PART-D	FORMULATION OF MASTER PLAN			
[Table]				
Table S/R-D1-1	Improvement Targets for Off-site and On-site Development Plan (for 5-year span)	S/R-D-1	D-1	D1.2
Table S/R-D1-2	Improvement Targets for Off-site and On-site Development Plan (for 5-year span)	S/R-D-2	D-1	D1.2
Table S/R-D1-3	Treatment Capacity Allocation for On-site Sludge Treatment between STPs and WWTPs	S/R-D-3	D-119	D9.4.2
Table S/R-D4-1	Current Removal Rate for BOD and SS	S/R-D-4	D-35	D4.3
Table S/R-D4-2	Basic Unit for Calculation of Mass Balance	S/R-D-4	D-39	D4.4
Table S/R-D4-3	Calculation of Mass Balance for Wastewater (1/2)	S/R-D-5	D-41	D4.5.3
Table S/R-D4-3	Calculation of Mass Balance for Wastewater (2/2)	S/R-D-6	D-41	D4.5.3
Table S/R-D4-4	Unit Amount of Desludging Sludge	S/R-D-7	D-41	D4.5.3
Table S/R-D7-1	Required Land Area for WWTP Sites in Each Case	S/R-D-13	D-71	D7.1.1
Table S/R-D7-4	Summary of Case Study	S/R-D-17	D-71	D7.1.1
Table S/R-D7-5	Proposed Screening	S/R-D-18	D-72	D7.1.2
Table S/R-D7-6	Proposed Grit Removal	S/R-D-20	D-72	D7.1.2
Table S/R-D7-7	Proposed Effluent Disinfection	S/R-D-21	D-72	D7.1.2
Table S/R-D7-8	Computation of Sewer Design for Sewerage Zone No. 1 (1/3)	S/R-D-40	D-76	D7.2.2
Table S/R-D7-8	Computation of Sewer Design for Sewerage Zone No. 1 (2/3)	S/R-D-41	D-76	D7.2.2
Table S/R-D7-8	Computation of Sewer Design for Sewerage Zone No. 1 (3/3)	S/R-D-42	D-76	D7.2.2
Table S/R-D7-9	Computation of Sewer Design for Sewerage Zone No. 2	S/R-D-43	D-76	D7.2.2
Table S/R-D7-10	Computation of Sewer Design for Sewerage Zone No. 3	S/R-D-43	D-76	D7.2.2
Table S/R-D7-10	Computation of Sewer Design for Sewerage Zone No. 4	S/R-D-43	D-76	D7.2.2
Table S/R-D7-11	Computation of Sewer Design for Sewerage Zone No. 5	S/R-D-43	D-76	D7.2.2
Table S/R-D7-12	Computation of Sewer Design for Sewerage Zone No. 6 (1/2)	S/R-D-44	D-76	D7.2.2
Table S/R-D7-12	Computation of Sewer Design for Sewerage Zone No. 6 (2/2)	S/R-D-45	D-76	D7.2.2
Table S/R-D7-13	Computation of Sewer Design for Sewerage Zone No. 7	S/R-D-46	D-76	D7.2.2
Table S/R-D7-14	Computation of Sewer Design for Sewerage Zone No. 8	S/R-D-46	D-76	D7.2.2
Table S/R-D7-15	Computation of Sewer Design for Sewerage Zone No. 9	S/R-D-46	D-76	D7.2.2
Table S/R-D7-16	Computation of Sewer Design for Sewerage Zone No. 10	S/R-D-46	D-76	D7.2.2
Table S/R-D7-17	Computation of Sewer Design for	S/R-D-47	D-76	D7.2.2

