CHAPTER 1 CONSTRUCTION PLAN

1.1 Type of Major Works

Type of major works concerned with construction of flood control facilities are as shown in ***Table 1.1***.

In addition, at section Chincha River-3 in Chinca River where a diversion weir is planned, the removal work of the damaged existing diversion weir is classified to the preparatory works.

Table 1.1 Type of Major Works

PARTIDA (Type of Works)			Object River
1.0	OBRAS PROVISIONALES	Temporary works	All rivers Cañete, Chincha, Pisco, and Majes-Camaná River
1.1	CAMPAMENTO PROVISIONAL DE OBRA	Temporary work office	
1.2	CARTEL DE OBRA	Work signboard	
1.3	CAMINO DE ACCESO HABILITACION A OBRA	Temporary work road	
1.4	MOVILIZACION Y DESMOVILIZACION DE MAQUINARIA PESADA	Heavy machine mobilization	
2.0	OBRAS PRELIMINARES	Preparatory work	All rivers Cañete, Chincha, Pisco y, Majes-Camaná River
2.1	TRAZO NIVELACION Y REPLANTEO	Leveling and Layout	
2.2	CONTROL TOPOGRAFICO	Survey control	
2.3	MOVILIZACION Y DESMOVILIZACION DE MAQUINARIA PESADA	Heavy machine mobilization	
2.4	DEMOLICION DE OBRAS DE CONCRETO	Demolition of concrete structure	Chincha River Chinca-3 diversion weir
2.5	DESCOLMATACION DE CAUCE	Riverbed excavation	
2.6	ELIMINACION DE MATERIAL EXCEDENTE	Disposal of surplus soil	
3.0	MOVIMIENTO DE TIERRA	Earthwork	All rivers Cañete, Chincha, Pisco, and Majes-Camaná River
3.1	DESCOLMATACION DE CAUCE	Riverbed excavation	
3.2	CARGUIO Y TRANSPORTE DE MATERIAL DE RIO PARA RELLENO	Transportation of embankment materials	
3.3	CONFORMACION Y COMPACTACION DE DIQUE SECO	Embankment & surface compaction	
3.4	EXCAVACION DE UÑA PARA CIMENTACION	Excavation for revetment foundation	
3.5	PERFILADO Y ACABADO DE TALUD DE DIQUE	Shaping & finishing slope of embankment	
3.6	ELIMINACION DE MATERIAL EXCEDENTE	Disposal of surplus soil	
3.7	EXCAVACION PARA ESTRUCTURAS EN MATERIAL DE CANTO RODADO	Riverbed excavation (for structures)	
4.0	ENROCADO DE PROTECCION	Revetment Work	All rivers Cañete, Chincha, Pisco, and Majes-Camaná River
4.1	EXTRACCION DE ROCAS CON EXPLOSIVOS	Rock removal with explosives	
4.2	SELECCION Y ACOPIO DE ROCA	Accumulation of rocks	
4.3	CARGUIO Y TRANSPORTE DE ROCA	Transportation of rocks	
4.4	ENROCADO DE TALUD DE DIQUE	Revetment work	
4.5	ACOMODO DE ROCA EN UÑA DE DIQUE	Piling Rock (for foundation)	
4.6	SUMINISTRO E INSTALACION DE GEOTEXTIL NO TEJIDO	Installation of suction preventng sheet	
5.0	OBRAS DE CONCRETO	Concrete work	Chincha River Chinca-3 diversion weir
5.1	ENCOFRADO Y DESENCOFRADO PARA MUROS	Formwork	
5.2	CONCRETO FC=210 KG/CM2	Concrete placement (FC=210 KG/CM2)	
6.0	GAVIONES	Gabion	Chincha River Chinca-3 Bed protection work of diversion weir
6.1	SELECCION Y ACOPIO DE PIEDRA DE 6" - 8"	Accumulation of crushed rocks (6～8 inch)	
6.2	CARGUIO Y TRANSPORTE DE ROCA	Transportation of rocks	
6.3	ARMADO E INSTALADO DE GAVION TIPO CAJA PARA ANCLAJE (5.0x1.0x1.0)m	Setting & anchoring box (5.0x1.0x1.0)m	
6.4	LLENADO DE GAVION CAJA CON PIEDRA (5.0x1.0x1.0)m	Filling box with crushed stones (5.0x1.0x1.0)m	
6.5	TAPADO DE GAVION CAJA (5.0x1.5x1.0)m	Capping box (5.0x1.0x1.0)m	

1.2 Construction Method for Major Works

Since the works of flood control facilities consist of general construction works for embankment, revetment, excavation, concrete placement, etc., construction method is based on the construction standard in Peru.

1.2.1 Earthworks (MOVIMIENTO DE TIERRA in Spanish)

It is a construction works concerned with riverbed excavation and embankment.

(1) Riverbed Excavation (DESCOLMATACION DE CAUCE)

It applies to excavation of riverbed.

TRACTOR S/O HP/D155X5 (tractor) is used for main machine.

(2) Embankment Materials Conveyance (CARGUIO Y TRANSPORTE DE MATERIAL DE RIO PARA RELLENO)

Although river-bed excavation materials is used for embankment materials, in case of shortage, it is conveyed from the neighborhood by dump truck with specification of CAMION VOLQUETE 6X4 / 318 - 395 HP / 10 - It carries by 12 M3

The conveying distance is designed as 5km.

EXCAVADORA HIDRAULICA 158H.P. / PC220 (back-hoe) is used for loading machine.

(3) Embankment and Rolling Compaction (CONFORMACION Y COMPACTACION DE DIQUE SECO)

Spreading, leveling and rolling compaction are carried out using the embankment materials carried from riverbed and the neighborhood area.

TRACTOR S/O HP/D155X5 (tractor) is used as main machine.

(4) Bank Slope Finishing (PERFILADO Y ACABADO DE TALUD DE DIQUE)

The part of slope, where revetment is constructed, is faired in order to spread suction preventing sheet.

EXCAVADORA HIDRAULICA 158 HP / PC220 (backhoe) is used.

(5) Soil Disposal (ELIMINACION DE MATERIAL EXCEDENTE)

The soil disposal is carried out when the riverbed excavation material remains after using it for embankment.

CAMION VOLQUETE 6X4 / 318 - 395 HP / 10 - It carries by 12 M3 (dump truck) is used for conveyance.

The conveyance distance is designed as 5km.

EXCAVADORA HIDRAULICA 158H.P. / PC220 (backhoe) is used for loading machine.

1.2.2 Revetment Works (ENROCADO DE PROTECCION)

It is the construction work of revetment by boulder. Boulders are quarried out and carried from quarry site. The distance to quarry site is designed as 20km.

(1) Quarry for Rock by blasting (EXTRACCION DE ROCAS CON EXPLOSIVOS)

The quarry for rock by blasting is carried out in quarry site.

COMPRESORA NEUMATICA 335-375 PCM, 93 HP (compressor), and MARTILLO NEUMATICO DE 21 KG (breaker) is used.

The rock drilling with drill and the explosive charge are carried out.

(2) Piling up of Rock (SELECCION Y ACOPIO DE ROCA)

The rock quarried out by blasting is piled up.

TRACTOR S/O HP/D155X5 (tractor) is used for main machine.

(3) Conveyance of rock CARGUIO Y TRANSPORTE DE ROCA

Rock material is carried from quarry to embankment site.

CAMION VOLQUETE 6X4 / 318 - 395 HP / 10 (dump truck) is used for conveyance.

The conveying distance is designed as 20km.

EXCAVADORA HIDRAULICA 158 HP / PC220 (backhoe) are used as loading machine.

(4) Revetment Works ENROCADO DE TALUD DE DIQUE

The revetment works by boulder in slope of dike is done.

EXCAVADORA HIDRAULICA 158 HP / PC220 (backhoe) is used for main machine.

(5) Installation of rock (excavation part for foundation) ACOMODO DE ROCA EN UNA DE DIQUE

The revetment works in excavation part for foundation is done by backfilling of boulders.

EXCAVADORA HIDRAULICA 158 HP / PC220 (backhoe) are used.

(6) Installation of a Prevention-of-Soil-raw-out Sheet SUMINISTRO E INSTALACION DE GEOTEXTIL NO TEJIDO

The suction preventing sheet using bonded textile is laid. It is laid by manpower.

1.2.3 Concrete Works (OBRAS DE CONCRETO)

(1) Formwork (ENCOFRADO Y DESENCOFRADO PARA MUROS)

The formwork by wooden form and falsework are done. It is done by manpower.

(2) Concrete Placement (CONCRETO FC=210 KG/CM2)

The concrete production and the placing are carried out by machinery as shown below.

MEZCLADORA DE CONCRETO DE 11 P3-18 HP (concrete mixer) and VIBRADOR DE

CONCRETO 4 HP 1.50" (vibrator) is used.

The placing is conducted by manpower.

1.2.4 Gabion Installation - Anchor (5.0x1.0x1.0 m) GAVIONES

The Gabion works is carried out by manpower.

CHAPTER 2 WORK PLAN

2.1 Work Plan

(1) Construction Period

Since January to March is the period which river flow increases especially also in the rainy season in Peru, the river works is not carried out in this period. Therefore, nine months from April to December is fixed as the work period.

