

Social, Livelihood and Biodiversity Indicators and Mitigation Actions for Power Sector Development

Presented at the first workshop on "Strategic Environmental Assessment in Power Development Plan VII" Quy Nhon, 12 – 13 July 2010

Why doing social, livelihoods and biodiversity impacts analysis

- The focus of the Vietnam development is on balancing economic development with social equity and environmental sustainability (Agenda 21).
- All development has social, livelihoods, environment, biodiversity benefits and costs.
- There is a nescessary to internalize and find solution for social and biodiversity mitigation in development (power plant) projects

Overall Approach/Rationale

- Different types of power generation have a wide variety of different impacts on people, the environment.
- These need to be measured as accurately and objectively as possible
- If possible, use quantitative measures
- Where not possible, use scales to measure or estimate the severity of the impacts
- Social and livelihoods mitigation has to be seen and implement as a long-term development assistant, including the nonmaterial aspects
 – not just compensation
- For social, livelihood and biodiversity impacts, most (but not all) are more local in their effects: impacting on people and ecosystems in the environs of the plant

Impoverishment Risks and Reconstruction: A Model for Displacement and Resettlement (IRR model)

Risk Factors	Type of Mitigation Action	Specific Measures Recommended for the Mitigation Package for
Landlessness	Land-based resettlement	•Compensation for land, crops, fishponds
Joblessness	reemployment	 Investment for production development Investment for livestock development Investment for irrigation Extension training Community development fund
Homelessnes s	House reconstruction	Residential houseMoving allowance within province
Marginalizati on	Social inclusion;	 Support for resettlement Allowance for the resettlement supporting group Assistance partial and indirect Project Affected People

Impoverishment Risks and Reconstruction: A Model for Displacement and Resettlement (IRR model)

Risk Factors	Type of Mitigation Action	Specific Measures Recommended for the Mitigation Package for
Increased morbidity	Improved health care	 Sanitation construction Health & hygiene training Communal health care centre
Food insecurity	Adequate nutrition	•Rice support for long enough
Loss of access	Restoration of community assets and services	 Public architectural works Local road infrastructure development Maintaining infrastructure
Social disarticulation	Networks and community rebuilding	 Moving graveyards Building cultural infrastructure Supporting for the cultural restoration and rehabilitation activities Compensation/support host population

Social/Cultural Impact Indicators

Type of	Indicators	Objective
Impacts		
Displaced	1. Number Displaced	Ensure Proper
People	2. % Ethnic Minority	Resettlement Package
		and Social & Cultural
		Equity
Social/Cultural	1. Impacts on Cultural & Religious	Avoid or Compensate for
Impacts	Sites	Damage and Ensure
100	2. Loss of Areas of Cultural Importance	Effective Participation
	3. Impact on local social institutions	through amended
	and culture	planning guidelines
	4. Changes in access to external	
	markets and institutions	
1	5. Lack of Public Awareness &	
	Participation in Planning	
	6. Increased social problems, crime	
K. C. Star		

Livelihood Impact Indicators

Type of Impact	Indicators	Objective
Impact on	>Changes in parttern of local	Provide Proper Compensation:
Livelihoods	communities access to natural	Benefit Transfer Schemes
	resource	
	>Agricultural Land Lost	
	Fisheries/Forest Products Lost	Provide Proper Compensation:
		Benefit Transfer Schemes
	Job/Income Opportunities	Support Employment and
		Enterprise Development
	Limitation of Reserved Land	Ensure Proper Site for
	Area for Resettlement and	Resettlement is Available
	Cultivation	

Biodiversity Impact Indicators

Type of	Indicators	Objective
Impact		
Loss of	Hectares of High Biodiversity	Implement Biodiversity Protection
Biodiversity	Value Area Likely to be	Programme
Value	Impacted	
	Hectares of Protected Areas	Ensure Enforcement of Protected
	Likely to be Impacted	Areas Regulations
	Length of River Upstream &	Mitigate through compensation
	Downstream Likely to be	and restocking where feasible
	Impacted	
	Loss of Wetland and/or Coastal	Avoid or Compensate for Damage
	Habitat	
7	Ecosystems Impacts from	Avoid or Compensate for Damage
1 DOR	Cooling Waters	
	Impacts on Migratory Birds or	Measures to reduce bird/bat
Contraction and the second second	Bats	collisions with power lines, wind
		turbines, etc

Natural Resource Impact Indicators

Type of Impact	Indicators	Objective
Declining Access	Hectares of Forest	Institute Community Forestry Programme
to Natural	Lost or Impacted	
Resources	Reduction in Fish	Provide Proper Compensation
	Catches	
N. N.	Increased Soil	Avoid or Compensate for Damage: Benefit
	Erosion/Siltation	Sharing Mechanism
	Obstruction to Natural	
	Landscape/Loss of	
	Amenity Values	

Hydrological, Atmospheric and Climate Change Indicators and Mitigation Actions for Power Sector Development

Overall Approach/Rationale

- Different types of power generation can have wide-ranging and farreaching impacts
- These can be hard to measure but are often of great significance in their impact
- Can be trans-boundary, or even global in their effects
- Often represent a 'risk' rather than a universal impact
- Often not possible to directly 'target' mitigation or compensation measures

Hydrological Impact Indicators

Type of Impact	Indicators	Objective
Alterations to the	Changes to Wet/Dry	Monitor flows & adjust reservoir
Hydrological	Season River Flows	management where necessary
Cycle	Reduction of flood risks	Integrate into river basin and flood management systems
	Impacts on Water Quality, BOD	Monitor and take remedial actions where necessary
	Effects on Minimum Environmental Flows	Monitor and manage flows to ensure minimum flows maintained
	Downstream Erosion/Sedimentation	Flow control & remedial structures where needed
	Radiological releases into water bodies	

Climate Change Impact Indicators

Type of Impact	Indicators	Objective
Climate Change	CO ₂ Release from	Instigate benefits transfer measures
Impacts	Reservoirs	
	Methane Release from	Ensure biomass cleared from reservoir
	Reservoirs	area before flooding
	CO ₂ , Other GHG	Instigate benefits transfer measures
	Release from Thermal	
	Power Plants	
	CO_2 release from	Reinjection of CO_2 in the reservoir
	geothermal fluids	
	CO ₂ release from	Instigate benefits transfer measures
	Bagasse combustion	

Atmospheric Pollution Impact Indicators

Type of Impact	Indicators	Objective
Human and Environmental Health Impacts of	Impacts of PM ₁₀ , SO ₂ , NOx on Human Health & Morbidity	Instigate benefits transfer measures
Atmospheric Pollution	Impacts of PM, SO ₂ , NOx, N, S, Acid Deposition on Water Ecosystems and Crop Production	Instigate benefits transfer measures
	SO ₂ , PM, Acid Deposition Impacts on Buildings, other structures & on water bodies, ecosystems	Instigate benefits transfer measures

Atmospheric Pollution Impact Indicators

Type of Impact	Indicators	Objective
	Impacts of Electric	Provide proper compensation where
	and Magnetic Field of	impacts are proven
	Transmission Lines	
	on Human Health	
	Impacts of NOx, CO	Initiate benefits transfer measures
	and PM emissions	
	from Bagasse	
	combustion	
	H_2S and other gases	Removal of H_2S and other gases from
	release from	geothermal steam
	geothermal fluids	

Scenarios Analysis: Basic Concepts and Approach in PDP VII SEA

Workshop on Strategic Environmental Assessment in Power Development Plan VII – Quy Nhon 12-13 July

Bach Tan Sinh and John Soussan

Contents

- Context: SEI and power sector in VN
- Basic concepts of Scenarios
- Approaches applied for PDP VII

The Context: SEA & power sector in Viet Nam

- SEA relatively new to Viet Nam but now a mandatory requirement for national planning processes
- Some SEA experience, including for hydropower, but not at a strategic planning level
- SEA Guidelines under evolution: this study should contribute to their development
- Concerns over environmental & social impacts of hydropower

The Goal

To optimize the potential contribution of power sector to national development through a strategic planning approach that balances economic development, social equity and environmental sustainability

Contents

- Context: SEI and power sector in VN
- Basic concepts of Scenarios
- Approaches applied for PDP VII

Scenarios are

stories... tools for ordering one's perceptions about alternative future environments in which today's decisions might be played out. Ron Johnston

Scenarios are not....

science fiction...about predicting the future; rather they are about perceiving the future in the present Peter Schwartz.

What is a scenario?

