APPENDIX-D COST ESTIMATES

CHAPTER D1 BASIC CONDITIONS

D1.1 Basic Conditions for Cost Estimate

The basic conditions and assumptions employed for cost estimation of the Project are as follows:

- Cost estimate refers to the prices as of September 2008.
- Exchange rate are as of September 2008, and they are as follows:

1 US Dollar (US\$) = 4,107 Riel

= 107.99 Yen

- Unit prices of labor, construction materials, engineering works, etc., were collected from MOWRAM and market.
- Construction is undertaken on the contract basis, and V.A.T is excluded from construction costs.
- The Initial Investment cost consists of the following items, and assumptions and contents of each item are explained in table below:

Item	Item Descriptions	Assumption	Contents for Item / Remarks
No.	Item Descriptions	(%) and Key Items	Contents for field / Kemarks
1.	Construction Cost	See Section 9.2.3	1-1 Headworks and Major Related Structures
			1-2 Main and Secondary Sysytems
			1-3 On-farm Development
2.	Project Supporting Pograms Cost	5 % of Item 1	2-1 Meteo-hydrological Observation Strengthen-
			ing Program
			2-2 MOWRAM Staff Capacity Development
			2-3 PDOWRAM Staff Capacity Development
3.	Physical Contingencies	10 % of Items (1+2)	
4.	Sub-Total	Items (1+2+3)	
5.	Consulting Services Cost		5-1 Detail Design (D/D)
			5-2 Construction Supervision (C/S)
			5-3 FWUC Establishment and Strengthening
			5-4 Agricultural Extension Activities
6.	Tax & Duty	10 % of Items (4+5)	
7.	Land Acquisition Cost	See Section 9.2.4	For anticipated area
8.	Project Administration Cost	10 % of Item 4	
9.	Price Escalation	5 % /annum	Referred to IMF World Economic Outlook Database,
		of Item 4	October 2007

Items and Assumptions for Initial Investment Costs for the Project

Prepared by JICA Study Team

- Price escalation rate (Item 9) is assumed to be at 5.0 %/annum; i.e., based on the average of annual change ratio of inflation (consumer price) in Cambodia between year

2003 and 2008 (five years).

Cambodia		U	Remarks				
Items	2003	2004	2005	2006	2007	2008	Average change ratio 2003-2008
1. GDP (Current Price)	4.662	5.338	6.293	7.272	8.488	9.623	+0.992/year
Change Ratio (%)	-	14.5	17.9	15.6	16.7	13.37	15.6%/year
GDP Deflator	105.38	110.51	117.17	122.60	128.68	135.45	+6.01/year
Change Ratio (%)	-	4.9	6.0	4.6	5.0	5.3	5.2%/year
2. GDP (Constant Price)	4.424	4.830	5.371	5.931	6.596	7.104	+0.536/year
Change Ratio (%)	-	9.2	11.2	10.4	11.2	7.7	8.1%/year
3. Inflation (Av. Consumer Price)	104.72	108.69	115.06	120.48	128.32	135.37	+6.13/year
Change Ratio (%)	1.2	3.8	5.9	4.7	6.5	5.5	5.3%/year

Annual Change of Economic Index in Cambodia

GDP(Constant Price)=GDP(Current Price) ÷GDP Deflator, 100 = Year 2000

Prepared by JICA Study Team based on "IMF World Economic Outlook Database, October 2007"

- Construction costs are divided into foreign currency portion (FC) and local currency portion (LC). Ratios of the FC and the LC are estimated for each component as follows, referring to similar types of the projects in Cambodia:

Ratio for Foreign and Local Currency Portion

Item	Sub-Item		Currency Portion Rat		
No.	Item Descriptions		Foreign Currency	Local Currency	
1-1	Headworks and Major Related Structures	Earthwork Mechanic Works (Gate) Other than the above (Such as concrete works)	0.2 0.9 0.7	0.8 0.1 0.3	
1-2	Main and Secondary Sysytems		0.7	0.3	
1-3	On-farm Development		0.2	0.8	

CHAPTER D2 SUMMARY OF COST ESTIMATES

D2.1 Cost Estimate

D2.1.1 Initial Investment Costs

The initial investment cost for the Project are summarized and shown in the following table. The initial investment cost is estimated at about US\$ 97.95 millions, which is equivalent to Riel. 402 billions. The cost estimates of the initial investment cost are shown in Table D2.1-1 for the Project, and in Tables D2.1-2 to D2.1-7 for the Sub-projects bases, respectively.