(2) Work Plan

The designated work areas for each river are apart from several kilometers to tens km. The work plan is formulated for each area on the assumption that work is carried out separately arranging required construction machineries.

Construction work shall be commenced in April. In case of entering flood season due to exceeding of planned period such as nine months, the extension of work period shall be reviewed by taking into account rest period for three months from January to March.

Although the work plan for divisions of each river is shown in detail after the following clauses, the summary of the work period is shown in ***Table 2.1***.

Table 2.1 **Work Period for each River**

River Name	Section	Actual Work Period	Total Work Period	Remarks
Canete River	Canete-1	3months	3months	
	Canete-2	5&3/4months	5&3/4months	
	Canete-3	3&3/4months	3&3/4months	
	Canete-4	2months	2months	
	Canete-5	4months	4months	
Chincha River	Chico-1	5months	5months	
	Chico-2	2months	2months	
	Chico-3	12months	1year 3months	Rainy season 3months; no works
	Matagente-1	6months	6months	
	Matagente-2	5months	5months	
Pisco River	Pisco-1	5months	5months	
	Pisco-2	5months	5months	
	Pisco-3	2&2/4months	2&2/4months	
	Pisco-4	2months	2months	
	Pisco-5	2&2/4months	2&2/4months	
	Pisco-6	9months	9months	
Majes-Camana River	Camana-1	5&1/4months	5&1/4months	
	Camana-2	3&2/4months	3&2/4months	
	Camana-3	6&1/4months	6&1/4months	
	Camana-4	3&1/4months	3&1/4months	
	Majes-5	5months	5months	
	Majes-6	5&1/4months	5&1/4months	
	Majes-7	4&2/4months	4&2/4months

CHAPTER 3 COST ESTIMATE FOR FLOOD CONTROL FACILITIES

3.1 Method of Cost Estimate

Since there was no cost estimate standard which is authorized by government organization in Peru, the cost estimate was carried out based on the criteria of CAPECO (Camara Peruana de Construction: Peru construction association).
Unit price for labor, material, etc. were used the price as of August, 2011.

3.1.1 Items for Cost Estimate

The project cost for the flood control facilities consists of the following cost.

(1) Direct Cost (COST DIRECTO in Spanish)

Direct cost for construction.

(2) Indirect Cost (COST INDIRECTO)

(2-1) Overhead Cost (GATOS OPERACTIVOS)

According to the scale of the direct cost, the indirect cost is applied in 10-15% of range for the direct cost.

In this study, since the scale of the project was not defined, standard 15% was adopted.

(2-2) Profits (UTILIDAD)

10% of the direct cost is taken into account for the direct profits by works.

(3) Taxes (IGV)

The tax is counted as 18% in sum total of the direct cost (COST DIRECTO) and the indirect cost (COST INDIRECTO).

3.1.2 Calculation Method for Direct Cost

The required staffs, materials and equipment for construction are listed, and the unit price is clarified according to each work item. The quantities for each work item are multiplied, and the construction cost is calculated.

Since price of materials or construction machineries differ by the area, the unit price is calculated according to the area in detail, but there is no big difference fundamentally.

About the area in the Majes-Camana River, the unit price is shown in ***Table 3.1***.

Table 3.1 **Unit Price (1/5)**

3.3 Cost Estimate for Direct Cost

The cost estimate for direct cost of each river is arranged, and is shown in table below.

3.3.1 Canete River

3.3.2 Chincha River

3.3.3 Pisco River

3.3.4 Majes-Camana

3.4 Cost Estimate of the Project

Cost estimate for the project is shown in ***Table 3.3***.

Table 3.3 **Cost Estimate of the Project**

CHAPTER 4 COMPENSATION

4.1 Land Acquisition

4.1.1 Rural Area

The rural areas is the land which is used for agriculture, livestock, forest and conservation, and is not conditioned as city territory. The city suburbs are not included. Land, water resources, ecosystem and buildings that exist in there are also included.

(1) Unit Price in Rural Area

The rural area (farmland) currently confirmed at the river basin is classified into two groups. It is dike with revetment and dike without revetment.

Table 4.1 **Classification of Agriculture Area**

Dike with revetment	Along-river area	Erosion area
		Under-production area
	Not neighboring part of the river	
Dike without revetment	Neighboring part of the river	
	Not neighboring part of the river	

Unit price for farmland (sol /1ha) by river basin was set up on the following criteria.

- Formal information is collected from the irrigation association according to river basin.
- Farmland price by market information
- Interview with farmhouses.

Table 4.2 **Unit Price for Land Acquisition in Rural Areas**

The main factors of the price fluctuation for each river basin are as follows.

- The annual water use volume (campaign), and the required water resources volume calculated from land use
- Quality of soil in farmland and climates
- Cultivated crops and average yield of crops

(2) Inundate Areas in the Rural Area

The inundate area which is directly related to the project is a) land without riverbank protection, b) eroding land along riverside, and c) land under production.

Figure 4.1 **Dike without Revetment in Farmland/ Area along River/ Erosion Area**

Figure 4.2 **Dike without Revetment in Farmland/ Area along River/ Area under Production**

(3) Canete River Basin:

The areas to be scheduled land-acquisition in the Canete River basin is area of 1.24 ha in the eroded farmland, and 0.93 ha in the under- production farmland.

Table 4.3 **Land Acquisition for Farmland in the Canete River Basin**

Critical Point	Location	Farmland (ha)		
		Along-river area		
		Bank side	Erosion	Under-production
Ca – 02	6+700 - 8+300	Left		
		Right		0.01
Ca - 03	10+100 - 11+200	Left	1.24	0.69
		Right		
Ca - 05	25+000 - 26+600	Left		
		Right		0.23
Total			**1.24**	**0.93**

(4) Chincha River Basin:

In the Chincha River basin, the eroded farmland is area of 2.54 ha, and the under-production farmland is area of 1.28 ha.

Table 4.4 **Land Acquisition for Farmland in the Chincha River Basin**

Critical Point	Location	Farmland (ha)		
		Along-river area		
		Bank side	Erosion	Under-production
Ch - 01	2+900 - 4+900	Left	0.77	
		Right		
Ch - 03	23+900 - 24+400	Left		
		Right	0.69	
Ma - 01	2+400 - 4+800	Left	0.40	
		Right		0.80
Ma - 02	7+800 - 10+400	Left	0.68	
		Right		0.48
Total			**2.54**	**1.28**

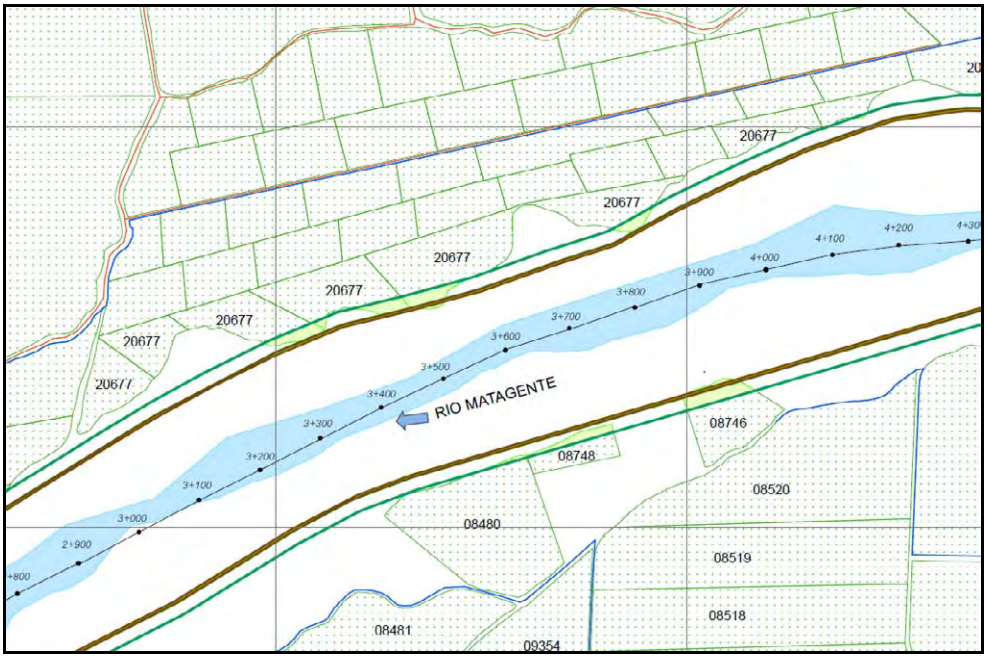

Figure 4.3 **Land Aquisition in the Chincha River Basin (MA-01)**

(5) Pisco River Basin:

The area of land-acquisition schedule in the Pisco River basin is area of 17.07 ha in the eroded farmland and 3.20 ha in the under- production farmland.

Table 4.5 **Land Acquisition for Farmland in the Pisco River Basin**

Critical Point	Location	Farmland (ha)		
		Along-river area		
		Bank side	Erosion	Under-production
Pi – 01	2+900 - 5+000	Left	0.31	
		Right		
Pi – 02	6+400 - 7+900	Left		1.17
		Right		
Pi – 04	19+500 - 20+500	Left	3.28	
		Right		
Pi – 05	25+900 - 26+700	Left		2.03
		Right		
Pi – 06	34+500 - 36+500	Left		
		Right	13.48	
Total			**17.07**	**3.20**

Many of farmlands to be scheduled land-acquisition are concentrated in retarding reservoirs (PI-06).

