Chapter 1 Outline of the Project

1.1 Background of the Project

The Independent State of Papua New Guinea (herein after referred to as "PNG") has one of the world's largest tropical rainforests and leads the Coalition of Rainforest Nations. Wood harvested from forests is one of the major export goods alongside with mineral resources and agricultural products and contributes significantly to the country's economy. As approximately 87 % of the people of PNG live in rural areas, forests play important roles in the lives of people in rural areas as sources for food supply, fibers and construction materials. The tropical rainforests of PNG are important also for conservation of biodiversity as new species of organisms have been registered almost every year.

The conversion of forest areas through gardening and subsistence agriculture, etc has reduced the forest cover from 38 million ha (approximately 82 % of the total land area of PNG) in 1972 to 33 million ha (approximately 71 %) in 2002. As a result of conversion to gardens for subsistence agriculture, etc. Thus, the rate of decline and degradation of forest resources is a serious problem in PNG.

PNG, jointly with Costa Rica, first proposed "Reducing Emissions from Deforestation and Forest Degradation in Developing Countries (REDD)" at the 11th Conference of the Parties to the United Nations Framework Convention on Climate Change (COP11) in 2005. Since then, the Government of PNG has been working actively toward developing and implementation of measures in reduction and degradation of forests through participation of relevant government offices and donors. Its achievement so far includes the formulation of "the Forest and Climate Change Policy Framework" in 2009 and the establishment of a technical working group on REDD+[1] under the Office of Climate Change and Development in 2010.

Estimation of CO2 emissions and absorption by forests is a basic requirement for the implementation of REDD+. However, the fact that data on forests at the accepted level of accuracy required for the estimation have not been fully available in PNG is the major obstacle to the implementation of practical measures.

Against this background, the Government of PNG submitted a request to the Government of Japan for technical cooperation for the capacity development on forest resource monitoring with the aim of constructing a system to monitor vast forest areas in PNG using satellite imagery and GIS and human resource development for the system construction. In response, JICA conducted a detailed design survey in November 2010. During this survey, JICA and the Government of PNG reached an agreement on the framework for the cooperation and signed and exchanged the Record of Discussions (R/D) describing the details of the framework on November 26th, 2010.

In accordance with the R/D, JICA decided to implement "the Project for the Capacity Development on Forest Resource Monitoring for Addressing Climate Change in Papua New Guinea," for the three-year

[1] At present, REDD is being discussed as a framework of an international system, "REDD+," which includes not only measures against the reduction and degradation of forests, but also promotion of sustainable forest management.

project between March 2011 and March 2014, with the PNG Forest Authority (PNGFA) as the counterpart. Two long-term experts, the chief advisor who is in charge of forest administration and the person in charge of forest surveys and project coordination had been dispatched to PNG for the periods between March 2011 and March 2014 and between May 2011 and March 2014.

1.2 Purpose of the Project

The table below shows the overall goal, project purpose and outputs of the Project. The Project aimed to achieve the project purpose through implementation of the project activities and collaboration with long-term experts.

Overall goal:	Forests in PNG is conserved and managed in sustainable manner as an important mitigation and adaptation measure against climate change.
Project purpose:	To address climate change, the capacity of relevant institutions in PNG is enhanced for the monitoring of nation-wide forest resource including carbon stock.
Outputs:	1. Nation-wide forest basemap is improved by using remote sensing technology. 2. National level forest resource data base is improved. 3. To address climate change, the monitoring system of forest resource including carbon stock is improved.

1.3 Scope of the Project

The Project is part of the technical cooperation project which is implemented in accordance with the R/D concluded between the Government of PNG and JICA in November 2010.

1.3.1 Counterpart organization and beneficiaries of the recipient country

[Counterpart organization]	Papua New Guinea Forest Authority (PNGFA)
[Beneficiaries]	PNG Forest Authority (PNGFA), Forest Research Institute (FRI) UPNG Remote Sensing Centre UPNGRS, PNG University of Technology (PNG Unitech), Department of Environment & Conservation (DEC) etc.

1.3.2 Project Area

The Project covered the entire area of PNG. However, major Project activities are to be implemented from Port Moresby. The Project Office was established in the Head Office of the counterpart (C/P)

organization in Port Moresby.

1.3.3 Scope of the Project

The Project is to provide assistance to the C/P organization in capacity development in such technologies as remote sensing.

1.4 Organizational Structure for the Project Implementation

Figure 1-1 shows the organizational structure for the implementation of the Project.

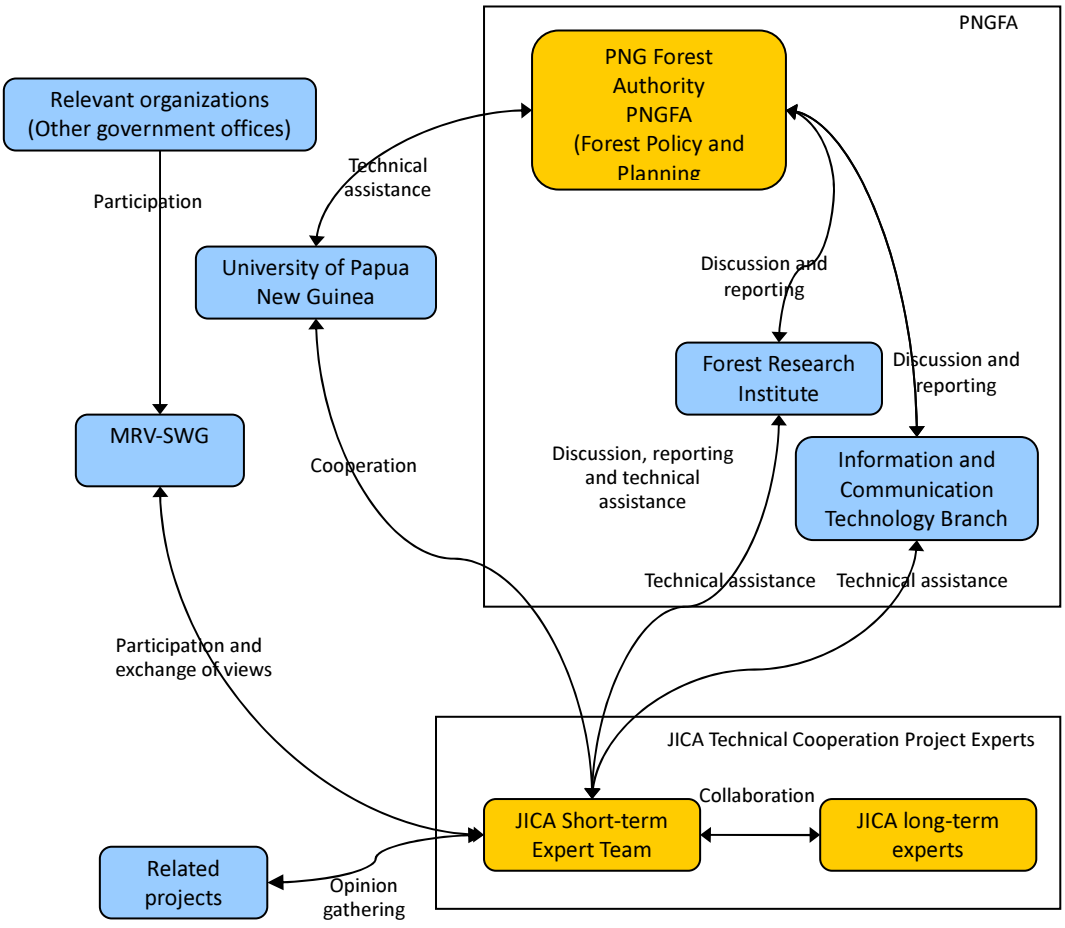

Figure 1-1 Organizational Structure of the Project Implementation

1.4.1 Papua New Guinea Side Implementation Agency

The counterparts (main members that participated in discussions and activities) are listed in Table 1-1.

Table 1-1 List of Counterparts

Name	Division (Position)	Project Field Handled
Ruth C H Turia	Director - Forest Policy and Planning	Project Director
Goodwill Amos	Manager - REDD & Climate Change	REDD Advisor
Constin Bigol	Manager - Inventory & Mapping	Project Manager
Dambis Kaip	Manager - Aid Coordinator	Coordinator
John Worimbangu	Senior Forest Plans Officer	Forest Planning
Margaret Tongo	Forest Plans Officer	Forest Planning

Kipiro Damas	Researcher at Forest Research Institute	GIS Trainee at FRI
Kunsey Lavong	Researcher at Forest Research Institute	Field Survey Leader and GIS Trainee at FRI
Maman Tavune	Researcher at Forest Research Institute	Field Survey Leader and GIS Trainee at FRI

1.4.2 Japan Side Expert Team

The Japanese experts are listed in Table 1-2.

Table 1-2 Japanese Experts

Name	Field
Masamichi Haraguchi	General/remote sensing 1
Masaki Kawai	Remote sensing 2 (SAR)
Kunihiro Ishii	Forest GIS database 1 (Overall design)
Yasuyuki Okada	Database 2 (Detailed design/Operation and development)
Ryota Kajiwara	Forest Basemap/Ground Truth

1.4.3 Joint Coordinating Committee (JCC)

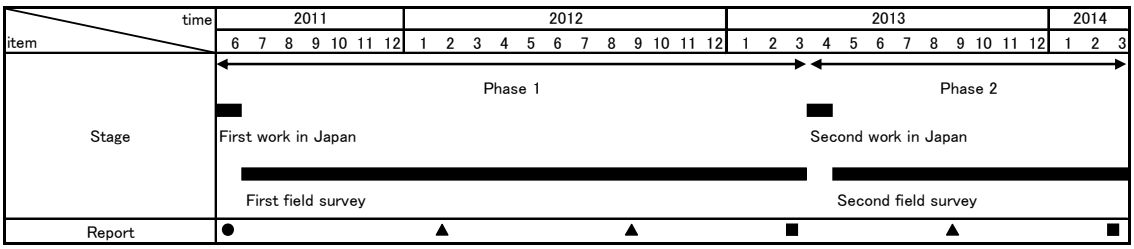
A meeting of the JCC was held in the capital city of Port Moresby, with an explanation and discussion concerning the yearly results of activities and plans for subsequent activities and other operations, after which the agreement of the participants was obtained. The JCC has the following functions, and holds at least one meeting a year during the term that yearly activities are conducted.

- Preparation of Annual Project Plan in accordance with Plan of Operation
- Evaluation of overall project progress and level of achievement
- Review of problems related to project implementation
- Review of changes in activity content made according to situation

1.4.4 Overall Schedule

The overall schedule for this project is described in Table 1-3.

Table 1-3 Overall Schedule



Chapter 2 Basic Policy for Project Implementation

2.1 Basic Concept of Project

An outline of the project is shown in Figure 2-1. This project is being implemented to develop a national forestry resource monitoring system in Papua New Guinea in order to obtain an accurate grasp of the current status of the forest base, changes in the forest and other details with the objective of promoting the implementation of measures against climate change (REDD+) through Sustainable Forest Management (SFM).

The main activities consist of: "1. Obtaining grasp of current state of national forest resources utilizing satellite data (preparation of forest basemaps)", "2. Development of national forest resource database that links satellite data and ground data" and "3. Development of trial reference emissions level for REDD+", and implementing the training necessary for item "1." to "3.".