No.	Item	Amount	Remarks		
		(US\$ 1,000)			
1.	Construction Cost	48,764	See Sub-Section 9.2.2 for detail		
2.	Project Supporting Programs Cost	2,438	5 % of Item 1		
3.	Physical Contingencies	5,120	10 % of Items (1+2)		
4.	Sub-Total	56,322	Items (1+2+3)		
5.	Consulting Services Cost	14,332			
6.	Tax & Duty	7,065	10 % of Item (4+5)		
7.	Land Acquisition Cost	841	For 391.9 ha		
8.	Project Administration Cost	5,632	10 % of Item 4		
9.	Price Escalation	13,762	5 %/annum of Item 4		
10.	Grand Total	97,954	Items 4+5+6+7+8+9		

Initial Investment Costs for the Project

Prepared by JICA Study Team

D2.1.2 Disbursement Schedule

The annual disbursement schedule for the Project is shown in the table.

Na	Item	Amount (US\$ 1,000)							
No.	Ltem	Total	2010	2011	2012	2013	2014	2015	2016
1.	Construction Cost	48,764	0	3,428	23,449	18,587	3,149	151	0
2.	Project Supporting Programs Cost	2,438	0	610	488	488	488	364	C
3.	Physical Contingencies	5,120	0	404	678	1,908	364	50	0
4.	Sub-Total	56,322	0	4,442	26,331	20,983	4,001	565	0
5.	Consulting Services Cost	14,332	2,150	3,153	5,016	2,723	860	287	143
6.	Tax & Duty	7,056	215	760	3,134	2,371	486	85	14
7.	Land Acquisition Cost	841	252	589	-	-	-	-	
8.	Project Administration Cost	5,632	0	0	2,633	2,098	400	57	0
9.	Price Escalation	13,762	0	0	5,674	5,797	1,361	230	0
10.	Grand Total	97,954	2,617	10,088	42,788	33,972	7,108	1,224	157

Annual Disbursement Schedule for the Project

Years 2008, 2009, 2017 are omitted from the above table due to no disbursement scheduled.

D2.2 Construction Cost and Related Costs

D2.2.1 Construction Cost

Cost estimates of construction costs (Item 1) were carried out for the following components of each sub-project. Construction cost includes costs for general items, miscellaneous works and contractor's expense, such as overhead.

Item 1-1: Headworks and Major Related Structures

Diversion weir, intake structures and other important major structures for each Sub-project

Item 1-2: Main and Secondary Systems

Irrigation and drainage canals including related structures.

Item 1-3: On-farm Development

Tertiary systems and their related facilities, including FWUC office, drying yards and storage for paddy for each sub-project.

The construction cost for the Project and each sub-project are summarized in the following table. It ranges from US\$ 15.2 millions, equivalent to Riel. 62.4 billions (for Lum Hach), to US\$ 4.0 millions, equivalent to Riel. 16.6 billions (for Wat Chre). The Construction cost becomes relatively higher for the sub-projects in which the headworks systems are to be rehabilitated/ re-constructed. The breakdown of the construction cost for the Sub-projects bases are shown in Tables D2.2-1A to D2.2-6A, respectively.

			Remarks					
No.	Item	Amount	Cost Bre					
		(US\$ 1,000)	(L					
1.	Construction Cost	Total	1-1	1-2	1-3			
	A. Ream Kon Rehabilitation Sub-Project	10,586	3,747	5,805	1,034	w/ HW		
	B. Por Canal Rehabilitation Sub-Project	5,175	57	4,058	1,060			
	C. Damnak Ampil Rehabilitation Sub-Project	6,371	3,348	1,791	1,232	w/ HW		
	D. Wat Loung Rehabilitation Sub-Project	7,403	-	6,030	1,373			
	E. Wat Chre Rehabilitation Sub-Project	4,034	1,774	1,680	580	w/ HW		
	F. Lum Hach Rehabilitation Sub-Project	15,195	5,869	7,660	1,666	w/ HW		
	Total Construction Cost	48,764	14,795	27,024	6,945			

Construction Cost for the Sub-Project

w/HW: Headworks will be re-built in the particular sub-projects.