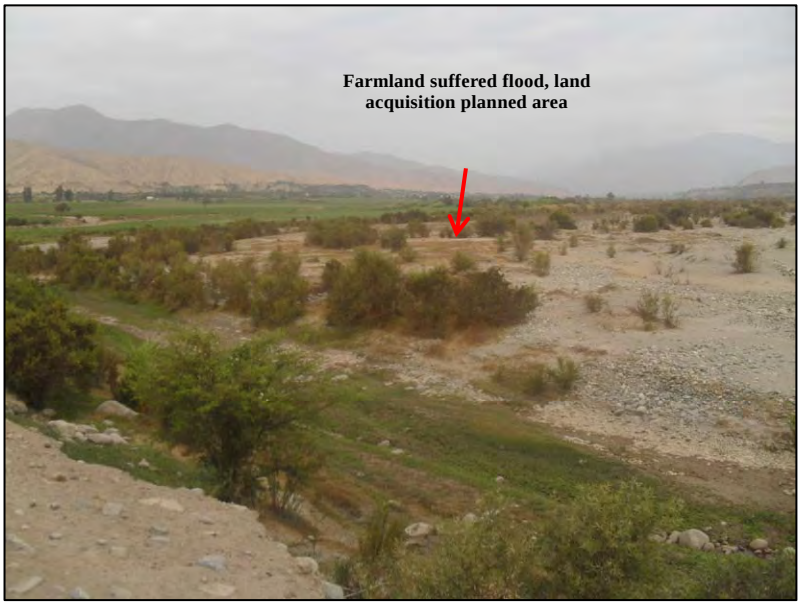

Figure 4.4 **Left-Bank Side in the Pisco River (PI-06), Land Acquisition Area**

(6) Camana River Basin:

According to the afforestation type (Type II) proposed in the river basin, the land-acquisition area in MC-03 point is area of 2.94 ha.

Table 4.6 **Land Acquisition for Farmland in the Camana River Basin**

Critical Point	Location	Farmland (ha)		
		Along-river area		
		Bank side	Erosion	Under-production
MC-03	11+000 - 17+000	Left		2.94
		Right		
Total				**2.94**

(7) Majes River Baisin:

The land acquisition of the under-production farmland is required of each object place. Sum total area reaches at 8.39 ha.

Table 4.7 **Land Acquisition for Farmland in the Majes River Basin**

Critical Point	Location	Farmland (ha)		
		Along-river area		
		Bank side	Erosion	Under-production
MC-04	48+000 - 50+500	Left		0.79
		Right		
MC-05	52+000 - 56+000	Left		2.41
		Right		
MC-06	59+000 - 62+500	Left		2.01
		Right		2.31
MC-07	64+500 - 66+500	Left		0.49
		Right		0.38
Total				**8.39**

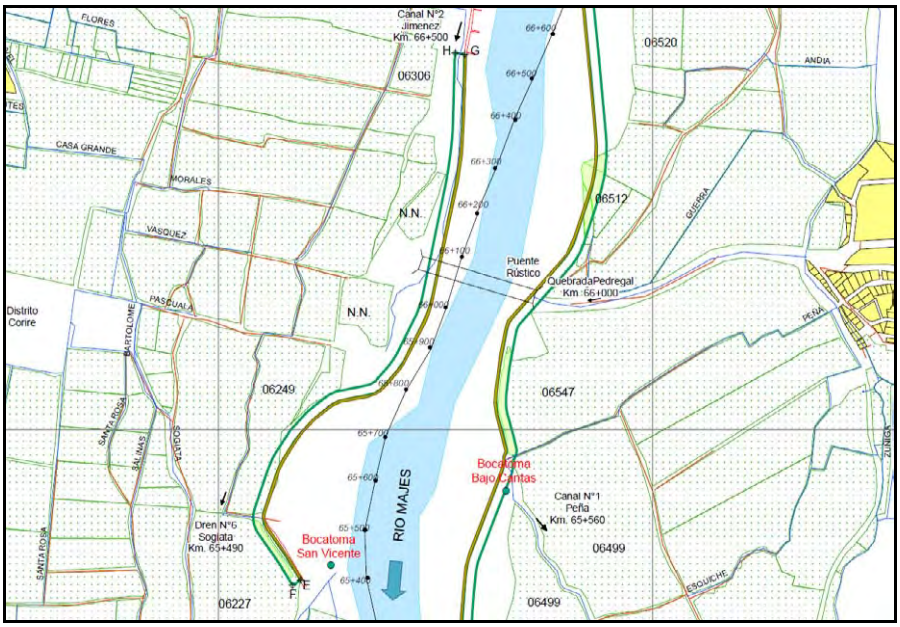

Figure 4.5 **Land Aquisition in the Majes River Basin (MC-07)**

(8) Land-acquisition Cost for Rural Area

The land acquisition cost in rural area in each river basin is calculated by multiplying the inundate area by the unit price. In this time, the calculation is carried out as of January, 2012.

Table 4.8 **Land Acquisition Cost in Rural Area in the Canete River Basin**

Table 4.9 **Land Acquisition Cost in Rural Area in the Chincha River Basin**

Table 4.10 **Land Acquisition Cost in Rural Area in the Pisco River Basin**

Table 4.11 **Land Acquisition Cost in Rural Area in the Camana River Basin**

Table 4.12 **Land Acquisition Cost in Rural Area in the Majes River Basin**

The grand total cost for land acquisition in the rural area by private sector price is 1,430,813 sols. The summarized table according to each area is shown below.

Table 4.13 **Total Cost for Land Acquisition in Rural Areas**

4.1.2 Urban Areas

Urban area is defined as a village and area used for urban function such as housing, commerce, industry, or others. Even if there is no building, it is land with the general public services (power supply, water supply and sewage, etc.) as a village.

The urban areas to be scheduled land acquisition have buildings and/or lands fundamentally. These areas are located on the riverside in the study area of the project, and many of them are received fundamental public services such as water supply, sewerage and electricity services, etc.

(1) Unit Price in Urban-areas

The building of the urban areas related to the project is classified into two groups.

- Public infrastructure and housing.

The classification according to the kind of building material is as follows similarly.

- Construction (brick), Adobe (sun-dried brick) and Kincha (sticks/ small logs)

Table 4.14 **Classification by Buildings in Urban Area**

Classification	Category	Materials
Public Infrastructure	I	Building I(Brick)
Housing	II	Building II(Brick)
	III	Adobe (Sun-dried brick)
	IV	Kincha

Based on the data of the formal construction price table in the desert area computed by the Ministry of Construction and Housing, the average unit price for every category was calculated.

Table 4.15 **Unit Price for Building Construction (Sol x m^2)**

Table 4.16 **Unit Price for Land Acquisition in Urban Area**

(2) Inundation Areas in Urban Areas

There are urban inundation areas in the Canete, Chincha and Majes River basins.

Canete River Basin:

The afforestation area of zone Ca-01 (km 4+200-5+200) crosses the Urbanito Village and the Pedro Cruz Village. These villages are in the right bank of the Canete River, and are surrounded by house buildings. The collapsed buildings in the inundation areas were shown in the following table according to the main materials.

Table 4.17 **Inundation Area of Urban Area in the Canete River Basin**

Critical Point	Location	Area with buildings (m2)			Area without buildings (m2)
		Housing construction II (Brick)	Adobe (Sun-dried brick)	Kincha	
Ca – 01	4+200 - 5+200	387.18	1,161.53	2,323.07	967.94
Total		**387.18**	**1,161.53**	**2,323.07**	**967.94**

Figure 4.6 **Right-bank Side of URBANITO Village in the Canete River**

Chincha River Basin:

In the right-bank side of the Matagente River, the Chacarilla Village is near the El Carmen bridge. This village is located on extension of the dike (afforestation area), and the land acquisition is needed.

Table 4.18 **Inundation Area of Urban Area in the Chincha River Basin**

Critical Point	Location	Area with buildings (m2)			Area without buildings (m2)
		Housing construction II (Brick)	Adobe (Sun-dried brick)	Kincha	
Ma - 02	7+800 - 10+400	402.77	419.62	191.55	1,164.24
Total		**402.77**	**419.62**	**191.55**	**1,164.24**

Figure 4.7 **CHACARILLA Village**

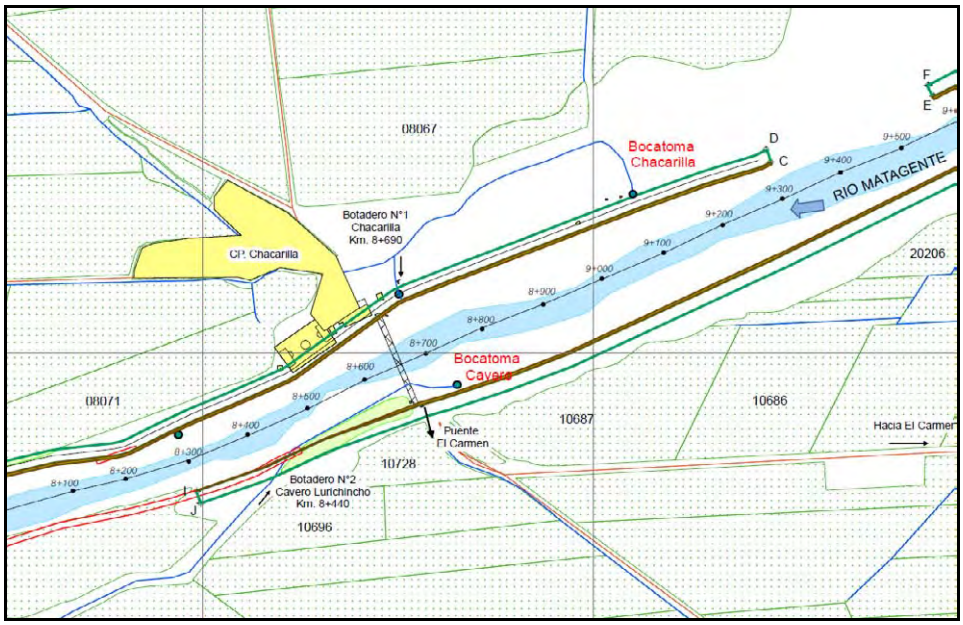

Figure 4.8 **Inundation Area of Urban Area in Chincha River Basin (Ma-02)**

Majes River Basin:

The Punta Colorada Village is located near the Colorado Bridge in the right-bank side of the Majes River. Since residences, church and recreational areas are located in this village, and afforestation area (MC-06) is included, the land acquisition is required.