Reference List of Tables and Figures

No.	Title	Page in SP/R	Page in M/R	Section in M/R
	Sewerage Zone No. 11			
Table S/R-D7-18	Computation of Sewer Design for Sewerage Zone No. 12	S/R-D-47	D-76	D7.2.2
Table S/R-D7-19	Computation of Sewer Design for Sewerage Zone No. 13	S/R-D-47	D-76	D7.2.2
Table S/R-D7-20	Computation of Sewer Design for Sewerage Zone No. 14	S/R-D-47	D-76	D7.2.2
Table S/R-D9-1	Basis for Calculating Construction Costs for Sewerage System	S/R-D-50	D-102	D9.1.1
Table S/R-D9-2	Results of Regression Analysis	S/R-D-52	D-102	D9.1.1
Table S/R-D9-3	Area and Length of Main Sewer for Each Pipe Diameter	S/R-D-53	D-102	D9.1.1
Table S/R-D9-4	Estimation Model Branchlet Extension Pipe	S/R-D-54	D-102	D9.1.1
Table S/R-D9-5	Number of Installing Pipe and Branch Pipe Extension of Each Sewerage Zones	S/R-D-54	D-102	D9.1.1
Table S/R-D9-6	Construction Cost for Sewerage Development Plan by each Zone (1/3)	S/R-D-55	D-103	D9.1.1
Table S/R-D9-6	Construction Cost for Sewerage Development Plan by each Zone (2/3)	S/R-D-56	D-103	D9.1.1
Table S/R-D9-6	Construction Cost for Sewerage Development Plan by each Zone (3/3)	S/R-D-57	D-103	D9.1.1
Table S/R-D9-7	Annual O&M Cost for Sewerage Development Plan by each Zone	S/R-D-57	D-104	D9.1.1
Table S/R-D9-8	Sewerage Service Income by each Zone	S/R-D-58	D-104	D9.1.1
Table S/R-D9-9	Project Cost for Sewerage Development Plan by each Term	S/R-D-59	D-116	D9.4.1
Table S/R-D9-10	Sewerage Service Income by each term	S/R-D-59	D-116	D9.4.1
Table S/R-D9-11	Construction Cost for Sewerage Development Plan by each Zone (Breakdown by Local currency and Foreign currency) (Market price-based) (1/2)	S/R-D-60	D-103	D9.1.1
Table S/R-D9-11	Construction Cost for Sewerage Development Plan by each Zone (Breakdown by Local currency and Foreign currency) (Market price-based) (2/2)	S/R-D-61	D-103	D9.1.1
Table S/R-D9-12	Annual O&M Cost for Sewerage Development Plan by each Zone (Breakdown by Local currency and Foreign currency)	S/R-D-62	D-104	D9.1.1
Table S/R-D9-13	Breakdown of Construction Cost for Sewerage Development (1/7)	S/R-D-63	D-103	D9.1.1
Table S/R-D9-13	Breakdown of Construction Cost for Sewerage Development (2/7)	S/R-D-64	D-103	D9.1.1
Table S/R-D9-13	Breakdown of Construction Cost for Sewerage Development (3/7)	S/R-D-65	D-103	D9.1.1
Table S/R-D9-13	Breakdown of Construction Cost for Sewerage Development (4/7)	S/R-D-66	D-103	D9.1.1
Table S/R-D9-13	Breakdown of Construction Cost for Sewerage Development (5/7)	S/R-D-67	D-103	D9.1.1

PART-D FORMULATION OF THE NEW MASTER PLAN

D1 General Considerations

D1.2 Improvement Targets

Table S/R-D1-1 Improvement Targets for Off-site and On-site Development Plan (for 5-year span)

	Item	Units	2012	2014	2020	2025	2030	2035	2040	2045	2050
Population	Design Population	1,000person	12,665	12,665	12,665	12,665	12,665	12,665	12,665	12,665	12,665
	Administrative Population	1,000person	10,035	10,361	11,284	11,994	12,665	12,665	12,665	12,665	12,665
	Day-time Population	1,000person	13,379	13,815	15,046	15,992	16,887	16,887	16,887	16,887	16,887
	Sewerage Population	1,000person	168	387	1,685	2,884	4,478	5,775	7,130	8,572	10,166
	Floating Population	1,000person	3,345	3,454	3,761	3,998	4,222	4,222	4,222	4,222	4,222
	On-site Served Population	1,000person	8,567	9,974	9,599	9,110	8,188	6,890	5,535	4,093	2,500
	*CST Served Population	1,000person	8,366	8,425	7,199	5,694	4,094	2,584	1,384	512	0
	* On-call population for CST	1,000person	8,366	8,024	4,799	3,321	2,047	969	346	64	0
	* Regular De-sludging Population for CST	1,000person	0	401	2,400	2,372	2,047	1,615	1,038	448	0
	*MST Served Population	1,000person	201	1,550	2,400	3,416	4,094	4,306	4,151	3,582	2,500
	*Regular De-sludging Population for MS1	1,000person	0	1,550	2,400	3,410	4,094	4,306	4,151	3,382	2,500
	Open Defecation Population	1,000person	1,300	0	0	0	0	0	0	0	0
Off-Site	Facility Coverage Ratio	%	2	7	21	30	42	50	64	74	80
	Adopted as Target of Facility Coverage Ratio	%	2	7	20	30	40	50	65	75	80
	Facility Coverage Population	1,000person	168	747	2,334	3,631	5,327	6,286	8,049	9,322	10,166
	Facility Capacity (daily average wastewater flow)	1,000m ³ /day	34	149	467	726	1,065	1,257	1,610	1,864	2,033
	Facility Capacity (daily maximum wastewater flow)	1,000m ³ /day	45	199	622	968	1,420	1,647	2,117	2,456	2,681
	Service Coverage Ratio	%	2	4	15	24	35	46	56	68	80
	Adopted as Target of Service Coverage Ratio	%	2	4	15	25	35	45	55	70	80
	Served Population for Off-Site	1,000person	168	387	1,685	2,884	4,478	5,775	7,130	8,572	10,166
	Wastewater Flow should be treated (daily average)	1,000m ³ /day	34	77	337	577	896	1,133	1,404	1,692	2,011
	Wastewater Flow should be treated	1,000m ³ /day	45	103	449	769	1,194	1,511	1,872	2,257	2,681
On-Site	On-site system Coverage Ratio	%	85	96	85	76	65	54	44	32	20
	Adopted as Target of On-site system Coverage Ratio	%	85	96	85	75	65	55	45	30	20
	CST user ratio	%	83	81	64	47	32	20	11	4	0
	MST user ratio	%	2	15	21	28	32	34	33	28	20
	Upgrading Ratio CST to MST	%	2	16	25	38	50	63	75	88	100
	On-site Served Population	1,000person	8,567	9,974	9,599	9,110	8,188	6,890	5,535	4,093	2,500