Prepared by JICA Study Team

D2.2.2 Land Acquisition Cost

Land acquisition cost for the Project is estimated based on the actual anticipated area for each sub-project. Total area of the land acquisition is expected to be 391.9 ha (details are referred to Chapter 7), and cost is estimated at about US\$ 0.84 million, which is equivalent to about Riel. 3.45 billions. The land acquisition cost for Sub-projects are shown in Tables D2.2-1B to D2.2-6B, respectively.

D2.2.3 O & M Cost

O & M cost for the major facilities, such as headworks, main and secondary systems of each sub-project is divided into the following 2 categories under conditions and assumptions explained below:

- Annual O&M cost: Estimated at about 2 % of the construction costs for the major facilities (Items 1-1 and 1-2).
- Major repair cost: Major repair including replacement will be executed every 10 years, and the cost is assumed to be 10 % of the construction costs for the major facilities (Items 1-1 and 1-2).

The annual O & M cost for the Project is estimated at about US\$ 836,000, which is equivalent to Riel 3,435 millions. In addition, major repair cost for the Project is estimated at about US\$ 4.18 millions, which is equivalent to Riel 17.2billions. The summary of the O & M cost is given in table below. The O&M cost for each Sub-project are shown in Tables D2.2-1B to D2.2-6B, respectively.

	Item		Remarks					
No.		Amount	Cost Breakdown of Item 1					
		(US\$ 1,000)	(L	J S\$ 1,000)

	including replacement)	(Riel.17.2 billions)						

O&M Costs for the Project

Prepared by JICA Study Team

D2.3 Currency Portion for Project Evaluation

Construction costs are divided into foreign currency portion (FC) and local currency portion (LC) as explained in Section D1.1, and are used in the project evaluation. The results of are shown in Table D2.3-1 for the Project basis, and in Tables D2.3-2 to D2.3-7 for the Sub-projects bases, respectively.

CHAPTER E1 OBJECTIVES OF PROJECT EVALUATION

E1.1 Objectives

The objectives of the project evaluation are as follows:

- Examination of the economic viability of the proposed project;
- Examination of the financial impact of investment to irrigation system rehabilitation on beneficiary farmers' capacity to pay in each sub-project area; and
- Examination of indirect benefit, intangible benefit and socio-economic impact of the proposed project.

The results of the examinations are to be employed as factors in judging the economic viability, financial soundness and social acceptance of the proposed project.

E1.2 Proposed Sub-projects for Evaluation

Citing the screening results of 21 candidate schemes made in the M/P study, the proposed project has been formulated by selecting the following six candidate schemes as described in Chapter 4. As it is planned to implement all the construction works, project supporting programs, consulting services, land acquisition and project administration in the form of one package for seven years from 2010 to 2016, the project evaluation in this Chapter is to be made for the proposed project, not for the respective sub-projects.

River Basin	Sub-project	Command Area under Proposed Project (ha)
Moung Russei	Ream Kon Rehabilitation	1,890
0	Por Canal Rehabilitation	1,940
Pursat Dan	Damnak Ampil Rehabilitation	2,270
	Wat Loung Rehabilitation	2,540
	Wat Chre Rehabilitation	1,020
Boribo	Lum Hach Rehabilitation	3,100
	Proposed Project	12,760

List of Evaluated Sub-projects

CHAPTER E2 ECONOMIC EVALUATION

E2.1 Economic Evaluation Procedures

The both project benefit and cost are estimated based on the following conditions;