According to observation by the field reconnaissance, buildings with 2 stories and buildings of adobe (sun-drying brick) are many.

Figure 4.9 **PUNTA COLORADA Village**

Table 4.19 **Inundation Area of Urban Area in the Majes-Camana River Basin**

Critical Point	Location Location	Area with buildings (m2)			Area without buildings (m2)
		Housing construction II (Brick)	Adobe (Sun-dried brick)	Adobe (Sun-dried brick)	
Total		**569.06**	**3,969.28**	**2,599.25**	**1,642.13**

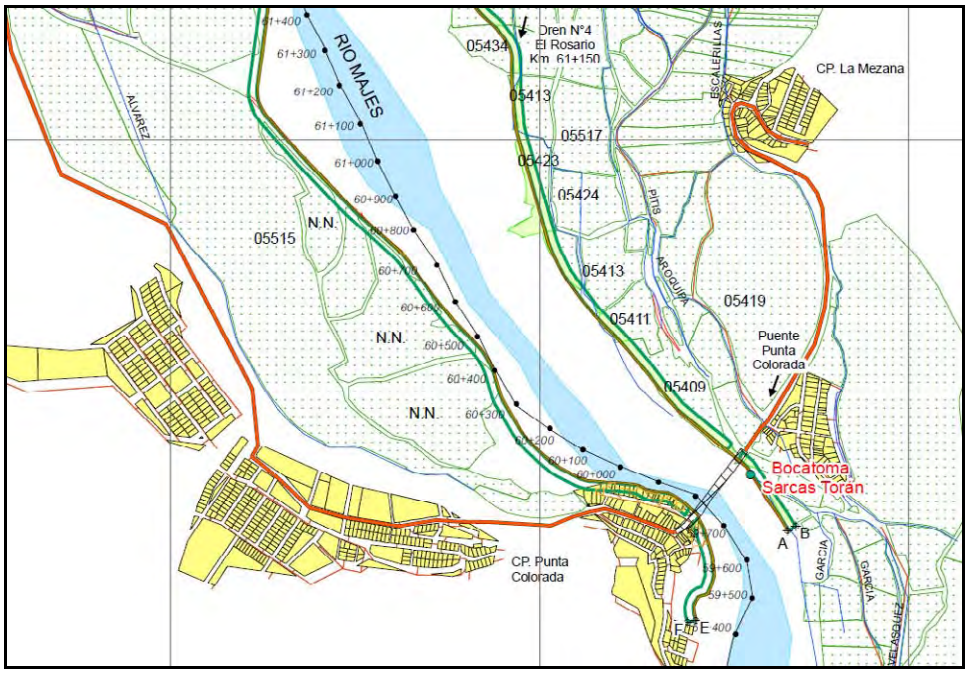

Figure 4.10 **Inundation Area of Urban Area in the Majes River Basin (MC-06)**

Figure 4.11 **PUNTA COLORADA Village**

(3) Land-acquisition Cost in Urban Areas

The land-acquisition cost in urban areas was calculated according to the existence of buildings. The cost was calculated by multiplying building area by unit price when there is building, and land area by unit price when there is not building (Cost as of January, 2012).

Table 4.20 **Land Acquisition Cost in Urban Area in the Canete River Basin**

Table 4.21 **Land Acquisition Cost in Urban Area in the Chincha River Basin**

Table 4.22 **Land Acquisition Cost in Urban Area in the Majes River Basin**

(4) The Total Cost for Land Acquisition in Urban Areas

The total cost for land acquisition in market price is 5,754,678 sols. The table is shown according to each river basin.

Table 4. 23 **Summary of Land Acquisition Cost in Urban Areas**

4.2 Compensation for Infrastructures

4.2.1 Water Resources Infrastructure

There is the functioning water-resources infrastructure in/near the dike. Compensation for infrastructure is needed in order to continue the function. Infrastructure compensation is mainly for the structure of intakes, drainages, canals, and drain ditches.

(1) Unit Price for Water-resources Infrastructure

In order to calculate the unit price, the construction design of general intake and discharge structure was carried out, quantities for each facility were calculated, and the unit price used for the proposed project was set.

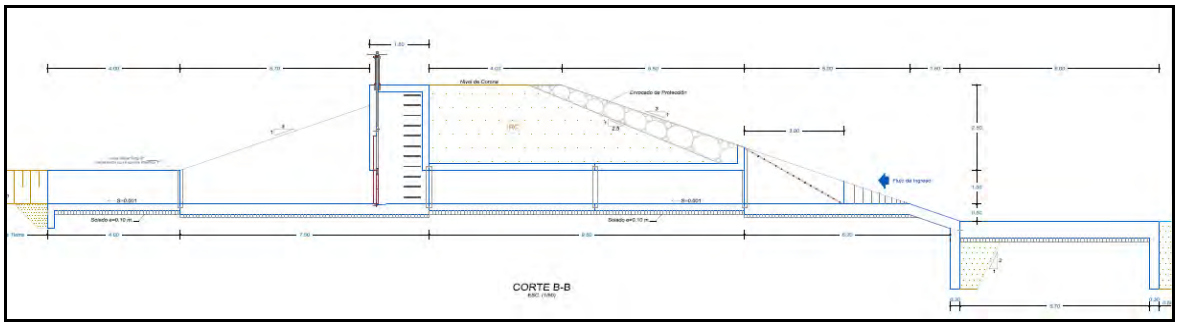

Figure 4.12 **Typical Design for Intake Structure (Type I)**

Table 4.24 **Unit Price of Compensation for Water Resources Infrastructure**

Intake Structure (Sol / unit)		Drainage Structure (Sol / unit)		Canal Structure (Sol / m)	
Type I Q> 0.0 - 1.0 m3/s	Type II Q> 1.0 - 1.5 m3/s	Type I Q> 0.0 - 1.0 m3/s	Type II Q> 1.0 - 1.5 m3/s	Type I Q> 0.0 - 0.5 m3/s	Type II Q> 0.5 - 1.0 m3/s
97,270.91	103,178.81	94,859.54	97,755.68	59.54	119.08

(2) Identification of Water-Resources Infrastructure

As for the facilities required for compensation, the locations, the discharge and the length of canals and drain ditches are identified by the information from the local irrigation associations and the field reconnaissance.

Canete River Basin:

The compensation for water resources infrastructures such as drainage structures and canal structures is mainly needed.

Table 4.25 **Water Resources Infrastructure in the Canete River Basin**

Critical Point	Location	Drainage Structure		Canal Structure		
		Name	Q (m3/s)	Name	Q (m3/s)	L (m)
Ca - 01	4+200 - 5+200	Pachacamilla	1.25			
		Mendieta	0.60			
Ca - 02	6+700 - 8+300			Ascona	0.20	202.00
Ca - 03	10+100 - 11+200	Palo Herbay	0.80			
TOTAL						**202.00**

Figure 4.13 **PACHACAMILLA Drainage (Ca-01)**

Chincha River Basin:

The compensation for the intake structures (Puquio Santo, Chacarilla, and Cavero) and drainage structures (Perez and La Altura) in the Matagente River is needed.

Table 4.26 **Water Resources Infrastructure in the Chincha River Basin**

Critical Point	Location	Intake Structure		Drainage Structure	
		Name	Q (m3/s)	Name	Q (m3/s)
Ma - 01	2+400 - 4+800	Puquio Santo	0.50	Pérez	0.4
Ma - 02	7+800 - 10+400	Chacarilla	0.50	La Altura	0.8
		Cavero	1.50		
Total					

Figure 4.14 **CAVERO Drainage Structure Constructed by the Area's Residents (Ma - 02)**

Pisco River Basin:

There is the Toma Baca canal.

Table 4.27 **Water Resources Infrastructure in the Pisco River Basin**

Critical Point	Location	Canal Structure		
		Name	Q (m3/s)	L (m)
Pi – 02	6+400 - 7+900	TomaBaca	0.3	70
Total				70

Camana River Basin:

The Montes Nuevos intake structure was confirmed.