D4 Mass Balance of Wastewater

Table S/R-D4-1 Current Removal Rate for BOD and SS

Notes:

* Sedimentation rate for SS of Septic Tank is based on Actual transportation amount of current Sludge Treatment Plants.

Actual transportation amount(2010) : $93,769 \text{ m}^3/\text{year}$ (liquid based) = $256 \text{ m}^3/\text{day}$ (Liquid based) = 2.6 t/day (Dry based; sludge concentration=1%) Sedimentation rare for SS of Septic Tank : 2.6 t/day / Generated amount of Septic Tank 104.1 t/day = 2.5 %

FORM A – Customer Evaluation of Desludging Services Provided

Customer Particulars :	Name (optional) :						
	Premises	address :					
Cor	ntact No :						
Date of Deslusging Provide	d :						
Desludging Done by :		IWK staffs IWK appointed contractor					

Dear Sir / Madam,

We have recently provided septic tank desludging services to your premises and as part of our attempt to further improve IWK services to its customers, we would like to know your opinion of the desludging services provided to you. We would also be pleased to have your comments on improvements to desludging services that you would like to see.

We would appreciate it very much if you could spare a few minutes of your valuable time in filling up this evaluation form and returning it to IWK staff or return it to us at a later date. Any comments you give will be treated in the strictest confidential.

We thank you for your cooperation.

Please response to the following questionnaires by tick one of the box for each subject

	Questionnaires	Yes	Satisfactory	No
1	Were you satisfied that your septic tank was desludged properly ?			
2	Were the operators on time as promised or scheduled ?			
3	Was the work place left clean after the desludging work completed ?			
4	Were the operators polite and courteous ?			
5	Were the operators dressed properly ?			
6	Did the operators appear neatly dressed and clean ?			
7	Do you have any other suggestions or comments to further improve IV	WK deslu	dging services :	

FORM B – Supervisor's Evaluation of Desludging Services Provided

Training Program For Desludging Services Personnel

Training program and refresher courses should be provided to all the desludging services personnel in all aspects of the customer–IWK interface, as part of the efforts to :

- Improve communication techniques, courtesy and etiquette when approaching and talking to customers;
- Enhance the image of IWK that is projected by the desludging crew at customer's premises;
- Brief on follow up action that would be taken to assess level of customer satisfaction;
- Provide a feedback on customer perception and expectation of quality desludging services provided by IWK.
- The following desludging services personnel shall undergo the training :
- Head of Section
- Supervisor of both IWK staff and the appointed desludging contractor
- Field Surveyor

• Desludging crew comprising the Tanker Driver and Operator of both IWK staff and the appointed desludging contractor The Unit Manager and Head of Section should ensure that all desludging services personnel from both IWK staff and also from appointed desludging contractors are given sufficient training and coaching in order for them to carry out the desludging services efficiently and safely whilst potraying a good image of IWK at all times. The training program shall be carried out before the personnel are assigned to carry out the desludging services. The follow up refresher training courses also to be organised as part of improvement program.

