### 10 BASIC PLAN FOR THE NORTH-SOUTH HIGH-SPEED RAILWAY

# 10.1 Role of North-South High-speed Railway in the Overall Transportation System

10.1 The physical characteristic of Vietnam, i.e., a long stretch of land with two major growth centers on opposite ends separated by a distance of more than 1,500km without equivalent growth centers in between, has long been the country's main development and political concern. Such a setting has greatly affected development in general, particularly transportation development, in many ways. Integrating the north and south economic centers requires large investment in infrastructure, even as demand remains relatively limited due to the long travel. Absence of large urban areas and growth centers along the north–south corridor also amplifies development difficulties. Moreover, transportation infrastructure and services are poorly provided, further suppressing transportation demand.

10.2 However, the situation has been quickly changing; steady economic growth driven by the rapid progress of the north and south development clusters has pushed transportation demand higher than ever, calling for improved connectivity between the north and south. During the period between 1999 and 2008, demand for passenger and goods transportation between the north and south increased by 2.6 and 3.0 times, respectively. Recently, the development of the central cluster has gained momentum, and the interaction among the three development clusters has quickly picked up. Future demand along the corridor for both passengers and goods is therefore estimated to become high.

10.3 While demand has rapidly increased in quantity, the quality of transportation services has not improved as much as required. Traffic congestion on roads in and around the main urban areas and along main transportation corridors has become serious. Increased vehicular traffic, especially of larger trucks, has caused serious traffic accidents on roads and has damaged pavements due to overloading and poor maintenance. Existing roads are also vulnerable to various disasters. The existing railway is a single-tracked system with numerous at-grade crossings with roads, weak bridges, and sharp curvature which limit transportation capacity at higher speeds. Coastal shipping has a large potential but has not been fully tapped due to inadequate infrastructure, inefficient operation, poor connectivity between land transportation, and lack of services, among others. Air transportation services, which have improved dramatically, are limited to the high-end market, although its potential for long-distance north–south travel is considered as significant. Although all modes of transportation are available to serve the corridor, their quality has to be improved a lot.

10.4 Vietnam's further growth in a more competitive and sustainable manner requires a much tighter integration of the north and south, which are at the moment competing for development priority, but which can complement each other's development efforts and goals when provided with improved connectivity, especially through transportation. Toward this end, the development of a high-speed railway together with expressways is considered an opportunity to dramatically improve services. However, it should be noted that high-speed railway should not only intend to connect the south and north but, of equal importance, to promote the process of urbanization and economic development along its route. Without this rationale in mind, the role of a high-speed railway will become limited.

#### 10.2 Conceptual Plan for the High-speed Railway

#### 1) Tasks of Study Component

10.5 The study component on the NSHSR has been the main focus of VITRANSS 2 because of various uncertainties surrounding it including large investment costs, demand for such services, mobilization of fund sources, and impact on regional development, among others. Painstaking effort was made particularly in estimating the level of investment needed for, and likely ridership on, the NSHSR. The tasks in studying the NSHSR are briefly explained as follows:

- (a) **Define Role of NSHSR:** In the first Steering Committee meeting held in December 2007, it was agreed that the NSHSR should be examined comprehensively to define its role as an integral part of the overall transportation system in the country.
- (b) Study Alternatives: In the second Steering Committee meeting held in March 2008, it was agreed that alternatives in HSR development in terms of route, service level, relationship with the existing railway, and locations of terminals in Hanoi and HCMC, among others, should be studied comprehensively to provide a sufficient basis for decision making.
- (c) Coordinate Parallel Studies: Following the discussions in the Steering Committee meetings, the VITRANSS 2 Study Team and the Transport Investment and Construction Consulting (TRICC)-Japan Transportation Consultants, Inc. (JTC) Team, which was also conducting their own study on the NSHSR, coordinated with each other in conducting their respective studies. VITRANSS 2 formulated the overall strategy for NSHSR development and the TRICC-JTC study formulated the detailed plans. The two study teams exchanged data and information during the course of their studies. VITRANSS 2 Study Team shared data on demand forecast and project evaluation, while the TRICC-JTC Team provided information mainly on engineering and costs.
- (d) Prepare Alternatives: Basic alternative NSHSR routes were formulated based on the extent of using existing railway facilities and space. Discussions were then held in the third Steering Committee meeting held in June 2008 and the agreements made then are as follows:
  - (i) Existing railway lines will be separated from the NSHSR because the former, which has a meter gauge, must comply with a prior ASEAN commitment that the railway in Vietnam would be part of the Singapore–Kunming Railway Link (SKRL). Besides, the existing railway provides freight and local passenger transportation services, while the NSHSR would exclusively be for passenger movement;<sup>1</sup>
  - (ii) For the NSHSR, two alternative concepts were worked out: one is a completely new line and the other makes use of the existing railway alignment. Wherever sections of the latter would be deemed suitable for high-speed operation, the NSHSR tracks would be constructed in parallel to the existing railway. For sections with substandard curvature and structures, new alignments would be identified; and
  - (iii) The location of terminals in Hanoi and HCMC would be a critical concern for the study. Alternatives and relevant discussions are presented here.

<sup>&</sup>lt;sup>1</sup> A discussion was also held on the combined operation of passenger and freight services on the NSHSR. However, as the differences in the nature of services, including operating speeds on long distances, may cause conflicts and poor safety levels, it was decided that the NSHSR would be dedicated to passenger services.

#### 2) Alternative Route Plan

10.6 A preliminary alignment study was undertaken using the available 1:50,000 topographic maps based on two alternative concepts, namely, one with completely new alignment and the other making the alignment parallel to the existing one wherever the required technical standards could be met. The total length of the completely new alignment would be 1,570km, while the combined new and existing alignments would be about 1,600km (see Figure 10.2.1 for the general alignment and Figure 10.2.2 for a more detailed plan of a sample section).

10.7 A total of 25 preliminary sections were identified which took into consideration the areas with higher population concentrations and the prospects for high-speed train operation. The average spacing between stations is about 61km.

10.8 In planning routes and alignments, the following factors were considered:

- (a) **Topography and Curvature:** These will affect the target maximum and operating speeds of the NSHSR. It is considered that the completely new alignment can ensure a maximum speed of 300km/h, while the combined alignments can meet a maximum speed of 200km/h;
- (b) **Connectivity of NSHSR Stations with Existing Stations:** It is planned that NSHSR stations would be constructed close to existing railway stations for better connectivity and access; and
- (c) **Other Key Factors:** Thes include road crossings, avoiding disaster-prone and environmentally sensitive areas, among others.

10.9 Results of the preliminary alignment plans were handed over to TRICC and further study was undertaken by them in close coordination with the VITRANSS 2 Team. The new-alignment alternative was eventually considered the right option, judging from the engineering analysis and economic/financial evaluation.

#### 3) Location of Stations in Hanoi and HCMC

10.10 The location of the NSHSR terminals in Hanoi and HCMC will be important not only for the residents of the two cities but also for those residing in hinterland provinces and will be using the NSHSR. Clearly, this means that a good access through efficient connectivity with urban and provincial transportation will be crucial. An analysis of the NSHSR demand indicates that the NSHSR would attract fairly a lot of passengers from the provinces beyond Hanoi and HCMC.

10.11 However, constructing terminals in these cities will face various difficulties since both are so heavily developed and congested that it would require careful planning to design the structure and minimize negative social impacts while maximizing economic development opportunities.

10.12 Notwithstanding this obstacle, alternative locations of the terminals were identified in Hanoi and HCMC to assist in the comparative assessment (see Table 10.2.1).

Table 10.2.1	Alternative Locations of NSHSR Terminals in Hanoi and HCMC
--------------	------------------------------------------------------------

	Alternative Location	Description/Comment
	1. Existing Hanoi Station	<ul> <li>Terminal will be located in heavily congested urban area though space for constructing it is available.</li> <li>Access to the central station will be difficult unless it is built underground, which will be expensive and may conflict with UMRT Line 3.</li> <li>Traffic congestion at and around the terminals will become serious due to ingress/egress of NSHSR passengers who require feeder services.</li> <li>Good connectivity with UMRT Line 1 and Line 3.</li> <li>Will entail higher cost.</li> </ul>
H A N O I	2. Crossing between Existing Rail and Proposed Ring Rail in the South	<ul> <li>Less conflict with urban traffic.</li> <li>Good connectivity with provincial rail lines using the proposed ring rail and UMRT Line 1.</li> <li>Will provide opportunity to develop a new urban center leveraging on the NSHSR terminal.</li> <li>Will entail lower cost.</li> </ul>
	3. West of Hanoi Urban Areas	<ul> <li>Good opportunity to serve rapidly growing urban areas in the west and to develop a new urban center.</li> <li>Possibility to extend NSHSR toward Noi Bai Airport using western section of existing rail and Thang Long Bridge.<sup>1</sup></li> <li>Good connection with urban rail and Lang-Hoa Lac corridor must be ensured.</li> <li>Will entail lower to medium cost.</li> </ul>
	1. Existing Hoa Hung Station	<ul> <li>Easier construction of terminal and with available space.</li> <li>Difficult access to the terminal unless the existing alignment is converted for the NSHSR. If the existing railway will be elevated, access to the terminal will only be possible via underground.</li> <li>Will entail higher cost.</li> </ul>
H C M	2. Connection with UMRT Line 1 Station	<ul><li>Least-cost solution.</li><li>Will require coordination with ongoing Line 1 project.</li></ul>
C	3. Connection with UMRT Line 2 at Thu Thiem Station	<ul> <li>Will provide opportunity to develop a new central station in Thu Thiem new CBD close to the existing CBD.</li> <li>Good connection with UMRT Line 2.</li> <li>Opportunity to link HCMC and new urban center in Nhon Trac and new international airport in Long Thanh.</li> <li>Will entail medium cost.</li> </ul>

<sup>1</sup> When the proposed ring rail is completed, the west section may not be fully utilized by provincial lines. Thang Long Bridge is provided with double tracks with standard gauge.

#### 4) Operations Plan

10.13 A preliminary study of the operation of a high-speed train showed that Hanoi and HCMC can be connected around 5 hours 30 minutes when the maximum train speed is 300km/h.

#### Table 10.2.2 Estimated Travel Time between Hanoi and HCMC on the NSHSR (Max. Speed 300km/h)

Action	Travel Time				
Stopping at all 26 stations	About 6hours 50minutes				
Stopping at 6 priority stations only	About 5hours 40minutes				
Source: TRICC-JTC Team.