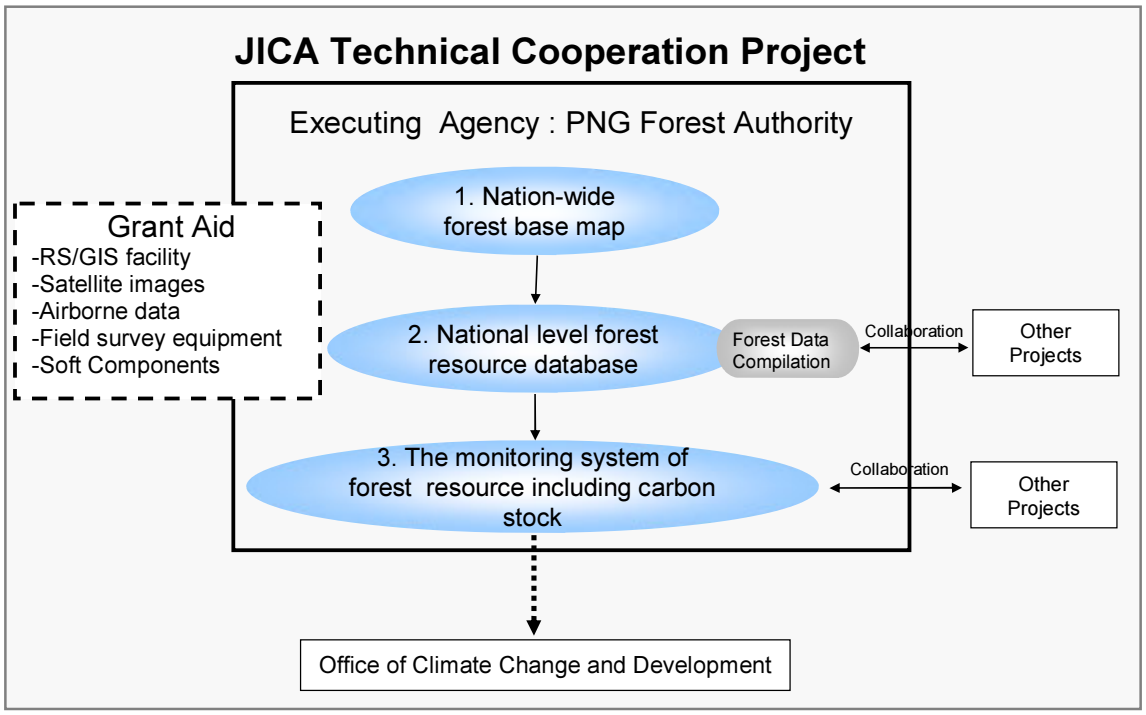


Figure 2-1 Overview of JICA Technical Cooperation Project

In addition, in order to provide a concrete image of an overview of the project described in Figure 2-1, the various issues were organized into the current status of forest resource monitoring in PNG (As-Is), future objectives (To-Be) and challenges that exist between these (Problems) so that the proper approach could be determined for them respectively during this project. These relationships have been compiled in Figure 2-2.

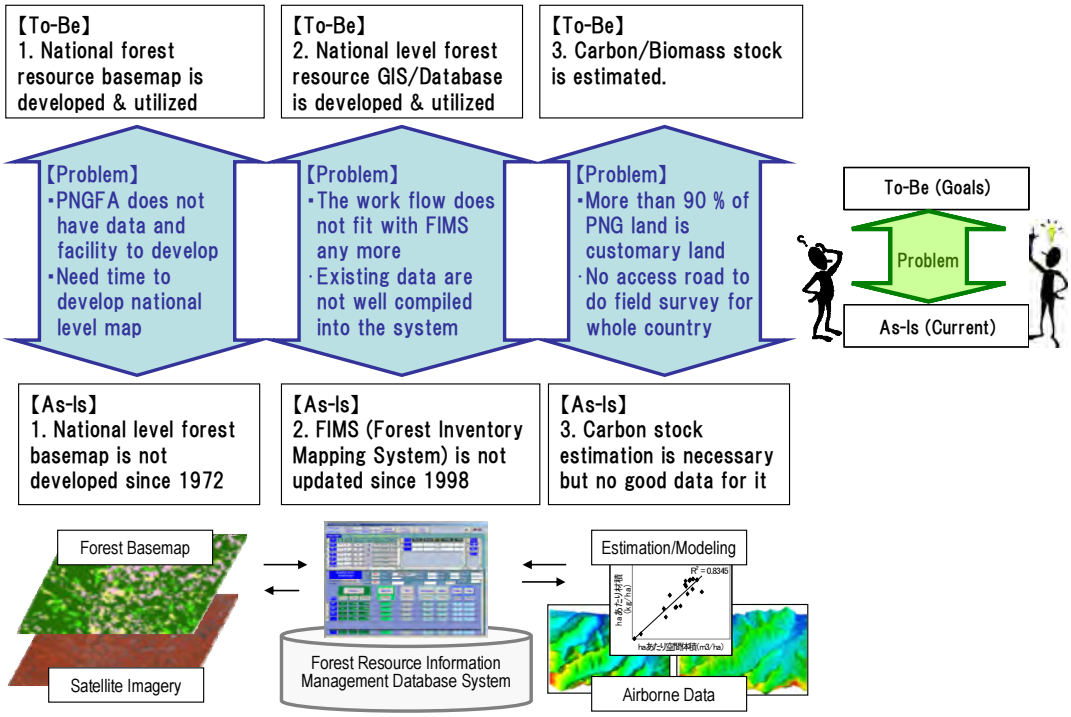

Figure 2-2 Organization of Current Status of Forest Monitoring in PNG, Future Objectives and Problems

Furthermore, this project had been implemented to be closely coordinated with the " Forest Preservation Programme" under the Grant Aid for Environment and Climate Change (hereinafter GAECC) in fiscal 2009. Coordination between JICA technical cooperation and technical assistance provided under the GAECC, as well as the division of roles are described in Figure 2-3. This project mainly consists of the analysis and design of forest monitoring, utilization and operation of maps and databases, and capacity building related to these fields.

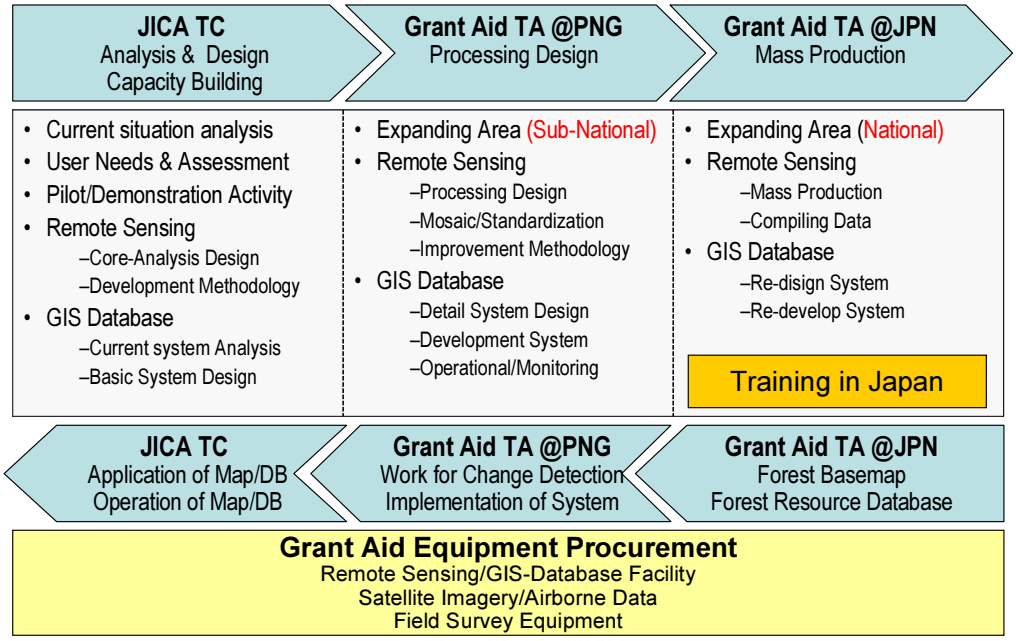

Figure 2-3 Coordination of JICA Technical Cooperation & GAECC and Division of Roles

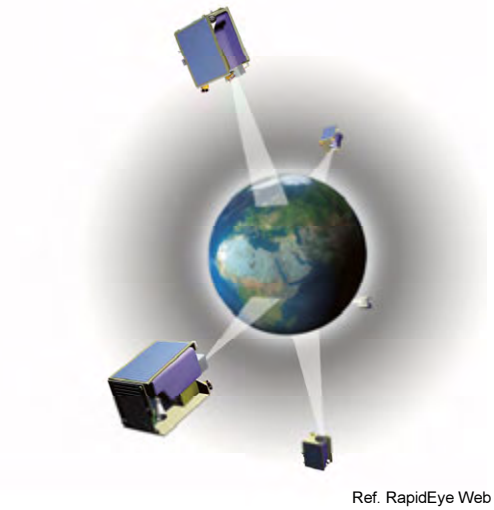
Bidding for equipment required for GAECC was conducted in August 2011, and then equipment was delivered by March 2012. The equipment delivery ceremony was held on 13th March, 2012. It is expected that the optical satellite images which had been an issue of concern in the acquisition of data in the past was addressed by using five RapidEye satellites which acquired data for the entire nation of PNG in a short period of about one year, yet still provided color images with 5m resolution.



Ref. RapidEye Web

Orbit	620 km, sun synchronous
Number of Satellites	5
Spacecraft Mass	150 kg each
Image Data Downlink	>60 Mbps
Onboard Data Storage	>1500 km of image data
Max. Spacecraft Roll Angle	± 25 degrees
Payload Type	Push broom Optical Imager 5 Optical bands
Swath	78 km
Nadir Pixel Ground Sampling Distance	6.5 m
Global Revisit Time	1 day
Average Repeat Period (Europe and North America)	<5 days
DEM Generation Capability	Yes
Mission Life	7 Years

2.2 Project Design Matrix (PDM)

As described above, this project is providing assistance to develop remote sensing technical skills and other types of capacity by the PNG side C/P (counterpart) agencies. Cooperation will be implemented with the framework indicated in Table 2-1 in order to achieve these objectives, a PDM was prepared based on this, and it was approved at the first JCC meeting.

Table 2-1 Project Design Matrix (PDM)

Narrative Summary	Objectively Verifiable Indicators	Means of Verifications	Important Assumptions
Overall Goal: Forests in PNG is conserved and managed in sustainable manner as an important mitigation and adaptation measure against climate change.	1 Forestry sector policies and plans for climate change mitigation and adaptation are developed / revised by using upgraded forest resource database. 2 Forest areas which are sustainably conserved and managed are increased and aligned to meet the targets of PNG Vision 2050.	Reports of related government agencies and local governments	- Appropriate satellite images are continuously provided.
Project Purpose: To address climate change, the capacity of relevant institutions in PNG is enhanced for the monitoring of nation-wide forest resource including carbon stock.	Nation-wide monitoring of forest resource including carbon stock is carried out and the improved GIS database is properly managed in collaboration with related institutions.	1 Project reports 2 Interview with PNGFA, OCCD and related institutions	- There is no particular change in government's policies on nature conservation and climate change. - There is no particular change in natural conditions of PNG.
Outputs: 1 Nation-wide forest basemap is improved by using remote sensing technology.	1.1 Nation-wide forest basemap is developed by using remote sensing data. 1.2 Manuals and workflow design documents for preparing, utilizing and managing the forest basemap are prepared. 1.3 More than 10 officers become capable of preparing and managing nation-wide forest basemap. 1.4 Workshops for the developed nation-wide forest map are held and 70% of the participants consider the workshops useful.	1.1 Developed Nation-wide forest basemap 1.2 Prepared manuals and workflow design documents 1.3 Examination of trained staff 1.4 Questionnaires to the workshop participants	- There is no significant organizational change in PNGFA affecting implementation of the Project.
2 National level forest resource database is improved.	2.1 GIS-based national level l forest resource database is developed. 2.2 Manuals and database design document s for preparing, utilizing and managing the forest resource database are prepared. 2.3 More than10 officers become capable of preparing and managing nation-wide forest resource database. 2.4 Workshops for the developed national level forest resource database are held and 70% of participants consider the workshops useful.	2.1 Developed GIS-based database 2.2 Prepared manuals and database design documents 2.3 Examination of trained staff 2.4 Questionnaires to the workshop participants	
3 To address climate change, the monitoring system of forest resource including carbon stock is improved.	3.1 The basic design of appropriate forest resource monitoring system is prepared in written format. 3.2 The past change of national forest carbon stock is estimated. 3.3 Preliminary reference emission levels for REDD+ are developed.	3.1 Project reports 3.2 Project reports 3.3 Project reports	
Activities: 1.1 Capture and analyze current condition of remote sensing utilization in forest sector. 1.2 Prepare a basic design of remote sensing analysis based on the result of 1.1. 1.3 Conduct preliminary analysis of remote sensing data. 1.4 Conduct on-site checking of the result of the preliminary analysis. 1.5 Conduct secondary analysis of remote sensing data using the result of on-site checking. 1.6 Develop nation-wide forest basemap. 1.7 Train related institutions/personnel for above 1.2 to 1.6 activities. 2.1 Capture and analyze currently available data on nation-wide forest resources. 2.2 Prepare a basic design of national level forest resource database based on the result of 1.2 and 2.1. 2.3 Develop the national level forest resource database linked with the forest basemap and ground survey data. 2.4 Train related institutions/personnel for above 2.2 to 2.3 activities. 3.1 Participate in national multispectral working groups for addressing climate change including REDD+ working group to promote communication and collaboration with relevant public and private organizations. 3.2 Liaise with the Office of Climate Change and Development (OCCD) to ensure the project activities are implemented in line with national policies and strategies. 3.3 Prepare a basic design of the forest resource monitoring system. 3.4 Estimate the past change of forest carbon stock by analyzing the developed national forest resource database. 3.5 Develop preliminary reference emission levels for REDD+, based on the estimated past change in forest carbon stock.	**Input:** **Japanese Side** **Experts** - Chief Advisor/ Forest Management - Project Coordinator - Remote sensing Expert - Forest GIS / Database Expert - Biomass Survey Expert - Other experts necessary for the implementation of the Project **Machinery and Equipment** - Vehicle: 1 unit - Equipment for training and survey; - Office equipment and stationeries; - Other materials necessary for the implementation of the Project **Training of Papua New Guinean personnel in Japan/PNG**	**Papua New Guinean Side** **Counterparts & Administrative personnel** - Project Director - Deputy Project Director - Project Managers - Deputy Project Manager - Technical staff - Administrative personnel(Secretary, Drivers, Other supporting staff) **Land, Buildings and Facilities** - Office spaces and facilities within Forest Policy and Planning Directorate, PNGFA HQ, Port Moresby for the implementation of the project; - Electricity, air conditioning, water supply and necessary telecommunication facilities including telephone, facsimile and internet services; and - Other facilities necessary for the implementation of the Project **Administration and operational costs**	- Commitment by Papua New Guinean government and cooperation by authorities concerned are maintained. - Counterparts are not transferred to other departments and/or agencies. - Papua New Guinean government budget for PNGFA is maintained at least at the same level as present. **Pre-conditions** - There is no particular change in government's policies on nature conservation and climate change.