Table 4.28 **Water Resources Infrastructure in the Camana River Basin**

Critical point	Location	Intake Structure	
		Name	Q (m3/s)
MC-01	0+000 - 4+500	Montes Nuevos	1.00
Total			

Majes River Basin:

At the Majes River basin, the intake structure (Bajo Cantas), the drainage structure (Vizcardo, Pampa Blanca, El Rosario, Sogiata), the canal structures and the drain ditches were confirmed. The Pedregal River is flowing into the Majes River similarly.

Table 4.29 **Water Resources Infrastructure in the Majes River Basin**

Critical Point	Location	Intake structure		Drainage Structure		Canal Structure / Drain Ditch		
		Name	Q (m3/s)	Name	Q (m3/s)	Name	Q (m3/s)	L (m)
MC-04	48+000 - 50+500			Vizcardo	0.30			
MC-05	52+000 - 56+000			Pampa Blanca	0.20	Pampa Blanca	0.3	350
MC-06	59+000 - 62+500			El Rosario	0.25			
MC-07	64+500 - 66+500	Bajo Cantas	0.70	Sogiata	0.30	Peña	0.25	69.81
				Qda. Pedregal	100.00	Jiménez	0.20	475.00
Total								544.81

Figure 4.15 **PAMPA BLANCA Drain Ditch (MC-05)**

(3) Compensation cost for Water Resources Infrastructure

The compensation cost for water-resources infrastructure was calculated according to the type (I or II) and the classifications (intake structure, drainage structure and canal/ drain ditch) (cost as of January, 2012).

Table 4.30 **Compensation Cost for Water Resources Infrastructure in the Canete River Basin**

Table 4.31 **Compensation Cost for Water Resources Infrastructure in the Chincha River Basin**

Table 4.32 **Compensation Cost for Water Resources Infrastructure in the Pisco River Basin**

Table 4.33 **Compensation Cost for Water Resources Infrastructure in the Camana River Basin**

Table 4.34 **Compensation Cost for Water Resources Infrastructure in the Majes River Basin**

(4) Total compensation cost for water resources infrastructure

The total compensation cost for the water-resources infrastructure according to each river basin is xxxxxx in sols (private sector price) as shown in the following tables.

Table 4.35 **Total Compensation Cost for Water Resources Infrastructure**

4.2.2 Road Infrastructures

The compensation or rearrangement of roads in the afforestation area is needed.

(1) Unit Price of Road Infrastructure

There are three type roads such as national road, regional road and local road. The unit price of road construction per 1km was calculated as the average cost.

Table 4.36 **Compensation Unit Price for Road Infrastructures**

(2) Road Infrastructure Classification

Road and afforestation area cross in zone Ca-02 and Ca-05 in the Canete River basin.

Table 4.37 **Road Infrastructure in the Canete River Basin**

Critical Point	Location	Regional Road		Local Road	
		Paved Road (m)	Unpaved Road (m)	Paved Road (m)	Unpaved Road (m)
Ca - 02	6+700 - 8+300				234.00
Ca - 05	25+000 - 26+600	180.00			
Total		**180.00**			**234.00**

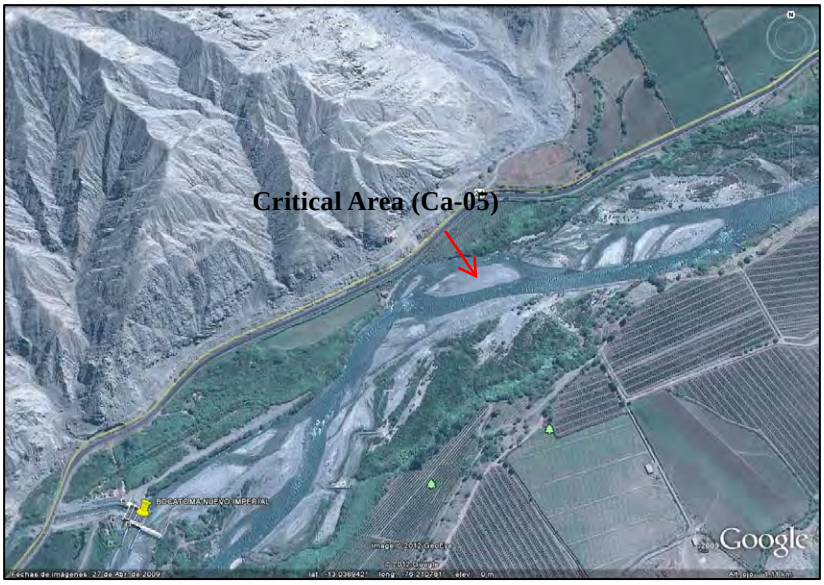

Figure 4.16 **SAN VICENTE – LUNAHUANA Regional Road**

(3) Compensation cost for road infrastructures

The compensation cost for road infrastructures was calculated by road type and road length required compensation (cost as of January, 2012).

Table 4.38 **Compensation Cost for Road Infrastructures in the Canete River Basin**

4.3 Total Cost for Land Acquisition and Compensation

4.3.1 Total Market Price

Area of land acquisition and compensation cost in rural-areas and urban-areas (water resources and road infrastructures) in market price are summarized as follows.

Table 4.39 **Summary of Land Acquisition and Compensation Cost by Market Price**

4.3.2 Total Social Price

In order to change market price into social price, the following criteria is based on.

- The land-acquisition cost in rural area at market price is only tax (3%). The conversion factor (CF) is set as 0.97.
- The land-acquisition cost in urban area at market price includes consumption tax (18%). The conversion factor (CF) is set as 0.847.
- The conversion factor (CS) of the compensation cost for water resources infrastructure was obtained from data of water resources projects.
- The conversion factor (CF) of the compensation cost for road infrastructure was obtained from SNIP of Ministry of Economy and Finance (Resolucion Directoral No.003-2011-EF/68.01: Annex SNIP 10-V3.1, FC=0.79).

Table 4.40 **Conversion Factor for Social Price (CF)**

Object Item	Coefficient
Land Acquisition for Rural Area	0.970
Land Acquisition for Urban Area	0.847
Water Resources Infrastructure	0.827
Road Infrastructure	0.790

4.5 Operation and Maintenance Cost

Operation and maintenance cost after completion of the Project is summarized in ***Table 4.47***. Operation and maintenance work for each facility or critical point consists of preparatory works, earth works and revetment maintenance works as follows.

Category	Work Item	Assumption for O&M Cost Estimate
Preparatory Works	Mob/Demob of Heavy Equipment	➢ Mobilization of bulldozer is assumed. It is confirmed that there are heavy equipment rental companies in each project site. Besides, water user associations aslo have bulldozer.
	Topographic Survey	➢ Topographic survey for whole dike lenghth.
Earth Works	Channel Normalization	➢ Target areas of channel normalization are the river sections where riverbed excavation is required. 30 cm depth excavation by bulldozer is assumed.
Revetment Maintenance Works	Cutting trees	➢ Reffering to past PERPEC projects, 667 trees/1km is need to be cut.
	Rearrangement of Boulders	➢ Reffering to past PERPEC projects, 1% of boulder riprap is assumed to be washed away.

Annual O&M costs are shown in ***Table 4.48*** to ***Table 4.52***. Annaual O&M cost is about 0.9% of construction cost in average.

CHAPTER 1 BENEFITS

1.1 Method of Calculating Benefits

The benefits of flood control projects are the reduction of flood damages by comparing with-the-project and without-the-project. Assuming that the life of flood control facility is 50 years, the amounts of damage are caluculated in every flood occurence probability (2-50 year), and then expected annual average of damage reduction (EAADRs) is estimated by interpolation method based on those flood damages and occurence probability, total of the EAADRs is assumed as the benefits turned by the construction of facilities.

The same way are specified in.Guidelines for flood control in Peru (GUIA METODOLOGICA PARA PROYECTOS DE PROTECCION Y / O CONTROL DE INUNDACIONES EN ÁREAS AGRICOLAS O URBANAS, 4.1.2p-105)

The calculating methods of specific benefits are as follows,

① Flood inudation analysis for each (2 years to 50) of the occurrence probability in case of without the projects is carried out and the amount of flood damage is calculated in the flood area.

② Then , flood inudation analysis in case of with-the-projects are carried out, and the amount of flood damage is calculated in the flood area.

③ The total benefits are estimated from the difference between ① and ②, and adding benefits of facilities other than levees (such as intake faicilities, road embankment on)

Damages are consists of direct damage by flood inunadation and indirect damages (such as inability of farming, intercption losses of traffic on) derived from the collpase of facilities.