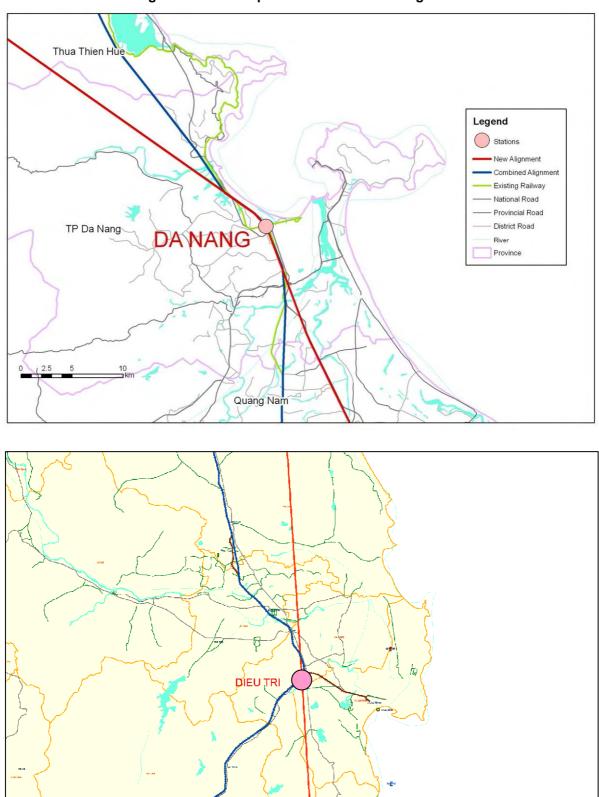

Figure 10.2.2 Sample Section of NSHSR Alignment

#### 5) Construction Cost Estimates

10.14 Based on the study on alignment, civil works and operations, the investment cost for the NSHSR was estimated for the purpose of assessing investment viability.<sup>2</sup> The results of the work show that the construction of the infrastructure and facilities require approximately USD 38 billion or about USD 25 million per kilometer (see Table 10.2.3). Note that this is economic cost which excludes rolling stock cost, contingency, and taxes.

tem	New Alignment: Assumed Speed 300km/h
	Total Cost (USD mil.)
Civil work & track	19,612
Station	2,818
Subtotal	22,430
	732
6	7,008
ommunications	5,352
vice	711
	1,791
Total	38,024
nil.)	22.6
	Civil work & track Station Subtotal Sommunications vice

Table 10.2.3 Estimated Investment Cost for the NSHSR<sup>1</sup>

Source: TRICC <sup>1</sup> Economic cost excluding rolling stock, contingency and taxes.

#### 6) Requirement for Rolling Stock

10.15 The number of cars required for HSR operation differs depending on transportation demand. Assuming an average occupancy of 81 passengers per car (100% of seats) and an average running kilometrage of 2,000km per day per car, the rolling stock requirement and its cost were estimated (see Table 10.2.4).

Table 10.2.4 Number of Cars Required and Rolling Stock Cost<sup>1</sup>

Speed of NSHSR	Fare Level (% of Airfare)	Pax-km, 2026 (mil./day)	No. of Cars Required, 2026	Rolling Stock Cost, 2026 (USD mil.)
300km/h	100	70	520	2,266
	50	123	918	4,003
	25	161	1,202	5,243
200km/h	100	57	427	1,862
	50	102	759	3,311
	25	138	1,027	4,480

Source: VITRANSS 2 Study Team.

Assumes: (i) opening in 2026; (ii) average occupancy: 81 pax/car (100% of seats); (iii) average daily kilometrage: 2,000 km/car; (iv) cost includes that of maintenance cars; and (v) excludes taxes.

#### 7) Estimate of Operating Cost

#### (1) Operating Cost

#### (a) O&M Cost (Excluding Personnel Cost and Taxes)

10.16 It is difficult to precisely estimate the O&M cost of HSR due to the unavailability of data. To overcome this problem, some railway statistics were collected from Japanese sources as shown in Table 10.2.5.

<sup>&</sup>lt;sup>2</sup> As the level of engineering study is at the master planning stage yet, it should be noted that costs may vary considerably at the detailed planning stage.

Railway Company	Variable Cost (JPY/pax-km)	Fixed Cost (JPY million/ route-km/year)	Route-km (km)	Transportation Density (000 pax/route-km)
Odakyu	1.18	154	120.5	245.4
Keihin Kyukou	1.59	162	87.0	197.6
Tsukuba Express	1.20	57	58.3	73.9
Touyou Kousoku	1.63	71	16.2	71.2
Aichi Kanjou	3.67	22	45.3	8.5
Hokuetsu Kyukou	2.25	24	59.5	8.1
Abukuma Kyukou	4.49	7	54.9	1.8

 Table 10.2.5
 O&M Cost<sup>1</sup> of Selected Private Railway Companies in Japan

Note: Compiled by VITRANSS 2 Study Team based on available documents

<sup>1</sup> Excluding personnel cost and taxes.

10.17 Using the data listed above, a regression analysis was conducted for both fixed and variable O&M costs. The results are presented in tables 10.2.6 and 10.2.7. For both analyses, transportation density is the explanatory variable. Note that the values are all expressed in Japanese Yen (JPY).

Table 1	0.2.6 Estimates	s of Fixed O&M (	Costs <sup>1</sup>
	Transportation	Fixed Cost	Fixed (

Railway Company	Transportation Density (000 pax/route-km) X	Fixed Cost (JPY mil./ route-km/year) Y	Fixed Cost (JPY mil./ route-km/year) Y calculated
Odakyu	245.4	154	172
Keihin Kyukou	197.6	162	141
Tsukuba Express	73.9	57	63
Touyou Kousoku	71.2	71	61

Note: Y=aX+b, a=-0.633, b=4.457, (R=0.901).

<sup>1</sup> Excluding personnel cost and taxes.

#### (b) Personnel Cost

10.18 In order to estimate personnel cost, JR's transportation performance in terms of passenger-km per employee was first reviewed. It was 5,840 transport units per employee in 2006. Transport unit is the sum of passenger-km and ton-km. In Vietnam, however, this performance is hardly expected due to the differences in operational scale and quality of assets.

10.19 In 2006, the number of railway employees in Vietnam was 42,000, and they were paid VND 593 billion for salary and social insurance. This is equivalent to VND 14.12 million per employee per year.

10.20 Given a transportation volume in terms of passenger-km (PKT), the personnel cost is calculated as follows:

- (i) Total number of employees: NE = PKT/(5840/2) half performance of JR
- (ii) Total personnel cost: PC = NE x 14.12 (VND million)

#### (c) Total Operating Cost (Excluding Taxes)

10.21 Table 10.2.8 summarizes the estimated operating cost by scenario. The share of personnel cost was extremely low. Per passenger-km, the unit cost ranges roughly US cent 3 to 5.

Speed of NSHSR	Fare Level (% of airfare)	Pax-km, 2026 (mil./day)	Fixed Cost//Year, 2026 (USD mil.)	Variable Cost/Year, 2026 (USD mil.)	Personnel Cost/Year, 2026 (USD mil.)	Total, 2026 (USD mil.)	Unit Cost (US cent/pax-km)
	100	70	626	472	20	1,119	4.4
300km/h	50	123	933	687	36	1,657	3.7
	25	161	1,153	809	47	2,009	3.4
	100	57	554	412	17	983	4.7
200km/h	50	102	811	609	30	1,450	3.9
	25	138	1,018	737	40	1,795	3.6

#### 10.3 Demand Analysis

#### 1) Sensitivity of HSR Demand against Speed and Fare Levels

10.22 The table below shows the estimated modal shares of the HSR under different speed and fare assumptions.

Condition         Road         Expwj         Total         Road         Expwj         Total         Road         Expwj         Total         Road         Final         Air           2008         No. of pax/day (000)         -         -         29.6         -         -         6.55         3.1         -         17. Table 10.3.1 Demand for HSR under Different Assumptions, 2030

10.23 If the fare is half of the base case (300km/h, same fare as air), the number of HSR passengers would increase by about 42%, as shown in Table 10.3.2. If the HSR speed becomes 200km/h, patronage decreases by about 22%. However, even when the HSR speed is 200km/h but the fare is half of that of the base case, the number of HSR passengers would be about 13% higher than the base case.

Co	ondition	No. of HSR Passengers (000/day)					
300 km/h	Airfare	146					
	Airfare*1/2	208					
	Airfare*1/4	248					
200 km/h	Airfare	114					
	Airfare*1/2	165

Table 10.3.2 Estimated Number of HSR Passengers, 2030

10.24 Table 10.3.3 shows the intermodal relationships among Hanoi, Danang, and HCMC in the north–south corridor. Between Hanoi and HCMC, HSR shares 30% in the base case (300km/h, same fare as air) which is considerably low compared to air (67%). However, if the fare is halved, the share of HSR jumps to 62%, surpassing air's 36%. When the HSR speed becomes 200km/h, the HSR shares decrease considerably.

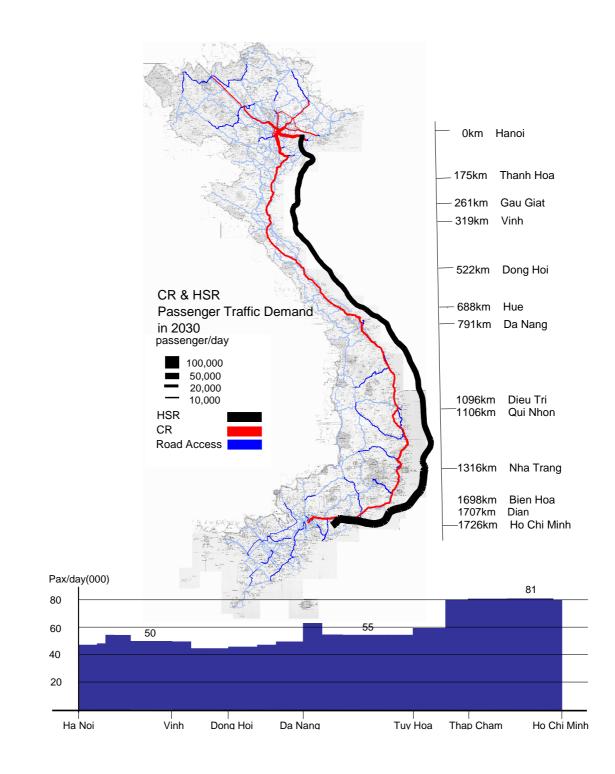

10.25 Between Hanoi and Danang, as well as HCMC and Danang, HSR shares become higher than Hanoi–HCMC's. HSR and air seem to compete evenly with each other in this distance range (700–800km).