The training program should include but not limited to the following topics :

- (a) How to greet the customer and communicate with them, tone and voice level etc.;
- (b) Personal appearance and grooming, use of proper dressing and name tag;
- (c) Behaviour at work site;
- (d) The concept of operator is the representative of IWK to serve the customer;
- (e) The concept of "customer is always right" and what to do under any possible situation at site;
- (f) Honesty at work and giving the customer the best service possible;
- (g) Assessing customer satisfaction level through surveys and general feedback;
- (h) The extent of IWK obligations to carry out desludging services to septic tanks;
- (i) Operation of desludging tanker and equipment on board the vehicle;
- (j) Maintenance of desludging tanker, equipment and vehicle;
- (k) Cleanliness of vehicle, tools and equipment and image of IWK;
- (l) Safety at work site, confined space entry, personal hygiene and cleanliness;
- (m) Responsibility to have the covers open, clearing of blockage at private sewer lines, inspection chambers, damage to cover, septic tank etc.
- (n) How to entertain customers request on additional services which are not part of IWK desludging services;
- (o) Consequences of neglect of duty, willfully wrong reporting, soliciting or receiving money for service provided, bringing disrepute to the good name of IWK, improper disposal of tankered sludge to unauthorised site etc;
- (p) What to do when access denied, nobody at home etc.
- (q) Confirmation, verification and acknowledge by the customer upon desludging services being provided.
- (r) Responsive desludging services and charging tariff/rates and payment mechanism.

D7 Layout Plan and Facility Plan for Off-Site System (Sewerage)

D7.1 Proposed Plans

D7.1.1 Proposed Plans for Sewer Network

(1) **Outline of Sewer Network**

14 candidate sites for WWTP to be secured were selected as mentioned in "D2 Proposed Sewerage Zones". To verify its feasibility, 4 cases were examined and compared with other 3 alternatives.

- Case-1: Proposed 2 large-scale sewerage zones
- Case-2: Proposed 3 large-scale sewerage zones
- Case-3: Proposed 6 medum-scale sewerage zones
- Case-4: Proposed 14 small-scale sewerage zones determined based on the location of WWTP sites (proposed in the New M/P)

Since land acquisition of WWTP sites has become one of the major problems in DKI, alternative proposals have been prepared focusing on the lands among the 14 sites where relatively big areas can be secured with a reference of current land use plan and future land use plan.

Sewerage Plant Site		Minimum Required Area (ha)			Space for	Current Conditions		
		Case-1	Case-2	Case-3	Case-4	Expansion	2011	2030

Total		69.1	69.2	69.2	68.9			

 Table S/R-D7-1
 Required Land Area for WWTP Sites in Each Case

Note : Space for expansion at the proposed site : \bigcirc Enough, \bigcirc Moderate, \triangle Few, \times No space Source: JICA Expert Team

(2) Proposed 2 Large-Scale Sewerage Zones (Case-1)

This is a proposal to divide into 2 large-sale sewerage zones from east to west of DKI Jakarta and WWTPs are planned at Kamal-Pegadungan in the north-west and Marunda in the north-west. Facility plan and main sewer facilities are shown in Figure S/R-D7-1.

This plan will cost much because maximum diameter of trunk sewer becomes 3,800mm, pipe jacking will not be applied (usually up 3,000mm) and relay pumping station are needed.

Also, since the high prioritized areas become far from WWTP, it will take much time to construct the pipe installation work and accordingly the initial investment becomes high. Moreover, it is needed to secure a large land as one WWTP site and it is expected to be more difficult for land acquisition.

Figure S/R-D7-1 Proposed 2 Large-Scale Sewerage Zones (Case-1) - Schematic Diagram and Main Sewerage Facilities

(3) **Proposed 3 Sewerage Zones (Case-2)**

This is a proposal to divide into 3 large-scale sewerage zones among east, west and south of DKI Jakarta and WWTPs are planned at Kamal-Pegadungan in the north-west, Marunda in the north-west, and Waduk Kp. Dukuh (Pond Planning). Facility plan and main sewer facilities are shown in Figure S/R-D7-2.

This plan, as in the case of 2 large-scale sewerage zones, will cost much because maximum diameter of trunk sewer becomes 3,200mm, pipe jacking will not be applied and relay pumping station are needed.

Also, since the high prioritized areas become far from WWTP, it will take much time to construct the

pipe installation work and accordingly the initial investment becomes high. Moreover, it is needed to secure a large land as one WWTP site and it is expected to be more difficult for land acquisition.

4,000 2,000 0 4,000 Meters

Figure S/R-D7-2 Proposed 3 Large-Scale Sewerage Zones (Case-2) - Schematic Diagram and Main Sewerage Facilities

(4) Proposed 6 Medium-Scale Sewerage Zones (Case-3)

This is a proposal to divide into 6 medium-scale sewerage zones which contains the candidate sites for WWTP with relatively large scale area to be secured.