- All the prices are expressed in constant prices as of September 2008, and the foreign currency exchange rate is fixed at USD 1.00 = Riel 4,107;
- The project life is assumed to be 50 years starting from 2010, the proposed year for commencement of project implementation;
- Economic farm gate prices of internationally traded agricultural inputs and outputs are calculated in the form of export and import parity prices as shown in Table E2-1, citing the World Bank Commodity Price Forecasts as of August 2008;
- A standard conversion factor (SCF) is determined at 0.986 as the average value for the last six years between 2001 and 2006 for the adjustment of prices reflecting the market distortion, which is estimated based on the formula as mentioned below

$$SCF = (I + E) / [(I - Is + It) + (E + Es - Et)]$$

Where, I = Total import value (CIF) to Cambodia, E = Total export value (FOB) from Cambodia, s = subsidy, and t = tax;

- A shadow wage rate (SWR) is assumed to be 0.30 for the adjustment of labor costs reflecting the market distortion, which is defined as the ratio of the total annual labor force requirement for the whole candidate irrigation project areas against the total annual labor force available in the same areas. Various relevant sources¹ are referred to for this calculation and the ratio calculated based on 2020 projected population is adjusted by multiplying by SCF (SWR = 8,102,121/26,430,987 x 0.986 = 0.3022);
- Financial construction cost is assumed to be composed of 70% for foreign currency portion and 30% for local currency portion. The foreign currency portion is further broken down into 35% for equipment cost and 65% for material cost, while the local currency portion is formed of 15% for equipment cost, 15% for material cost, 20% for common labor cost and 50% for skilled labor cost; and
- Conversion factors of financial construction cost to economic values are determined as0.81 for material costs and 0.73 for equipment costs in the foreign currency portion as well as 0.86 for material costs and 0.78 for equipment costs in the local currency portion, all of which are estimated by excluding transfer payments such as taxes, duties, subsidies, interest, land acquisition cost, etc. included in the financial construction costs.

¹ Cambodia Statistical Yearbook 2006, NIS, Ministry of Planning; First Revision, Population Projection for Cambodia 1988 – 2020; and SEIRA Commune Database 2005, Ministry of Interior

E2.2 Economic Benefit

In the four river basins, irrigation and drainage benefits are expected to be derived from the increase in irrigated paddy field area coupled with the increase in paddy yield and cultivation area of upland crops and vegetables. The economic benefit is defined as the incremental net benefit between the present "Without Project" condition and the future "With Project" condition. In constructing proposed irrigation and drainage facilities, some part of existing paddy field will be acquired. Such change in the "right of way" area has been taken into account in formulating the future land use plan. In this regard, no production foregone as negative benefit is considered in estimating the annual economic benefit.

The project benefit is assumed to be realized from the early wet crop season of the next year after construction works are finished according to the construction schedule. The target crop yield is also assumed to be fully realized at the fifth crop season. Based on these assumptions, the irrigation benefit of each sub-project is estimated as shown below, and the project benefit is fully realized from 2020 onward.

All	Annual Frogress of Construction works and increase in Froject benefits											
Sub-project	Item	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020~	
Ream Kon	Work progress	10	60	98	100	-	-	-	-	-	-

Annual Progress of Construction Works and Increase in Project Benefits

Note: W/O; Present/Without project condition, and W/P; With project condition Prepared by JICA Study Team

Based on the above, the annual increase in irrigation area, paddy production and incremental net benefit of the proposed project are estimated as summarized below. The details of economic benefit estimate by sub-project are given in Tables E2-2 to E2-15.

Annual increase in Flojeet benefits												
Annual Increase	Unit	2012	2013	2014	2015	2016	2017	2018	2019	2020~		
Cropped area under irrigation	(ha)	950	7,541	12,517	13,343	13,385	13,385	13,385	13,385	13,385		
Paddy production	(ton)	420	4,660	10,760	15,700	20,570	25,020	27,050	27,360	27,370		
Increment economic benefit	(M. Riel)	682	6,290	12,852	17,369	21,580	25,426	27,180	27,450	27,462		
	('000 US\$)	166	1,532	3,129	4,229	5,254	6,191	6,618	6,684	6,687		

Annual Increase in Project Benefits

E2.3 Economic Cost

The following are to be taken up as economic investment cost items:

- Direct construction cost including head works and major related structures rehabilitation, main and secondary system rehabilitation, on-farm development, miscellaneous works and contractor's expense;
- Project supporting program cost;
- Consulting services cost; and
- Physical contingencies.