	Condition		Route (Length)	Car	Bus	CR	HSR	Air	Total

#### 2) Sensitivity of HSR Demand under Partial Construction Scenario

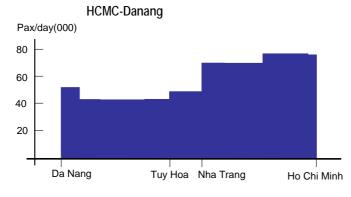

10.26 Table 10.3.4 summarizes the demand forecasts for different sections assuming a partial completion of the HSR. Figure 10.3.4 shows the demand distribution by section for these assumed cases. It should be noted that the estimated cross-sectional demand is only slightly less than that of the complete line from Hanoi to HCMC.

#### **10.4** Economic and Financial Evaluation

10.27 This section describes only the economic and financial evaluation of the NSHSR's viability. (For the comprehensive evaluation of NSHSR, including environmental analysis, this is presented in Chapter 5.)

#### 1) Economic Evaluation

#### (1) Economic Benefits

10.28 Passenger time saving, O&M cost saving of other modes, and reduction in road traffic accidents were taken as economic benefits. Although other benefits can be considered, such as growth in industrial outputs and environmental influences, those were excluded from the economic analysis, since those are largely dependent on the social condition and political will.

#### (a) Passenger Time Cost Saving

10.29 Passenger time cost saving was calculated by the following formula:

Passenger Time Cost (without HSR) – Passenger Time Cost (with HSR)

10.30 Since the unit passenger time cost differs by mode and by year, passenger-hours should first be calculated by mode for the entire transportation network. Table 10.4.1 shows the passenger time costs by mode and by year assumed in this study. In addition, it was also assumed that HSR passengers would belong to the high-income group.

Condition	Mode	2008	2010	2020	2030
Average Income	Car/Air	400	421	694	1,056
(USD/month)	Bus/Rail/IWT	200	211	347	528
Passenger Time	Car/Air	2.50	2.63	4.33	6.60
Cost (USD/hour)	Bus/Rail/IWT	1.25	1.32	2.17	3.30

 Table 10.4.1
 Assumed Passenger Time Costs

Source: VITRANSS 2 Study Team.

Notes: 1. 160 working hours a month.

2. Income growth in proportion to per capita GDP.

#### (b) O&M Cost Saving of Other Modes

10.31 The HSR reduces the passenger transportation volumes of other modes. By traffic assignment, passenger-km figures can be obtained by mode as shown earlier in Table 10.3.1. The table below summarizes the estimated operating cost by transportation mode.

Table 10.4.2	Operating	Cost by	Transportation	Mode

		(VND/pax-km)
Mode	Economic	Financial
Car (Ordinary Road)	941	1,426
Car (Expressway)	993	1,372
Bus (Ordinary Road)	427	443
Bus (Expressway)	535	548
CR	250	290
Air	1,077	1,215

#### (c) Reduction in Road Traffic Accidents

10.32 Due to the shift of passengers to HSR from road transportation, road traffic accidents are likely to decrease in proportion to a reduction in road passenger-kilometers. Table 10.4.3 shows the estimated economic losses from road traffic accidents for the period 2007–2020. The average growth rate is expected to be 8.24% per year<sup>3</sup>. The reduction in economic losses was calculated based on road passenger-kilometers under a "with" and "without" HSR cases, the resulting difference of which was taken as one of the economic benefits of the HSR.

Year	GDP in VND Billion	Losses in VND Billion
2007	1,130,000	32,657
2008	1,220,400	35,270
2009	1,318,032	38,091
2010	1,423,475	41,138
2011	1,537,353	44,429
2012	1,660,341	47,984
2013	1,793,168	51,823
2014	1,936,621	55,968
2015	2,091,551	60,446
2016	2,258,875	65,281
2017	2,439,585	70,504
2018	2,634,752	76,144
2019	2,845,532	82,236
2020	3,073,175	88,815

Table 10.4.3 Estimated Economic Loss from Road Traffic Accidents

#### (2) Evaluation of Entire NSHSR (Hanoi–Ho Chi Minh)

#### (a) Opening by 2026 (Base Case)

10.33 Table 10.4.4 presents the cost and benefit stream of the NSHSR project (Hanoi-Ho Chi Minh, 300km/h, 100% of airfare) calculated based on the conditions stated above. 2026 was assumed to be the starting year of HSR operation. Analysis period is 30 years from 2016 to 2045. O&M cost, passenger time cost saving, and operating cost saving were assumed to increase year by year at an annual rate of 4.9% (annual growth rate of trip generation/attraction, 2020–2030). Road traffic accident cost was assumed to grow at 8.2% a year.

10.34 Table 10.4.5 presents the results of economic evaluation. All the calculated EIRRs are below the threshold of 12%, even indefinable in some cases. When the speed of HSR is 300km/h, EIRR becomes 2–3% higher than that of 200km/h cases. The amount of economic benefit is small throughout the analysis period compared to the economic cost. Thus the economic viability of the HSR project is considered low under the assumed condition. The reason is clear: the HSR gets a share of the passenger transportation market from other modes of transportation, particularly from its competitor, the faster mode of air. Therefore, passenger time cost saving, which is usually the major benefit in ordinary transportation projects, is small.

<sup>&</sup>lt;sup>3</sup> Since per capita GDP will grow at 5.1% p.a. and the number of vehicles at 7.7% p.a, the accident rate of a vehicle will decrease at about 4% p.a.

#### Table 10.4.5 Economic Indicators of HSR Project (Hanoi–Ho Chi Minh, Opening by 2026)

Speed of HSR (km/h)	Fare Level as % of Airfare	No. of Passengers, 2030 (000/day)	EIRR (%)	Benefit–Cost Ratio (at 12%p.a.)
300	100	146	-	0.46
300	75	172	5.6	0.58
300	50	208	6.9	0.66
300	25	248	9.6	0.84
200	100	114	-	0.29
200	75	136	-	0.46
200	50	165	4.2	0.51
200	25	203	6.5	0.65

#### (b) Opening by 2036 (10-year Delay)

10.35 The above analysis assumed the opening of the HSR by 2026. If this opening is delayed, the project's economic viability naturally becomes higher due to the increase in traffic demand. Table 10.4.6 summarizes the results of analysis when the opening of the HSR is delayed by 10 years. The situation shows that the EIRR will improve by about 5%, and the low-fare case (25% of airfare, similar to bus fare) will become marginally feasible. The 200km/h cases were excluded from this analysis, because it is already clear that they entail almost the same cost and are less favorable compared to 300km/h cases.

Speed of HSR (km/h)	Fare Level as % of airfare	No. of passengers, 2040 (000/day)	EIRR (%)	Benefit–Cost Ratio (at 12%p.a.)
300	100	235	7.7	0.70
300	75	277	9.8	0.85
300	50	335	11.6	0.98
300	25	399	14.9	1.21

 Table 10.4.6
 Economic Indicators of HSR Project (Hanoi–Ho Chi Minh, 2036 Opening)

Source: VITRANSS 2 Study Team.

#### (c) Opening by 2046 (20-year Delay)

10.36 If the opening of the HSR is further delayed, its economic viability will improve even more. Table 10.4.7 summarizes the results of analysis when the opening of the HSR is delayed by 20 years, that is, 2046. The EIRR will again improve by about 5%, and all the cases will become economically feasible. However, this forecast was made mainly by extrapolation based on various assumptions prepared for 2020 and 2030.

Table 10.4.7 Economic Indicators of HSR Project (Hanoi–Ho Chi Minh, Opening by 2046)

Speed of HSR (km/h)	Fare Level as % of Airfare	No. of Passengers, 2050 (000/day)	EIRR (%)	Benefit-Cost Ratio (at 12%p.a.)
300	100	378	12.2	1.02
300	75	446	14.2	1.16
300	50	539	16.3	1.32
300	25	642	19.9	1.59

Source: VITRANSS 2 Study Team.

#### (d) Opening by 2026 Amid Extensive Urban Development

10.37 The poor economic performance of the NSHSR project is primarily due to the lack of demand generated by and attracted to the medium- to small-sized cities located between Hanoi and Ho Chi Minh City. If urban development is carried out extensively and more rapidly than assumed, then the demand for the HSR will increase and its economic viability will improve. Table 10.4.8 shows the results of such an analysis. Table 10.4.9 summarizes the assumption adopted in urban development. Note the rapid urbanization assumed for Thanh Hoa, Vinh, and Danang. Since urbanization will inevitably proceed in Vietnam, and when the rapid urbanization of the cities between Hanoi and Ho Chi Minh meets the national strategy of balanced development of the nation, this scenario should be paid more attention.

10.38 The EIRR of the HSR project will become 2–3% higher than the Base Case in this scenario, and the low-fare case reaches the threshold of 12%.

Speed of HSR (km/h)	Fare Level as % of Airfare	No. of Passengers, 2030 (000/day)	EIRR (%)	Benefit–Cost Ratio (at 12%p.a.)
300	100	225	4.9	0.55
300	75	261	6.2	0.63
300	50	311	9.3	0.83
300	25	368	12.3	1.03

#### (e) Opening by 2036 (10-year Delay) with Extensive Urban Development

10.39 This case assumes a 10-year delay of opening of the HSR operations and extensive urban development. The result is shown in Table 10.4.10. As expected, the EIRR will improve further, by about 4–5% as compared to the cases mentioned above. The medium-fare case (50% of airfare) will become economically feasible in addition to the low-fare case.

# Table 10.4.10Economic Indicators of HSR Project (Hanoi–Ho Chi Minh, Opening by 2036 amid<br/>Extensive Urban Development)

Speed of HSR (km/h)	Fare Level as % of Airfare	No. of Passengers, 2040 (000/day)	EIRR (%)	Benefit–Cost Ratio (at 12%p.a.)
300	100	362	8.9	0.80
300	75	420	10.3	0.89
300	50	501	14.1	1.14
300	25	592	17.6	1.39

Source: VITRANSS 2 Study Team.

