ul style="list-style-type: none"> L = 6,435 m, I = 1/1,000 Horseshoe section 2r = 5.0 m Design discharge Q = 50 m³/s River improvement <ul style="list-style-type: none"> L=2,395m, I=1/200 Cross section B10.0 m x H3.0 m (side slope 1:0.5) Design discharge Q = 65 m³/s Diverting Weir <ul style="list-style-type: none"> W=137.9 m, H= 9.3 m, Design discharge Q = 1,370 m³/s Crest width Bc = 70 m Overflow depth Hw =4.9 m Gates H6.7m x B5.0m x 2nos. 	<ul style="list-style-type: none"> Construction Cost \$82,940,000 O&M Cost \$1,597,000/year Unit cost \$10.7/m³ 	<ul style="list-style-type: none"> Construction cost and O&M cost will be highest among the alternative countermeasures. Volume of sediment released is almost the same with other alternatives, however reliability and effectiveness of sediment releasing is high. Length of bypass channel is very long. And compensation for land acquisition will be necessary.
2) Sediment sluicing by new gates		<ul style="list-style-type: none"> This method is to path through incoming flood inflow from the Keduang River with high turbidity to the downstream reaches through new gate before deposition in the reservoir. New sluicing gate is to be installed on the right abutment of the dam to make the Keduang flood inflow smoothly flowing into sluice gate. Efficiency of Sediment Removal <ul style="list-style-type: none"> Volume 843,000 m³ (wet year) Concentration 2,712 ppm (wet year) * wet year 1998-1999 	<ul style="list-style-type: none"> Sediment gate <ul style="list-style-type: none"> H12.6 m x B5.0 m x 4nos. Spillway channel <ul style="list-style-type: none"> L = 723 m, B = 20 m Fore bay excavation <ul style="list-style-type: none"> Level of excavation EL.127.0 m Volume 183,000 m³ 	<ul style="list-style-type: none"> Construction Cost \$35,630,000 O&M Cost \$672,000/year Unit cost \$4.7/m³ 	<ul style="list-style-type: none"> Facilities required are only sluicing gate and chute way which can be constructed within the dam area, so no need for land acquisition. Construction cost is cheapest among the alternatives, it is around 1/2 of the sediment bypassing. Effectiveness of sediment release is almost the same as the sediment bypassing. Sediment sluicing is only effective when the reservoir water level is low mainly in the beginning of the wet season. When the reservoir water level is high, efficiency on sediment releasing becomes small.
3) Sediment storage reservoir with new gates in reservoir		<ul style="list-style-type: none"> This method is to create a small sediment storage reservoir for the sediment inflow from the Keduang River inside the reservoir. The small sediment storage reservoir is created by installation of closure dike. New gate is to be installed for sediment releasing on the same location of the sediment sluicing alternative. Because of small capacity of sediment storage reservoir, the reservoir water level rises rapidly due to inflow from the Keduang River. The stored water in the storage reservoir is diverted into the main reservoir through the new overflow weir. Efficiency of Sediment Removal <ul style="list-style-type: none"> Volume 1,380,000 m³ (wet year) 	<ul style="list-style-type: none"> Closure dike : double sheet pile <ul style="list-style-type: none"> L = 650 m, H = 15 m, B = 10 m Sediment gate <ul style="list-style-type: none"> H12.6 m x B7.5 m x 4nos. Spillway channel <ul style="list-style-type: none"> L = 723 m, B = 20 m Fore bay excavation <ul style="list-style-type: none"> Level of excavation EL.127.0 m Volume 183,000m³ Overflow weir <ul style="list-style-type: none"> L = 150 m, B = 10 m 	<ul style="list-style-type: none"> Construction Cost \$47,090,000 O&M Cost \$908,000/year Unit cost \$3.8/m³ 	<ul style="list-style-type: none"> Sediment storage reservoir can be operated separately from the main Wonogiri reservoir. Sediment flushing can be operated without lowering main reservoir water level. All facilities can be constructed within dam site area without land acquisition. Garbage issues at intake will be solved because almost all of the garbage from the Keduang River is retained in the storage reservoir. Sediment flushing can be made after storing water up to NHWL in the main reservoir. As well as sediment flushing, sediment sluicing can be made in the beginning of the wet season. Sustainability, reliability and effectiveness of sediment releasing are highest among the alternative countermeasures.