A scenario helps to determine opportunities and risks Forecast Scenario

- extrapolation of historical data
- linear pattern of thought
- primarily quantitative results

- correlations and interrelations in the system
- alternative projections of the future
- qualitative results
- basis for decision making
- alternative options to react to changing market conditions
- qualitative approach to future market definition
- minimisation of corporate risk

The Value of Scenarios

 learning by putting knowledge to use
 challenging mind-sets by developing plausible alternatives

3) learning through discussion and dialogue Scenarios are descriptive narratives of plausible alternative projections of a part of the future, methodically researched and developed in sets of 3,4 or more to study how an organisation would fare in each future.... Fahey and Randall 1998

Scenarios improve the quality of decision-making by:

- questioning assumptions
- developing fresh insights
- getting the 'measure' of problems
- developing shared understanding
- rehearsing responses
- developing robust strategies, effective if circumstances change

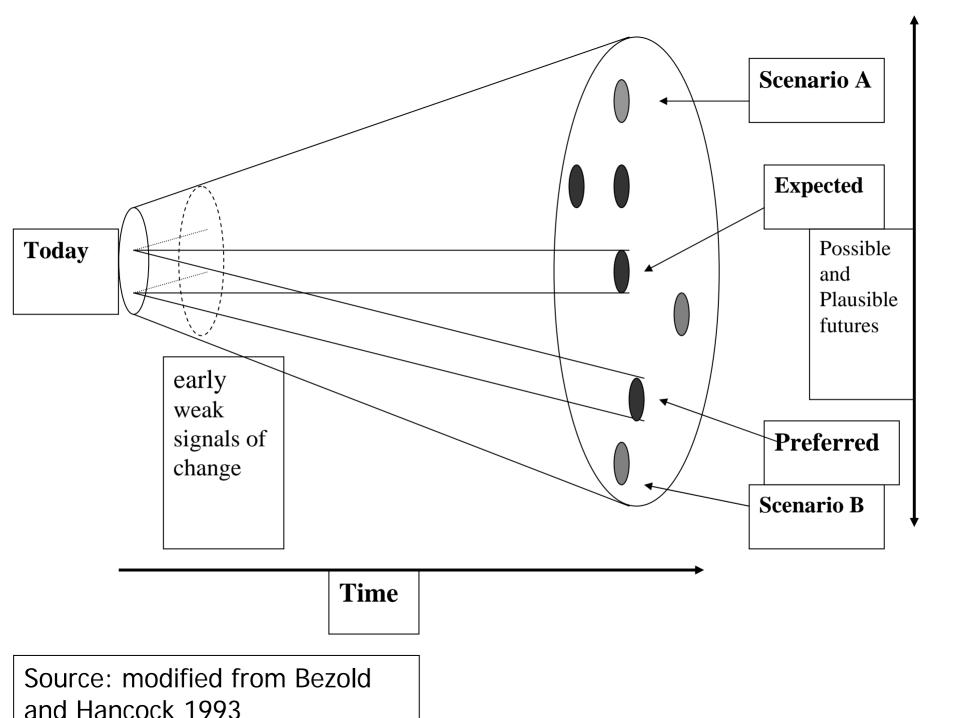

Ron Johnston 1999

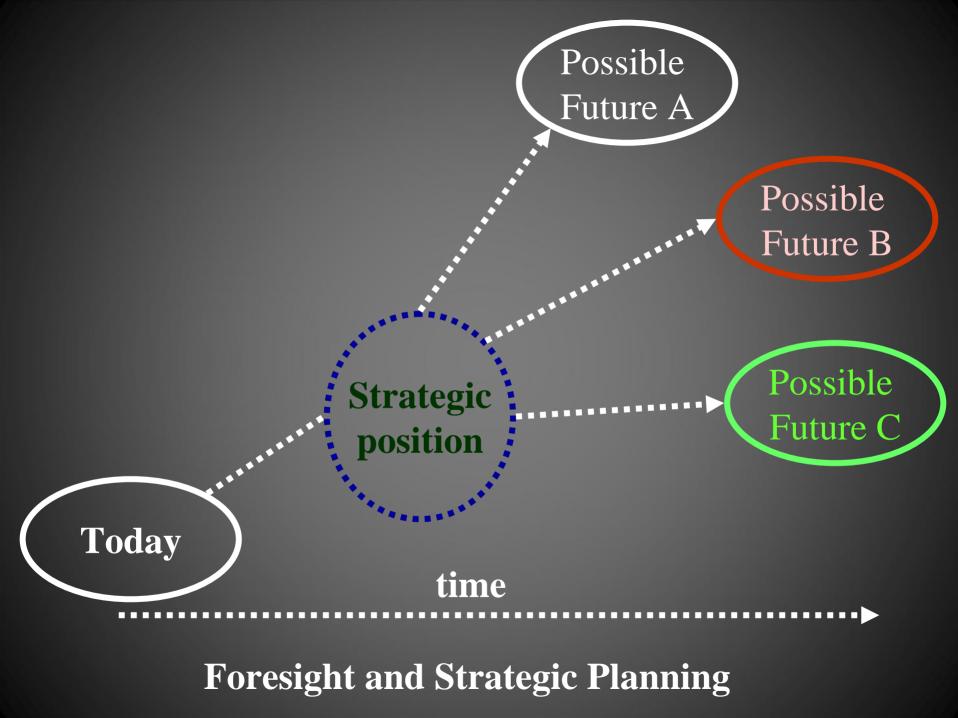

What do we want the SEA Scenarios to tell us?

- Define a range of *sustainable* power sector development futures
- Sustainable: take account of full range of economic, social and environmental issues
- Goal is to maximise the contribution of sustainable power sector to Viet Nam's development
- Give policy choices to assess the implications of different key strategic issues for power sector development
- Provide clarity, transparency and objectivity in decision making

Definition of Foresight:

Foresight involves systematic attempts to look into the future of science, technology, society and economy, and their interactions, in order to promote social, economic and environmental benefits

Why use foresight – a summary > to anticipate change and shape the future \succ to prioritise effort and funds ≻to integrate S&T with social, economic and environmental needs \triangleright to change mind-sets

Essentials of foresight:

a framework for thinking FROM the future
a range of plausible futures instead of a single one

consultative – involve all stakeholders
 systematic and analytic – but also creative
 process is at least as important as product

Key Issues

- What are the most important problems and opportunities relevant to power sector in Vietnam in the future?
- Defined from the current scoping exercise

Key Drivers

- Key drivers are drivers of change influencing the key issues.
- Society
- Technology
- Economics
- Environment
- Politics
- Example of key drivers:
- Rapid urbanisation changes patterns of consumption and demand for electricity

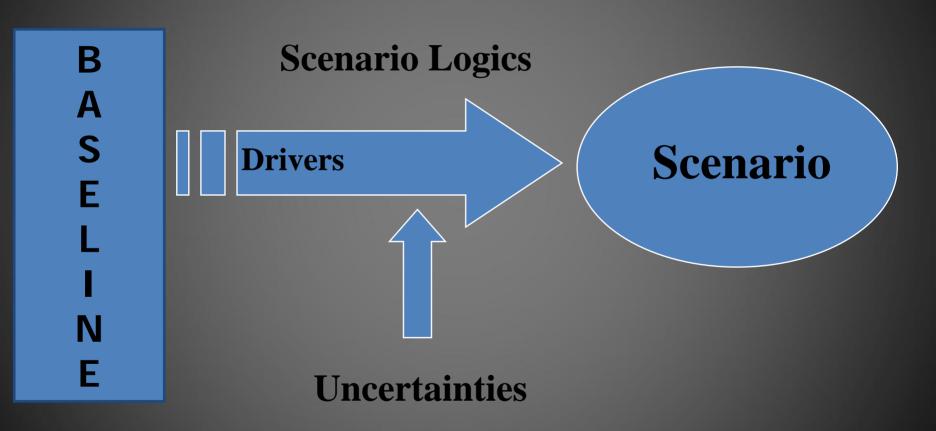

Concept of Uncertainty

- Uncertainty is discontinuity which dramatically alters the outcome
- Each of them has different degree of impact and different degree of uncertainty
- Uncertainty is **NOT PROBABILITY**