#### (f) Influence of Fuel Prices on Road and Air Transportation

10.40 Recently, oil prices have fluctuated remarkably. However, in the long run, it is expected to be in an upward trend. If fuel prices for road vehicles and airplanes go up by 50%, the EIRR of the HSR project will improve by 1–2% for each of the cases mentioned above.

#### (3) Evaluation of Partial Completion of NSHSR

#### (a) Opening by 2026 (Base Case)

10.41 Table 10.4.11 presents the results of the economic evaluation for the partial completion of the NSHSR. In this analysis, each of the sections was assumed to be independent from the others, i.e., when one is constructed, the others are not existing. Compared to the construction of the entire Hanoi–Ho Chi Minh route, the economic viability becomes considerably higher, particularly in short sections such as Hanoi–Ninh Binh, Hanoi–Thanh Hoa, Nha Trang–Ho Chi Minh, and Phan Thiet–Ho Chi Minh. The low- and medium-fare cases of these sections seem to be feasible economically, though the EIRRs are still marginal. The relatively higher performance of a partial HSR completion can be attributed to lower competition with air transportation, i.e., the HSR is strong in medium-distance travel.

Section	Speed of HSR (km/h)	Fare Level as % of Airfare	No. of Passengers, 2030 (000/day)	EIRR (%)	Benefit–Cost Ratio (at 12%/year)

 Table 10.4.11
 Economic Indicators of HSR Project by Section (Opening by 2026)

#### (b) Opening by 2020 (6 Years Early)

10.42 The Vietnamese government has a strong intention to complete part of the NSHSR by 2020. In order to test the reality of this plan, economic evaluation was conducted assuming its opening in 2020. The results show that the EIRR will become lower than the base case by about 3%, thereby falling below the threshold of 12% (see Table 10.4.12).

Section	Speed of HSR (km/h)	Fare Level as % of Airfare	No. of Passengers, 2030 (000/day)	EIRR (%)	Benefit-Cost Ra- tio (at 12%/year)
1. Hanoi–Ninh Binh	300	100	19	8.4	0.70
(97km)	300	75	20	9.1	0.75
	300	50	20	9.4	0.78
	300	25	21	9.9	0.82
2. Hanoi–Thanh Hoa	300	100	46	8.0	0.70

 Table 10.4.12
 Economic Indicators of HSR Project by Section (Opening by 2020)

#### (c) Opening by 2020 (6 Years Early) with Extensive Urban Development

10.43 Table 10.4.13 shows the results of an economic evaluation of the HSR opening by 2020, six years earlier than the base case, and amid extensive urban development. EIRRs improve by about 3–5% compared to the case above. The effect of extensive urban development is larger in the north for Hanoi–Ninh Binh, Hanoi–Thanh Hoa, and Hanoi–Vinh rather than in the south. This is due to the difference in the distribution of cities where extensive urban development is assumed to take place.

Section	Speed of HSR (km/h)	Fare Level as % of Airfare	No. of Passengers, 2030 (000/day)	EIRR (%)	Benefit–Cost Ratio (at 12%/year)
1. Hanoi–Ninh Binh	300	100	39	13.0	1.10

# Table 10.4.13Economic Indicators of HSR Project by Section (Opening by 2020 amid<br/>Extensive Urban Development)

Source: VITRANSS 2 Study Team.

#### (d) Influence of Fuel Prices on Road and Air Transportation

10.44 The influence of oil price increases was tested as well. If fuel prices for road vehicles and airplanes go up by 50%, the EIRRs of the HSR project will improve by about 2% for each of the cases mentioned above.

#### 2) Financial Evaluation

#### (1) Analysis of Fare Levels for Maximum Revenue

10.45 Figure 10.4.1 presents the relationship between HSR demand and fare levels. HSR revenue reaches its maximum when fare levels are around 90% of airfare. This relation should be carefully taken into account in the implementation plan of the NSHSR project, because economic viability and financial viability conflict with each other in general. Which means the lower the fare, the higher the economic viability becomes due to increased demand. However, low fares will not sustain the commercial operation of the HSR. Moreover, low fares attract more passengers which in turn increases the O&M cost to cope with the increased demand.

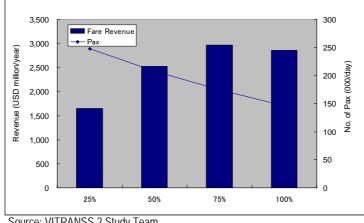

Figure 10.4.1 HSR Revenues for Different Fare Levels at 300km/h Speeds, 2030

#### (2) Evaluation of Entire NSHSR (Hanoi–Ho Chi Minh)

#### (a) Opening by 2026 (Base Case)

10.46 Table 10.4.14 presents the expenditure and revenue stream for the base case calculated based on the conditions stated earlier (example for 300km/h high-fare case only). Year 2026 was assumed to be the starting year of HSR operation. Analysis period is 30 years from 2016 to 2045, similar to economic evaluation. Expenditure is about 18% bigger than economic cost to include contingencies and various taxes. Financial viability is low, as FIRR is indefinable. However, farebox recovery ratio is calculated at 2.0 on average for the operation period of 20 years<sup>4</sup>.

10.47 Table 10.4.15 summarizes the results of financial evaluation for the base cases that assumed an opening year of 2026. Financial viability is generally very low as FIRRs cannot be calculated. However, the farebox recovery ratio, which is the ratio of fare revenue to operating expenditure and rolling stock cost, is favorable being over 1.0 for high- to medium-fare cases. This means that the HSR is commercially sustainable if the huge initial cost is shouldered by the government. Moreover, if premium fare is introduced at double the ordinary fare (and is applied to passengers who use HSR even when the fare is double), the farebox recovery ratio improves further. This implies that even the mediumto low-fare cases could become commercially sustainable.

Source: VITRANSS 2 Study Team.

In railway projects, it is generally difficult to attain an FIRR over 15% due to the huge initial cost and the logn time required for construction. In Japan, farebox recovery ratio is deemed as one of the criteria for the private sector to participate in the operation.

#### (b) Opening by 2036 (10-year Delay)

10.48 Table 10.4.16 summarizes the results of analysis when opening of HSR delays by 10 years. FIRR is still either indefinable or very low.

Year	Pax-km	Expenditure	Revenue	Profit
	(million/day)	(USD million)	(USD million)	(USD million)

Note: Premium fare is double the ordinary fare.

#### (c) Opening by 2046 (20-year Delay)

10.49 If the HSR opening is further delayed by 20 years, that is, by 2046, its economic viability will improve again (see Table 10.4.17). FIRRs are still either very low or indefinable, though some improvement is seen.

Speed of USD	Earo Loval	No. of Passengers,		Fare Level No. of Passengers, FIRR Farebox Recover		Farebox Recovery	Premium Fare Applied		
Speed of HSR (km/h)	as % of Airfare	2050 (000/day)	(%)	Ratio, Ave. (range)	FIRR (%)	Farebox Recovery Ratio, Ave. (range)

300	50	539	-	1.2 (0.2 <b>-</b> 1.8)	6.8	1.9 (0.3-2.9)			
300	25	642	-	0.6 (0.1-1.0)	-	1.1 (0.2-1.8)			

 Table 10.4.17
 Financial Indicators of HSR Project (Hanoi–Ho Chi Minh, Opening by 2046)

Source: VITRANSS 2 Study Team.

Note: Premium fare is double the ordinary fare.

#### (d) Opening by 2026 amid Extensive Urban Development

10.50 The poor financial performance of the NSHSR project is primarily due to its huge cost and partially due to the lack of demand generated from, and attracted to, the medium- to small-sized cities located between Hanoi and Ho Chi Minh City. Similar to economic evaluation, a financial analysis was conducted assuming an extensive urban development (see Table 10.4.18). However, no significant improvement is observed.

## Table 10.4.18Financial Indicators of HSR Project (Hanoi–Ho Chi Minh, Opening by 2026 amid<br/>Extensive Urban Development)

Speed of USD	Fare Level	No. of Passengers,	FIRR	Farebox Recovery	Premium Fare Applied	
Speed of HSR (km/h)	as % of Airfare	2030 (000/day)	(%)	Ratio, Ave. (range)	FIRR (%)	Farebox Recovery Ratio, Ave. (range)
300	100	225	4.1	2.1 (0.7 <b>-</b> 2.7)	N.A.	N.A.
300	75	261	-	1.7 (0.5 <b>-</b> 2.2)	N.A.	N.A.
300	50	311	-	1.2 (0.4-1.6)	5.0	1.9 (0.6-2.5)
300	25	368	-	0.6 (0.2-0.8)	-	1.1 (0.3-1.5)

Source: VITRANSS 2 Study Team.

Note: Premium fare is double the ordinary fare.

#### (e) Opening by 2036 (10-year Delay) amid Extensive Urban Development

10.51 This case assumes a 10-year delay of opening and extensive urban development (Table 10.4.19). Although the FIRRs improve to some extent as compared to the case mentioned above, the entire project still remains unfeasible financially.

### Table 10.4.19 Financial Indicators of HSR Project (Hanoi–Ho Chi Minh, Opening by 2036 amidExtensive Urban Development)

Speed of HSR	Fare Level as % of Airfare	No. of Passengers, 2040 (000/day)	FIRR (%)	Farebox Recovery Ratio, Ave. (range)	Premium Fare Applied		
(km/h)					FIRR (%)	Farebox Recovery Ratio, Ave. (range)	
300	100	362	7.0	2.3 (0.5-3.1)	N.A.	N.A.	
300	75	420	5.0	1.8 (0.4-2.5)	N.A.	N.A.	
300	50	501	-	1.3 (0.3 <b>-</b> 1.8)	7.8	2.0 (0.4-2.8)	
300	25	592	-	0.7 (0.1-1.0)	-	1.2 (0.2-1.7)	

Source: VITRANSS 2 Study Team.

Notes:

1. To calculate farebox recovery ratio, the cost of rolling stock additionally acquired during the operation period is taken into account.

2. Premium fare is double the ordinary fare .

#### (3) Evaluation of the Partial Completion of NSHSR

#### (a) Opening by 2026 (Base Case)

10.52 Table 10.4.20 presents the results of financial evaluation for the partial completion of the NSHSR. In this analysis, each of the sections was assumed to be independent from other sections; i.e., when one is constructed, the others do not exist. Although financial viability is also low in this case similar to the construction of the entire Hanoi-Ho Chi Minh route, the farebox recovery ratio suggests the possibility of a commercial operation of the NSHSR—only if the huge infrastructure cost is shouldered by the government.