Tabel 8.6.3

Evaluasi Alternatif Penanganan Aliran Sedimen dari Sungai Lainnya

Alternatives	Feature	Facility Plan	Cost	Evaluation
1) Sediment storage dam for sediment removal (Check dam, Sabo dam)	<ul style="list-style-type: none"> ◆ Sediment storage dams are constructed on the river channel of major tributaries to trap and store sediments, and to remove by excavation. ◆ Removal works of sediment deposits is carried out in the dry season ◆ Trapped sediments shall be periodically removed by excavation by back hoe and conveyed to spoil banks by trucks. ◆ Relatively coarse sediments are deposited in the storage dam and finer sediments flow into the reservoir 	<p>i) Sediment Storage Dam x 83 units</p> <p>Dam width W = 116 m Dam height H = 9.3 m Storage Capacity V = 24,000 m³ Crest width Bc = 70 m Overflow depth Hw = 5.0 m</p>	<p>i) Construction Cost \$225,460,000</p> <p>ii) O&M Cost \$3,189,000/year</p> <p>iii) Unit cost \$12.8/m³</p>	<ul style="list-style-type: none"> ◆ This method is common to trap sediments in river. Many check dams have been already constructed. However these dams have been already filled with sediments without excavation. ◆ As the target sediment is wash loads, sediment trapping ratio will be very small. ◆ Further, trapping capacity of storage dam is very small comparing the sediment inflow, so many storage dams shall be constructed to cope with sediment inflow. ◆ Due to limitation of locations of storage dam, trapped sediments in the storage dam shall be removed by excavation. Thus huge spoil bank areas shall be required.
2) Hydraulic dredging in reservoir	<ul style="list-style-type: none"> ◆ This method is to remove the deposited sediment in the reservoir by hydraulic dredging. ◆ Dredged sediments shall be conveyed to spoil banks. 	<p>i) Dredger Suction dredger, 600PS x 10 units</p>	<p>i) Construction Cost \$44,567,000</p> <p>ii) O&M Cost \$3,202,000/year</p> <p>iii) Unit cost \$4.3/m³</p>	<ul style="list-style-type: none"> ◆ Huge spoil bank areas shall be required. ◆ Running cost is very expensive. ◆ Reliability of sediment removal is high.
3) Dry excavation in reservoir	<ul style="list-style-type: none"> ◆ Dry excavation in the reservoir shall be carried out by back hoe or crawler-mounted bulldozer for swamp in the dry season when deposited sediments appear on the ground near the river mouths of major tributaries in the reservoir. ◆ Excavated sediments shall be conveyed to spoil banks by trucks. 	<p>i) Bulldozer 4t, swamp x 2,960 units</p> <p>ii) Crawler loader, 2.3 m³ x 40 unit</p> <p>iii) Dump truck, 20 ton x 165 units</p>	<p>i) Construction Cost \$287,990,000</p> <p>ii) O&M Cost \$7,754,000/year</p> <p>iii) Unit cost \$19,0/m³</p>	<ul style="list-style-type: none"> ◆ Reliability of this method is high. ◆ This method is apply for sediment removal in sediment storage dam, however, to cope with all sediments deposited in the reservoir (around 20,000 m³/day) by sole dry excavation, many systems are required, consequently cost must be very high. ◆ Huge spoil bank areas shall be required.
4) Managing of sediments within reservoir by releasing from the intake	<ul style="list-style-type: none"> ◆ This method aims at moving the previously deposited sediments toward the dead zone of the reservoir, thereby maintaining or increasing the effective capacity of the reservoir. ◆ At the beginning of wet season, the maximum intake discharge (70 m³/s) shall be released continuously for long duration, say 2 months. ◆ This method is categorized as sediment sluicing by use of the existing intake. 	<p>No new facilities might be necessary. Maintenance of the existing intake shall be necessary.</p>	<p>i) Construction Cost \$0</p> <p>ii) O&M Cost \$0/year</p> <p>iii) Unit cost \$ 0/m³</p>	<ul style="list-style-type: none"> ◆ Reliability of this method is very low without countermeasure for blocking of intake due to garbage. ◆ Garbage removal system is st the intake will be indispensable. ◆ This method has been functioned at normal operation, however it can not be a solution to cope with massive sediment inflow into dam reservoir. ◆ Significant amount of water shall be released and thus there is a risk that the reservoir water level can not reach NHWL.