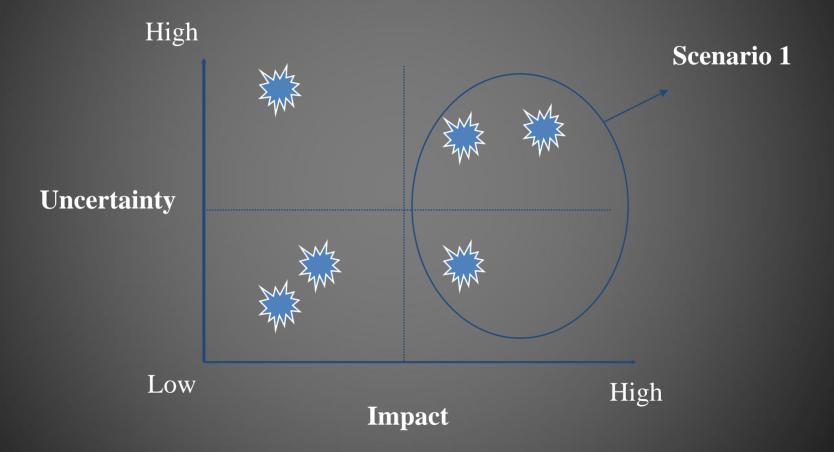

Degree of Uncertainty

- If you believe that an event is likely to occur OR is unlikely to occur, the uncertainty is <u>LOW</u>
- If you have no view of likelihood of occurrence, the uncertainty is HIGH
 Example of uncertainty
- Climate change impacts severely disrupt weather patterns and rainfall variability

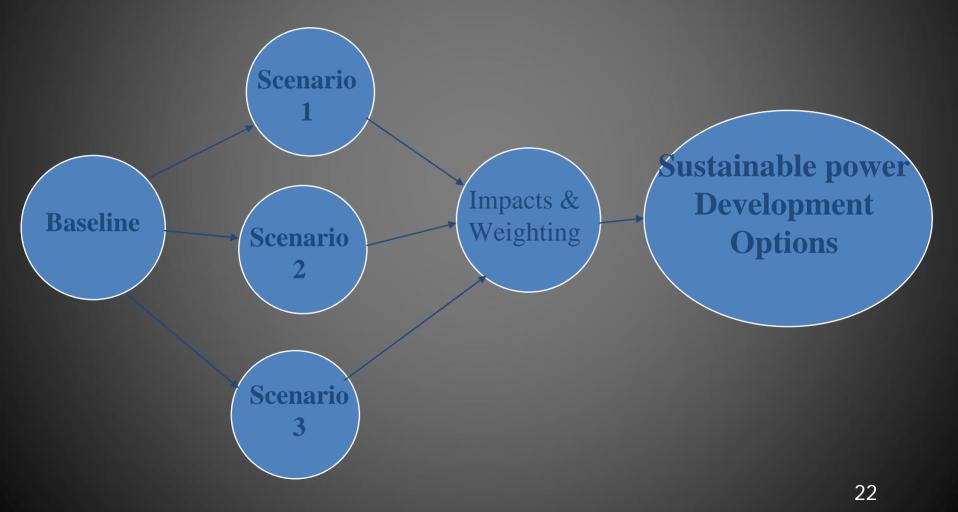

Construction of Scenarios

Matrix of Scenario Building

Outputs of Scenarios

The Approach to the SEA

- The SEA undertaken in close collaboration with national partners: working group
- Replicable: no expensive collection of new data, rather use of existing data in new forms
- Sustainable: develop capacities to implement SEA for power sector in PDP VII
- Evidence: as far as possible, develop quantitative analysis, with economic valuation where possible
- Strategic: assessment of potential impacts risks and of mitigation actions/costs
- Costs internalized into overall economic assessment of hydropower schemes

SEA as a tool for Strategic Planning

- SEA is a process of evidencebased analysis of social and environmental issues
- Balanced analysis to build consensus, including recognising trade-offs and linking sector goals to national development
- Decision-oriented: not just about identifying problems, but also about agreeing on solutions

Phases of the SEA

Scoping Baseline **Scenarios** Impact Analysis Weighting and Trade-Offs Reporting

Scoping Exercise: The Top 5 Strategic Issues

- Sustainable water resources management
- Mitigating impacts on project affected people
- Maintaining ecosystems integrity in power sector development
- The power sector planning system

Scenarios – a Framework for Envisioning Futures

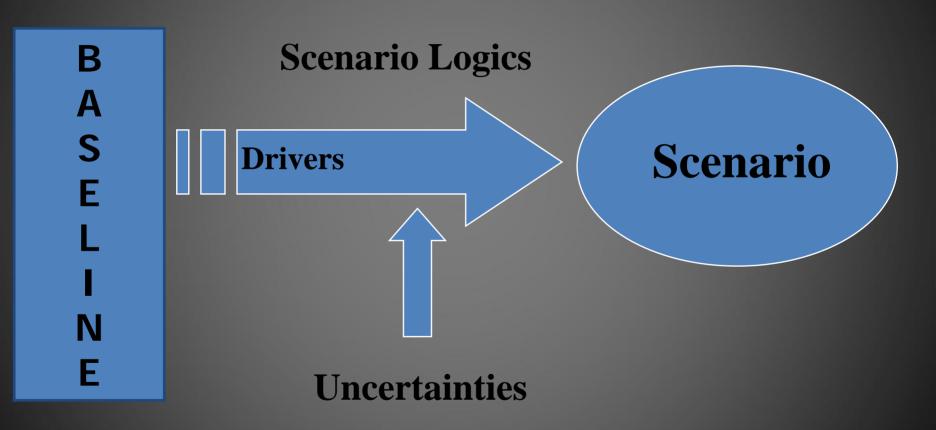

- Stories of the future told to inform current decision-making.
- What are Scenarios and what are they useful for?
- Good scenarios are: Plausible, Consistent, Engaging, Compelling, Informative

Overview of the Process

- 1. Set boundaries (time, space, themes)
- 2. Identify what drives the story of the present
- 3. Identify issues for the future
- 4. Identify the type of exercise
- 5. Construct a scenario framework
- 6. Begin drafting scenario narratives
- Decide on the form for the quantitative analysis & begin carrying it out
- 8. Assess, learn, revise

Construction of Scenarios

Constructing the Scenarios

- 1. Define number of scenarios
- 2. Define alternative generating sources
- 3. Identify power schemes in PDP VII
- Assess total social and environmental risks and impacts for each scenario,

Constructing the Scenarios (cont)

- Define (where possible) economic valuation of social and environmental costs & benefits for each scenario
- 6. Internalize costs into overall economic assessment of each scheme & for each scenario
- 7. Assess weighting in relation to key strategic issues
- 8. Define actions to internalize cost & mitigate impacts

Thanks for Listening

STRATEGIC ENVIRONMENTAL ASSESSMENT OF THE PDP VII APPROACHES TO ECONOMIC VALUATION

John Soussan Stockholm Environment Institute

The Objectives

The economic valuation of the different social, environmental and economic impacts of power sector development allows the SEA to achieve 2 key objectives:

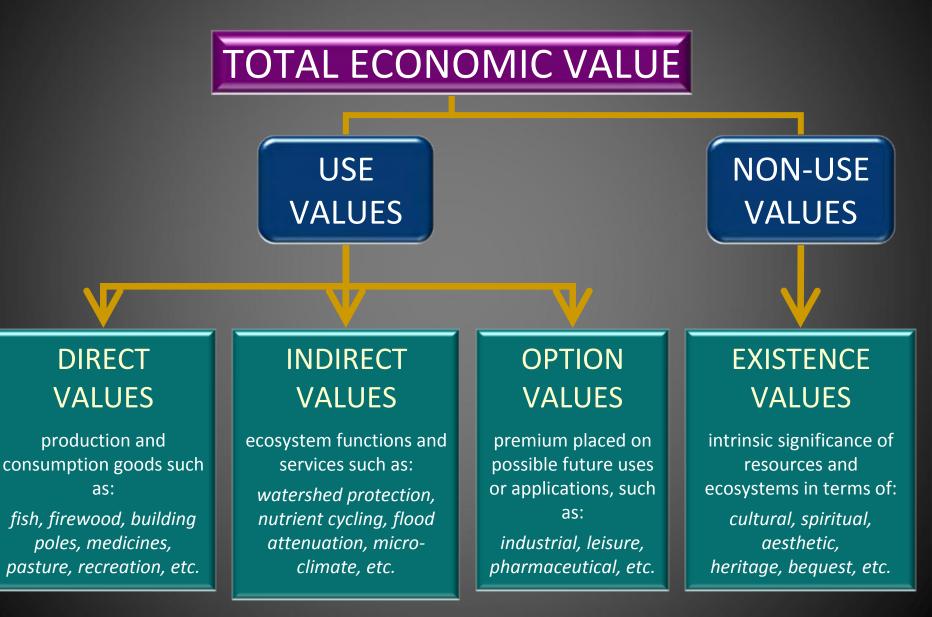

1.It allows the analysis to compare the relative significance of different types of impacts

2.It provides the means to internalize costs and benefits into the main economic analysis of the PDP that have previously been treated as externalities