2.3 Plan of Operation

A Plan of Operation (PO) has been prepared that is linked with the PDM "Activities", "Indicators" and "Target Values". The PO is shown in Table 2-2.

Table 2-2 Plan of Operation

As of November 26, 2010

Outputs		Activities		Year 1				Year 2				Year 3			
				1Q	2Q	3Q	4Q	1Q	2Q	3Q	4Q	1Q	2Q	3Q	4Q
1	Nation-wide forest base map is improved by using remote sensing technology.	1.1	Capture and analyze current condition of remote sensing utilization in forest sector.												
		1.2	Prepare a basic design of remote sensing analysis based on the result of 1.1.												
		1.3	Conduct preliminary analysis of remote sensing data.												
		1.4	Conduct on-site checking of the result of the preliminary analysis.												
		1.5	Conduct secondary analysis of remote sensing data using the result of on-site checking.												
		1.6	Develop nation-wide forest base map.												
		1.7	Train related institutions/personnel for above 1.2 to 1.6 activities.												
2	National level forest resource database is improved.	2.1	Capture and analyze currently available data on nation-wide forest resources.												
		2.2	Prepare a basic design of national level forest resource database based on the result of 1.2 and 2.1.												
		2.3	Develop the national level forest resource database linked with the forest base map and ground survey data.												
		2.4	Train related institutions/personnel for above 2.2 to 2.3 activities.												
3	To address climate change, the monitoring system of forest resource including carbon stock is improved.	3.1	Participate in national multisectoral working groups for addressing climate change including REDD+ working group to promote communication and collaboration with relevant public and private organizations.												
		3.2	Liaise with the Office of Climate Change and Development (OCCD) to ensure the project activities are implemented in line with national policies and strategies.												
		3.3	Prepare a basic design of the forest resource monitoring system.												
		3.4	Estimate the past change of forest carbon stock by analyzing the developed national forest resource database.												
		3.5	Develop preliminary Reference Emission Levels for REDD+, based on the estimated past change in forest carbon stock.												

Legends

- Activities that must take place at a given time
- Occasional activities
- Activities that will be continued over the given time, but in low intensity

Chapter 3 Activity Output of Project

3.1 Achievement of the Project Outputs

In the Final Report Workshop of this project held on March 5th and 6th 2014, the C/P Project Manager and the long-term expert presented a report on the project purpose and evaluation and progress in achievement of the project outputs in relation to the purpose. Table 3-1 shows the evaluation and progress in achievement of the outputs presented in the workshop.

Table 3-1 Project Purpose and Progress in Achievement of the Outputs

Project Purpose	**Indicators**	**Verifications**
To address climate change, the capacity of relevant institutions in PNG is enhanced for the monitoring of nation-wide forest resource including carbon stock.	Nation-wide monitoring of forest resource including carbon stock is carried out and the improved GIS database is properly managed in collaboration with related institutions.	The Project Purpose has been achieved with the achievement of Output 1, Output 2 and most of Output 3.
Outputs	**Indicators**	**Verifications**
Output 1 Nation-wide forest basemap is improved by using remote sensing technology.	Indicator 1 Nation-wide forest basemap is developed by using remote sensing data. Indicator 2 Manuals and workflow design documents for preparing, utilizing and managing the forest basemap are prepared. Indicator 3 More than 10 officers become capable of preparing and managing nation-wide forest basemap.	Indicator 1 Nation-wide forest basemap version 1 was developed. (but further improvement is needed.) Indicator 2 Manuals and documents, including Satellite Imagery Interpretation Cards, Satellite Image Classification Manual, and GIS/GPS User's Manual, were developed. Indicator 3 Ten officers participated in the training in the forest basemap, of whom five, who were appointed Leading Officers,

		participated in the intensive training.
	Indicator 4 Workshops for the developed nation-wide forest map are held and 70% of the participants consider the workshops useful.	Indicator 4 Workshops for the developed nation-wide forest map were held for five areas and the participants considered the workshops useful.
Output 2 National level forest resource database is improved.	Indicator 1 GIS-based national level l forest resource database is developed.	Indicator 1 GIS-based national level forest resource database was developed.
	Indicator 2 Manuals and database design documents for preparing, utilizing and managing the forest resource database are prepared.	Indicator 2 Manuals for the Forest Inventory Processing System (FIPS) and the Forest Inventory Mapping System (FIMS) were developed.
	Indicator 3 More than10 officers become capable of preparing and managing nation-wide forest resource database.	Indicator 3 Eleven officers participated in the training on the forest resource database, of whom five, who were appointed officers in charge, participated in the intensive training.
	Indicator 4 Workshops for the developed national level forest resource database are held and 70% of participants consider the workshops useful.	Indicator 4 100% and 90% of the participants in the WSs held in March 2012 and March 2013, respectively, considered them useful.
Output 3 To address climate change, the monitoring system of forest resource including carbon stock is improved.	Indicator 1 The basic design of appropriate forest resource monitoring system is prepared in written format.	Indicator 1 Preparation of the system was partially completed with the development of a manual for field survey of vegetation and the forest environment, among others.

	Indicator 2 The past change of national forest carbon stock is estimated. Indicator 3 Preliminary reference emission levels for REDD+ are developed.	Indicator 2 Partly completed (for a specific area, not nation-wide). Indicator 3 Partly completed (for a specific area, not nation-wide).

3.2 Implementation Schedule

The implementation schedule (revised at the beginning of Phase2) that takes the above PO into consideration is shown in Table 3-2. The work performance / plan for the staff engaged in the project (Phase1) are shown in Table 3-3 and (Phase2) are shown in Table 3-4.

Table 3-2 Implementation Schedule (revised at the beginning of Phase 2)

3.3 Expenditure of the Project Cost in Papua New Guinea

Table 3-5 shows the expenditure of the project cost in Papua New Guinea in each project phase.

Table 3-5 Expenditure of the project cost in Papua New Guinea by phase

Phase 1 (from June 2011 to March 2013)

Item	Amount (yen)
General project costs (vehicle-related costs, cost of consumables, travel allowances and expenses, communication and transportation costs)	3,421,000
Equipment/material purchase costs	1,638,000
Local consultancy contracts	0
Total	5,059,000

Second year (Phase 2) (from May 2013 to March 2014) (As of February 2014)

Item	Amount (yen)
General project costs (vehicle-related costs, cost of consumables, travel allowances and expenses, communication and transportation costs)	3,585,000
Equipment/material purchase costs	0
Local consultancy contracts	0
Total	3,585,000

Local consultancy contracts

No local consultant was employed in this project.

Subcontracting

No part of implementation of this project was subcontracted.

3.4 Implementation Flow

A flow chart for project implementation (revised at the beginning of Phase 2) is shown in Figure 3-1 Implementation Flow.

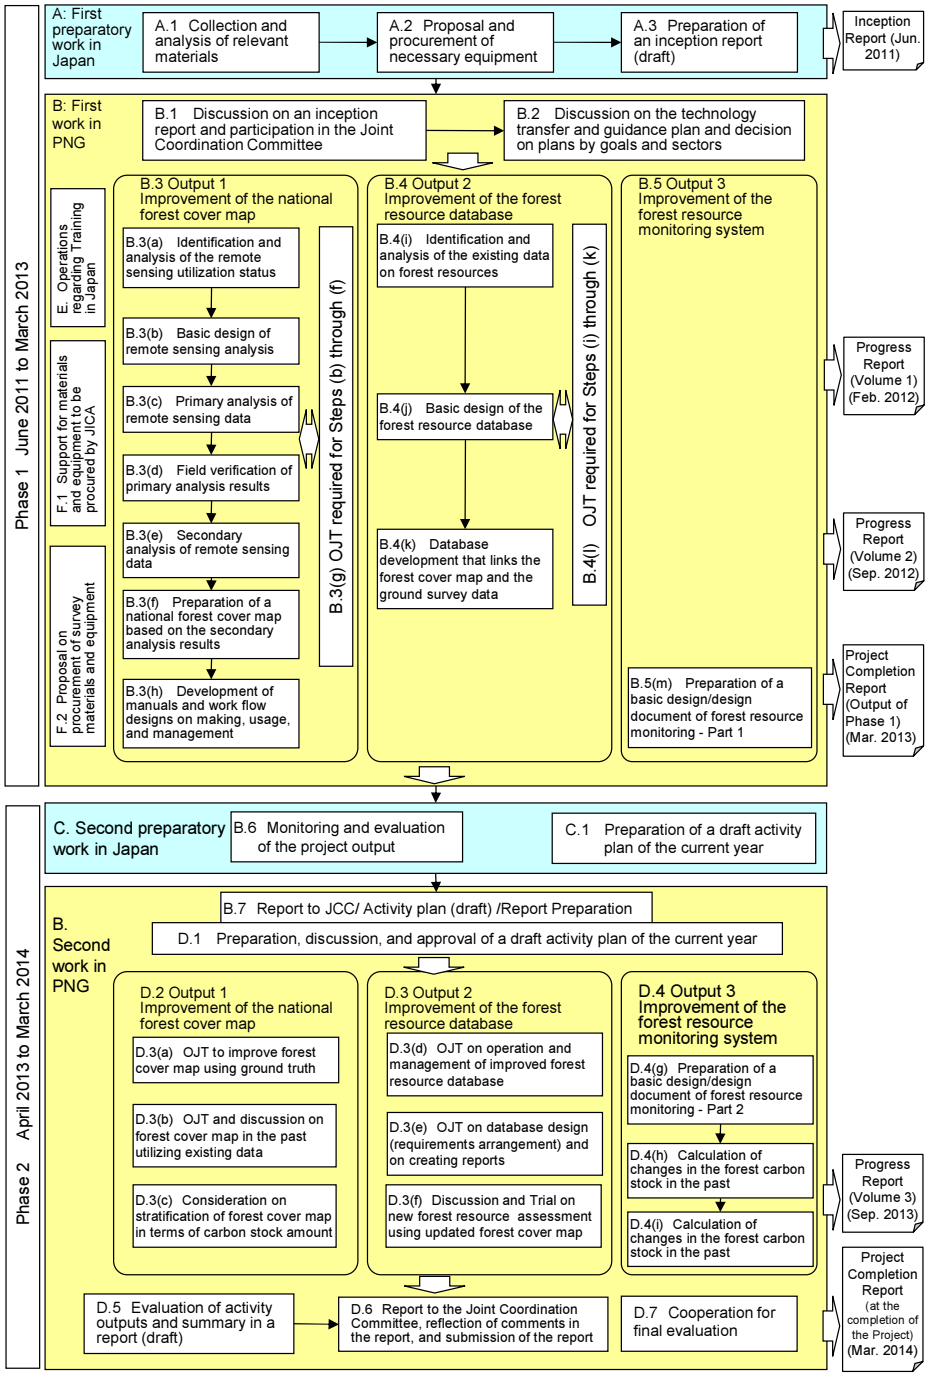

Figure 3-1 Implementation Flow (revised at the beginning of Phase 2)

The persons in charge of the respective project implementation items are shown in Table 3-6.