Tabel 9.1.1 Pelajaran dari Pengalaman Sebelumnya Pada Proyek-proyek Konservasi DAS Wonogiri

<p><u>1. Technical Issues</u></p> <ul style="list-style-type: none"> - Well integrated & coordinated physical and vegetative or civil and agricultural measures are - Combined package of conservation measures and improved agricultural practices must provide adequate and immediate & long term financial gains to farmers for ensuring positive participation of - Introduction of measures which are accepted & practiced by farmers/farmers groups and sustainable; not sophisticated, low cost, use of available materials. - Agro-forestry approaches: Past projects were too much forestry oriented; to employ integrated forestry & agronomic approaches. - Not blue print approaches, but area specific & flexible prescriptions by watershed conditions are - High priority to be given to sub-watersheds which are main contributors to the acute sedimentation problems in the Wonogiri Reservoir. - Land is often left by the family head working on a seasonal basis in the cities. Recommended agricultural measures are to be in line with this reality. - Crop Selection & Cropping Pattern <ul style="list-style-type: none"> - Need of crops tolerant to dry climate & with adequate economic value - Introduction of area specific superior crops/commodity andalan for dry land - Further adaptation of multiple cropping system with legumes should be aimed for improvement of - Development of commodities suitable for conservation purposes is to be envisaged. - Selection of agricultural commodities should be based on market potential followed by technical & - One alternative is to combine perennial crops with seasonal crops in home compound & dry farm
<p><u>2. Project Management Issues</u></p> <ul style="list-style-type: none"> - Project failed because of top-down management & use of inflexible prescriptions poorly adapted to loc - Reasons not following integrated approaches; project expenditures are to be spread as much as possible among villages and communities in the project area. - Planning is to be based on prospects for sustainable income flow, farmers traditional customs of cultivation, off-farm income, availability of credits & markets, existing social priorities. - Grant aid in terrace rehabilitation has resulted in a detrimental change in social behavior in self reliant activities for soil conservation and terrace rehabilitation. - Depending solely on conservation measures would mean implementing remedial measures without tackling, preventing and solving the real causes. - Monitoring of performances of the programs implemented seldom practiced in the past. - Precondition for success: strong & motivated extension services involving PPL & PKL will form the key in implementing & sustaining conservation efforts. - Government support is still required & essential for supporting farming activities. The level of incentives should be sufficiently high to induce farmers participation in soil conservation programs. - Legal or official procedures will be necessary for controlling cropping pattern in dry farm land.
<p><u>3. Social & Institutional Issues</u></p> <ul style="list-style-type: none"> - Institutionalization of integrated & synergetic efforts & activities toward watershed management in the Wonogiri catchment area is to be envisaged. - Technical collaboration team & technical working team at kabupaten level and integrated - institutions at kecamatan & village levels are to be established. - Multi-stakeholders dialog at district & watershed levels are to be maintained. - As farmers are becoming more interested in income earned in non-agricultural activities, they are increasingly reluctant to invest in their own farm especially when it concerns maintenance of their - To achieve a balance between the farmers aspiration & the project objectives, an integrated planning which involves the bottom-up and bottom-down approaches is needed. - Peoples behavior depends on their local culture. So, whatever programs must be formulated accordingly and not given as a uniform package for all locations, but must be arranged together with their leaders and then given to the people by various methods of extension and communications. Traditional values must be taken into account to ensure participation of communities.
<p>1/: Lessons learned was extracted based on the review on the following reports & interview with the agencies concerne</p> <ul style="list-style-type: none"> - Consulting Services for the Upper Solo (Wonogiri) Watershed Protection Project, Monitoring & Evaluation Final Report, July 1991, BCEOM - Report on the Evaluation of Wonogiri Watershed Management, Watershed Management Technology Center (BP2TP DAS), Surakarta, 1995

Project Name: Construction of Sediment Storage Reservoir with New Gates in the Wonogiri Reservo
Target Area: In/around the Wonogiri Reservoir **Project Period: 4 years**