#### (b) Opening by 2020 (6 Years Early)

10.53 The Vietnamese government has strong intentions of completing part of the NSHSR by 2020. In order to test the reality of this plan, financial evaluation was conducted assuming its opening by 2020. The results are shown in Table 10.4.21. Financial viability becomes even lower than the base case.

Section	Speed of HSR (km/h)	Fare Level as % of Airfare	No. of Passengers, 2030 (000/day)	FIRR (%)	Farebox Recovery Ratio, Ave. (range)
1. Hanoi–Ninh Binh	300	100	19	-	1.2 (0.6-1.6)

 Table 10.4.21
 Financial Indicators of HSR {Project by Section (Opening by 2020)

#### (c) Opening by 2020 (6 Years Early) with Extensive Urban Development

10.54 Table 10.4.22 shows the results of financial evaluation when the HSR is opened by 2020, six years earlier than the base case, and amid extensive urban development. Financial viability will improve considerably in this case due to demand increase from extensive urban development, although the overall financial performance will still be very low.

Section	Speed of HSR (km/h)	Fare Level as % of Airfare	No. of Passengers, 2030 (000/day)	FIRR (%)	Farebox Recovery Ratio, Ave. (range)
1. Hanoi–Ninh Binh	300	100	19	-	1.6 (0.7-2.0)

### Table 10.4.22 Financial Indicators of HSR Project by Section (Opening by 2020 amid Extensive<br/>Urban Development)

#### 3) Conclusion

10.55 The results of the economic and financial analyses for the NSHSR Project is summarized as follows:

- (i) The determination of the fare level of the NSHSR needs careful consideration, because demand significantly influences economic and financial viability. From both economic and financial points of view, the fare level at around 50% of airfare seems reasonable;
- (ii) The entire stretch of the NSHSR between Hanoi and Ho Chi Minh becomes economically feasible if the opening is around 2036 and if extensive urban development has taken place or the prices of fuel for road vehicles and airplanes have increased by more than 50%. The financial viability is very low due to the huge cost required for construction. However, the O&M cost and the rolling stock can be covered by fare revenue; and
- (iii) The partial completion of the NSHSR by 2020, i.e., Hanoi–Ninh Binh, Hanoi–Thanh Hoa, Hanoi–Vinh, or Nha Trang–Ho Chi Minh sections, will become marginally feasible economically if urban development in the cities along the NSHSR becomes more rapid than at present. If the completion could be delayed to 2026, then the Hanoi– Ninh Binh, Hanoi–Thanh Hoa, Nha Trang–Ho Chi Minh, or Phan Thiet–Ho Chi Minh sections would become economically feasible even without accelerated urbanization and if the fare is set lower. Financially, however, the feasibility is very low, although the O&M cost and the rolling stock cost can be covered by the fare revenue as well.

10.56 To realize the NSHSR, many key issues should be addressed besides the construction work. It is preferable to tackle these issues as soon as possible before the constuction or the operation starts.

Key Aspects	Main Issues
<ul> <li>Land Acquisition</li> </ul>	<ul> <li>Delay in land acquisition for a partial section affects the schedule for a whole line, resulting in high risks of NSHSR development.</li> <li>Effective implementation approach and implementation plan for smooth implementation must be introduced.</li> </ul>
<ul> <li>Human Resource Development</li> </ul>	<ul> <li>Human resource development programs should be designed to train necessary staff in proper ways.</li> <li>It should consider the current human resource situation and concrete study methodologies.</li> </ul>
<ul> <li>Design of Development and Operational Institutions</li> </ul>	• Institutional reform plan which provides clear institutional responsibilities and jurisdictions setup to develop and operate HSR in harmony with existing railways shall be necessary.
<ul> <li>Development of Regulations including Technical Standards</li> </ul>	<ul> <li>Efficient and smooth railway development and operation require development of regulations stipulating the roles of local authorities, private sector and other stakeholders, development procedures, engineering standards as well as land acquisition process and development and operational institutions</li> </ul>
<ul> <li>Integrated High Speed Railway and Urban Development Plan</li> </ul>	<ul> <li>Integrated development plan of NSHSR and urban area will enforce the importance of NSHSR as transport system connecting urban areas and growing centers strongly and accelerating the well-balanced national land development.</li> <li>Integrated urban development also ensure the feasibility of NSHSR.</li> </ul>
<ul> <li>Implementation Plan</li> </ul>	<ul> <li>Implementations of NSHSR face varieties of issues (funding, land acquisition, connectivity with urban transport in Hanoi and HCMC, development measures in sections where require high level engineering approaches, e.g. Hai Van Tunnel, disaster prevention, environmental impacts and others.)</li> <li>Feasible sections should be chosen based on a detailed feasibility study. Sections must be developed with a phased approach.</li> </ul>

Table 10.4.23 Main Issues for North-South High Speed Railway Development

10.57 The required tasks were identified as shown in the following table. Conducting these tasks carefully and substantially, the construction would be implemented smoothly and the operation would start in efficient and effective manner without any big troubles

	Tasks		Actions
1.	Land Acquisition	(a)	Adopt HSR to Urban Development Plan
		(b)	Establish implementation system for local central government
		(c)	Develop regulations regarding land acquisition
		(d)	Acquire land for test truck
		(e)	Acquire land for priority sections
2.	Human Resource Development	(a)	Develop human resource development plan
		(b)	Develop human resource development system
		(C)	Implement training
3.	Design of Development and Opera-	(a)	Develop HSR operational institution Plan
	tional Institutions	(b)	Develop relevant regulations
		(C)	Develop operational institutions
4.	Development of Regulations includ-	(a)	Develop regulations and implementation standards regarding HSR technical standards
	ing Technical Standards	(b)	Develop regulations regarding HSR construction and operations
5.	Integrated High Speed Railway and	(a)	Revise urban development plans and local development plans
	Urban Development Plan	(b)	Implement integrated urban development projects
		(c)	Develop HSR promoting measures
		(d)	Implement HSR promoting measures
6.	Implementation Plan	(a)	Conduct F/S
		(b)	Formulate phased development plan
		(C)	Implement Detailed Design for each phase

### 11 BASIC PLAN FOR THE NORTH-SOUTH EXPRESSWAY

#### 11.1 Role of North–South Expressway in Overall Transportation System

11.1 The need for high-quality transportation infrastructure to provide much more improved services, especially along the national backbone, has long been a priority policy in the national land and transportation development plan of Vietnam. One such plan is the development of the North–South Expressway together with the development of a high-speed railway, air transportation, and coastal shipping.

11.2 Although intensive investments in roads have been made during the last decade, the demand–supply gap has widened more than ever in and around major urban areas and along main transportation corridors. In addition to the sharp increase in overall road traffic volume, significant changes have taken place in the nature of traffic, such as increase in cars for passenger transportation and heavy trucks for goods transportation, although motorcycle numbers remain considerable on the roads. These changes are taking place everywhere on conventional national roads which are mostly substandard and associated with unplanned roadside developments. Many sections of main roads have become degraded, hampering smooth inter-city traffic and decreasing safety and comfort levels for local transportation. Safety levels have also suffered due to increasing mix of different types of traffic. While these problems can be alleviated by widening main roads, this too is difficult to implement on many sections because of the need for resettlement and high investment costs, among others. Segregating long-distance heavy traffic from local traffic is also hard to implement because of the many at-grade intersections.

11.3 Because of the above, a need for expressways has been increasingly felt in Vietnam from the economic, social, and environmental viewpoints. The main roles of expressways in Vietnam are thus envisioned as follows:

- (a) Segregate Long-distance Traffic from Local Traffic: Urbanization in Vietnam is expected to further progress long into the future. It is also expected that industrial development will intensify and become extensive along main roads. In order to respond to the changing situation, the development of expressways to segregate nonlocal traffic is important, although existing roads will still need improvement to best suit local traffic needs. With a very significant number of motorcycles, it is also necessary to consider the use of expressways by this mode;
- (b) Facilitate Provision of Competitive Transportation Services Ensuring Efficiency, Safety, and Amenity: Vietnam is and will be a trade-oriented economy that requires efficient and economic transportation services to lessen transportation costs and time along main transportation corridors and at gateways. For this, expressways offer a practical and realistic solution. At the same time, Vietnam intends to promote both international and domestic tourism. Safe and comfortable travel via road between home cities and tourism destinations can only be provided by expressways which, however, must provide users with necessary information and services during travel;
- (c) Serve as Strategic Means of Regional Development: The potential impact of expressway development on regional development must be tapped to the maximum extent possible and must be weighed when their routes are selected. Expressway development should also be done in an integrated manner with urban, industrial, tourism and other developments. Adequate measures to promote local economic development through expressway development must also be worked out;

- (d) Serve as Core Transportation Corridors Integrating Key Transportation Modes: Intermodal connectivity in Vietnam's transportation system remains weak. Because of this, the provision of high-quality and efficient transportation services has been difficult. As existing congested and substandard roads are unable to function efficiently, expressways can and must fulfill the role of roads. For this, the current expressway network plan needs to be further elaborated with due consideration of the following:
  - (i) Guarantee of connectivity among major cities, provincial capitals, and growth centers including major industrial zones, gateway ports and airports, all of which must be accessed by expressways within a reasonable period of time;
  - (ii) Realization of effective network configuration with national and major provincial roads, as well as urban roads; and
  - (iii) Provision of the desired quality of passenger and freight transportation services by strengthening intermodal facilities, logistics, and road user service facilities, as well as introducing IT applications.

# 11.2 Concept Plan

11.4 The latest expressway master plan, prepared by the MOT and approved by the Prime Minister under Decision No. 1734/QD-TTG dated 1 December 2008, includes a network of 5,753km of expressways, as illustrated in Figure 11.2.1. VITRANSS 2 adopted this plan and used it as basis in formulating the expressway development strategy.

11.5 The MOT expressway master plan includes two north–south expressways which have a total length of 3,262km. The north–south expressway in the east is 1,941km and the one in the west is about 1,321km. The expressways will consist of 1,096km of four-lane sections (30%), 1,719km of four- to six-lane sections (>50%), 357km of six-lane sections (10%), 100km of six- to eight-lane sections (3%), and 40km of eight-lane sections (0.1%). The estimated cost of the expressways is almost VND 320 trillion (USD 19 billion).