3.5 Activities Related to Output 1

Output 1: Nation-wide forest basemap is improved by using remote sensing technology

<Phase 1: June 2011 – March 2013>

3.5.1 Obtain Grasp / Analyze Remote Sensing Utilization Status

During the first field survey (from June 25 to July 9 2011), hearings and discussions were held to obtain a grasp of the current status of remote sensing.

(a) Obtaining Grasp of Current Status of Remote Sensing Data in FIMS/FIPS

The aerial photographs used to prepare the FIMS were taken in the 1970s, and the spatial resolution is high, but since they were taken in the analog age, forest distribution and forest classification work was performed at a small scale with a digitizer board. Consequently, there were discrepancies between the current forest distribution and forest classification, and deviations in the position. Hearings were conducted concerning the current FIMS and FIPS in order to solve these problems.

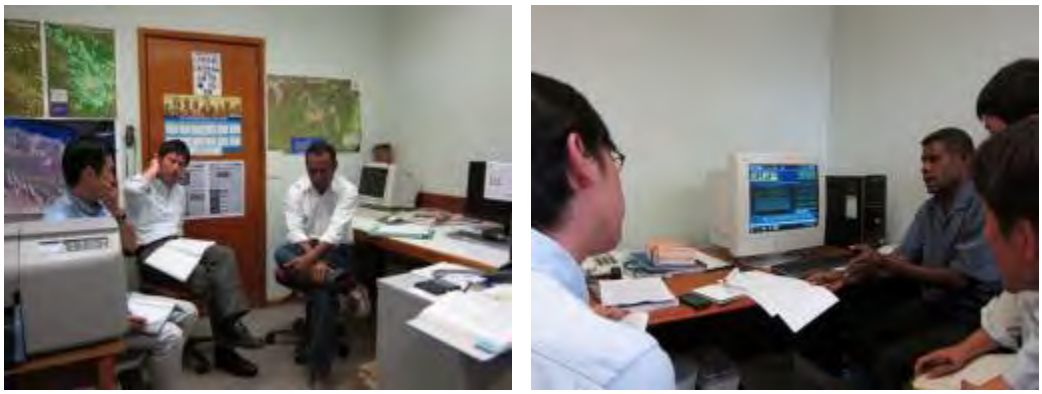

Figure 3-2 Image s of Hearings Concerning FIMS (Left) and FIPS (Right)

In addition, the following materials were obtained to help obtain a grasp of current conditions.

- Forest Resource Vegetation Mapping of Papua New Guinea
- Papua New Guinea Resource Information System (PNGRIS) Handbook 3rd
- FIM Forest Inventory and Mapping System User Guide

(b) Obtaining Grasp of Requests to REDD+

In order to obtain a grasp of how the forest basemaps that will be prepared by March 2014 under this project are related to REDD+, the respective relationship with the FIMS, FIPS and satellite images was organized. Discussions on the requests made to REDD+ were held with C/P and have been compiled in Figure 3-3.

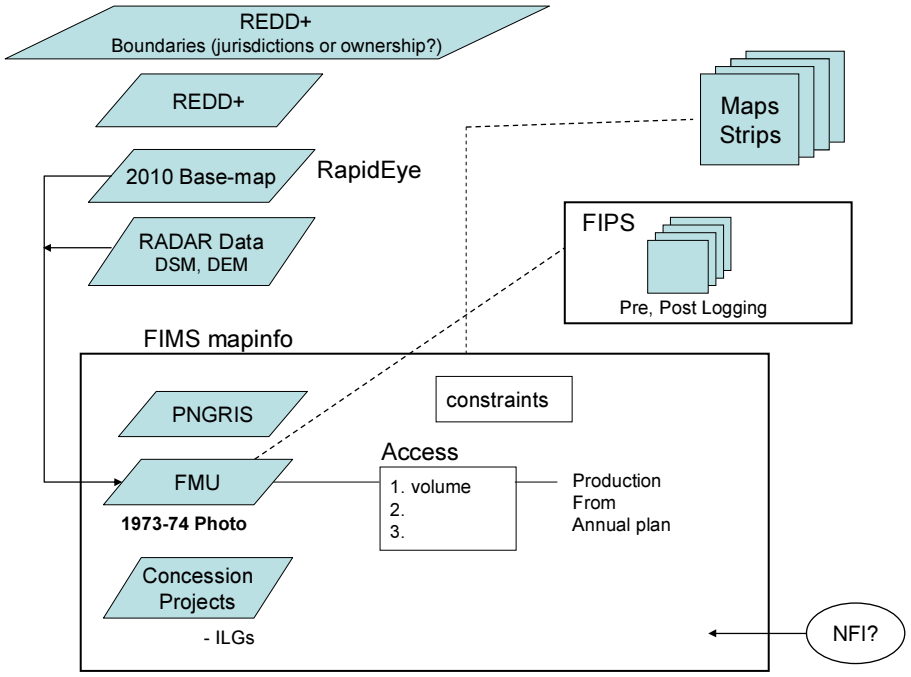

Figure 3-3 Obtaining Grasp of Requests to REDD+

(c) Cooperation with Other Agencies

Discussions were held to review the sharing range of satellite images that will be procured under this project and with grant aid cooperation. The target data consists of RapidEye (optical sensors), PALSAR (radar) and GeoSAR (airborne SAR). Due to differences in the number of licenses for which the respective data can be shared, discussions were held with the C/P on the agencies with which the data will be shared. The respective satellite image product levels and number of licenses (number of agencies) that can be used are shown in Table 3-7.

Table 3-7 Respective Satellite Image Project Levels and Number of Licenses

		Preliminary (5,000km^2)	G.A. (whole country)
RapidEye	1:Raw data	1 *1	5
	2: Processed/Analysis (Raster)	1	5
	3: Processed/Analysis (Vector)	no limit	no limit

*1 Can be increase later by additional payment

PALSAR	1:Raw data	1	1
	2: Processed/Analysis (Raster)	no limit	no limit
	3: Processed/Analysis (Vector)	no limit	no limit

GeoSAR (2011)	1:Raw data	depend on PNGFA	x *2
	2: Processed/Analysis (Raster)	depend on PNGFA	x
	3: Processed/Analysis (Vector)	depend on PNGFA	x

*2 But, 2006 data can be accessible (only mainland)

3.5.2 Basic Design of Remote Sensing Analysis

During the second field survey (from October 8 to October 22, 2011), hearings and discussions concerning the basic design for the preparation of forest cover maps were held.

(a) Organization of Classification Items

First, the land cover classification codes registered in the FIMS were extracted and organized. The person in charge was asked to select the classification codes required for the Forestry Authority to perform the work, and the classification codes that can be obtained from the actual satellite images were reviewed. During this project, 17 items were organized that are indicated in blue in Table 3-8 out of the items that can be classified from satellite images.

Table 3-8 Classification Codes in FIMS and Target Classifications Codes for This Project

IPCC GL-AFOLU	UPNG	Structural formation	Vegetation type	Condition	Code	
Forest lands		Forest	Low Altitude Forest on Planins and Fans	below 1000m	Pl	Large to medium crowned forest
					Po	Open forest
					Ps	Small crowned forest

Cropland		Other Non-vegetation and areas dominated by land use			O	PNGRIS agricultural land use intensity classes 0-4
Wetlands					E	Lakes and large rivers
Other Land					Z	Bare areas
Settlements					U	Larger urban centres

(b) Obtaining Grasp of Classification Item Features

Comparisons were made of how existing vegetation types appear in optical sensor images (RapidEye) and radar sensor images (PALSAR). Existing GIS data was overlaid onto satellite images when comparison was performed to confirm how which items (shapes, colors, sizes, patterns, shadows, etc.) can be interpreted, and these results were organized in Table 3-9.

Figure 3-4 Review of Classification Items

Table 3-9 Features of Classification Items That Can be Interpreted from Optical Sensor Images (RapidEye)

Structural formation	Vegetation type	Shape (Crown)	Color	Shape	Size	Pattern	Texture	Shade	Circumstance	Tree picture
Forest	Low Altitude Forest on Plains and Fans "P" (<1,000m)		Mixed			Relatively regular Scattered crown	Relatively regular, fine in Natural (RGB 4:5:2) Image of RapidEye		Along coast, flat topography, lower elevation (<50-100) than H	
	Low Altitude Forest on Uplands "H" (<1,000m)					vary	vary in RapidEye in Natural Image (RGB 4:5:2) of RapidEye		Upland, hilly/ aspects/ slope, higher elevation (>50-100) than P, Mountain range	
	Lower Montane Forest (>1,000m) "L"		(Dark when Intact, lighter after disturbance)			Relatively regular,	(Dense, thick, undulating canopy) (RGB452)		(1,000 m demarcation is not very visible) (Inaccessible areas)	
	Montane Forest "Mo" (>3,000m)									
	Dry Seasonal Forest "D"									
	Littoral Forest "B"			sparsely, patchily scattered Crown Open canopy	Medium	Regular crowns	Relatively regular, fine in Natural		Sign of settlement and gardening Often within 150-200m from coast line	
	Seral Forest (River line) "Fri"		Lighter green		Vary in small area	Mixed	Mixed		Along river (can be mixed with gardening)	
	Swamp Forest "Fsw"									
Woodland "W"										
Savanna "Sa"										
Scrub "Sc"										
Grassland and Herbland "G"	Grassland		Reddish brown (RGB452)	NA	NA	NA	Matt		Sign of settlement and gardening and areas Often contains burnt patches	
Estuarine Communities	Mangrove		Medium green in RapidEye optical image (RGB452) Visible from PALSAR				Rough, uneven		Often within 150-200m from coast line Along the river (can be associated with littoral forest)	
Other Non-vegetation and areas dominated by land use	PNGRIS agricultural land use intensity classes 0-4				Oil palm: Small, fine	Oil palm: Very regular,	Oil palm: smooth	Oil palm: None	Oil palm: Along road, flat	
	Lakes and large rivers		Purple, blue						(Sea surface looks similar)	
	Bare areas		Light brown							
	Road system		Clearly visible in RGB5:4:2							
	Larger urban centres									

The features in Table 3-9 were used as reference to determine whether or not forest classification can actually be interpreted from optical sensor imagery (RapidEye).

Figure 3-5 Results That Were Actually Interpreted (Orange Marker Line is Interpreted Border Line)

3.5.3 Primary Analysis of Remote Sensing Data

(a) Strengthening of Basic Knowledge in Preparation for Remote Sensing Analysis

In preparation for the analysis of remote sensing data, training using JICA-NET and training in Japan were implemented. The JICA-NET is a self-instructional text for RS/GIS analysis. Mr. Constin (Department Chief) and Mr. Perry (Senior Map Production Engineer) from the Forestry Authority came to Japan to participate in training.