The economic investment cost is estimated by applying relevant conversion factors to each cost components like materials, equipment, common labor and skilled labor of the both foreign and local currency portions. According to the construction schedule, the annual disbursement schedule of the estimated economic investment cost as shown below. The details of economic cost estimate by sub-project are given in Tables E2-9 to E2-14.

The annual O&M cost and major repairing cost are also converted to economic values in the same manner. The latter is allocated every 10 years.

								Un	it: Millio	on Riel
Economic Cost	2010	2011	2012	2013	2014	2015	2016	Total	2025	2026
Initial investment cost	0	9,150	62,267	49,237	8,330	404	0	129,389	-	-
Supporting program cost	0	738	590	590	590	443	0	2,951	-	-
Physical contingency, 10%	0	989	6,286	4,983	892	85	0	13,235		
Consulting services cost	4,255	6,240	9,928	5,389	1,702	567	284	28,365	-	-
Total economic cost	4,255	17,117	79,071	60,199	11,514	1,499	284	173,939	-	-
(<i>'000 US\$</i>)	1,036	4,168	19,253	14,658	2,804	365	69	42,353	-	-
Annual O&M cost	-	-	27	99	169	181	182	-	182	182
Major repairing cost	-	-	-	-	-	-	-	-	6,983	3,366

Annual Disbursement of Economic Cost

Prepared by JICA Study Team

E2.4 Economic Evaluation and Sensitivity Analysis

In conducting economic evaluation, the economic cost and benefit stream is prepared for the project life period of 50 years, comprising the project investment cost, annual O&M cost and major repairing cost for the cost stream as well as annual irrigation and drainage benefit in the build-up and full swing stages for the benefit stream.

Sensitivity analysis is made for the following four cases:

- Case-1: Construction cost 10% up;
- Case-2: Irrigation water supply 1 year delay;
- Case-3: Target yield of crops 10% down; and
- Case-4: Case-1 combined with Case-3.

The results of economic evaluation and sensitivity analysis are expressed by the economic internal rate of return (EIRR), surplus between net present values of benefit and cost (B–C) at

- - -

discount rate of 8% and benefit-cost ratio (B/C) as summarized as below, and the details are given in Tables E2-15 to E2-19.

		EIDD	Net P	resent Value (8	% discount i	rate)	
Item		EIRR	Benefit	Cost	B-C	B/C	
		(%)		(Million Riel) F			
Economic Evaluation	12.8	229,181	141,526	87,655	1.62		
Sensitivity Analysis	Case-1	11.9	229,181	153,398	75,783	1.49	
• •	Case-2	11.6	211,661	141,504	70,157	1.50	
	Case-3	10.3	182,329	141,504	40,825	1.29	
	Case-4	9.5	182,329	153,398	28,931	1.19	

Results of Economic Evaluation and Sensitivity Analysis

Prepared by JICA Study Team

As seen in the above, it can be said that the proposed project is economically feasible under the conditions set up as described.

CHAPTER E3 FINANCIAL EVALUATION

E3.1 Financial Evaluation Procedures

The prospected impact of the proposed project on beneficiary farmers' capacity to pay is indicated by estimating farm budget based on typical farm size and farming practice type of each sub-project area. The increase in net return between the present "Without Project" and future "With Project" conditions reveals that how much additional capacity to pay after deducting farming cost beneficiary farmers can expect to gain through participation to the proposed project.

To estimate the farm budget on the financial price basis, actual farm gate prices of all farm inputs and outputs as of September 2008 are to be used. Further, the balance between non-farm income and family expenditure is estimated. Then the sum of net return to be gained from farm operation and balance of non-farm activities is calculated as net surplus which can be defined as farmer's capacity to pay.

E3.2 Increase in Farmers' Capacity to Pay

Based on the examination results on financial crop budget and farm household economy of typical farm size in each sub-project area under the both conditions of present/without project and with project as presented in Appendix-B, the increase in farmers' capacity to pay is estimated as below.