No.		Section	Length (km)	No. of Lanes	Cost (VND bil.)
North-South Express-	1	Cau Gie–Ninh Binh	50	6	9,300
way in the East	2	Ninh Binh–Thanh Hoa	75	6	12,380
	3	Thanh Hoa–Vinh	140	6	22,120
	4	Vinh–Ha Tinh	20	4-6	2,580
	5	Ha Tinh-Quang Tri	277	4	21,610
	6	Quang Tri–Da Nang	178	4	18,160
	7	Da Nang–Quang Ngai	131	4	17,820
	8	Quang Ngai–Quy Nhon	150	4	23,700
	9	Quy Nhon–Nha Trang	240	4	24,960

# 11.3 VITRANSS 2 Expressway Plan (Do-maximum Network)

11.6 The approved expressway master plan covers a comprehensive network, and many related studies are ongoing to realize the plan, as of this writing. However, the VI-TRANSS 2 Study Team proposes the following in order to improve the master plan.

### 1) Classification of Expressway Network

11.7 In the light of the function of each expressway in the whole network and the conceptual network development plan shown in Figure 11.3.1, expressways can be classified into two categories, i.e., primary and secondary.

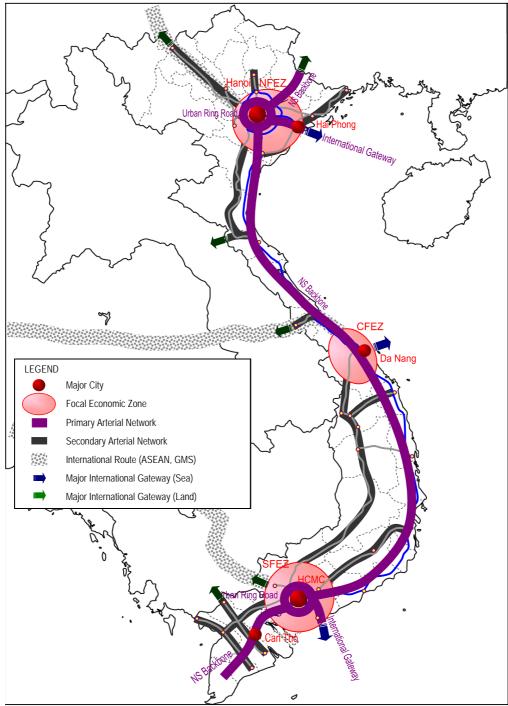

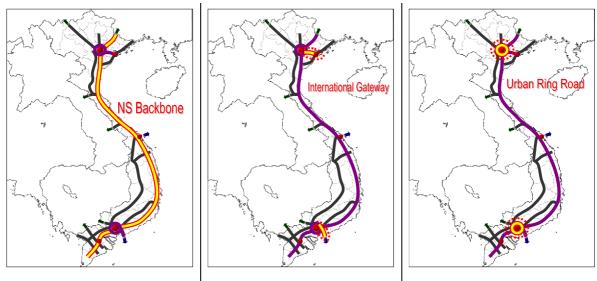

Figure 11.3.1 Conceptual Network Development Plan

Source: VITRANSS 2 Study Team

### (a) Primary Arterial Network

11.8 The Primary Arterial Network, comprising the north–south backbone, international gateways, and urban ring roads shown in Figure 11.3.2, connects the strategic ports of the country. The importance of developing and strengthening this network is further heightened by the need to promote regional development.

Source: VITRANSS 2 Study Team.

#### (b) Secondary Arterial Network

11.9 The remaining expressways are classified as the Secondary Arterial Network. To ensure the country's balanced development, this network is indispensable and has to be developed.

### 2) Proposed Four (4) Supplementary Expressway Segments

11.10 The following three (3) expressways are proposed in addition to those proposed in the MOT plan:

### (a) Danang-Ngoc Hoi, 250km

- 11.11 The Danang–Ngoc Hoi Expressway is recommended because:
- Expressways should form a network, instead of stopping in Ngoc Hoi as a dead-end. This segment will provide an alternative to the coastal route, thereby contributing to the socio-economic development of the area as well, and
- (ii) Pakxe (Lao PDR)–Ngoc Hoi–Danang is one of the east–west economic corridors of the Greater Mekong Subregion (GMS). Besides promoting cross-border economy, this segment is expected to contribute to the development of the entire GMS.

### (b) Quang Ngai–Dak To, 170km

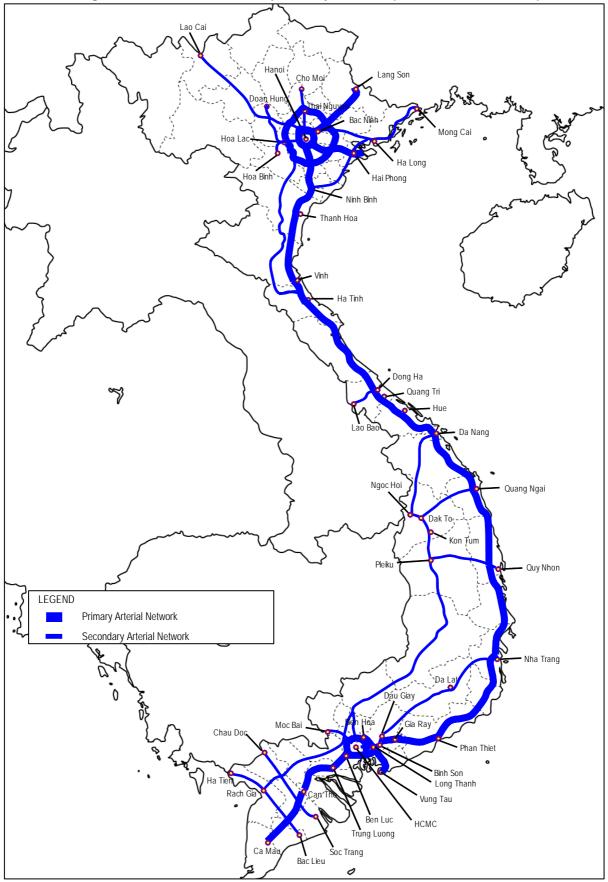

- 11.12 The Quang Ngai–Dak To Expressway is recommended because:
- (i) This segment is essential to connect Lao PDR and the Dung Quat Industrial Zone (DQIZ) where an oil refinery facility started production on 22 February 2009. DQIZ needs a strong transportation infrastructure in order to distribute its products not only in Vietnam but outside as well. Trucks carrying goods produced in Lao PDR and to be

exported through the Danang Port can carry backhaul freight such as oil and other products from the DQIZ, and

(ii) The distance between Danang and Quy Nhon is 300km, a little too long not to have an east–west expressway.

### (c) Nha Tran–Da Lat, 80km

- 11.13 The Nha Trang–Da Lat Expressway is recommended because:
- (i) Expressways should form a network; therefore Da Lat should not be a dead-end. Moreover, this segment will provide an alternative expressway to the coastal route, thereby contributing to the socio-economic development of the area as well, and
- (ii) Both Nha Trang and Da Lat are famous tourist destinations in Vietnam. Reaching these cities within an hour's drive will surely contribute not only to tourism but also to regional industries.

# 11.4 Demand Analysis

11.14 The summary of the analysis of road traffic volume under different scenarios, including indicators for freight, passenger, and vehicles, are shown in Table 11.4.1. Results clearly show that the impact of expressways on the overall road traffic would be significant, as follows:

- Expressways would accommodate 70% of car traffic and 49% of bus traffic in terms of passenger-kilometers, 52% of freight in terms of ton-kilometers, as well as vehiclekilometers of the respective modes. This will improve the traffic situation on the existing modes, and
- (ii) The impact of the NSHSR would be insignificant, diverting only 5% of car/bus traffic on expressways.

 Table 11.4.1
 Traffic Volume Indicators by Scenario

Source: VITRANSS 2 Study Team.

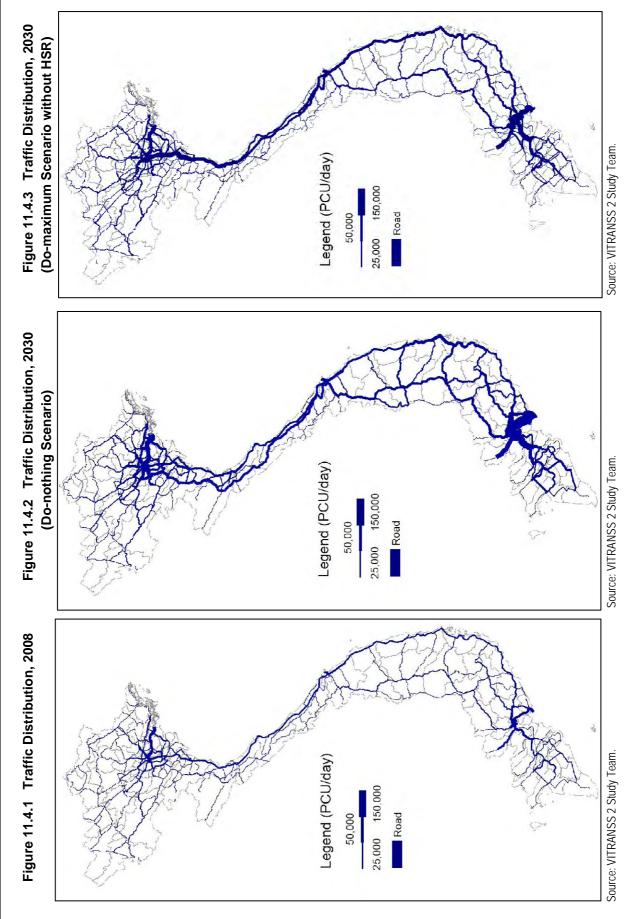

11.15 Traffic demand on expressways was estimated based on the updated database and STRADA for the following scenarios:

- (i) 2008 current situation without expressways;
- (ii) 2030 Do-nothing Scenario without expressways;
- (iii) 2030 Do-maximum Scenario with all planned expressways implemented; and
- (iv) 2030 Do-maximum Scenario with all planned expressways implemented plus NSHSR.
- 11.16 Results of the analysis indicate the following:
- (i) The current situation shows traffic is concentrated around Hanoi and HCMC including the main corridors such as Hanoi Hai Phong and sections from HCMC toward four directions including Bien Hoa, Ba Ria Vung Tau, My Tho, and Binh Duong (see Figure 11.4.1). Congestion is also limited to these areas;