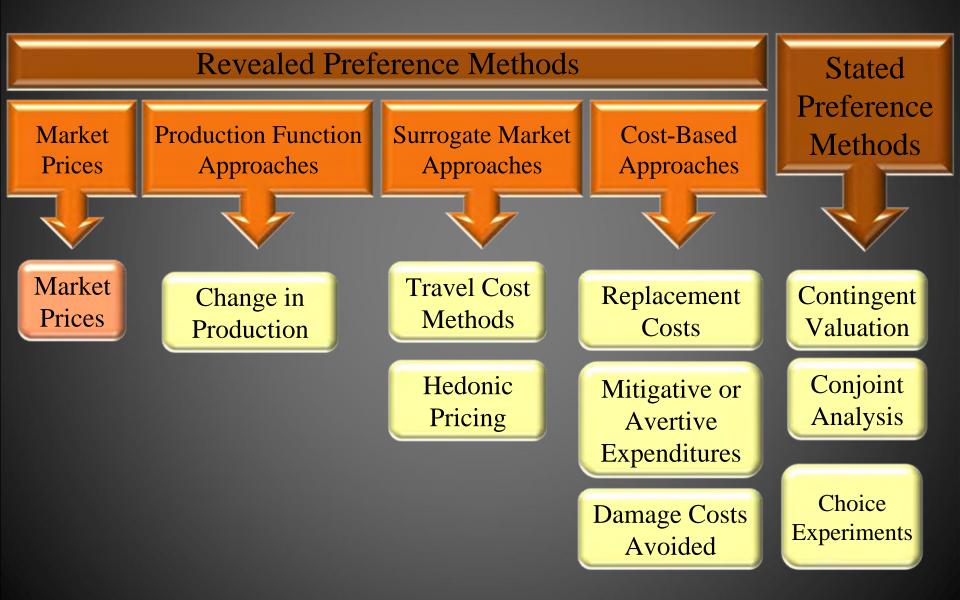

Understanding Valuation

- Economic valuation is a relatively new field for many types of social and environmental values that are not conventionally priced or traded
- It is not perfect: doing valuation usually involves making assumptions and judgments
- Values are relative: what something is worth is very different for different types of people
- Not everything can be valued: some things that are very valuable to people cannot be given an economic price

The Total Economic Value Framework

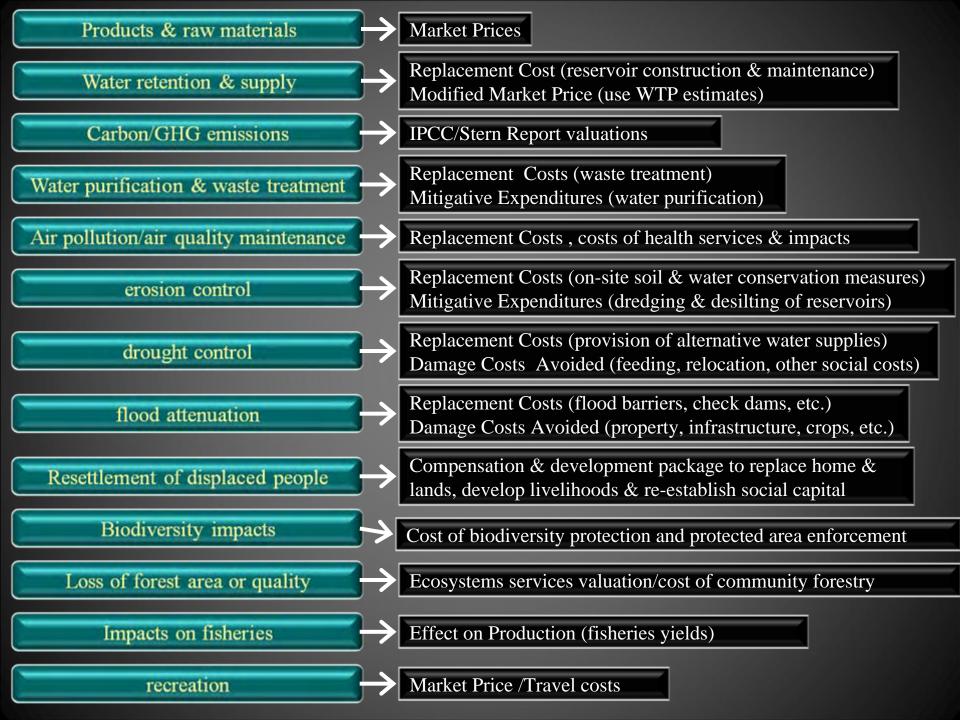

Social and Ecosystem Valuation Techniques

Selecting the Right Method

- As shown above, there are many types of techniques that can be used for valuation
- Each has its advantages and disadvantages
- Some require more data, and more accurate data, than others
- Some require extensive surveys: e.g. contingent valuation
- In some cases, value not the loss of inherent values (not possible) but the cost or remedial measures

Internalizing the Externalities

- Once the main impact costs and benefits are calculated for each category of generation source (& each major plant), these costs and benefits are very straightforwardly included in the overall economic calculation of the different generation sources
- This can then be used to re-assess the least cost' calculations for power supply options, to reflect their full economic costs and benefits

Some Examples from the PDP VI Hydropower SEA

- The SEA re-calculated the costs of a more comprehensive resettlement and development package for displaced communities, based on international best practice
- The SEA estimated the value of the changes to the annual distribution of river flows due to reservoir construction
- The SEA calculated the air pollution and climate change costs of thermal (least cost) alternatives to the planned hydropower schemes

Re-calculation of Resettlement Costs

No	Hydropower schemes	Original total social mitigation (Million VND)	Adjusted total social mitigation (Million VND)
1	Ban Chat	1,201,064.00	1,415,440.65
2	Huoi Quang	480,025.00	566,662.85
3	Song Bung 4	209,929.00	262,088.78
4	Dong Nai 2	435,409.00	527,590.96
5	Khe Bo	311,897.00	406,275.81

Approaches to Integrating Fossil Fuel Price Volatility in Electricity Planning

Workshop on Methodology and Identification of Key Environmental Issues of Strategic Environmental Assessment in Power Development Plan VII Hai Au Hotel, Qui Nhon City, Vietnam 12-13 July 2010

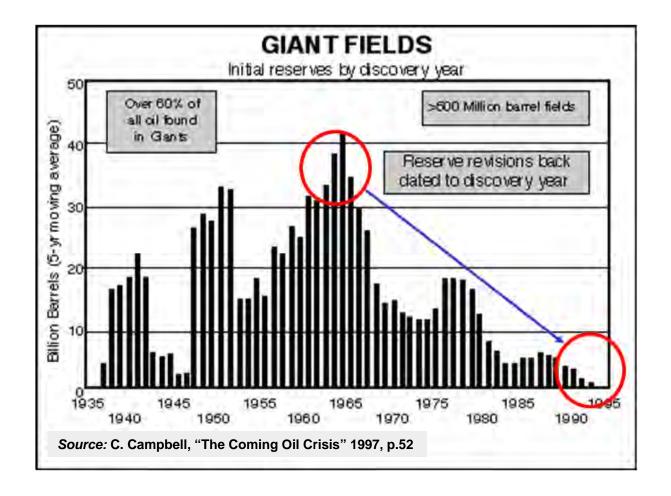

> Dr. Romeo Pacudan Energy Planning Specialist (Consultant) ADB/GMS RETA 6289

Structure of Presentation

- Coming Scarcity of Fossil Fuels
- Energy Price Volatility
- Electricity Least-Cost Planning
- Risk Integration
- Porfolio-based Electricity Planning