Narrative Summary	Verifiable Indicators	Means of Verification	Important Assumptions
<p>Overall Goal Long-term ability of the Wonogiri reservoir function will be secured for 100 years.</p>	<p>1) Decreasing ration of the effective storage volume in the reservoir</p> <p>2) Water supply to the Wonogiri irrigation area</p>	<p>Reservoir sedimentation survey and monitoring of water supply</p>	<p>There will be no drastic change in reservoir management policy of Government of Indonesia</p>
<p>Project Purpose 1) The existing intake structure will be completely relieved from the sediment and garbage inflow from the Keduang River. 2) Majority of sediment and garbage from the Keduang River will be released from the new gates to the downstream reach from the dam.</p>	<p>1) Sediment deposition level at the intake (every 2 month)</p> <p>2) Frequency of interruption of power generation and water supply</p> <p>3) Volume of released sediment from the new gates</p>	<p>1) Echo sounding survey at the intake</p> <p>2) Operation record of power generation and water supply</p>	<p>1) PJT I Bengawan Solo will operate the sediment storage reservoir according to the new operation rule.</p> <p>2) PJT I Bengawan Solo will conduct sedimentation survey at the intake periodically.</p>
<p>Outputs Sediment storage reservoir with new gates will be constructed in the Wonogiri reservoir.</p>	<p>Visible confirmation</p>	<p>Surver record Progress report, completion report and evaluation report of the construction stage</p>	<p>1) The sediment storage reservoir will be operated according to the reservoir operation rule and maintained properly.</p> <p>2) Maintenance dredging at the intake will be conducted periodically.</p>
<p>Activities Construction of: 1) Sediment stodrage reservoir with new gates in the Wonogiri reservoir, 2) Closure and overflow dikes Socialization of downstream residents (stakeholders) for the construction</p>	<p>Inputs Janapnese side: Funding assistance for construction of the sediment storage reservoir with new gates Indonesian side: Government administration Allocation of proper O&M cost by PJT I Bengawan Solo</p>		<p>Construction cost does not increase drastically.</p> <p>Pre-conditions 1) The watershed condition does not change drastically from the condition in 2006. 2) The demand of water supply from the reservoir does not change drastically. 3) Water quality of the downstream reach is not drastically deteriorated.</p>

Tabel 11.5.4 PDM Penanganan Mendesak (2/2)

Project Name: Watershed Conservation in Keduang River Catchment

Target Area: Keduang River Watershed

Project Period: 3 years

Narrative Summary	Verifiable Indicators	Means of Verification	Important Assumptions
Overall Goal Long-term ability of the Wonogiri reservoir function will be secured for 100 years.	1) Decreasing ration of the effective storage volume in the reservoir 2) Water supply to the Wonogiri irrigation area	Reservoir sedimentation survey and monitoring of water supply	There will be no drastic change in reservoir management policy of Government of Indonesia
Project Purpose 1) Annual sediment inflow from the Keduang River will be reduced from 1.22 million m ³ to 0.80 million m ³ . 2) Agricultural productivity will be increased with provision of next generation of farmers with resources of another agricultural income.	1) Sediment deposition in the reservoir (every 3 year) 2) Increase of agricultural productivity 3) Balance of cash flow of farmers	1) Echo sounding survey in the reservoir 2) Operation record of power generation and water supply	1) Aspiration of local farmers to participate in the watershed conservation does not change drastically. 2) Cooperation efforts of line agencies concerned does not change drastically. 3) Aspiration of local farmers to maintain the rehabilitated terrace does not change drastically.
Outputs In the watershed of Keduang river, 1) K2TAs will be established in the selected area. 2) Farmers understandings on the importance of land and water conservation will be deepened in the selected areas. 3) Demonstration plots will be prepared and managed by the key farmers. 4) 11,260 ha of upland field will be rehabilitated through participation of farmers. 5) Agro-forestry will be developed and applied in the selected area.	1) Establishment of committee and farmer groups 2) Progress of project works and supporting program 3) Record of demonstration plots 4) Number of participants for the works and supporting program 5) Change of land use, cropping pattern, terrace improvement, framing practices, etc. 6) Change of income of village/groups 7) No. of request and discussion with the executing agency 8) Change of the project plan	1) Survey report 2) Record of weekly and monthly meeting (monitoring on members) 3) Monitoring survey	1) Aspiration of local farmers to participate in the watershed conservation does not change drastically. 2) Cooperation of line agencies concerned does not change drastically.
Activities 1) Formulation of K2TA 2) Farmer training on: -Land & water conservation -Terrace formation, improvement and rehabilitation -Agro-forestry development 3) Making demonstration plot 4) Farm input supply 5) Labor cost subsidy 6) Field staff training on soil & water conservation	Inputs Japanese side: Funding assistance for implementation of watershed conservation Indonesian side: Government administration Technical and financial support program for land management and agricultural promotion		1) Cost of the farm input and the materials for terrace rehabilitation do not change dramatically. 2) Needs of upland farmer is not changed. Pre-conditions 1) The watershed condition does not change drastically from the condition in 2006. 2) The demand of water supply from the reservoir does not change drastically.