1.2 Method of Calculating Amount of Damage

In this study, total amount of damage of direct and indirect cost is estimated by means of the items listed in the ***Table 1.1***. (See details in Appendix-1, 1 to 7)

Table 1.1 **Items of Calculating Amount of Flood Damage**

Classification of Damage	Items of Damage	Remarks
(1)Direct Damage	①Crop damage	・Field crops in the flood season Flood damage on crops is calculated by multiplying the inundation depth and the number of days depending on the damage rate ・Facilities of farming, such as agricultural farmland and irrigation channels ・the amount of crop damage by multiplying the damage ratio depending on the number of days flooded and inundation depth with sediment damage to farmland assets

Classification of Damage	Items of Damage	Remarks
	② Damage to irrigation structures	・Amount of damage due to breach of structures such as irrigation intake facilities and irrigation channels.
	③Road damage	・Flood damage on roads is estimated by calculating the damage on the distribution.
	④Damage to Houses	・Buildings for residential and business buildings Calculated by multiplying the damage ratio to assets depending on the depth of water. Houses:residential and business building Household goods: Such as automobiles, clothing, furniture and appliances. Flood damage against houses,shops,assets,and stocks is calculated by multiplying the coefficient of flood damage by valuation of property according to the inundation depth
	⑤ Damage of public facilities	・Roads, bridges, sewer and urban facilities ・the damage of public facilities such as schools, churches etc.. the amount of damage of public civil facilities,etc is estimagted by multiplying the ratio corresponding to facilities by the damage amount of the general assets.
	⑥ Damage of public services	・Facilities such as railways, telephone, gas, water, power
(2)Indirect Damage	①Damage to agriculture	・Assume the damage caused by the inability of agricultural water supply due to the breach of irrigation structures ・reconstruction of irrigation structures and repair costs are estimated as direct damage.
	② Damage caused by blocking traffic	・Assumed the damage caused by blockage of the road which were destroyed by flood ・Cost of repair and reconstruction of roards is calculated as the direct damage.

(1) Direct Damage

Direct damage is calculated by multiplying the coefficient of damage corredponding to the flood water depth to the amount of assets valuation.

(2) Indirect Damage

For indirect damage, the effects of impact of the breach of intake facililies and road are taken into account. Method of calculating the amount of indirect damage is as follows.

a. Damage to the weir

For the breach of the weir, the sum of the direct damage for the reconstruction or rapair of the weir and indirect damage of crops due to the losses of harvesting by inability of water supply is calculated as the amount of damage.

1) Calculation of facility costs

Cost of intake facilities= facility construction costs per unit water intake × scale (amount of water

intake, length of the facility)

Facility construction cost per unit water intake: collect documents of the amount of water intake and facility construction costs of existing facilities(new, repair) and estimate the cost per unit by analyzing the correlation of those.

Facilities are assumpt to be complete loss at probabiliry 1/10 of river discharge.

2) Crop damage

Calculate the amount of revenue each year to crops that are irrigated cultivation in the area

Annual amount of revenue = (crop yield - costs) × number of annual harvest

High-yield crop = acreage under cultivation (ha) × unit frop yields (kg / ha) ×trading unit cost.

Cost = cost per unit area (S / .ha) ×acreaga under cultivation (ha)

b. Damage of road

Economic loss due to the blocking traffic is calculated as amount of damage cost.

amount of damage = Direct damage + indirect damage

amount of direct damage: road construction costs (new, repair)

amount of indirect damage : opportunity loss in case of impasable by the breach of the road (depreciation cost+ loss of labor costs)

period of impassable is assumed 5 days (In Peru.temporary road is constructed at about five days in general)

1.3 Calculation of Economic Evaluation

In cost-benefit survey for economic evaluation, two case of ①private price and ② social price which calculated by multiplying the (SCF) standard conversion factor to private price were considered.

The standard conversion factor (SCF) is the ratio of the private price in domestic and the social price calculated at the border with respect to all goods of the country's economy,

To convert economic price, the standard conversion factor SCF is applied for goods and services which were procured in the country.

In this study, economic evaluation is calculated based on the Guidelines which are available in Peru (Guideline of the National Public Investment System (Directorial Resolution No. 003-2011-EF/68.01, Annex SNIP 10-V3.1). Ministry of Economy and Finance is indicated SCF as shown in ***Table 1.2***.

At transformation from private costs to social costs, value-added tax the (18%) VAT does not considered. SCF of four river basin are shown in ***Table 1.3***. (See details in Appendix-2, 2.1)

In this project, it is necessary to consider the following components: at social evaluation.

- Infrastructure Costs
- Forestry and Vegetation Recovery Costs
- Training and Risk Prevention Costs
- Mitigation of Environmental Impact
- Detailled Design
- Supervision

Table 1.2 **Standard Conversion Factor (SCF) to Convert to Social Price**

1.4 Disaster Scale

As the results of flood inundation simulation and river flow capacity on 50 year occurrence flood, disaster scale for each basin in before and after the flood control flood control measures taken is

shown in ***Table 1.4***.

Table 1.4 **Flood Damage and Effect of Flood Control Measures in 50 Year Flood**

Basin	Inundation Area (ha)			Erosioned Area (ha)			Damage to water infrastructure (pcs)			Damage to roads (pcs)		
	Sin Proy.	Con Proy.	Efecto	Sin Proy.	Con Proy.	Efecto	Sin Proy.	Con Proy.	Efecto	Sin Proy.	Con Proy.	Efecto
CAÑETE	1,200	167	1,034	202	68	135	2	1	1	4	0	4
CHINCHA	2,352	1,020	1,332	132	35	97	2	0	2	4	4	0
PISCO	859	312	547	98	35	63	4	0	4	2	1	1
MAJES-CAMANA	3,098	545	2,552	1,318	399	919	13	7	6	5	2	3
TOTAL	7,509	2,044	5,465	1,750	537	1,213	21	8	13	15	7	8

*Some values differ due to the decimal consideration

By implementing the projects, the following damage mitigation can be expected.

(1) Throughout the 4 basins, flooding area is estimated as approximately 7,509 ha before the projects, however after the projects flooding area is expected to be reduced to approximately 2,044 ha, therefore there is a effect of protection against the flooding area of approximately 5,265 ha.

(2) Around 1,213 ha of farmland is protected from erosion or flow out caused by flood discharge.

(3) Breach risk of 13 intake weir is expected to be reduced, results in mitigating the damage possibility of farmland in irrigation area due to the inability of cultivating.

(4) Eigth locations of roads along the rivers are expected to be protected, results in avoiding the economic losses due to interruption of traffic.

1.5 Expected Amount of Damage in Each Return Period

Expected amount of damage in each river are shown in ***Table 1.5*** to ***Table 1.6*** in case of with-the-project and without-the project. Expected amount of damage in 50 years flood in case of without-the-project in each river are 158.2 million of Canete, 103.9 million of Chincha, 81.5 million of Pisco, 192.0 million of Mahes-Camana, expected damage is the highest in Mahes – Camana

1.6 Expected Annual Average of Damage Reduction (EAADR)

(1) Method of calculation

Expected annual average of damage reduction (EAADR) can be calculated by accumulating total of annual average damage cost of each flood scale which is obtainde by multiplying flood coccurence probability of flood scale to the amount of flood damage of each dischare scale.

Amount of flood damage by each probability years,

As the flood occurs stochastically, annual flow of benefit should be presented in the form of expected annual average of damage resudtion, which is calculated as follows,

Table 1.8 **Expected Annual Average of Damage Reduction**

Occurrence Probability	Damage Value			Interval Average of Damage Reduction	Interval Provability	Annual Average Damage Reduction
	w/o Project	w/ Project	Damage Reduction			
1/1			$D_0=0$			
1/2	L_1	L_2	$D_1=L_1-L_2$	$(D_0+D_1)/2$	1-(1/2)=0.500	$d_1=(D_0+D_1)/2$ x 0.67
1/5	L_3	L_4	$D_2=L_3-L_4$	$(D_1+D_2)/2$	(1/2)-(1/5)= 0.300	$d_2=(D_1+D_2)/2$ x 0.300
1/10	L_5	L_6	$D_3=L_5-L_6$	$(D_2+D_3)/2$	(1/5)-(1/10)= 0.100	$d_3=(D_2+D_3)/2$ x 0.100
1/20	L_7	L_8	$D_4=L_7-L_8$	$(D_3+D_4)/2$	(1/10)-(1/20)= 0.050	$d_4=(D_3+D_4)/2$ x 0.050
1/30	L_9	L_{10}	$D_5=L_9-L_{10}$	$(D_4+D_5)/2$	(1/20)-(1/30)= 0.017	$d_5=(D_4+D_5)/2$ x 0.017
1/50	L_{11}	L_{12}	$D_6=L_{11}-L_{12}$	$(D_5+D_6)/2$	(1/30)-(1/50)= 0.013	$d_6=(D_5+D_6)/2$ x 0.013
1/100	L_{13}	L_{14}	$D_7=L_{13}-L_{14}$	$(D_6+D_7)/2$	(1/50)-(1/100) =0.010	$d_7=(D_6+D_7)/2$ x 0.010
Expected Annual Average of Damage Reduction			$d_1+d_2+d_3+d_4+d_5+d_6+d_7$			

(2) Calculation of Expected Annual Average of Damage Reduction

Calculating results of Expected Annual Average of Damage Reduction on each river basin are shown in ***Table 1.9*** and ***Table 1.10***.

Table 1.9 **Results of Expected Annual Avarage of Damage Reduction (Private Price)**

Basin	Return Period	Probability	Damages (Thousand Soles)			Interval Avarafe Damage ④	Probability incremental value ⑤	Anual Mean Damage ④×⑤	Accumulated Anual Mean Damage

1.7 Benefits in Project Evaluation Period

Benefits are calculated for 15 years as the project evaluation period from the commencement of project operations.

The benefits of 15-year evaluation period by implementing the project is shown in ***Table 1.11***.