Since the maximum diameter of trunk sewer is 2,600mm, pipe jakcking can be adoptd and the construction cost will be less than that in Case-1 and Case-2. However, investment cost will become high because the sewerage zone is relatively large and it will take a long time for pipe installation. Moreover, a part of

WWTP site belongs to the private land and it will lead to difficulty of land acquisition. Therefore, it will be faced with several problems in the realization.

D7.1.2 Proposed Plans for WWTP

(1) **Technology for WWTP**

The proposed plans for WWTP at the Mater Plan level are prepared here. At the F/S stage, detail analysis with additional information shall be carried out.

(2) Screening

1) Introduction

Preliminary treatment typically consists of screening and grit removal. Screening removes large material such as rags, wood and plastics objects. If not removed, this material causes operating and maintenance problems such as plugging and damage to downstream pipe work and mechanical equipment.

2) Proposal Screening

Screen openings have historically been decreasing in size. In the 1970s, 19 to 25 mm screen openings were common. Through the 1980s and 1990s, screen openings generally decreased. Today, screens are generally equipped with openings that are 3 to 10 mm. smaller openings remove much of the material that can cause scum blanket accumulations in digesters and can plug sludge pumps. The move to screens with smaller opening is also driven in part by the need to remove identifiable objects from the sludge so that aesthetic issues do not arise during land application or other beneficial re-use.

In larger plants, mechanical cleaning is generally done on a timed basis or when head loss across the screen exceeds a preset maximum. Very little operator attention should be required during normal plant operations. Screens have to be lubricated and which have minimal moving parts below the water line are generally favored to minimize the exposure of maintenance personnel to raw sewage. Screens have few hazards. Protective enclosures are generally provided around the channel opening in which they are placed to eliminate fall hazards and exposure to moving parts. The environment around the influent screens generally contains odors and sometimes dangerous gases. Ventilation and corrosion in the screening area are major concerns, and odors from the area must be managed properly. The head works structure of a plant often can be visible due to the height of a screen structure.

Generally an inlet screen with 6 mm openings is used for WWTP. This size is becoming more common in North America. However, it does place limitations on equipment selection because some of the more common types of screens have larger openings.

The use of finer screens mandates the washing and compaction of removed solids. This additional process returns fecal material to the liquid stream for treatment in downstream processes, reduces screenings volumes substantially, and lowers the odor potential of the screenings. Compacted material also is much less objectionable and as a result is more readily accepted at a landfill.

Normally average quantity of screenings is approximately 0.175 m^3 per 1,000 m³/day of wastewater treated. After washing and compaction, the daily volume will be half that amount, approximately 0.09 m³ per 1,000 m³/day wastewater treated. Peak screenings volumes are about 10 times that amount.

Item	Proposal
Mechanically Raked Bar Screens	Mechanically raked bar screens are commonly used in WWTP to remove debris from the incoming wastewater, protecting downstream processes from plugging and debris accumulation. The screen is comprised of parallel bars, typically 8 to 8 mm to 25 mm. it is not possible to reduce opening width to less than 8 mm. these screens employ dual chain and sprocket mechanisms to drive the rake that cleans the bar screen. Multiple rakes are attached to the chain and remove the screenings by conveying them upward across a dead plate. At an elevated location, the screen through the flow upstream of the screen. The rake types do not completely penetrate the bar screen due to structural cross members that support the bars. Therefore, the screen is not completely cleaned. The rake arm can actually push screenings through the bars. Mechanically raked bar screens can be designed to fit almost any application, as there is a wide range of units available to fit various combinations of channel depth and width. The screens require significant headspace - more than that required for other screening options. These screens are generally durable.
	SCREENINGS
Segmented Chain Fine Screens	This screen is comprised of a series of links that are held together by rods. The links are plastic or stainless steel and each has a tooth that 'grabs' screenings for transport to the top and back of the screen for discharge. Each link is approximately 75 mm long and 6 mm wide. When placed alternately, the openings between the links provide the screen opening. Segmented chain screens were some of the first fine screens on the market and have been used in numerous plants where 6 mm openings were required. However, they have been prone to problems; the teeth have not released the solids when they pass through the spray bar or rotating brush that is intended to remove them. As a result, some screenings are washed from the back of the screen in its return path and re-enter the flow. In addition, when links break, they are difficult to replace.
Step Screens	Step screens use rows of self-cleaning plates that are cut in a staircase configuration. Every other plate is fixed and the alternating plates are connected to a rotating frame that revolves in a circular motion. Through its revolutions, the rotating plate steps pick up debris that has been deposited on the screen and lift it to the succeeding "step", lifting the material step-by-step to discharge at the top. Step screens have a low profile and can be fully enclosed. Enclosing the screens, as shown in the picture of the units, allows foul air to be contained and directed to an odor control system. None of the drive mechanism located below water level.
Escalator Screens	The escalator fine screen has perforated panels that are built in "steps" to provide increased screening surface area and the ability to remove larger screenings. The screen rotates in a clockwise direction, carrying heavier solids on the "step" to the screenings discharge. A rotating brush (as opposed to the typical rake wiper) is used to brush the screenings maintenance on escalator screens is generally higher