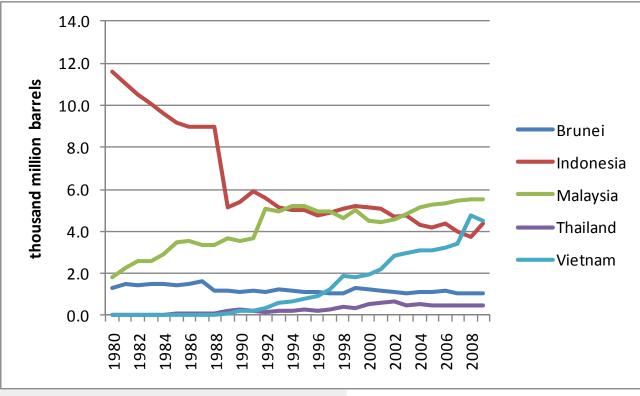

1. Coming Scarcity of Fossil Fuels

Discovery of Oil in Giant Fields

1. Coming Scarcity of Fossil Fuels

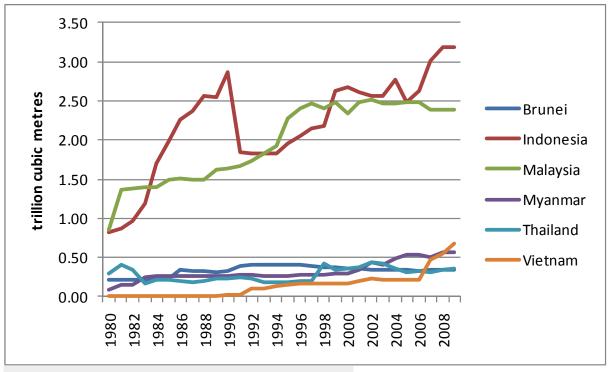

Declining oil reserves of Southeast Asian Countries

Source: BP Statistical Review of World Energy 2010

1. Coming Scarcity of Fossil Fuels

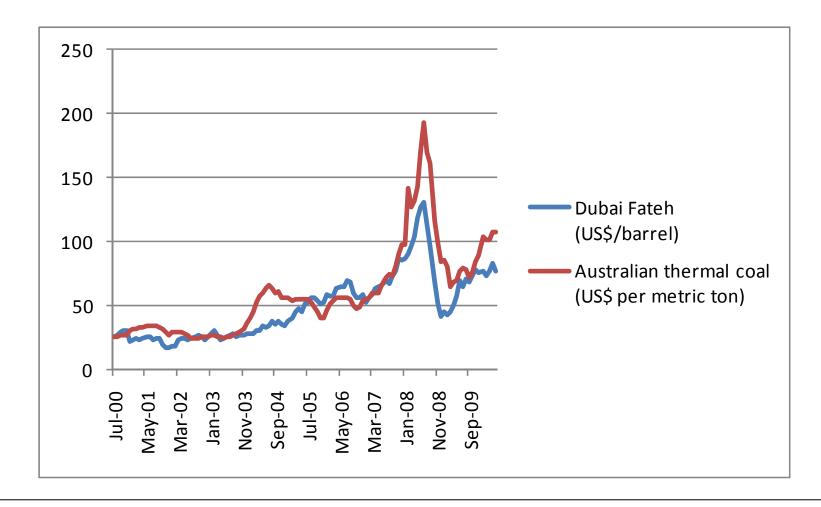

Declining gas reserves of Southeast Asian Countries

Source: BP Statistical Review of World Energy 2010

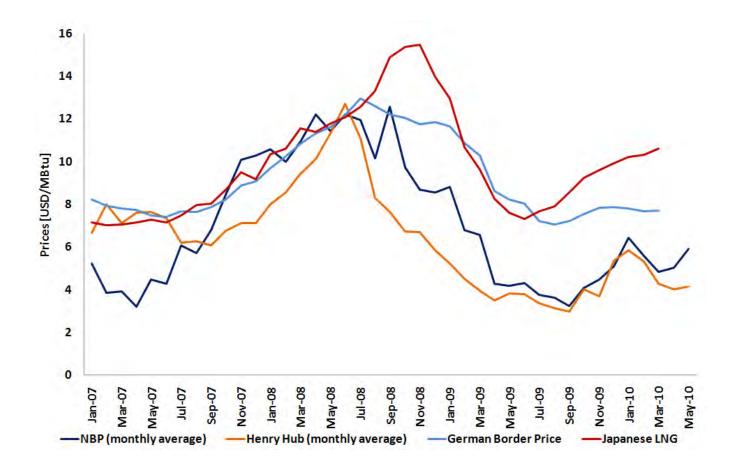

2. Fossil Fuel Price Volatility

Highly unstable oil and coal prices – *translate into risks*

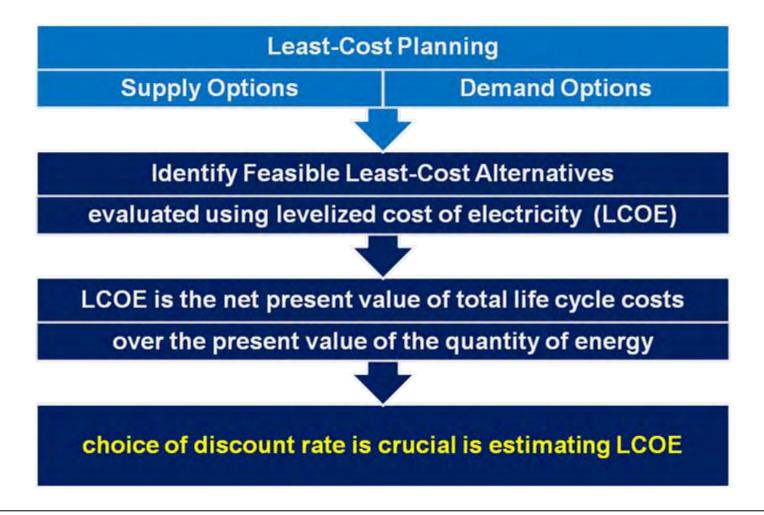

2. Fossil Fuel Volatility

Highly unstable natural gas prices - translate into risks

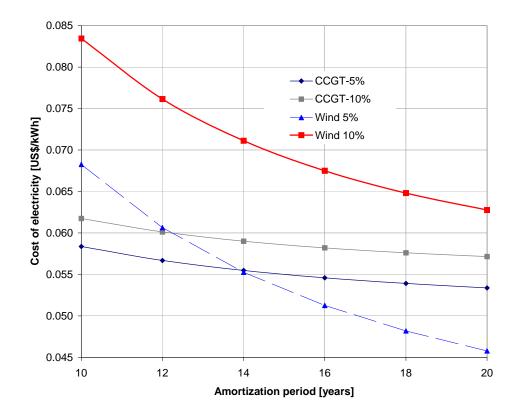

3. Electricity Least-Cost Planning

Levelized cost of electricity and discount rate

3. Electricity Least-Cost Planning

Levelized cost of electricity and effect of discount rate

Choosing higher discount rates heavily affects renewable energy technologies like wind, but does little to fuel-based technologies like CCGT.

Key Issue: discount rates must be tied to risk

- Renewables: no fuel price risk
- Gas: high price risk

4. Risk Integration

Risk adjusted cost of electricity based on historic fuel price risk

LCOE estimates ignores risk differentials among technologies

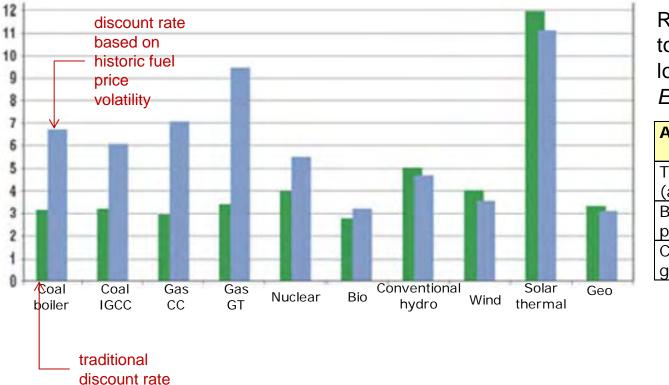

Fossil fuel prices vary systematically

> Passive/capital intensive technologies (renewables) are systematically riskless

> > LCOE estimates must be risk adjusted to reflect market risks

4. Risk Integration

Risk adjusted cost of electricity based on historic fuel price risk

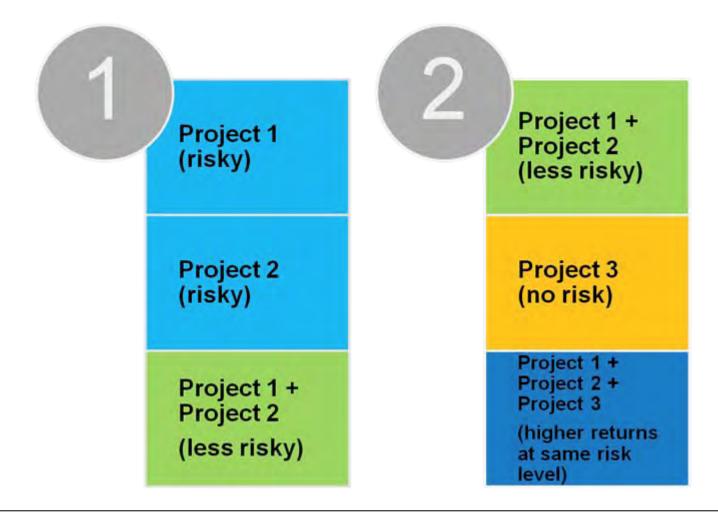

Electricity cost [US cents / kWh]

Risky cost-streams have to be discounted at a lower rate *Example*: CCGT fuel cost

Approach	Discount
	rate
Traditional	7%
(arbitrary)	
Based on historic fuel	2.3%
price volatility	
Contractually	3.9%
guaranteed prices	