Table 1.11 **Benefits by Implementing the Projects**

Basin	Economic Loss without -the-project		Economic Loss with-the-project		Expected Annual Average of Damage Reduction ①-③	Benefits for Evaluation period. ②-④
	Annual Average of Damage ①	Total Amount of Damage for Evaluation Period ②	Annual Average of Damage ③	Total Amount of Damage for Evaluation Peirod④		
Canete	13,952	209,273	1,678	25,169	12,274	184,104
Chincha	22,528	337,919	1,996	29,942	20,532	307,977
Pisco	18,568	278,516	724	10,860	17,844	267,656
Mahes-Camana	22,482	337,226	4,890	73,343	17,592	263,883
Whole 4 Basin	77,530	1,162,934	9,288	139,314	68,242	1,023,620

(i) Throughout the entire 4 river basin, in the annual average amount of damage is s/o 77,530 thousand in case of without-the-project, however it will be reduced by s/o 9,288 thousand in case of with-the-project.

The difference between with-the-project and without-the-project is reached by s/o 68,242 thousand, this means that 88.0% of Expected Annual Average of Damage reduction will be expected. As the results, total benefits of s/o 1,023,620 will be expected in 15 year evaluation period.

(ii) At the individual riverbasin, benefit in 15-year evaluation period, Chincha, Pisco, Mahesu –Camana and Caniete is generated high in the order. The difference between the maximum benefit and minimum benefit is about 1.6 times, and also similar levels of benefit in each river basin are generated by carrying out the project.

1.8 Summary of Benefits

By implementing this project, the following benefits can be expected.

(1) Approximately 5,500 ha of land will be protected from flooding.
(2) Approximately 1,215 ha per year of farmland will be protected from soil erosion and flow out across 4 river basin by river improvement.
(3) By protecting 13 intake weir, stable farming becomes possible.
(4) 8 location of road place will be avoided from failures, and contribute to the stability of the regional distribution and daily life.

(5) Througout the 4 river basins, benefits can be expected s/o 68,242 thousand on annual average, and s/o 1,023,620 thousand in 15 year evalution period

CHAPTER 2 SOCIAL EVALUATION

2.1 Purpose and Evaluation Index

The purpose of the social evaluation in this study is to examine the efficiency of investment in structural and non-structual measures using the technique of cost-benefit analysis from the view point of the national economy. As the method of social evaluation, cost-benefit ratio (B/C), net present value (NPV) and economic internal rate of return. (EIRR) is adopted. EIRR is as an indicator of the efficiency of investment.

EIRR is defined as the discount rate which even out the present value of costs incurred by the projects and the present value of the benefits, and it makes net present value(NPV)= 0 and B/C=1, indicating what percentage of profits being expected by investment.

Internal rate of return used in the economic evaluation is called as the economic internal rate of return (EIRR). Private price is converted to a economic price (so-called social price) to remove the effects of market distortions.

Internal rate of return (IRR), net present value(NPV) and B / C is calculated by a formula in the table below. In case of B/C=1 or NPV >0, the projects is judged as efficient from the view point of the national economy growth.

Table 2.1 **Evaluation index and Feature of Cost-Benefit Analysis**

Evaluation Index	Formula	Feature
(NPV:Net Present Value)	$NPV = \sum_{i=1}^{n} \frac{B_i}{(1+r)^i} - \sum_{i=1}^{n} \frac{C_i}{(1+r)^i}$	•The magnitude of net benefit by the implementation of the project can be compaired. ・Value changes by the social discount rate.
(B/C: Cost Benefit Ratio)	$B/C = \sum_{i=1}^{n} \frac{B_i}{(1+r)^i} \Big/ \sum_{i=1}^{n} \frac{C_i}{(1+r)^i}$	• The efficiency of investment can be cpmpaired by the size of the benefit per unit investment . ・Value changes by the social discount rate.
(IRR: Economic Internal Rate of Return)	$\sum_{i=1}^{n} \frac{B_i}{(1+r)^i} = \sum_{i=1}^{n} \frac{C_i}{(1+r)^i}$	・The efficiency of investment can be determined by comparison with the social discount rate. ・Not affected by the social discount rate.
Here, Bi: The benefits of the i-th year, Ci: The costs of the i-th year, r: Social discount rate (11%) n: Evaluation years		

2.2 Preconditions

Preconditions for each indicator to conduct the economic evaluation is as follows.

i) Evaluation Period

Evaluation period is the year 2013 - 2027 (15 years after construction started). The project schedule is assumed as below. In this study, evalution period is set as 15 years from implementing the costruction of the projects, however there is a possiblity to change evaluation years after in service 15 years under the guidance of the OPI.

- Detailed design year: 2012
- Construction period: 2013 to 2014
- The evaluation period: 2013 to 2027

Project evaluation period is set for 15 years as well as the period which has been adopted in perfil program report of this project. In provision of the SNIP, evaluation period is 10 years as a rule, however in case that the agency of project formation (DGIH in this project) permits the necessity, period can be changed. In Program Perfill Report, DGIH have adopted 15 years and obtained the approval from OPI and DGPM (March 19, 2010). And also 15 years has adopted in this study under the guidance of DGIH and OPI. In general, development study of JICA has been adopted 50 years. Economic evaluation in case of adopting 50 years as evaluation period is attached in Annex-14 project implementation plan of loan assisatance.

ii) Other preconditions

Price Level: 2011

Social discount rate: 11% (Pursuant to the provisions of the SNIP)

Project Cost: Separately estimated (Refer to ***Table 2.3 - 2.4***)
Annual Maintenance Costs: Separately estimated (see ***Table 2.5***)

2.3 Locations of Flood Control Facilities

In this project, the locations of flood control facilities were decided as the results of flood inunation simulation, which carried out reffering to field survey results and the accumulation of assets situation and, interview with irrigaition associations.

Construction items planed in this porject are repair of exixiting dike, embankment, river excavation, revetment, improvement or repair of diversin weir and intake weir and widening of river course.

Locations of flood control facilities on each river basin are shown in ***Table 2.2***.

Total project cost are shown in ***Table 2.3*** (Private Cost) and ***Table 2.4*** (Social Cost) and Annual maintenance cost is shown in ***Table 2.5***. (See details in ***Appendix-2***, ***2.2*** and ***2.3***)

Table 2.2 Location of Construction Site

River	Locatio		Critical Point	Main Protection Objects	Measure	Feature of Work	
Rio Canete	Ca-1	4..2-5.2 km	Narrow Section	Agricultural lands	Dike with bank Protection	Length Dike with bank Large Boulder Riplap	1,100 m 5,430 m3
	Ca-2	6.7～8.3 km	Innnuded Point		Dike with bank Protection	Length Dike with bank Large Boulder Riplap	3,200 m 113,700 m3 28,200 m3
	Ca-3	10.1-11.2 km	Narrow Section		Riverbed excavation, Dike with bank Protection	Riverbed excavation Dike with bank Large Boulder Riplap	L=700 m, V=80,270m3 1,630 m 16,730 m3

Table 2.3 **Total Project Cost (Private Price)**

Table 2.4 **Total Project Cost (Private Price)**

Table 2.5 **Annual Maintenance Cost**

2.4 Cost-Effective Analysis

Cost-Effective analysis is conducted by comparing total cost of construction and maintenance with total benefits (amount of damage reduction) brought out by construction flood control facilities, those costs is transferd to net present value with the use of social discount rate before comparing.
Therefore, at the time of evaluation being as the basis for estimating present value and 15 years from commencement of the project setting as evaluation period, total cost of the project is estimated by sum of present value required to complete flood control facility and maintenance, and total benefits is estimated by the sum of present value of expected annual average of damage reduction.
Table 2.6 shows the results of calculation of B / C, NPV, IRR at private cost. And ***Table 2.7*** shows those figures at social price. (See details in Appendix-2, 2.4 to 2.6)

Table 2.6 **Social Evaluation (B/C, NPV, IRR) (Private Price)**

Table 2.7 **Social Evaluation (B/C, NPV, IRR) (Social Price)**

2.5 Summary of Social Evaluation

Economic effects of the project has been confirmed for all basin in private cost and social cost. As the results of cost-effective analysis. Social evaluation in this project are as follows.

(1) Throughout the Entire 4 River Basin

1) B/C shows 1.89 in private price,and 2.60 in social price. Therefore, this project is considered to be relatively high cost effectiveness.
2) Even IRR shows 23% in the private price, and 32% in the social price, compared to 10% social

discount rate, which is the projects with high return on investment, there is a profitable enough .

(2) Througout the River Individually

1) Cañete River Basin has the highest economic benefits, B/C is 4.73, and 55% internal rate of return (IRR) in the social price,indicating a very high economic efficiency.
2) Similarly, in Chincha river basin, B/C is 3.89 and the internal rate of return is 47% in the social price, a very high economic effect can be expected as well as Caniete river basin.
3) In Pisco River Basin, campared with Cañete and Chincha river, the economic effect is not so high, however B/C is 2.13, IRR has shown a 27% in the social price, a healthy economic effect can be expected.
4) Majes–Camana river basin shows the lowest economic indicators such as B/C=1.53 and IRR=19% in the 4 river river basin, however both B/C and IRR has exceeded standard figure, so that the projects in both rivers can be expected required economic effectiveness as public works projects.

Others, as a positive effect with difficult mesurement by the project in monetary terms, below items can be mentioned.