The objective of training in Japan was to enable the participants to acquire a basic understanding of REDD+ and remote sensing / GIS techniques. During the first half of training, case studies related to REDD+ activities in Japan were introduced with the objective of enabling the trainees to grasp an overall image of future activities. During the latter half of training, practical training on forest classification with remote sensing was conducted while actually using PNG satellite images with the objective of organizing the basic information that will be required to allow the project to move forward in the future. The schedule of training in Japan is shown in Table 3-10.

Table 3-10 Schedule of Training in Japan

Week 1 (12th – 16th September)				
12th September	13th September	14th September	15th September	16th September
Orientation	Lecture and Discussion	Lecture and Discussion	Facility Tour	Orientation
• Orientation at JICA Tokyo. • Courtesy call for JICA headquarter and Forestry Agency. • Introduction of JICA's REDD+ projects in other countries.	• JAFTA: Design for forest resource monitoring investigation. • ERSDAC: Japan's satellite data.	• FFPRI: Projection of warming impacts and evaluation of carbon sink. • FFPRI: Global warming impacts and evaluation of carbon sink.	• Visit to the Geospatial Information Authority of Japan. • Visit to University of Tsukuba.	• Company introduction • KKC Facility tour • Overview of Remote sensing and GIS training.

Week 2 (19th – 23rd September)				
19th September	20th September	21st September	22nd September	23rd September
Holiday (Aged People's Day)	Facility Tour and Lecture	Lecture and Discussion	Lecture and Assessment	Holiday (Autumnal Equinox Day)
• Visit to Asakusa and Akihabara.	• JAXA: Visit to JAXA space center. • JAXA EORC: Introduction of case examples of SAR in forestry.	• Basic training about Remote Sensing and GIS using PNG satellite data. • Discussions about local forest cover classifications. • Creation of interpretation cards (Google Earth vs. RapidEye).	• Lecture about GIS and database of PNG forest. • Basic training and discussions about specifications. • JICA Tokyo: Assessment meeting. (Constin)	• Excursion of downtown Tokyo.

Table 3-10 Schedule of Training in Japan (Continued)

Week 3 (26th – 30th September)				
26th September	27th September	28th September	29th September	30th September
OJT: RapidEye Processing	OJT: RapidEye Processing	OJT: PALSAR Processing	OJT: PALSAR Processing	Summary and Discussion
• Introduction of Remote Sensing softwares. • Geometric correction. • Mosaic RapidEye images.	• Atmospheric correction. • Introduction of Object-base classification. • Explain of function of ERDAS IMAGINE for optical images.	• Applications of PALSAR data. • How to search PALSAR data using ERSDAC GDS website. • Introduction of GeoSAR data (difference between P-band and X-band).	・Processing of PALSAR data. ・Comparison between HH and HV polarization. ・Comparison between PALSAR imagery in 2007,2010.	• Comparison between RapidEye and PALSAR image. • Follow-up to this week training.

Week 4 (3rd – 7th October)				
3rd October	4th October	5th October	6th October	7th October
Manual Development	Manual Development	OJT : Arc GIS training	Report Development Summary and Discussion	Seminar and Assessment
• Development of simple operation manual (optical). • Follow-up discussions.	• Development of simple operation manual (radar). • Follow-up discussions.	• Introduction of ArcGIS.	• Development of evaluation report about the training. • Review of the training. • Discussion about the future plan.	• Participation to Viet Nam REDD+ seminar. • JICA Tokyo: Assessment meeting. (Perry)

The agencies that were visited during the first half of training in Japan and the content of lectures are described below.

- JICA Headquarters (JICA REDD+ project in other countries)
- Forestry Agency (Introduction of forestry management in Japan, visit to forestry resource DB room)
- Japan Forest Technology Association (Design of forest resource monitoring survey)
- Earth Remote Sensing Data Analysis Center (Overview of satellite data in Japan)
- Forestry and Forest Products Research Institute (Forecast of impact of global warming, evaluation of carbon dioxide absorption resources, etc.)
- Geospatial Information Authority of Japan (Visit to Science Museum of Map and Survey)
- Japan Aerospace Exploration Agency (Case study of forest analysis using Synthetic Aperture Radar [SAR])

Figure 3-6 shows a picture of a lecture.

Figure 3-6 Picture of Lecture at Forestry and Forest Products Research Institute

The latter half of training in Japan focused on practical training in satellite image analysis conducted by means of On-the-Job-Training (OJT). The ERDAS Imagine satellite image analysis software that was to be procured under the GAECC was used. After learning the basic image analysis functions, Milne Bay Rapid Eye imagery and PALSAR imagery which represent a preceding analysis area were used to teach the differences in the respective images and the differences in the analysis methods.

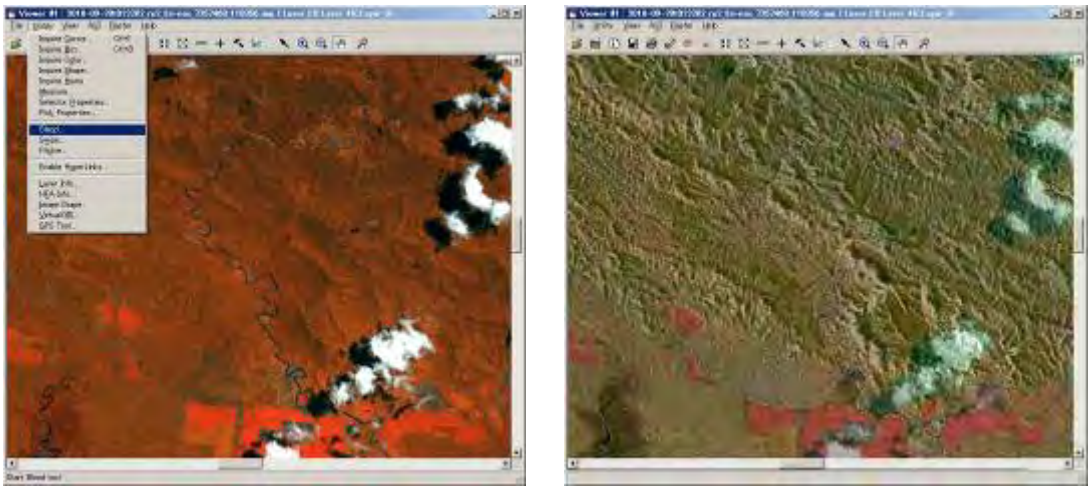

Figure 3-7 Optical Sensor Image (Left) and Comparison of Optical / Radar Image Features by Means of Permeabilization (Right)

At the end of training, the respective applications for optical sensors, radar sensors and airborne SAR data were compiled in Table 3-11 along with the demerits when using the respective data.

Table 3-11 Applications for Remote Sensing Images and Demerits When Actually Using

RapidEye	PALSAR	GeoSAR
Applications Forest/Vegetation Types Plantation Land-use Roads Rivers Settlements Natural/Man-made disaster	**Applications** Forest/Vegetation Change detection Geological structure Natural/man-made disaster Plantations	**Applications** Forest cover detection Tree height
Demerits Cloud cover Expensive	**Demerits** Difficult to interpret/understand	**Demerits** More expensive One time observation Limited area of observation (Cannot cover whole of PNG)

The results of training in Japan were compiled in an Image Analysis Manual. The trainees held a training report meeting at the Forestry Authority after they returned to Papua New Guinea. The trainees prepared the materials for the training report meeting themselves. There were some mistakes in the materials, but this meeting verified that the trainees had an overall understanding of the content of training in Japan.

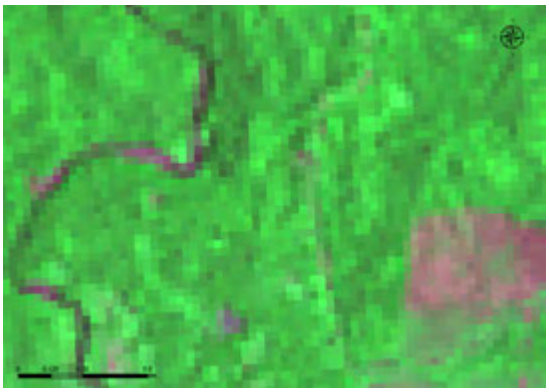
A picture of the training report meeting is shown in Figure 3-8.

Figure 3-8 Picture of Training Report Meeting

(b) Demonstration of Image Resulting from Remote Sensing Analysis

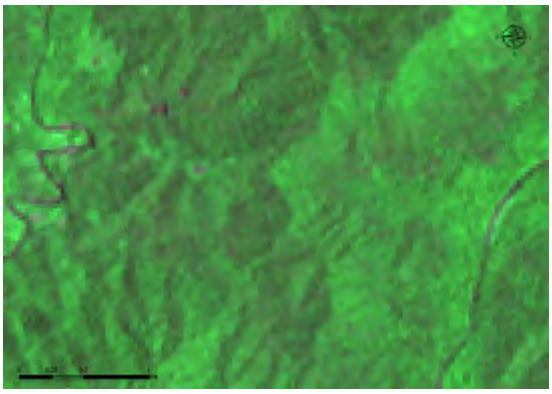
A demonstration was conducted using remote sensing images and GIS obtained in advance for a portion of the area to give the involved parties an image of how work (results) can be performed with the satellite images (RapidEye, PALSAR) and elevation data that were to be obtained under the GAECC program. The chairman of the Forestry Authority participated in the demonstration, which also served as an Interim Report on the results.

A review of the interpretablity of the monitoring target due to differences in satellite image resolution has been compiled in Figure 3-9. When (1) and (2) are compared, it can be confirmed that while it is difficult for the Forestry Authority to conduct adequate monitoring of logging roads and collection yards for which it is responsible with LANDSAT 30m class resolution, these areas can be clearly interpreted with RapidEye 5m class resolution. Next, when (3) and (4) are compared, it was confirmed that the logging road built in the center of the image in 2010 can be clearly interpreted with RapidEye.



(1) LANDSAT in 2000 (30m resolution)

(2) RapidEye in 2010 (5m resolution)

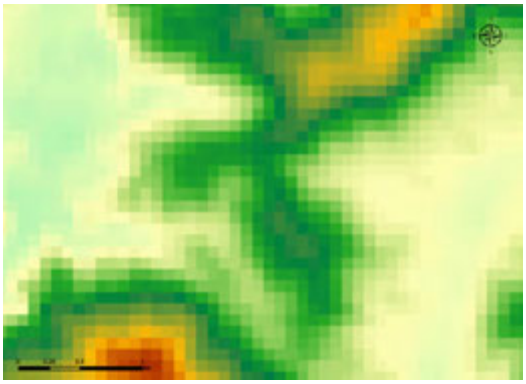


(3) LANDSAT in 2000 (30m resolution)

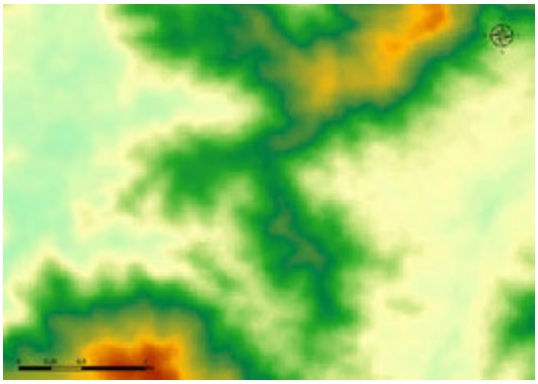
(4) RapidEye in 2010 (5m resolution)

Figure 3-9 Review of Interpretablity of Monitoring Target Due to Differences in Satellite Image Resolution

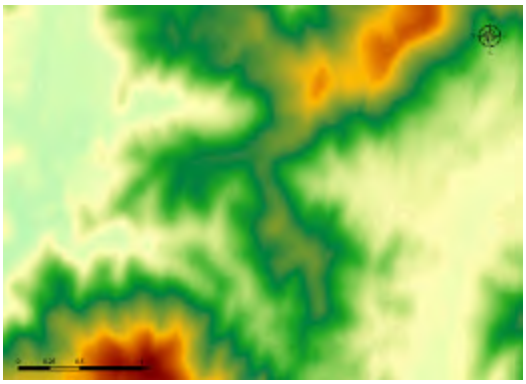
The differences in elevation data resolution and a demonstration of topographic analysis have been compiled in Figure 3-10. The 90m resolution elevation data that is used as the world standard is shown in (1), but this is not adequate for logging roads in PNG where there are many mountainous regions or for design applications for inventory surveys. The 30m resolution elevation data does improve the interpretablity (Refer to (2)), but it was verified that this does not guarantee stable quality in PNG where there is a high rate of cloud cover. The provision of 5m resolution elevation data (Refer to (3)) that covers the entirety of the main island of PNG has adequate resolution for the calculation of contour lines (4), shadow analysis (5) and slope analysis (6), and is a good match for the actual logging roads.