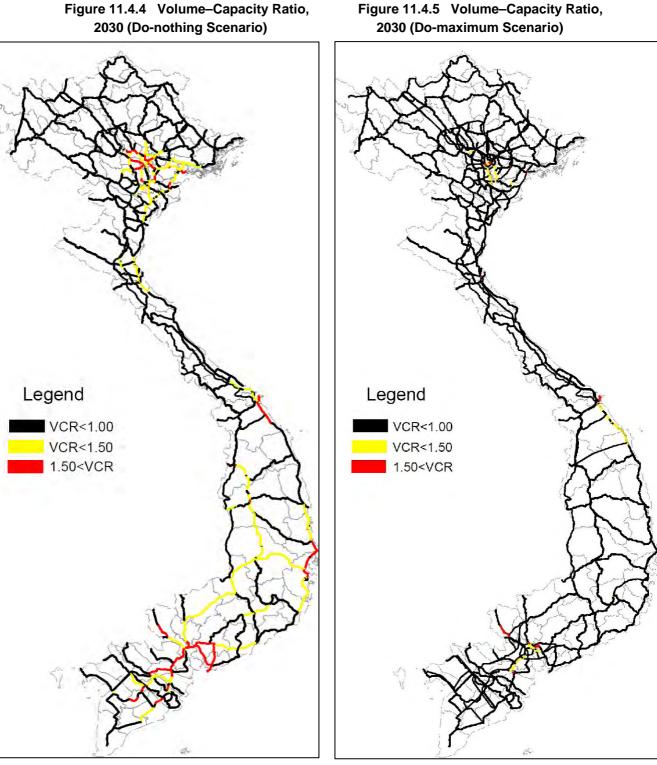

- (ii) Under the Do-nothing Scenario by 2030, the situation would be different; traffic increase would be significant around not only Hanoi and HCMC, but all over the country including in upland areas (see Figure 11.4.2). Traffic congestion would become widespread; particularly in the southern half of Vietnam (see Figure 11.4.3). Areas around Hanoi and HCMC would become seriously congested;
- (iii) When all planned expressways are developed, the situation by 2030 would dramatically improve. Particularly the effects of the North-South Expressway would be so significant that north south traffic would be streamlined (see Figure 11.4.4). Congestion would be limited to only some sections around Hanoi and HCMC (see Figure 11.4.5); and,
- (iv) The impact of the NSHSR on road traffic distribution was also analyzed and found it insignificant.

11.17 The above analysis indicates that the current expressway plan need the following modifications:

- (i) More in-depth analysis and planning for the road network including expressways around Hanoi and HCMC, and
- (ii) Prioritization of expressways by section, since it seems the planned expressways show an oversupply.

# 11.5 **Preliminary Evaluation**

### 1) Economic Evaluation

11.18 With the objective of reviewing the candidate expressway projects proposed in this chapter, economic evaluation was carried out under the following assumptions:

- (i) Each project would be open for service by 2020;
- (ii) Evaluation period is 30 years from 2020 to 2049;
- (iii) Project cost was newly estimated by the VITRANSS 2 Study Team using the latest cost information, and assumed to be reimbursed 10% by 2016, 30% by 2017, 30% by 2018, and 30% by 2019;
- (iv) Annual operating cost would be 5% of project cost;
- (v) Toll was assumed at US 5 cents/pcu/km after comparison with selected countries;
- (vi) Annual average growth rate of traffic would be 4.9% (the same as the overall growth of traffic by 2020–2030).
- (vii) For further details, refer to Chapter 8. of this Report.

11.19 Economic benefit was taken from the savings from vehicle operating cost (VOC) and passenger time cost.

11.20 Results are presented in Table 11.5.1 and Figure 11.5.1. Some of the North-South Expressway sections and suburban sections around HCMC show EIRRs of more than 12%. This means that these sections are economically feasible. Other sections, including the HCM route sections, show lower EIRRs.

11.21 The conclusion is that the expressway development plan should be trimmed down into a less ambitious and more practical arrangement at least for the short to medium term up to 2020.

### Table 11.5.1 Preliminary Economic Evaluation Results of MOT's Expressway Projects

Source: VITRANSS 2 Study Team. Note: V/C ratio, PCUs and benefit are as of 2030. Urban traffic was taken into consideration for calculating EIRRs (see Chapter 8)

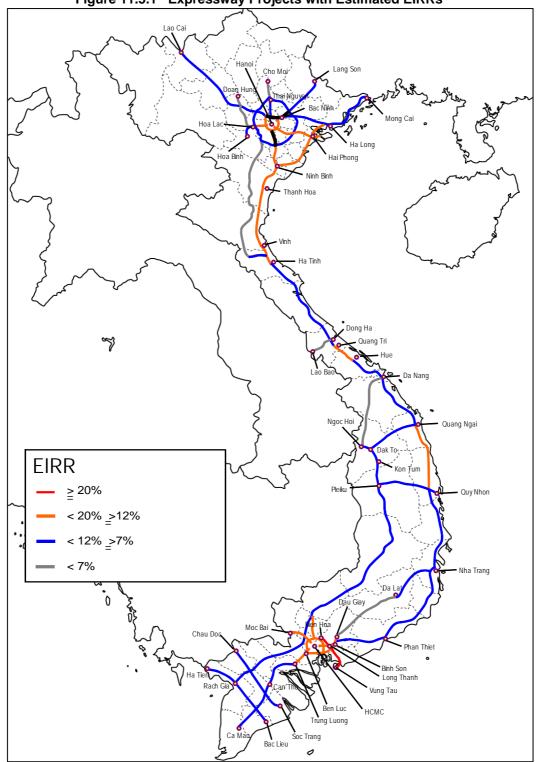

Figure 11.5.1 Expressway Projects with Estimated EIRRs

Source: VITRANSS 2 Study Team.

#### 2) Financial Evaluation

11.22 Based on the same assumptions made in the economic evaluation, a financial analysis was conducted for the candidate expressway projects. Assumed toll rates for 2030 are USD 0.05, 0.15, and 0.145 per vehicle-kilometer for car, bus, and truck, respectively. These correspond to about 10% of the expected time cost savings of car and bus users. The toll rate of truck was assumed to be the same as that of bus. These rates vary

in proportion to the per-capita GRDP estimated for each year.

11.23 Results are presented in Table 11.5.2 and Figure 11.5.2. There is no project which shows an FIRR of more than 15%, suggesting the difficulty of BOT arrangements. However, there are many projects that could be implemented by PPP scheme, judging from the FIRRs calculated. This needs further investigation.

Project	Cooling	Distance	V/C	Ν	lo of Vehicles		Project Cost	FIRR
Code	Section	(km)	Ratio	Car	Bus	Truck	(USD mil/km)	(%)

# 12 **RECOMMENDATIONS**

# 12.1 Recommendations for Subsectors (Preliminary)

# 1) Roads

12.1 The GRA should be made to grow into its intended role of becoming the road authority in Vietnam—by resolving its conflicts with VEC (with regard to overall network planning and determination of the scale of expressways) and MOC (with regard to interurban transportation development).

12.2 The regulatory function over toll roads should be taken out of VEC, so that the latter can focus on its main role as developer and partner of private investors in expressways.

- 12.3 Other key recommendations for the road subsector are the following:
- (i) Institutionalize a Five-year Road Investment Program;
- (ii) Create a project management bureau to formalize the status of PMUs and leverage the accumulated experiences of the staff;
- (iii) Spin off the CIENCOs into joint-stock companies, one at a time, so that they can evolve into competitive civil works contractors, on arms-length relationship with the MOT and its associated agencies;
- (iv) Study the possibility of merging the unit responsible for developing technical standards and that responsible for keeping the quality of construction into a "Road Technology Research and Development Institute"; and
- (v) Formalize the system of using the road maintenance fund.

## 2) Railways

12.4 Railway projects should be given a higher proportion of resources out of the total transportation investment budget to enable it to compete with other transportation modes. However, the allocation should be limited to those corridors where railway is the more efficient energy- and cost-wise.

12.5 Instead of a shotgun approach of trying to cater to everybody, the railway sector should target market niches in which it has the best chance of becoming competitive line by railway line. Clearly, the North–South Line is the most important with potentials for container transportation. On the shorter Hanoi–Haiphong Line, massive investments may not be able to overturn its disadvantage to trucking and to buses, when the parallel express-way gets built.

12.6 VITRANSS 2 has identified a basic package of improvement works; just enough to keep existing railway assets functioning at a capacity of 50 trains for both directions a day. This can be further decomposed and prioritized to support the railway's marketing plan. With additional funding, a second stage of railway improvements can be pursued, involving system rehabilitation and selective double tracking that will result in a step-increase in capacity and improved services. A third stage of system modernization will entail substantial technology upgrades and should be last in priority.

12.7 The HSR project is very capital-intensive and the development of a full section should be deferred beyond 2030. There are other lower-cost alternatives to improve the north–south linkage before then.

### 3) Ports and Shipping

12.8 The plans for the ports of Saigon, Danang, and Haiphong are under implementation. Hence, the focus should now shift to improving the connectivity of ports to roads, railways, and inland waterways. They are vital to the success or viability of the new deepsea ports.

12.9 For example, the Lach Huyen Port complex will need a bridge (about 2.4-km long) to connect it to the mainland of Haiphong. In the south, an expressway must be provided in time for the full operation of Cai Mep–Thi Vai. The same can be said about channel dredging of the Soai Rap channel to coincide with the completion of terminals in Hiep Huoc Area, or the navigation channel to Lach Huyen. Linkages to the ports of Can Tho and My Thoi also require improvements, especially with the completion of the Quang Chanh Bo channel.

12.10 At the local level, every port area has to be planned and developed harmoniously with its surrounding communities. This can be realized through a multisectoral Port Management Board, which will be responsible for regulating and concessioning terminals, setting performance targets, maintaining harbors and common navigation channels, and providing ship traffic management around the ports.

12.11 The connectivity issue, compounded by changing trade patterns as a consequence of the global economic meltdown, warrants caution about the accelerated development of Lach Huyen Port. The rationale for developing the Van Pho Transshipment Port is even weaker, and may have become moot with the first call of a direct trans-Pacific vessel at Cai Mep Port.

12.12 Separating the ports development burden from the shipping business is recommended as a long-term direction for VINALINES. Common-user ports ought to be developed by Vinamarine, which has no shipping business to protect, and therefore impartial, in the use of berths at ports. Vinalines should concentrate on shipping and logistics. A special financing facility for domestic fleet expansion should be established and be made available to other shipping companies. This should lead to greater competition and efficiency in domestic shipping services.