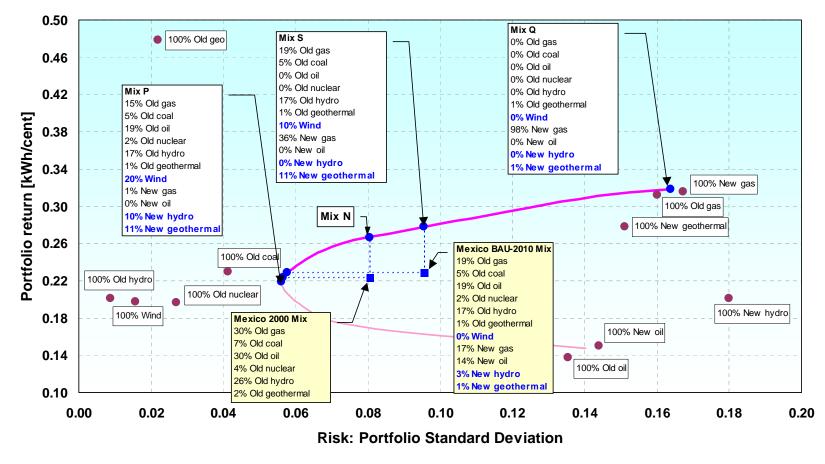

5. Portfolio Based Electricity Planning

Portfolio Theory

5. Portfolio Based Electricity Planning

Mexico Generating Portfolio

Mexico: Full Costs - 20% Wind

5. Conclusion

- Oil, coal and natural gas are fossil fuels with high price volatility, and therefore should be considered are risky coststream
- Traditional 'least-cost planning' discounting for cost of electricity calculations does not take into account fuel price risks which discriminate renewable energy technologies (RETs), but when levelized electricity costs are adjusted for risk, RETs become competitive
- Portfolio theory applied to levelized electricity cost estimates show that the addition of RET capacity reduce the overall (portfolio) risk while retaining the overall returns or cost of electricity

- Implications for Vietnam
 - Portfolio-based planning is an alternative approach and extension to the 'traditional' least-cost electricity planning
 - Portfolio-based techniques can guide policy makers towards developing effectively diversified minimumcost generating portfolios with minimum exposure to fossil fuel risk
 - Portfolio-based planning promotes energy security and environmental protection by investing in generation portfolio which is less exposed to fuel cost risk and environmentally unsustainable.

STRATEGIC ENVIRONMENTAL ASSESSMENT OF THE HYDROPOWER MASTER PLAN IN THE CONTEXT OF THE PDP VI

Quy Nhon, July 2010

Tran Viet Hoa, Division Head Department of Science & Technology Ministry of Industry and Trade

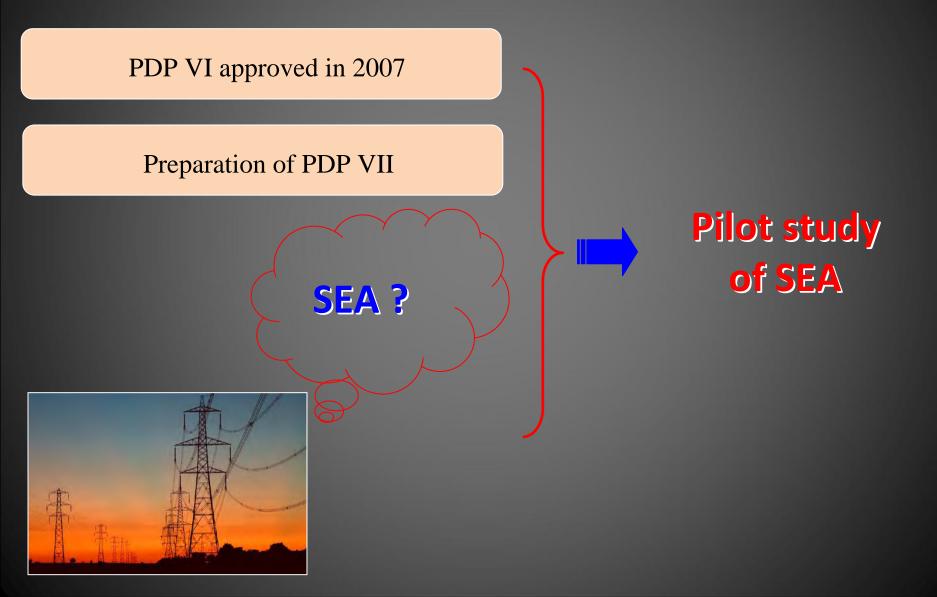

- Cooperation study on SEA development between ADB & MOIT
- **SEA of hydropower development plan in PDP VI**
- Some achievements

Cooperation study on SEA development between ADB &MOIT

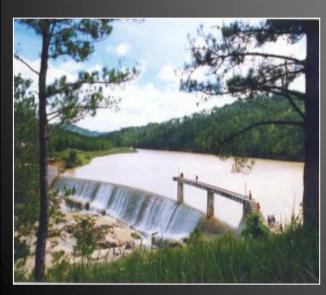

Context and objectives of study

SEA of hydropower development plan in PDP VI

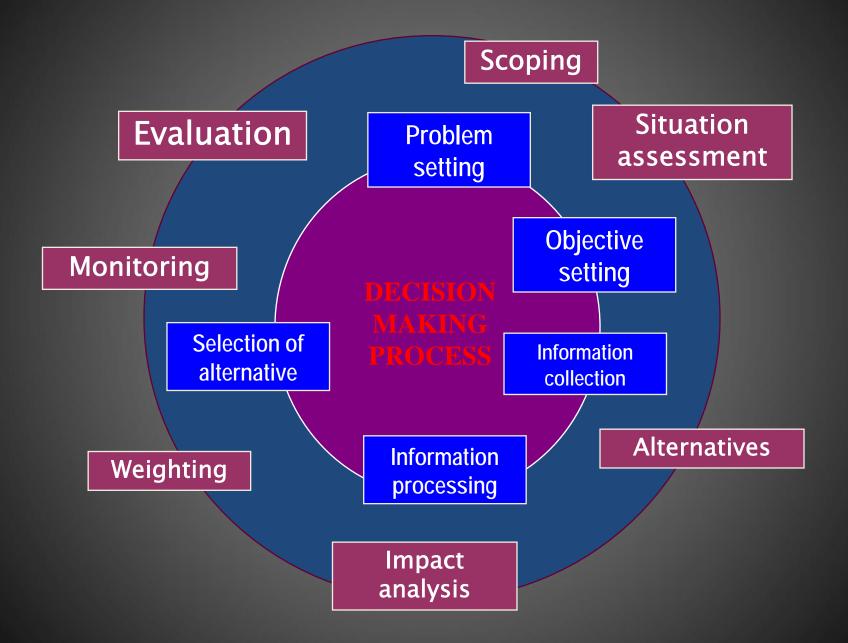

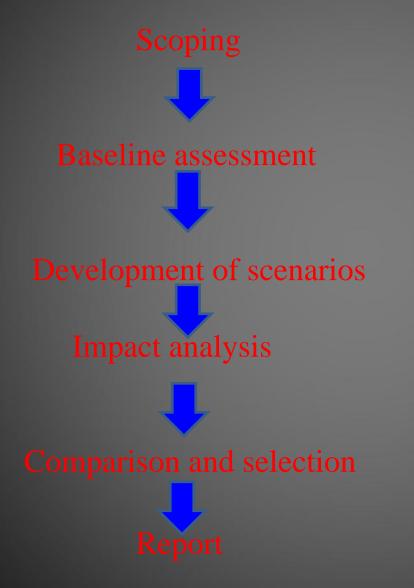

The Goal

To maximize the potential contribution of hydropower to national development through a strategic planning approach that balances economic development, social equity and environmental sustainability

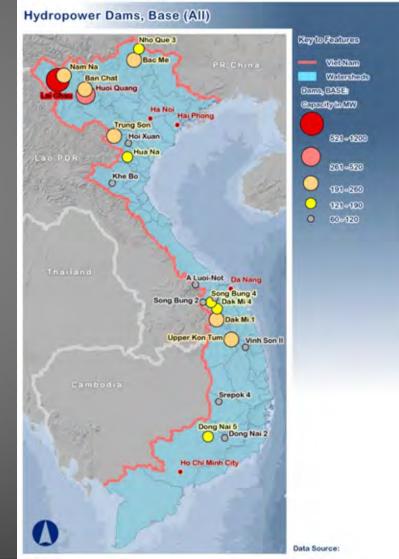

Steps of SEA

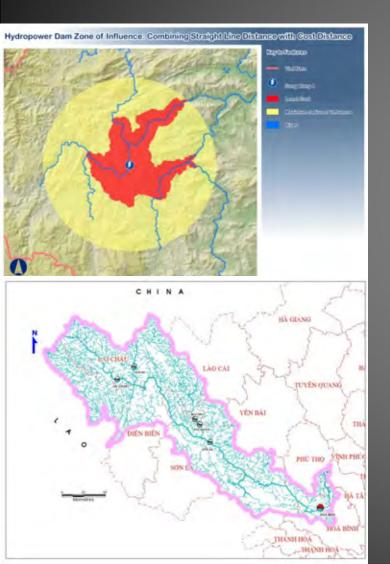

Scenarios of Future Power Generation Mixes

- Base Case: all hydropower planned up to 2025 goes ahead
- 3 Scenarios where hydropower replaced with thermal power
- Scenario: all hydro replaced with thermal power
- Zero case: no hydro & no thermal
- Analysed economic, social and environmental costs for each of the scenarios