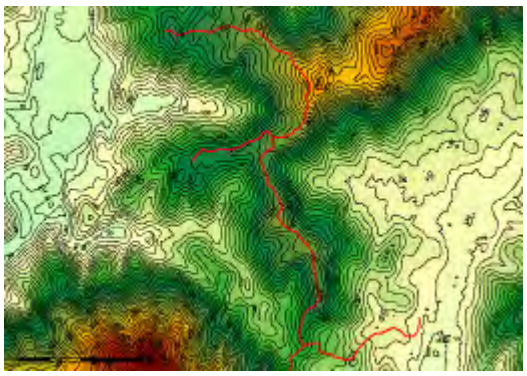
(1) Elevation data (90m resolution: SRTM)



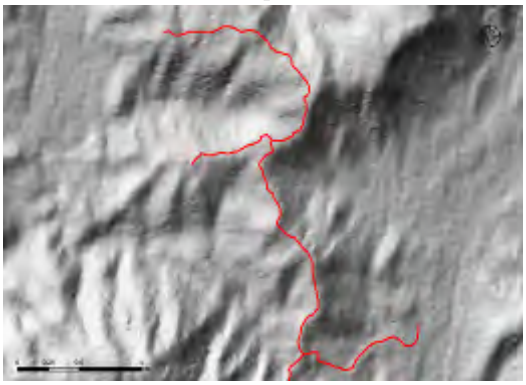
(2) Elevation data (30m resolution: ASTER GDEM)



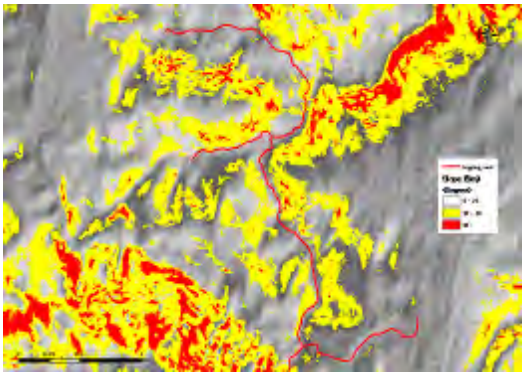
(3) Elevation data (5m resolution: GeoSAR sample)



(4) Elevation data original contour lines and logging roads



(5) Elevation data original shadow map and logging roads

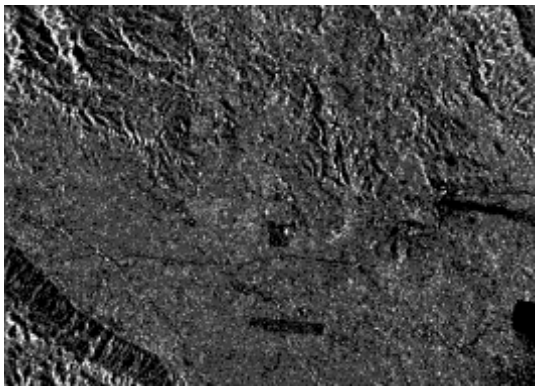


(6) Elevation data original slope map and logging roads

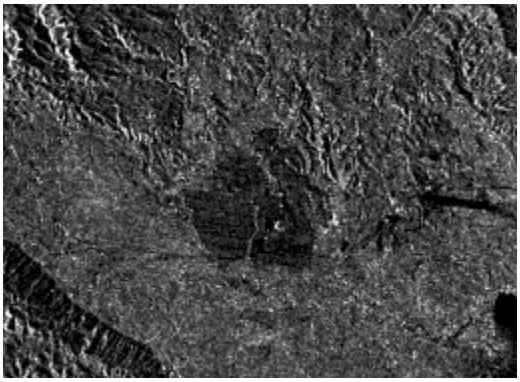
Figure 3-10 Differences in Elevation Data Resolution and Demonstration of Topographic Analysis

A comparison of a change extraction demonstration with PALSAR data using an optical image (RapidEye) has been compiled in Figure 3-11. The locations where there is a reduction in forest cover are dark in the PALSAR data. The locations in which there may have been a reduction in forest cover can be verified by simply combining the data from different years [(1) and (2)] to create a composite image (3) (locations displayed in purple in (3)). However, since it is difficult to judge the land being used where

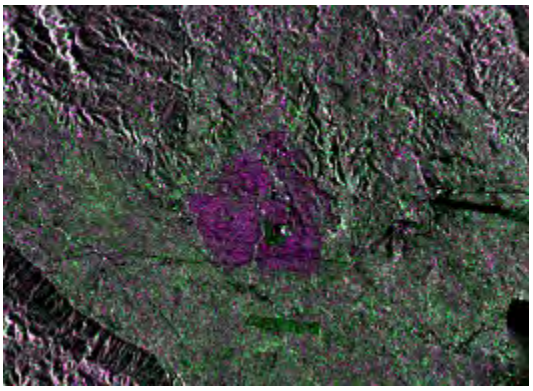
there is a reduction in forest cover, this data should be combined with optical images to facilitate effective management (Combination of (3) and (4)). In addition, a demonstration of automatic calculation of land use border lines using analysis software was conducted (which can be easily set) ((5) and (6)).



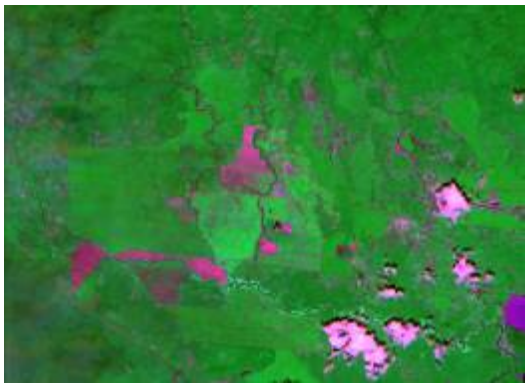
(1) PALSAR data in 2007



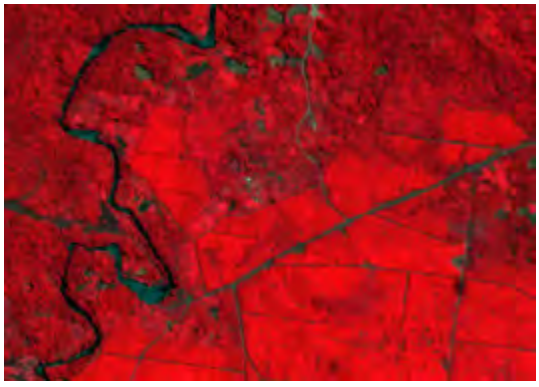
(2) PALSAR data in 2010



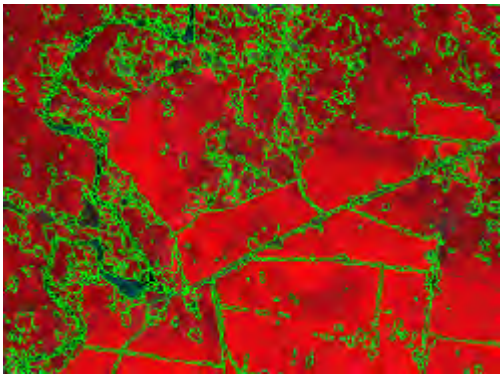
(3) PALSAR color composite image in 2007 & 2010



(4) RapidEye image in 2010



(5) RapidEye (False color display)



(6) Automatic calculation of border line (demonstration)

Figure 3-11 Comparison of Change Extraction Demonstration with PALSAR Data using Optical Image (RapidEye)

3.5.4 Field Confirmation of Primary Analysis Results

(a) Forest Observation from Ground

A one day field survey was conducted with the C/P to obtain a grasp of the forest conditions in PNG. Gardening plots, plantations and natural broad leafed forest areas that were observed along the Brown River are indicated by the red marks in Figure 3-12.

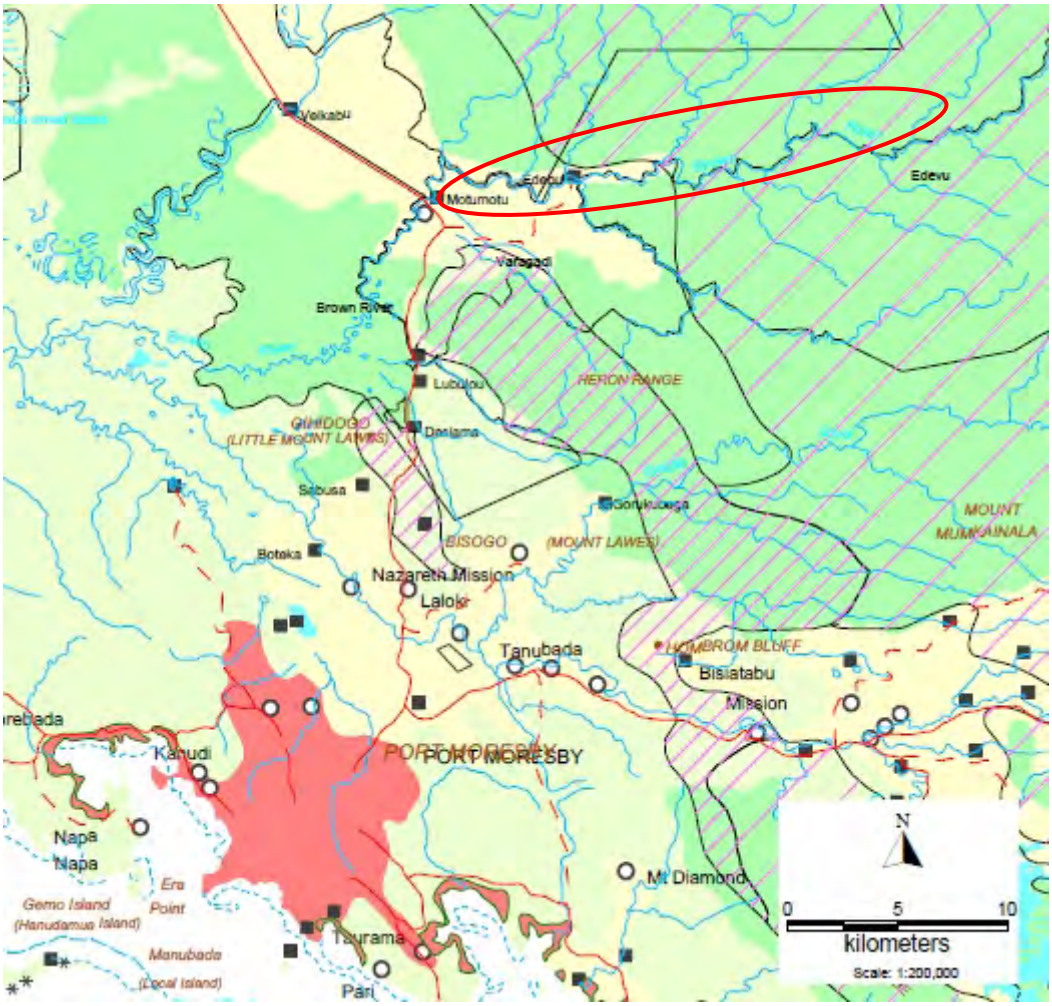


Figure 3-12 Field Survey Location Diagram

A picture of the local forest is shown in Figure 3-13.

Figure 3-13 Picture of Forest along Brown River

(b) Forest Observation from Helicopter

In preparation for analysis of forest conditions in PNG using remote sensing, staff participated in a forest observation survey by helicopter (Chopper) that was planned by the C/P and long-term experts in order to obtain a grasp of the correspondence between and interpretablity of forest conditions and satellite images by observing the forest conditions from above. After consultation with the C/P and long-term experts, the area around Mt. Hagen in the highlands where it is difficult to conduct a survey from the ground that has many changes in elevation and an abundant variation of vegetation was designated as the survey area. The helicopter survey flight plan, route and priority survey locations are shown by red lines and red dots in Figure 3-14.