	Crop Season,	Farm	Net Si	urplus	Inc	У		
Sub-project	Planting and	Size	W/O	W/P	Amount			Rate
	Irrigation	ha	'000 R	'000 R	4000 R	TR/ha	US\$/ha	times
Ream Kon Rehabilitation	WT-Normal	2.2	569	3,940	3,371	1,532	373	6.9
	WT-Pump	2.2	569	2,521	1,952	887	216	4.4
	WD-Normal	2.2	-243	3,071	3,314	1,506	367	33.1
	WD-Pump	2.2	-243	2,349	2,592	1.178	287	25.9
Por Canal Rehabilitation	WT-Normal	2.4	1,593	5,126	3,533	1,472	358	3.2
	WD-Normal	2.4	271	3,634	3,363	1,401	341	13.4
Dam Nak Ampil Rehabilitation	WT-Normal A	1.2	192	1,491	1,294	1,083	264	7.8
	WT-Pump A	1.2	192	917	725	604	147	4.8
	WT-Normal B	1.2	685	1,491	806	672	164	2.2
Wat Loung Rehabilitation	WT-Normal	1.4	632	2,372	1,740	1,243	303	3.8
	WT-Pump	1.4	632	1,701	1,069	764	186	2.7
Wat Chre Rehabilitation	WT-Normal	1.6	670	2,831	2,161	1,351	257	4.2
	WT-Pump	1.6	670	2,064	1,394	871	212	3.1
Lum Hach Rehabilitation	WT-Normal	1.4	266	3,321	3,055	2,182	531	12.5
	WT-Pump	1.4	266	2,235	1,969	1,406	342	8.4

Increase in Farmers' Capacity to Pay

Note: W/O; Present/Without project condition, W/P; With project condition, R; Riel, TR; 1,000 Riel, WT; Wet season transplanting, and WD; Wet season direct sowing

Prepared by JICA Study Team

The result shows that beneficiary farmers will be able to gain additional net surplus ranging from 604,000 Riel/ha or 147 US\$/ha to 2,182,000 Riel/ha or 531 US\$/ha. This reveals that every participated farmer in the proposed Sub-project may fully shoulder the annual O&M cost of their on-farm facilities and also pay water charge if it is set up at affordable rate.

E3.3 Indirect Benefit, Intangible Benefit and Socio-economic Impacts

E3.3.1 Indirect Benefit

As described in Appendix-C, supplemental irrigation water supply can be expected to downstream paddy fields of the Damnak Ampil Main Canal as well as the left bank area of the Lum Hach Head Works. In the both cases, surplus of discharge to be created at off-peak irrigation water supply time to Damnak Ampil, Wat Loung and Wat Chre Sub-projects as well as Lum Hach Sub-project can be used by farmers who are growing paddy in the areas where the surplus discharge can take in through the said canal or head works. These areas are excluded in defining a direct benefit to born by irrigation water supply by the proposed rehabilitation works of the existing irrigation structures. By utilizing the surplus discharge, however, paddy yield in the concerned areas will be able to be raised to a certain extent.

If it is assumed to make the present paddy yield level increase by 0.5 ton for the wet season through practicing the use of surplus discharge by farmers, the following increase in paddy production is anticipated as indirect benefits of the proposed Sub-project implementation. This increasing paddy yield is equivalent to the yield difference between supplemental irrigation paddy field and rain-fed paddy field.

	-		
Existing Structure to be	Scheme Indirectly	Command	Increase in Paddy
Rehabilitated by Project	Benefited	Area (ha)	Production (ton)
Damnak Ampil Main Canal	Damnak Ampil Extension	7,650	3,825
-	Bakan & Krouchi Seuchi	1,000	500
	Svay Don Keo River	2,200	1,100
Lum Hach Head Works	O Roluss Irrigation	3,400	1,700

Anticipated Indirect Benefit

Prepared by JICA Study Team

E3.3.2 Intangible Benefit

Though rehabilitation works of the existing irrigation and drainage systems in the proposed project area, the annual paddy production can be expected to go up from 21,000 tons before the proposed project implementation to 48,400 tons after the implementation as estimated in Tables E2-4 for Ream Kon Rehabilitation Sub-project, E2-6 for Por Canal Rehabilitation Sub-project, E2-8 for Damnak Ampil Rehabilitation Sub-project, E2-10 for Wat Loung Rehabilitation Sub-project, E2-12 for Wat Chre Rehabilitation Sub-project and E2-24 for Lum Hach Rehabilitation Sub-project. The summarized estimate is as shown below.