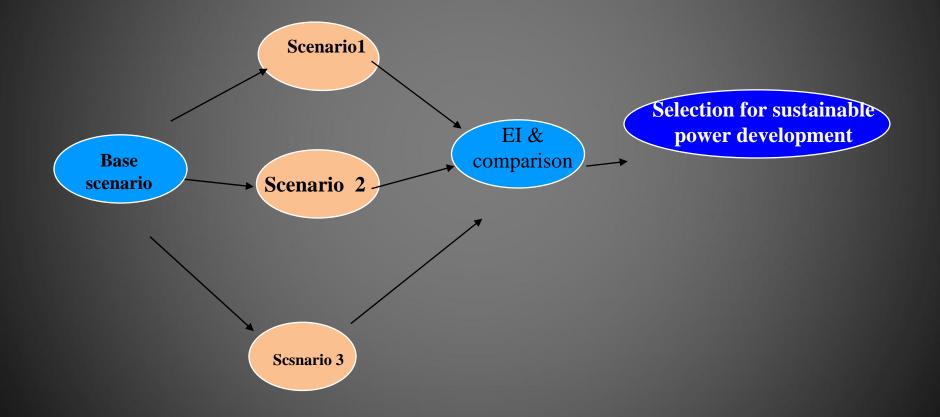

Steps in Assessing Impacts

Three Components: 1.Reservoir Area: land lost and people displaced 2.Zone of Influence: social and environmental impacts in the area of the dam and resettlement area

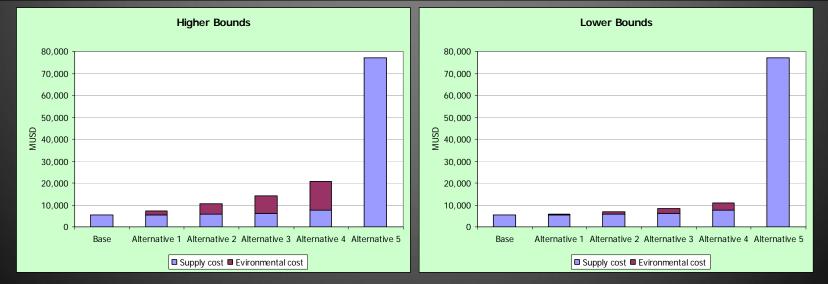

3.Wider Impacts: impacts beyond the zone of influence: air pollution & changes to hydrology in key river basins

Economic, environmental, social cost analysis for each scenario

Total Cost of Supply and Environmental Costs

Scenario	Present Value of Supply MUSD	Present Value of Environmental Cost Higher Bound MUSD	Present Value of Environmental Cost Lower Bound MUSD	Total Present Value Higher Bound MUSD	Difference Total Present Value Higher Bound MUSD	Total Present Value Lower Bound MUSD	Difference Total Present Value Lower Bound MUSD
Base	5,435.65	19.47	5.37	5,455.12	0	5,441.02	0
Alternative 1	5,445.48	1,882.51	477.32	7,327.98	1,872.86	5,922.80	481.78
Alternative 2	5,729.46	4,785.67	1,212.80	10,515.13	5,060.01	6,942.26	1,501.24
Alternative 3	6,268.42	7,994.41	2,025.66	14,262.83	8,807.71	8,294.08	2,853.06
Alternative 4	7,741.38	12,810.12	3,245.75	20,551.49	15,096.37	10,987.13	5,546.11
Alternative 5	76,937.87	0	0	76,937.87	71.482.75	76,937.87	71,496.85

Results and Recommendations

- Overall results show that a full package of social and environmental mitigation costs would not compromise the overall economic viability of the hydropower schemes in PDP VI
- Environmental costs of alternatives (thermal) are so high that the most favourable scenario is the full hydropower development
- SEA provides a means for developing a balanced analysis and constructing a consensus amongst stakeholders based on the best evidence available

Results and Recommendations (continued)

Recommendations to improve the effectiveness and sustainability of hydropower without compromising their economic viability or generating potential:

- 1. A full social development package for displaced people
- 2. Improved multi-purpose reservoir management
- 3. More effective identification of risks to ecosystems integrity at the strategic planning level within whole river basins
- 4. More local participation in hydropower planning and better links to local development planning and programmes
- 5. The integration of SEA into the power development planning cycle, including necessary changes to rules and regulations
- Capacity building to enhance SEA capabilities for the sector and for other sectors in Viet Nam

Some achieved results

Thanks for Listening

STRATEGIC ENVIRONMENTAL ASSESSMENT OF THE HYDROPOWER MASTER PLAN IN THE CONTEXT OF THE PDP VI POLICY RESPONSES FOR MITIGATION OF IMPACTS

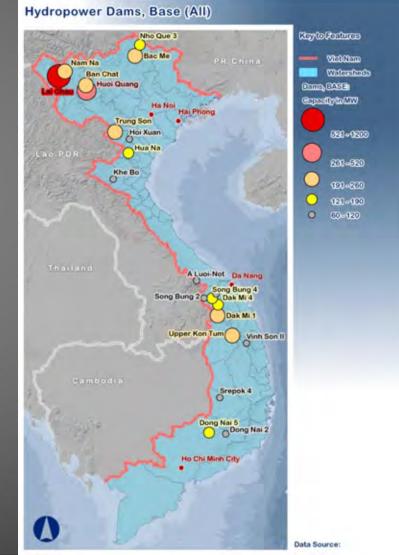

Ministry of Industry and Trade & Ministry of Natural Resources and the Environment In partnership with the Stockholm Environment Institute Supported by the Asian Development Bank

The Goal

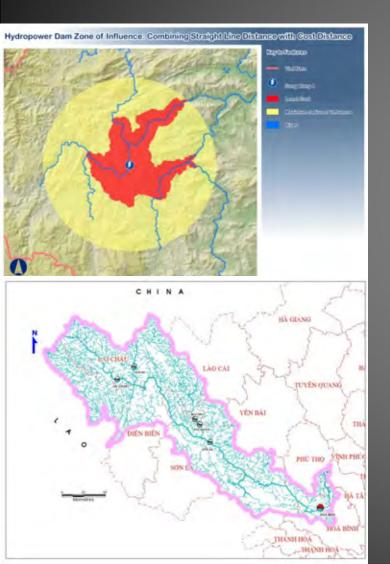

To maximize the potential contribution of hydropower to national development through a strategic planning approach that balances economic development, social equity and environmental sustainability

Five Scenarios of Future Power Generation Mixes

- Base Case: all hydropower planned up to 2025 goes ahead
- 3 Scenarios where hydropower replaced with thermal power
- Scenario: all hydro replaced with thermal power
- Zero case: no hydro & no thermal
- Analysed economic, social and environmental costs for each of the scenarios

Steps in Assessing Impacts

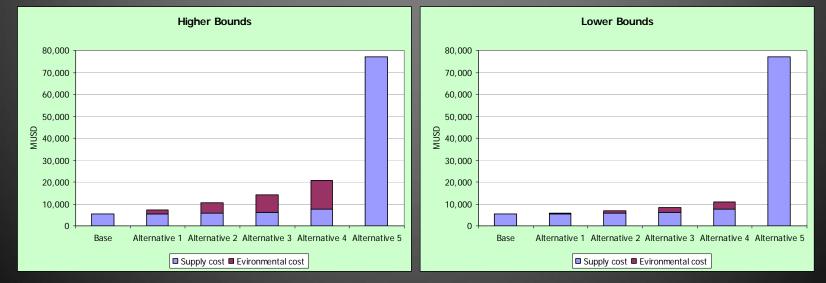

Three Components: 1.Reservoir Area: land lost and people displaced 2.Zone of Influence: social and environmental impacts in the area of the dam and resettlement area

3.Wider Impacts: impacts beyond the zone of influence: air pollution & changes to hydrology in key river basins

Total Cost of Supply and Environmental Costs

Governmental Policies on Forestry Environment Services (PFES) in Vietnam

Nguyen Tuan Phu Director of Department Government Office

CONTENTS

I. Necessity of PFES. **II. Basic concepts. III.** Governmental orientations on development of forestry environment services. **IV. Relation between PFES and EVN** V. Proposed cooperation between **MARD** and **EVN**

I. Necessity of PFES

- Need of jobs, created livelihood for people, social live for ethnic minority communities in mountainous, forestry areas.
- 2. Needs for environmental protection biodiversity preservation, natural disaster prevention of natural disasters, flood, typhoons, land slides, diseases.
- 3. Needs of forestry resources and lands.