1) To contribute to future economic development of the region by mitigating the stagnation of economic activities and the concern to flood damage.
2) Contribute to the increase of employment in the region for the construction of the projects.
3) Awareness of flood or other disaster of people living in the flooding area can be improved.
4) For reducing flood damage, stable farming becomes possible, to contribute to higher incomes.
5) Contribute to raise farmland prices

(3) From economic valuation mentioned above, by implementing this project, make a significant contribution to local economic development and poverty reduction can be expected.

CHAPTER 3 SENSITIVITY ANALYSIS

3.1 The Purpose

To cope with the uncertainty of the future due to changes in socio-economic conditions, sensitivity analysis is conducted.

However, in public works projects, there is a characteristic that it takes for a long time from planning to operation and also for service life after beginning of operation, so that a lot of uncertainties which make major impact on the costs or benefits in the future are existed, which can not be predicted deterministically.

Thus, the results of cost-benefit analysis with uncertainty, originally, is desirable to show with some width not rather than absolute and unique calculated from the scenario of one.

As the measure to settle those issues, sensitivity analysis is considered to be one of the idea.

By performing sensitivity analysis and showing the width of the results of cost-benefit analysis to play a proper execution of management of the project and accountability to the public, so that improve the accuracy and reliability of project evaluation.

3.2 Implementation of the Sensitivity Analysis

1) Outline of sensitivity analysis

There are three methods on sensitivity analysis as shown in ***Table 3.1***.

Table 3.1 **Method of Sensitibity Analysis**

Method of Sensitivity Analysis	Outline of Each Method	Outcome
Sensitivity Analysis by Each Factor	To understand the impact of the analysis results in case that only one factor in preconditions and assumptions that set at analysis was veried.	Range of possible values for an analysis of precondition and assumption when one is varied
Upper and Lower Case	Method is that, in the case of preconditions and assumptions set in the analysis, all the main ones were made to change, and set the case to become better or deteriorate, to know the width of the analysis results.	The range of values that can be taken in the results of the analysis, in case that all major preconditions and assumptions were changed
Monte Carlo Sensitivity Analysis	Gives the probability distribution in all the main variables of preconditions and assumptions set in the analysis, and by Monte Carlo simulation, the probability distribution of the analysis results is to know.	The probability distribution of the results of the analysis when all the main precondtions and assumptions has fluctuated

2) Contents of the Sensitivity Analysis in this Study

In this project, sensitivity analysis by a different factor has been employed in public works investment in general, and performed. Economic indicators and case study performed for sensitivity analysis are as follows.

Table 3.2 **Study Case and Economic Indicator in Sensitivity Analysis**

Indicator	Width of flctuation by different factor	Economic indicator evaluated
Construction cost	In case of 5% and 10% increase of construction costs.	IRR、NPV、B/C
Benefit	In case of 5% and 10% decline of benefits	IRR、NPV、B/C
Social discount rate	In case of 5% increase and 5% decline of social discount rate.	NPV、B/C

3) Sensitivity Analysis Results

The results of sensitivity analysis for each case study in private price and social price is shown in ***Table 3.3***.

Table 3.3 **Results of Sensitivity of IRR, B/C, NPV**

	Basin		Item	Basic Case	Case 1	Case 2	Case 3	Case 4	Case 5	Case 6
					Cost increase 5%	Cost increase 10%	Benefit decrease 5%	Benefit decrease 10%	Disc.rate increase 5%	Disc. rate decrease 5%

4) Evaluation of Sensitivity Analysis

Impact on the project due to changes in socio-economic situation in this study is as follows.

1) Throughout 4 basins

Despite 5% to 10% changes in expense and cost, both internal rate of return (IRR) and B/C is not seen large fluctuations. Since the fluctuation of NPV is also small, it can be said to be a project with high efficiency even if the economic and social situation changes more or less.

2) Individual river basin

As for Cañete river, Chincha river and Pisco river, the projects were indicated a highly efficient from the base case, even if small changes are occurred in costs and benefits, the value of IRR, B / C, and NPV indicate a small change, so that it can be said this projects have high efficiency.

In Majes-Camana river, when social dicount rate become 15% (5% increase), economic effciency

become lower than standard value in case of private price, however, in case of social price, indicate highly efficient in all cases.

CHAPTER 4 RISK ANALYSIS

Risk analysis for 4 river basins which make up the components of this projects was performed.

4.1 Definition of Risk

Increase of costs (%) and decrease of benefits (5) that make NPV=0 in social price calculated in the previous section, and define the risk of each river basin are as follows,

- Large Risk: NPV become 0 at 0% to less than 15% of increase of costs and 0% to less than 15% of decrease of benefits.
- Medium Risk: NPV become 0 at more than 15% to less than 30% and more than 15% to 30% of decrease of benefits.
- Small Risk: NPV become 0 at more than 30% of increase of costs and more than 30% of decrease of benefits.

Twenty-eight percent decrease in the cost and benefits to be 0% increase in the NPV of each basin in social price was calculated in the previous section, is defined as follows: the magnitude of the risk of each basin.

Basin becomes zero NPV by less than 0-15% reduction in benefits or increase in the cost of less than 0-15%: large risk

Basin becomes zero NPV by less than 30% to less than or more than 15 reduction of 30% to more than 15 benefit cost increases: During the risk

Basin becomes zero NPV by 30% or more reduction of more than 30 percent increase in the cost or benefit: risk small

4.2 The Magnitude of the Risk of each Basin

Calculation results of increase (%) of costs and decrease (%) of benefits which NPV becomes 0 in the case of social price at each river baisn are shown in ***Table 4.1***.

Benefits of Mahes-Camana indicates moderate risk in this table, however, risk increase of other river basin is very small.

For the basin that have large risk is required to conduct monitoring for the amount of cost reduction under construction and maintenance after completion of the construction.

Table 4.1 **Increase Amount of Costs (%) and Decrease (%) of Beneftis that Makes NPV=0**

	VAN = 0			
Basin	Cost increase (%)	Risk	Benefit decrease (%)	Riesgo
CAÑETE	471%	Low	79%	Low
CHINCHA	355%	Low	74%	Low
PISCO	136%	Low	53%	Low
MAJES-CAMANA	66%	Low	35%	Medium

CHAPTER 5 SUSTAINABILITY ANALYSIS

This project is carried out in collaboration with central government (DGIH) and water user associations of each river basin and local govenments.

Apportionment of costs of construction is shared among central government and water user associations associations of each river basin and local governments, respectively.

Sharing rate will be determined by consultations among relevant agencies, in this study it is assumed that 80% of the central government (DGIH), 15% of local government, and 5% of water users associations as a percentage of the general division.

On the other hand, after the construction of facilities, maintenance and management will be responsible for water user associations. Therefore, the sustainability of the project will be judged by the profitability of the projects and the maintenance ability by the water user associations.

(1) The Profitability of the Projects

As the result of social evaluation, the profitability of the projects of the whole basin and each basin indicates enough high, so that there are no problems with the sustainability of the the projects.

(2) Operation and Maintenance

Budget in recent water user associations of each basin is shown in ***Table 5.1***.

Table 5.1 **Budget of water users associations**

(unit:s/o)

River	Annual budget			
	2007	2008	2009	2010
Canete	2,355,539.91	2,389,561.65	2,331339.69	2,608,187.18
Chincha	1,562,928.56	1,763,741.29	1,483,108.19	
Pisco	1,648,019.62	1,669,237.35	1,725,290.00	1,425,961.39
Mahes-Camana		1,867,880.10	1,959,302.60	1,864,113.30
Total	5,755,792.18	9,526,298.10	15,536,928.01	5,898,261.84

*）Budget of Mahes-Camana water user asscociation on 2008 is assumed budget of Camana on 2008（1,122,078.40）+ budget of Mahes on 2009（745,810.70）due to the lack of data of water user association budget of Mahes

On the other hand, annual maintenance costs that are required after construction of facilities is shown in ***Table 5.2***.

Ratio of maintenance cost agaistr budget of water user associations on 2009 and Annual average of dumage reduction are shown in ***Table 5.2***.

Ratio of annual maintenance cost against anuual budget of water user associations in 2009, Majes-Camana river indicates the highest value of 36.2% and next 22.2% of Pisco and then 11.1% of Canete and 2.9% of Chincha.

On the other hand, the ratio of maintenance costs for annual average amount of damage reduction

is very low values, which have made 2% to 4%.

Therefore, maintenance costs can be thought to be absorbed sufficiently by water user associations. Furthermore, as for the ability of maintenance, it is thought to be possible for water users associations to conduct maintenance with the technical assistance of the Ministry of Agriculture and local govenments, due to the flood control facilities such as dike and weir in this project is familiar to associations.

Table 5.2 **The Ratio of Maintenance Costs for the Budget of Water Users Associations and for the Annual Average Amount of Damage Reduction**

Basin	Operation Cost (thousand soles) (1)	Anual OyM Cost (thousand soles) (2)	Anual OyM cost percentage (%) (3) = (2)/(1)	Mean anual damages (thousand soles) (4)	Percentage of OyM anual cost (%) (5) = (2)/(4)
Cañete	2,331	260	11.1	12,274	2.1
Chincha	14,831	435	2.9	20,532	2.1
Pisco	1,725	383	22.2	17,844	2.1
Majes-Camaná	1,959	710	36.2	17,704	4
Total	**7,499**	**1,788**	**23.8**	**68,242**	**2.6**