Annual	Increase in Pa	ddy Production	i in Proposed P	roject Area	
	Present Paddy	Present Paddy	Future Paddy	Future Paddy Production	Increased Paddy Production
Sub-project/Project	Cropped Area	Production	Cropped Area		
	(ha)	(ton)	(ha)	(ton)	(ton)
Ream Kom Rehabilitation	2,220	3,110	2,970	7,790	4,680
Por Canal Rehabilitation	2,480	3,870	3,060	8,170	4,300
Damnak Ampil Rehabilitation	2,490	4,050	2,270	7,490	3,440
Wat Loung Rehabilitation	2,765	4,260	2,540	8,380	4,120
Wat Chre Rehabilitation	1,090	1,660	1,020	3,370	1,710
Lum Hach Rehabilitation	3,320	4,080	4,400	13,200	9,120
Whole Project Area	14,365	21,030	16,260	48,400	27,370

Annual Increase in Paddy Production in Proposed Project Area

Prepared by JICA Study Team

In addition to such prospected increase in paddy production as the tangible benefit of the proposed Sub-projects, it can be considered that the availability of rice processed products like rice flour and ancillary business chances as typical intangible benefits attribute to the project implementation will be enhanced to a large extent. As a result, such increasing availability will be able to heighten a contribution degree to rural and individual farm economies through increase in inputs to be purchased and transported as well as value addition of outputs in the course of processing, transporting and transacting of rice and its product.

E3.3.3 Socio-economic Impacts

Citing the socio-economic survey findings, the average labor force is presumed at 2.5 persons a farm family in the six Sub-project areas and total farm households are estimated at around 8,300. If the annual working day of one family labor force is assumed to be 236 days, the available annual family labor force of 8,300 farm households in the six Sub-project areas is estimated at 4.9 million man-days. On the other hand, the annual farm labor requirement in the whole command areas of the six Sub-project sis estimated at approximately 1.5 million man-days under the present/without project condition based on the result of farm survey. Thus, the both estimates show that the whole farm labor requirement for the present farm operation can be covered by the available family labor force of farm households in the six Sub-project command areas.

However, the said farm survey result also points out such fact that every farm household is using 8 to 18 hired labors per 1 ha at peak times of farm operation like transplanting and harvesting in early wet crop season and wet crop season. Furthermore, the proposed rice cultivation practice under the normal or pump irrigation condition needs more farm labor inputs than as it is for the peak time of farm operation for every crop season. In this regard, the hired labor requirements are to be set up at 11 to 17 man-day/ha according to paddy cropping systems.

From this viewpoint, it can be considered that a sustainable socio-economic impact attribute to improvement of rice cultivation under irrigated condition as one of prospected fruits of the proposed project implementation is to provide jobless workers in rural areas with seasonal job opportunities to earn a certain incomes either in kind or cash. Based on the farm labor requirements for different cropping patterns proposed to the respective Sub-projects, therefore, necessary hired labor inputs are to be calculated and then increased hired labor inputs are estimated as an indicator of socio-economic impact. The estimated increase in the total hired labor inputs for each Sub-project is tabulated as below.

In view of socio-economy in the proposed six Sub-subject areas, the impact of project implementation can be expressed by increasing hired labor inputs by 82,370 persons or 54% every year. This increase reveals that employment opportunities even though temporary will be created at the peak time of farm operation like transplanting and harvesting in three rice cropping seasons consisting of early wet season, wet season and dry season.

	Present	Condition	Future (Condition	Increased
Sub-project	Cropped	Hired Labor	Cropped	Hired Labor	Hired Labor
	Area (ha)	Input (No.)	Area (ha)	Input (No.)	Input (No.)
Ream Kon Rehabilitation	2,230	33,804	3,254	53,969	20,165
Por Canal Rehabilitation	2,480	38,335	3,350	56,565	18,230
Dam Nak Ampil Rehabilitation	3,360	20,540	5,020	27,380	6,840