Figure 3-14 Helicopter Survey Flight Plan / Route and Priority Survey Locations

The actual flight path that was flown (red line), location and direction from which pictures were taken with the GPS camera (yellow arrow), and movement path on the ground (blue line) are shown in Figure 3-15. Pictures with GPS data (GeoTag pictures) were used to demonstrate to the C/P the mechanism to efficiently display the photographed location and direction using ArcGIS that was to be procured with the GAECC. Since satellite images have not been procured yet for this area at the training time, the background image is one taken with LANDSAT in 2000.

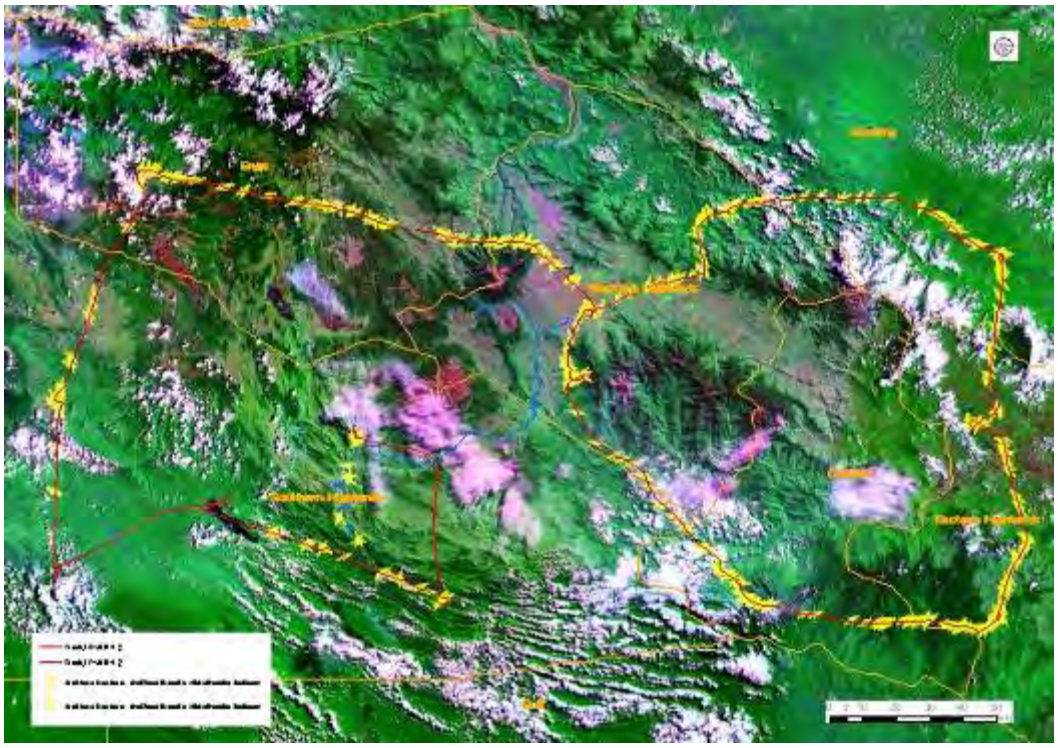

Figure 3-15 Actual Flight Path and Locations Where GPS Tag Pictures Were Taken

A number of enlarged pictures that were photographed with GPS tags are shown in Figure 3-16. By linking satellite images and actual pictures in this manner, the results can be utilized to verify the ground truth of remote sensing analysis (field verification data). In particular, the area where the helicopter survey was conducted this time is difficult to access from the ground, and valuable data was acquired that can be used to review the samples of classification work and classification results that will proceed in the future.

Marsh forests

Figure 3-16 Enlarged View of Locations Where Pictures with GPS Tags Were Taken and Actual Pictures (Continued)

Counterparts (C/P) that are familiar with the vegetation were asked to interpret the vegetation using pictures taken with a GPS camera, and then to compile the respective features. A sample of the pictures with GPS tags and interpretation of vegetation is shown in Figure 3-17. It was the first time for many of the C/P to actually observe the forest from above, and represented invaluable experience to improve the capability of the C/P to interpret vegetation on satellite images that is vital for conducting actual remote sensing analysis in the future.

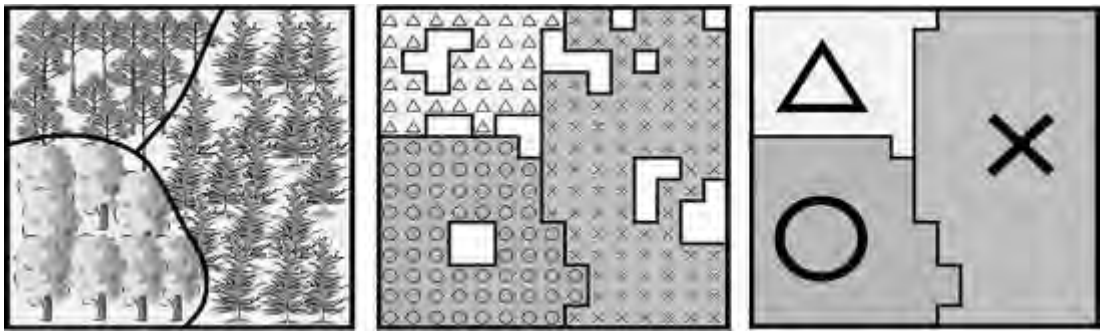
3.5.5 Secondary Analysis of Remote Sensing Data

(a) Review of Forest Classification Flow Chart

During the training in Japan that was previous described, trainees learned the features of optical sensor and radar sensor images and the usage procedure of satellite image analysis software. Here, satellite images that were actually procured under the GAECC are used to review techniques used for forest classification. The eCognition software that is capable of performing object based classification was used for forest classification. By using object based classification, forest classification can be performed by recognizing the forest as a collection of compartment and layer units, rather than in satellite image pixel units (Refer to Figure 3-18).



(a) Condition of Forest (b) Pixel Unit Classification (c) Object Based Classification

Figure 3-18 Differences between Pixel Unit and Object Unit Classification (Image)

For this project, a total of 17 forest classification items have been compiled in "Table 3-8 Classification Codes in FIMS and Target Classifications Codes for This Project". We had our counterparts verify these items on the satellite images, and deliberated as to which satellite images (band combination and vegetation index / elevation data) are effective. The results are shown in Table 3-12.

Based on the results of Table 3-12 and classification features of eCognition, satellite images (5 bands); NDVI (vegetation index), DEM (elevation data), Slope (slope angle) and Watershed (watershed boundary) were used as the input images for forest classification. Due to the fact that it has not been possible to obtain tree height data on the PNG mainland at the current point, it was decided that continued review would be performed concerning the usage of tree height data.

A review was conducted as to which input data was effective for the respective forest types using eCognition for this input data. After this, the threshold that is to be applied for classification was determined through a process of trial and error. A look at classification using eCognition is shown in Figure 3-19, and the results of classification during trial operation are shown in Figure 3-20.

Table 3-12 Review Results of Input Data That is Effective for Forest Classification

Classification Work Flow

No.	Vegetation or Forest Types	RS & GIS techniques Used to detect forest types									
		NDVI	Unsupervised Classification	PCA	rue Imag	Red Edge Band	Watershed polygons	Contour lines	Slope	DEM	Tree Canopy height

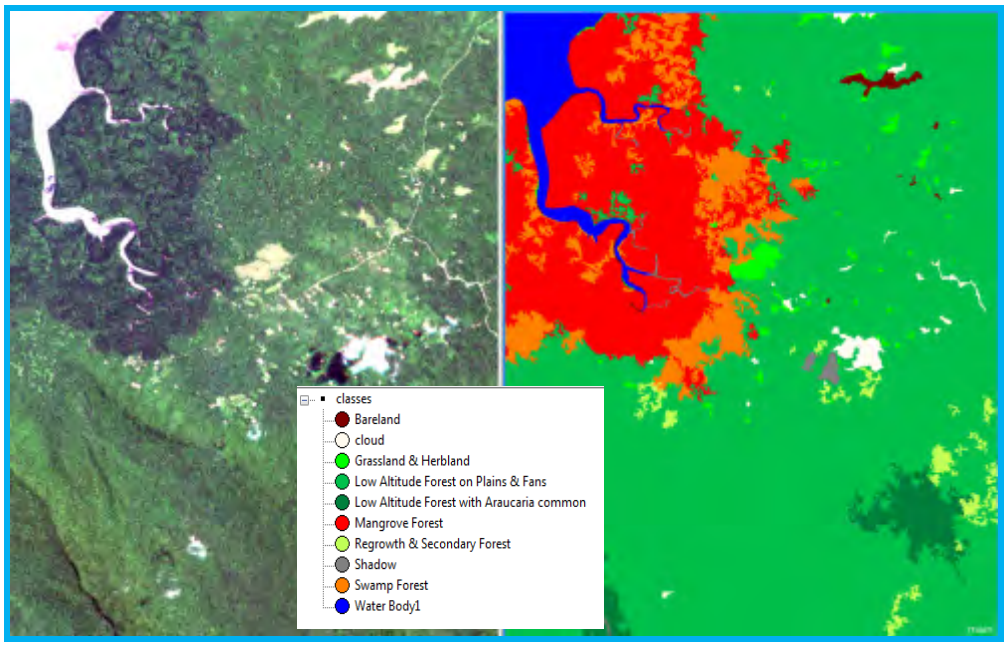
Figure 3-19 Appearance of Classification Flow Chart Review



Left diagram: Satellite image Right diagram: Review of classification parameters and classification results

Figure 3-20 Forest Classification Results (Classification Results during Parameter Review)

Regarding all 17 forest types, discussion was conducted with the four counterparts that participated in the review process to determine the data that will be used for object classification and threshold values compiled in one table. The reason for this is that threshold values are determined by human judgment and a process of trial and error, and consensual validation is required in order to judge whether or not the values are appropriate. The forest classification table (draft) that was created is shown in Table 3-13. A forest classification flow chart, which is a graphic representation of Table 3-13, is shown in Figure 3-21. Plans call for the general versatility of this forest classification table to be verified in the months ahead, with the table values optimized in order to create a final version of the forest classification table and the flowchart.

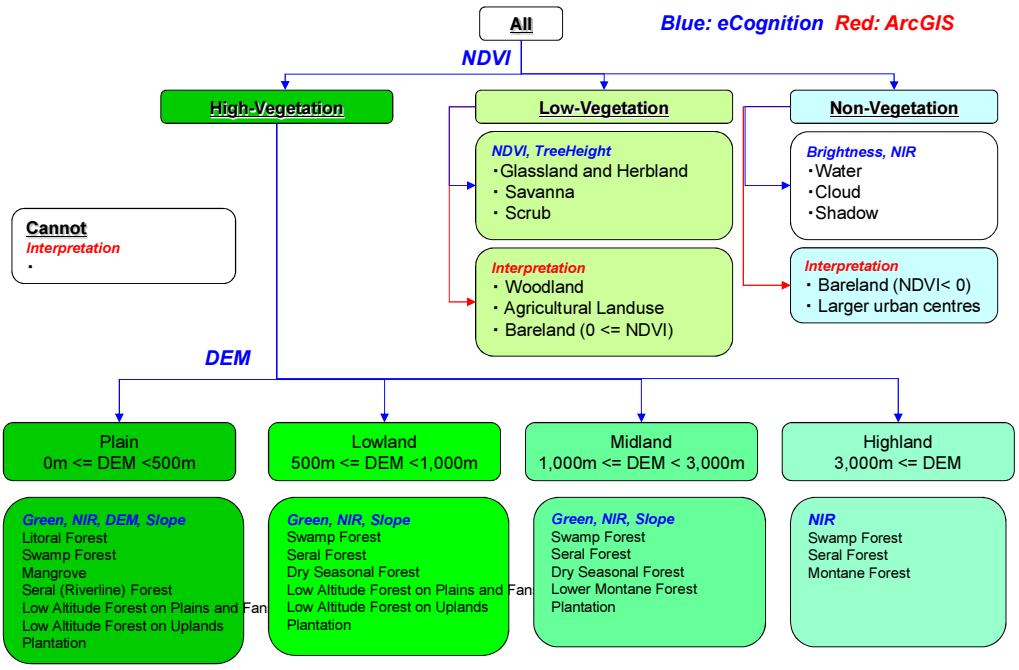

Figure 3-21 Forest Classification Flow Chart (Draft)

Automatic forest classification of a large volume of satellite images can be performed with eCognition by applying the classification flow chart shown in Figure 3-21. However, due to the fact that automatic classification by computer is not perfect, a fair amount of judgment and correction by people are required. Therefore, forest interpretation cards were created by the counterparts that are to be used as reference material to facilitate interpretation and correction. The forest interpretation cards describe the forest definitions in the FIMS, the "features of the respective classification items that can be interpreted by the optical sensors (RapidEye)", and the definitions of the classes defined by eCognition. A sample of the forest interpretation cards is shown in Table 3-14.