Table S/R-D7-5 Proposed Screening

Item	Proposal
	than mechanically raked bar screens because two drives are associated with this screen (one for the screen and one for the brush), wetted moving parts, and because of the finer degree of screening. These screens have a relatively low profile and can be readily contained for odor control. However, they have moving drive components below the water level that will require maintenance.
Drum - Basket Screens	Drum basket screens have a series of concentric circular screen bars that form an enclosed basket that is immersed in the incoming raw wastewater stream. The screen bars capture the debris by forming a mat on the upstream edges
	A series of tynes that extend through the screen bars is attached to a central shaft. As the shaft rotates, the tynes remove the screenings and raising them to a vertical position, from where they drop into a centrally positioned through that is equipped with a screw conveyor. The rotating movement of the screw conveyor transports the screenings out of the channel, and into a container located at floor level. During transport, the screenings are compacted, washed and dewatered to a solids content as high as 40 percent (as dry solids). The drum-basket screens have a low profile and can be either installed in a separate chamber or directly in the inlet channel. Excessive quantities of plastic and debris can interfere with the screening and screenings transport mechanisms.

Table S/R-D7-5Proposed Screening

3) Grit Removal

(a) Introduction

Grit removal takes out heavy inorganic and some organic particulates. Grit removal systems are generally sized to extract all inert material over 200 microns with a specific gravity over 2.5. There are options available that purport to remove smaller inert material. However, these process alternatives are not generally suited to large wastewater treatment plants. Grit is abrasive and causes substantial wear on downstream rotating equipment. This heavy, non-biodegradable material also accumulates in process tanks where the mixing intensity is not very high, e.g. aeration tanks and digesters.

Grit is classified and dewatered to reduce organics content and increase solids content. The goal of this process is to increase the solids content to above 80 percent while reducing the volatile solids content to less than 15 percent of the total. Material in this state is relatively innocuous and does not create serious odors.

The expected average dewatered grit quantities are 0.013 to 0.015 m³ per 1,000 m³/day of wastewater treated. Peak grit quantities will be almost 20 time this amount.

Item	Proposal				
Constant Velocity Grit Channels	Constant velocity grit removal channels remove send, silt, and gravel from the influent wastewater to reduce abrasive wear on downstream rotating equipment and to minimize solids deposition in downstream unit processes. Grit is removed in a channel in which the level is controlled to ensure that the horizontal velocity is maintained at a relatively constant rate. Depending on size, grit can be removed by hand, by gravity or mechanically. When removed mechanically, the grit is generally classified to separate large organic particles for return to the treatment stream, and dewatered. Constant velocity grit removal channel are generally only used in smaller facilities. For larger flows, the structural requirements become substantial and other grit removal processes with smaller footprints are generally used. Constant velocity grit removal channels and the associated equipment are subjected to considerable abrasive wear. Even equipment designed for this duty requires frequent maintenance to keep it in service. There is minimal flexibility available with this process unless multiple units are provided that can be brought on line as the flows increase. They generally operate all of the time. Well classified and dewatered grit can be disposed as solid waste with minimal difficulties. Constant velocity grit removal channels, but manually cleaned channels are labor intensive. The grit removal channels, but manually cleaned channels are labor intensive. The grit removal channels deverted for mechanically cleaned channels, but manually cleaned channels are labor intensive. For this work to be done, the equipment must be extracted from the wastewater and cleaned. Constant velocity grit removal channels dangerous gases. As a result, ventilation of the area is a major concern.				
Aerated Grit Removal Chambers	Aerated grit removal chambers are designed to remove sand, silt, and gravel from the influent wastewater to reduce abrasive wear on downstream rotating equipment and to minimize solids deposition in downstream unit process. Grit is removed in a chamber where air is introduced along one wall, inducing a spiral flow pattern. The bottom velocities are maintained at relatively constant rate by this action, allowing the grit to settle while the organics are maintained in suspension. Grit is removed mechanically using cantilever pumps or screw conveyors. The removed grit is generally classified to separate large organic particles for return to the treatment stream, and dewatered. This process requires less space than constant velocity grit removal channels, but more space than vortex grit removal chambers. Aerated grit channels are the most common means of grit removal in large WWTP. Equipment located within the chambers is subjected to considerable abrasive wear. Even equipment designed for this duty requires frequent maintenance to keep it in service. The aeration rate can be manipulated to achieve lesser or greater rates of solids removal. The chambers generally operate all of the time. Well classified and dewatered grit can be disposed as solid waste with minimal difficulties. Due to the classifying nature of this process, the grit removed from aerated grit removal chambers generally has a lower organic content than that from other processes. Aerated grit chambers are easily operated. The aeration rates should occasionally be checked to ensure that the system is optimized. The grit removal equipment has to be lubricated and repaired. The operating environment is generally offensive. For this work to be done the operator must enter the tank or the equipment must be extracted from the wastewater and cleaned. Grit removal chambers offer little hazard to the operating staff, but the environment around the channel generally contains odors and sometimes dangerous gases. Ventilation of the area is a major concern. A pri