12.13 The MOT and its maritime arm, VINAMARINE, have to step into the role of a "conductor" in an orchestra of diverse players. It needs to become an effective planning and regulatory body, leaving the rest of the tasks and burden to others. It can take the baton and enable a system of ports hierarchy to emerge. At the top of the hierarchy will be three international gateway ports, i.e., Cai Mep–Thi Vai, Haiphong, and Danang. More than 60% of the national capacity will be for the SFEZ, 30% for the NFEZ, and less than 10% for the CFEZ. Without the guiding hand of a Conductor, surplus capacities may coexist with shortages.

### 4) Inland Waterways

12.14 The subsector should make a fundamental shift in strategy. Instead of aspiring to do more, the IWT subsector should undertake a strategic retreat—by concentrating its limited resources on a core set of river corridors where it could be competitive and which it could defend and maintain adequately. The "retreat" will mean: (i) devolving responsibilities over most river ports to provinces, (ii) focusing on improving the road–river and river–seaport interfaces, (iii) leaving ferry and barge services to the private sector, and (iv) allocating its full resources on channel navigability. Instead of planning for a "do-maximum"

scenario, the subsector has to scale down its ambitions to where it can be most effective. A sustainable plan that it can adopt should entail investments of at least USD700 million but not exceeding USD1, 400 million over 10 years (from 2010–2020).

12.15 From the limited funds that it could get from the State budget, it should give highest priority to the maintenance of a core set of waterways. Rivers need to be desilted regularly, and its curvature protected, in accordance with the technical standards to which they have been classified. It is said that a 40% backlog in maintenance is occurring every year. Therefore, the subsector needs to recover lost ground by embarking on a major maintenance program in the next 10 years. In order to be effective, this needs to be empirically based, a product of regular and continuous river surveys.

12.16 To stabilize funding for waterway maintenance, the subsector should aim to establish a river maintenance fund. The National Assembly has recently approved the creation of a Road Maintenance Fund, but implementing details have yet to be formulated. The IWT should seek a share of this fund to the extent that the subsector also accounts for a large portion of the country's fuel consumption that would be subjected to levy. In addition, the subsector should harness the support of its primary customers, i.e., the industrial enterprises that locate along riverbanks and use the waterway as lifelines for their viability. With their support, two alternative sources of maintenance funds can be tapped: (i) annual fees on river fleet registration and inspection, and (ii) frontage tax on commercial and industrial properties along the rivers. The first would require a corollary improvement of the vessel registration system, while the second would need the support of local governments as it partakes of a land-use charge.

12.17 Next to asset maintenance, the safety of river navigation deserves priority. Safety can be boosted through an annual process of vessel inspection and registration, as well as a more rigorous pilot licensing and training program.

## 5) Aviation

12.18 Aside from building bigger terminals and/or more runways, the regional airport authorities should pursue system innovations, which require little investment to improve productivity (which results in higher throughput without new infrastructure).

12.19 It should adopt standards for airport development, including technical classification to guide planning and development of every airport in the national system, using ICAO and international best practices as templates.

12.20 The capital recovery mechanism should be reviewed and revised in the light of changes in the institutional setup. This is intended to improve the sector's financial sustainability. Also, a subsidy policy for "missionary routes" should be defined whereby an airline providing scheduled service at fares set by government below its production cost will receive a subsidy for the difference. Without the subsidy, the airline would cease to offer the service.

12.21 Caution must be exercised in the development of tourist-dependent airports, since traffic is seasonal and uncertain. The same caution should apply on a cargo hub airport (in Chu Lai) as its success hinges on the presence of large cargo volumes generated internally and on the entry of a global logistics player specializing in the business of air express delivery.

12.22 The subsector should reexamine its priorities and back this up with a realistic 10-

year capital investment program that takes into account the budget envelope. The inadequacy of investments and the need to upgrade its airports to international standards should prod the government into pursuing private sector participation (PSP). There is a window of opportunity in the development of a new passenger terminal in Noi Bai, a new cargo terminal in Noi Bai and in Tan Son Nhat, and the new Long Thanh International Airport. For the smooth development of Long Thanh, the Southern Airport Corporation (SAC) that manages TSN should be involved closely. A new joint-stock corporation with no experience in airport development has been tasked with development of Long Thanh. If SAC sees itself as being abolished or losing relevance once Long Thanh comes on-stream, it will likely be uncooperative in the transition.

### 6) Logistics

12.23 The most basic step to move up the country's status in logistics—from 1PL to 3PL level—is the upgrading of logistics competence. A wider appreciation of supply chain management in government and private circles is the key to subsequent reforms in policies and management practices. Organizing a public-private logistics forum, spearheaded by the freight forwarders' association, can trigger and push this agenda forward.

12.24 For its part, the government should proceed with the full-scale implementation of electronic data interchange (EDI) and paperless transaction system at Customs and border gates. The logistics industry will have no choice but to follow and adapt to this game-changing measure; then move farther up the ICT ladder into e-payments, B2B (business-to-business) transactions, and cargo visibility.

12.25 Thirdly, the government should consider amending its laws and regulations on foreign participation in logistics services. They are more restrictive than China's and will only delay the country's logistics development.

12.26 Lastly, the government should recalibrate its transportation infrastructure program by giving priority to the multimodal needs of its large—and growing—FDI enterprises. Containerization in shipping and railway should be promoted. As an added catalyst, it should establish two international logistics parks that are also multimodal transportation hubs: one in the northeast of Hanoi and the other between HCMC and Cai Mep–Thi Vai. Going beyond the traditional ICD concept, these proposed logistics parks shall encompass: (i) a free-trade zone for customs bonded warehouse operations, (ii) a product exchange and trade exhibition center, (iii) a railway container depot, (iv) a regional warehouse distribution center with cross-docking facility, and (v) advanced ICT-based logistics application systems.

# 12.2 Need for Further Technical Assistance

12.27 While VITRANSS 2 is unable to respond to all the important issues facing the transportation sector in Vietnam, areas that can be given possible technical assistance for further study have been identified as shown in Table 12.2.1. This tentative list will be further explained and elaborated based on subsequent discussions with relevant agencies.

Sector	Title/ Description	Responsible Agency
1. General	• Transportation Sector Management Capacity Strengthening Pro- jects: This intends to strengthen the transportation planning and man- agement capacity of related subsector agencies. It will cover: (i) strate- gic planning, (ii) project identification and evaluation, (iii) project imple- mentation.	MOT and related subsec- tor agencies
2. Roads and Road Transportation	<ul> <li>Road Maintenance and Asset Management Project: This intends to strengthen the road maintenance and asset management capacity of primary roads including expressways.</li> </ul>	MOT and GRA, VEC
3. Railway	• Project on Upgrading and Management Improvement of Existing Railways: This intends to formulate strategies and concrete steps to upgrade existing railways and improve management systems. Its main components are: (i) establishment of a method to assess the structural soundness of railway facilities and recovery systems, (ii) disaster pre- vention and recovery system, and (c) improvement of level crossings.	• VNR
	• Capacity Building for Railway-related Business Development: This intends to identify opportunities for various railway-related businesses and establish adequate mechanisms and management systems.	• VNR
	• Detailed Study for HSR: This intends to tackle the remaining issues of HSR, such as consistency with city planning, station location particularly in Hanoi and HCMC and operational requirement.	•
	• Hai Van Tunnel Development: This intends to study the feasibility of Hai Van tunnel both for HSR and existing VR line.	•
4. Maritime	<ul> <li>Port Management Strengthening Project: This intends to strengthen VINAMARINE's port management capacity. Its main components are: (i) establishment of a Port Management Body, (ii) establishment of de- sign evaluation systems, (iii) formulation of port facilities ledgers, and (iv) revision of the maritime code.</li> </ul>	<ul> <li>VINAMARINE, model sea ports</li> </ul>
	• Van Phong Port Development:: This is a feasibility study of Van Phong Transhipment port focusing on its future potential in comparison with other port projects of the region.	•
5. Inland Waterway	Comprehensive Inland Waterway Transportation Development and Management Plan for the Red River and Mekong River Deltas: This intends to formulate a comprehensive inland waterway network devel- opment and management plan for the two deltas	<ul> <li>MOT/ VINA, related Prov- inces</li> </ul>
6. Aviation	<ul> <li>Aviation Subsector Capacity-development Projects; Its main com- ponents are: (i) enhancement of the English proficiency of pilots and air traffic controllers, (ii) enhancement of business capacity to enable Viet- namese airports to be managed commercially, and (iii) development of environmental management capacity, especially for aircraft noise moni- toring and aircraft emissions.</li> </ul>	<ul> <li>CAAV, VANSCORP, Airport Corporations, Air- lines</li> </ul>
7. Multimodal Transportation	<ul> <li>Multimodal Transportation Development Project: Its main compo- nents are: (i) institutional/ regulatory framework development, (ii) FS on the development of logistics parks in NFEZ and SFEZ, and at cross- border gateways.</li> </ul>	MOT. VNR
8. Transportation Environment	• Urban Transportation Air Pollution Control Plan: This intends to formulate a comprehensive, integrated plan to reduce air pollution from mobile sources in major urban areas. Its main components are: (i) policy formulation, (ii) database building and management, (iii) awareness raising, (iv) capacity building, and (v) equipment support.	<ul> <li>MOT, Hanoi PC, HCMC PC, Others</li> </ul>

Note: 1) Through the discussion with MOT, it was decided to add the following 4 projects to the list because of the maturity for implementation: CH03 Phan Thiet - Gia Ray, which WB selected as one of the priority projects, CH06 Trun Luong – My Thuan – Can Tho, for which BOT by VIDB is expected for Trung Luong – My Thuan section and FS review is requested to JICA for My Thuan – Can Tho section, and CH 07 Lang Son – Bac Giang – Bac Ninh & CH12 Ha Long – Mong Cai, for which TAs for reviewing F/S and D/D are committed by ADB.
2) Regarding to IWT projects, CW01, CW02, CW03, CW08, CW09, CW12, CW14 and CW15 are the components of WB project which is "Development of Transport Infrastructure of the Mekong Delta" . On the other hand, CW04 CW05, CW06, CW07, CW10, CW11, CW13 and CW16 are the components of "Development of Transport in the Northern Delta Region".
3) Compiled by the VITRANSS 2 Study Team.