II. Basic concepts

1. Forestry environment: Consists of components of erotological forests; vegetables, animals, water, air, land, natural landscapes... which have value (called as forestry environmental use values) ...

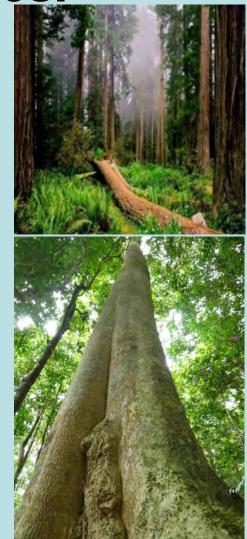

2. Forest environmental services: Supply of forest environmental values (water for hydropower plants, water for production and life; air, natural landscapes, gene preservation, biodiversity).

3. Payment for forestry environmental services: It is the payment paid by users of forestry environmental services to providers

III. Governmental orientations on development of forestry environment services.

- 1. Goods on forestry environmental services market are forestry environmental use values (Such as trees, animals, water, land, air and natural landscapes...),
- 2. The service providers are laborers in the forestry sector, direct investors, forest protectors and developers.

III. Governmental orientations on development of forestry environment services.

3. Buyers of forestry environmental services

Buyers of forestry environmental services are: Hydropower plants, water producing plants, services companies... which use forestry environmental services for producing products such as electricity, clean water, tourist products ...

The end users are consumers of electricity, water, tourist products... who buy these products and pay money to providers of forestry environmental services.

III. Governmental orientations on development of forestry environment services

4. Promoting socialization of forestry livelihood through application of policies on land;

Giving forestry lands to organizations, households, individuals and rural communities, facilitating access of people to the forestry environment services.

5. Establishment of financial mechanism system for activities in the forestry environmental services market.

5.1. Mechanism of payment for forestry environmental services.

> "Purchase - buy" takes place in society. Sellers and buyers need support from "the State".

5. Establishment of financial mechanism system for activities in the forestry environmental services market.

5.2. Mechanism of sharing Forestry Protection and Development Fund.

Trust fund of PFES is shared by ratios: (10 + 10 + 80) in the pilot period, of which :

5. Establishment of financial mechanism system for activities in the forestry environmental services market.

5.3. Mechanism of commissioning, assessment of quantity and quality of forests. The periodical payments for forestry environmental services shall base on contract of land delivery, forests assigned (long terms for organizations, households, individuals and communities in rural areas) as the legal background for evaluation of quality, quantities of forests; the inspecting team consists of 3 parties

IV. Relation between PFES and EVN

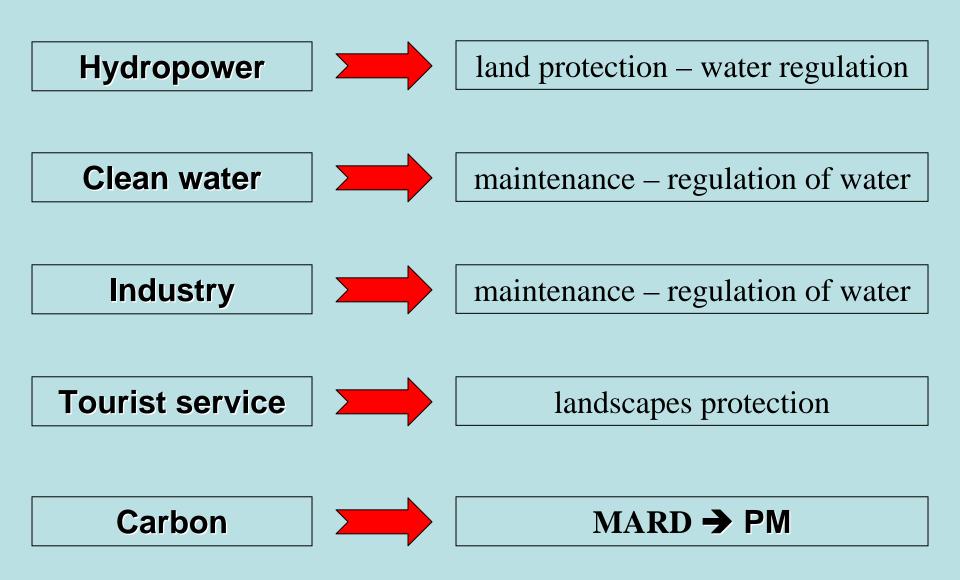

- Point 2, Article 4 of the Decree: there are 5 service types .
- a) Land protection, erosion prevention and prevention of reservoir, river, and stream sedimentation.
- b) Regulation and maintenance of water resource for production and life.
- c) Carbon absorption and capture by forests, GHG emission reduction by measures to prevent depreciation and reduction of forest areas.

IV. Relation between PFES and EVN

Article 7 of the Decree stipulates payers for forestry environmental services.

- 1. Hydropower producers.
- 2. Clean water producers and distributors.
- 3. Industrial producing facilities using water from water resources.
- 4. Organizations, individuals who do tourist business, and are beneficiaries from forestry environmental services.
- 5. Objects which have to pay for forest environmental services.

Payers and type of FES

V. Proposed cooperation between MARD and EVN

Formulation of Project

"EIA in development of power sector" for thermal power and hydropower projects

Product :

Project reports approved by the Government

Cost estimates, personnel plan, engineering plan, time schedule

Implementers :

EVN in charge + Forestry General Department under MARD

Formulation of Project

"Study on impacts of hydropower plants on reduction of forest area, biodiversity and lifetime of hydropower projects"

Products:

Project report defining work contents.

• Cost estimates, personnel plan, engineering plan, time schedule

Implementers:

EVN + Forestry General Department + Provincial People Committee

Formulation of Project

"Study on environmental impacts of GHG emission from thermal power plants"

Products:

Project report defining work contents.

• Cost estimates, personnel plan, engineering plan, time schedule

Implementers:

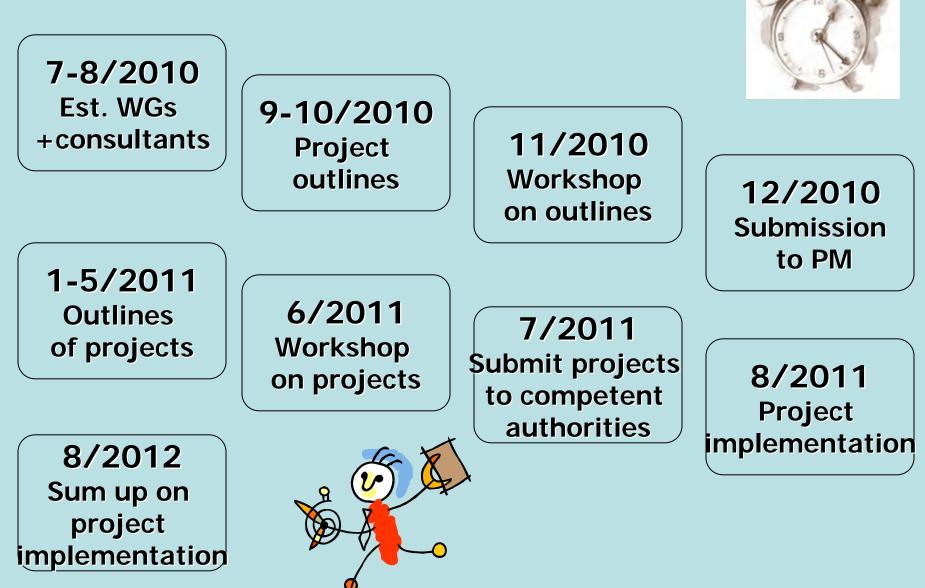

EVN + Forestry General Department + Provincial People Committee

Implementation steps

Getting permission from Prime Minister for formulation of Project

- Establishment of working group for each task.
- □ Formulation of Project, defining work contents, assignment of persons responsible for implementation.
- Consulting experts for each task
- Holding workshop on project outlines
- Submission to the Prime Minister for approval and carrying our implementation works
- Procedures for getting budget for project implementation
- Holding workshops for each project
- □ Submission to competent authorities for approval of projects

Time schedule

Thank you for attention