	Influent Channel
Vortex Grit	Vortex grit removal chambers are not as susceptible to passing low density sands and silts as other grit
Removal	removal systems, due to the induce gravity from the vortex action of the chamber. This makes vortex grit
Chambers	removal systems a better choice for WWTP, where soil conditions contain a very fine silt/sand mixer.
	Pump Grit Discharge Iniet Flow Propeller Blades
	Vortex grit removal chamber are designed to remove sand, silt, and gravel from the influent wastewater to reduce abrasive wear on downstream rotating equipment and to minimize solids deposition in the downstream unit processes. The flow into the channel is introduced tangentially and a vortex is a established by the velocity of the wastewater. The vortex is normally maintained by a mechanical mixer. Centrifugal forces convey the grit to the tank perimeter where it settles along the wall while organics are maintained in suspension. Grit is then pumped from the center of the bottom of central sump. Airlift pumps can also be used to remove the grit. However, these are ineffective and are not recommended. Flushing water or air is used to fluidize the settled grit prior to pumping to ease its removal. The removed grit is generally classified to separate large organic particles for return to the treatment stream, and dewatered. Vortex grit chambers are becoming more common for grit removal in small to large facilities all over the world. While not as effective at grit removal as aerated grit chambers, vortex chambers are less costly and have a smaller foot print than both constant velocity channels and aerated grit chambers, and have been used at increasing frequency in larger plants. Little mechanical equipment is subjected to aggressive wear in this process and when designed properly, it is not subject to grit accumulations that have been known to plug vortex grit can be disposed as solid waste with minimal difficulties.

4) Effluent Disinfection

Table S/R-D7-7 Proposed Effluent Disinfection

Item	Proposal					
Polishing Ponds	Polishing ponds can be used to achieve effluent disinfection. Natural predation and UV light inactivate					
	potential pathogenic organisms. Polishing ponds will reliably reduce pathogenic microorganism densities					
	where the effluent is clear and sufficient sunlight occurs. Generally, a hydraulic retention time of 5 o					
	days is required. Due to the relatively large buffer afforded by storage in the ponds, this process is no					
	adversely affected by flow variations. Polishing ponds are applicable where semi-arid condi					
	predominate and where land is readily available. However, they are not use for many large plan					
	urban areas due to the large areas required. The effectiveness of polishing ponds is somewhat dependent					
	upon climatic conditions and the effluent quality.					

Item	Proposal
item	Polishing manda requires minimal anaratan attention. However, settled solids have to be removed from the
	ponds on a regular basis. The herms and side clopes also require on going mointenance. Ponds are often
	seeded with water by acinth or other aquatic plants to inhibit algal growth which increases the affluent
	TSS and can affect the penetration of sunlight Ponds can also serve as breading grounds for mosquitoes
Chloringtion	Chloring gas is added to the treated affluent to inactive notantially nathogenic heaterin virtues and
Using Chloring	chloring gas is added to the frequent to mactive potentiarly pathogenic oacteria, viruses, and
	protozoa. Chiorine is transported to the facility in compressed gas cylinders, of generated on site
Gas	electrolytically. Gaseous chronine is metered into a solution line that is red to treated efficient. The
	wastewater passes through a chlorine contact tank with a minimum retention period of 15 of 50 minutes
	phot to discharge. At the end of the contact tank, the residual chlorine concentration is typically between
	0.5 and 2.0 mg/L. lower costs and proven ellectiveness have made chlorination the chemical distribution
	Of choice at most www.rs.wondwide.
	chloring is added up to cess provided that the enfuent residual is monitored to ensure that sufficient
	continue is added upsite and of the contact chamber. The ended is necessary to disinfect yearing flows
	A divergente of chloring food rate or concrelly outernated in leaser westewater treatment plants.
	Adjustments of chrome feed rate are generally automated in larger wastewater treatment plants.
	chiorine containers have to be re-fined of replaced as the supply is exhausted, various monitoring
	Chloring and is extremely hererdous and has to be handled with equition. Chloring release into the
	working anyironment presents a bazard to plant workers. In the event of an incident, staff must work in
	the area with the appropriate safety clothing and breathing apparatus
	Chloring is also toxic in the receiving environment. Accidental releases to the atmosphere can threaten
	the safety of the surrounding areas
	Chlorine is toxic in the aquatic environment in relatively small concentrations. For this reason a
	reducing agent is often added towards the end of the chlorine contact tank to react with the chlorine
	thereby removing the residual prior to discharge. Sulphur dioxide gas (SO2) or liquid bi-sulphite are
	generally used for this purpose. The reaction is very quick and requires minimum retention time.
	However, like chlorine, sulphur dioxide is a toxic gas and caution has to be exercised in its use.

Chlorination	A sodium hypochlorite solutions or bleach powder can be used as an alternative to gaseous chlorine. This
Using Sodium	significantly reduces the safety issues related to the transport, storage and feeding of chlorine gas on the
Hypochlorite	wastewater treatment plant site.
	Sodium hypochlorite is only available as a liquid and is usually purchased in bulk with between 12 and
	15 percents available chlorine. The solution decomposes more readily at high concentrations, and
	affected bt exposure to sunlight and heat. For example, a 16.7 percent solution stored 26.7 oC will lose
	10 percent of its strength in 10 days, 20 percent in 25 days, and 30 percent in 43 days. It must therefore
	be stored in a cool location. The handing and storage of sodium hypochlorite requires special design
	considerations because of its corrosiveness and the presence of chlorine fumes.
UV	UV light with a wavelength between 250nm and 260nm will damage cellular DNA. This phenomenon is
Disinfections	used to inactive wastewater bacteria by exposing effluent to light with these characteristics. Cell with
Low Wattage	damaged DNA are unable to replicate, and eventually die. UV light is emitted from low or medium
Constant Dose	pressure mercury vapor lamps. UV systems are available in various configurations. The most common
	for secondary or tertiary effluent consists of horizontal low or medium pressure UV lamps submerged in
	quartz tubes, mounted parallel to the flow in a relatively shallow channel. An alternative places vertical
	lamps perpendicular to the flow. Medium pressure or high pressure lamps may be more applicable to the
	disinfection of poor quality effluents. These lamps emit higher intensity light, but are not as energy

Table S/R-D7-7 Proposed Effluent Disinfection

Table S/R-D7-7 Proposed Effluent Disinfection

Item	Proposal				
	efficient. The high ongoing cost of electrical power is a major disadvantage of UV disinfection. UV disinfections have been gaining rapidly in acceptance. UV disinfection systems require minimal space as the hydraulic retention time required is less than one minute. UV disinfection is hydraulically limited, so is robust as long as sufficient units are available to handle the flow. It works well where used for effluents which are relatively clear. Pilot testing is suggested prior to use for any large facility as deterioration of feed quality can reduce effectiveness significantly. Large systems are flexible as additional channels can be brought on line as required to treat increased flows. UV disinfection systems are relatively easy to operate and maintain. Effluent quality is monitored by measuring the residual coliform densities. The UV lamps tend to foul and eventually will burn out. Lamps need to be cleaned at frequent intervals and replaced every one to two years. Debris can cause plugging problems. The environment surrounding a UV disinfection system is relatively innocuous, and no toxic byproducts are released into the receiving environment.				
	TREATMENT EFFLUENT UV CONTROL PLANELS LEVEL CONTROL GATE DISINFECTED EFFLUENT UV LAMP BANKS				
UV Disinfection High Wattage Pulsated Dose	Recent advances in UV technology have lead to the development of pulsed UV-based disinfection system that destroys microorganism and causes photo dissociation of organic contaminants in water and wastewater. The system generates UV light using pulses at very high voltages (10 to 45Kv) through a plasma lamp, which generates variable-pulsed UV light of intensity of up to 6 million watts. The system operates in a real-time mode adjusting the dose to both fluid flow and UV power (average and peak intensity) to accommodate a wide range of varying influent conditions, thereby producing the quality of fluid discharge desired by the operator. The system using Pulsed UV light technology with a peak power pulse of up to 6mm watts/pulse and with 1 to 30 pulses per second is able to achieve a 6 log, coliforms (~100%) destruction. This would permit the use of this technology on primary clarified wastewater for using then for agriculture. A typical such a UV module and lamp is depicted below:				
	Typical complete UV System Typical Pulsated UV Plasma Lamp