(b) Analysis of Watershed (Preparing for Usage in Forest Classification)

The watershed boundary in mountainous areas is located on ridge lines and saddleback areas, serving the function of inhibiting the flow of materials and people, with the capability of separating living zones or cultural zones. In addition, there are cases that these living zones or cultural zones become administrative boundaries. The flow of materials and energy within the watershed acts continuously in the downstream direction, and the watershed becomes an ecosystem. Therefore, a grasp of watershed boundaries needs to be obtained in order to conduct forest management, secure water resources, predict disasters and perform other such work.

Consequently, during this project, remote sensing DEM data will be used to perform watershed analysis in order to create the watershed boundaries. The size of the watershed boundaries will be created at three levels, from large watersheds to small watersheds, in consideration of usage at a variety of levels. In particular, the most detailed small watershed boundaries will be utilized in order to obtain a grasp of vegetation boundaries on forest cover classification diagrams that are created during this project.

The creation procedure for watershed boundaries is shown in Figure 3-22. GeoSAR data that was borrowed from UPNG RSC which is cooperating with the C/P was used as the DEM data. GeoSAR DEM data has an extremely high resolution of 5 meters, but this GeoSAR DEM data has locations where the data is missing. SRTM data with a resolution of 90 meters was used to supplement the locations where the data was missing (① in Figure 3-22). Small watershed boundaries were created in a number of different sizes, and the respective watershed boundaries were overlaid with the satellite images in order to determine the watershed size that best reflects the vegetation boundaries after discussion with the C/P (⑧ in Figure 3-22). The results of the survey which were overlaid onto the watershed boundaries and vegetation diagrams are shown in Figure 3-23. As a result of a review, the following conditions were established for the respective watershed boundary sizes: Cumulative flow volume of 50,000 or more for small watershed boundaries, 500,000 or more for medium watershed boundaries and 5,000,000 or more for large watershed boundaries.

A sample of a created small watershed boundary is shown in Figure 3-24.

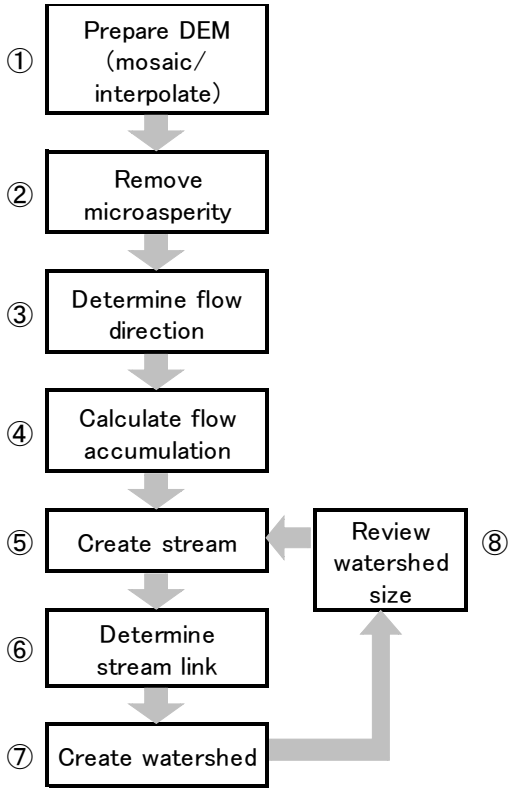

Figure 3-22 Watershed Boundary Creation Procedure

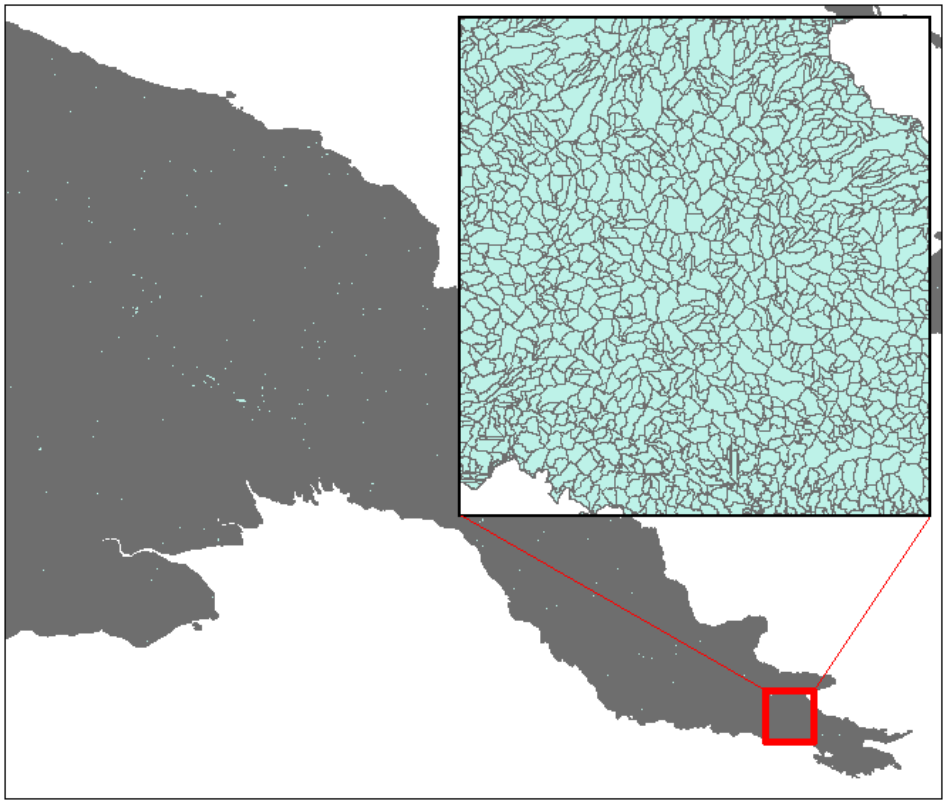

Figure 3-24 PNG Small Watershed Boundaries Created with DEM Data Analysis

3.5.6 Preparation of Nationwide Forest Cover Maps Based on Secondary Analysis Results

(a) Addition of Classification Categories

Deliberation was conducted again with the C/P and long-term experts regarding the forest cover diagram classification items. This resulted in classification of Grassland and Herbland using altitude, and classification of Forest plantations into Forest plantations and other plantations (Plantations other than forest plantations) due to the fact that the C/P has Plantation boundary data (Refer to Figure 3-25).

A list of the latest vegetation classification items which reflect these additions is shown in Table 3-15.

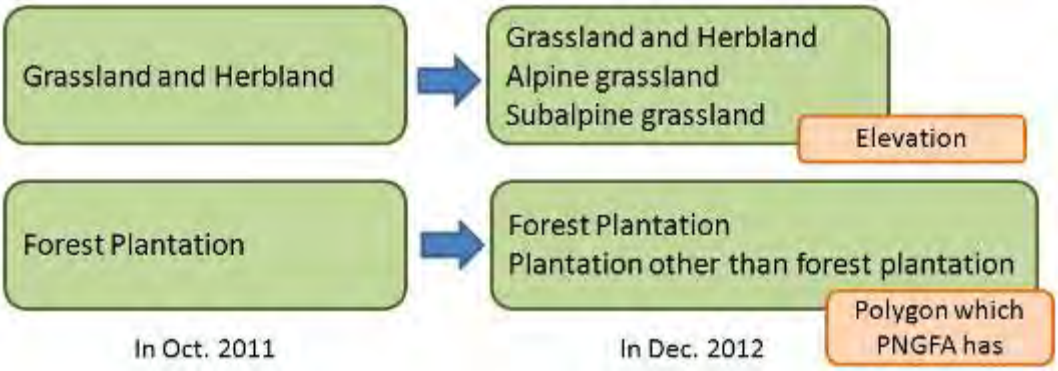

Figure 3-25 Change in Grassland and Plantation Classification Items

Table 3-15 List of Forest/Vegetation Classification Items

As of 10th December, 2012

IPCC GL-AFOLU	No.	Vegetation type	Condition	Code	No.	Remarks
Forest land	1	Low Altitude Forest on Plains and Fans	below 1,000m	Pl		Large to medium crowned forest
				Po		Open forest
				Ps		Small crowned forest
	2	Low Altitude Forest on Uplands	below 1,000m	Hl		Large crowned forest
				Hm		Medium crowned forest
				HmAr		Medium crowned forest with Araucaria common
				Hmd		Medium crowned depauperate/damaged forest
				Hme		Medium crowned forest with an even canopy
				Hs		Small crowned forest
				Hse		Small crowned forest with an even canopy
				HsAr		Small crowned forest with Araucaria common

(b) Addition of Distribution Characteristics

In order to reduce misclassification during automatic classification, verification of which regions the respective classification items exist was performed, as well as the approximate respective area. The Summary of FIMS (FOREST RESOURCES OF PAPUA NEW GUINEA SUMMARY STATISTICS FROM THE FOREST INVENTORY MAPPING (FIM) SYSTEM, 1998) was used as reference to add up the area for each vegetation type and each forest type in each province. The vegetation types are shown in Table 3-16, and the forest types are shown in Table 3-17.

Table 3-16 Area of Each Vegetation Type in Each Province (sq km, 1975)

Source : FOREST RESOURCES OF PAPUA NEW GUINEA
SUMMARY STATISTICS FROM THE FOREST INVENTORY MAPPING
(RIMI SYSTEM, 1988

In regard to vegetation types, the following things can be verified from Table 3-16.

- There are not any woodlands in Enga, Western Highlands or Simbu Prov. (Less than 5km^2 in Eastern Highlands).
- There is Savanna in Western, Gulf, Central, Milne Bay and Northern Prov.
- There is no Scrub in Eastern Highlands, East Sepik or New Ireland Prov. (Here, this indicates less than 10km^2).
- There are not any mangroves in Eastern/Western/Southern Highlands, Enga or Simbu Prov.

In addition, with respect to forest types, the following things can be verified from Table 3-17.

- There are not any Lowland Plains (altitude 1,000m or lower) in Eastern/Western Highlands, Enga or Simbu Prov.
- There are not any Lower Montane Forests (altitude 1,000m or higher) in Manus Prov.
- Dry Seasonal Forests are only in Western Prov.
- Most of the Littoral Forests are in Western, Central, Milne Bay and North Solomons Prov., amounting to approximately 80% of the total area.
- There are not any Seral Forests in Eastern/Western/Southern Highlands, Enga, Simbu, or Manus Prov.
- There are not any Swamp Forests in Eastern/Western Highlands, Simbu, Manus or New Ireland Prov. Most of the Swamp Forests are in Western, Gulf and East Sepik Prov., amounting to approximately 85% of the total area.

When automatic classification and correction of interpretation are performed, this information shall be taken into consideration when formulating the classification flow and interpretation procedure so that misclassification can be minimized as much as possible.

(c) Updating and Finalization of Forest Classification Flow Chart

Deliberations were conducted again with the C/P and long-term experts, taking the above content into consideration, and a flow chart to be used during automatic classification of forest was prepared. The forest classification flow chart is shown in Figure 3-26. The flow will be tuned-up based on the challenges/issues faced in the analysis/processing.

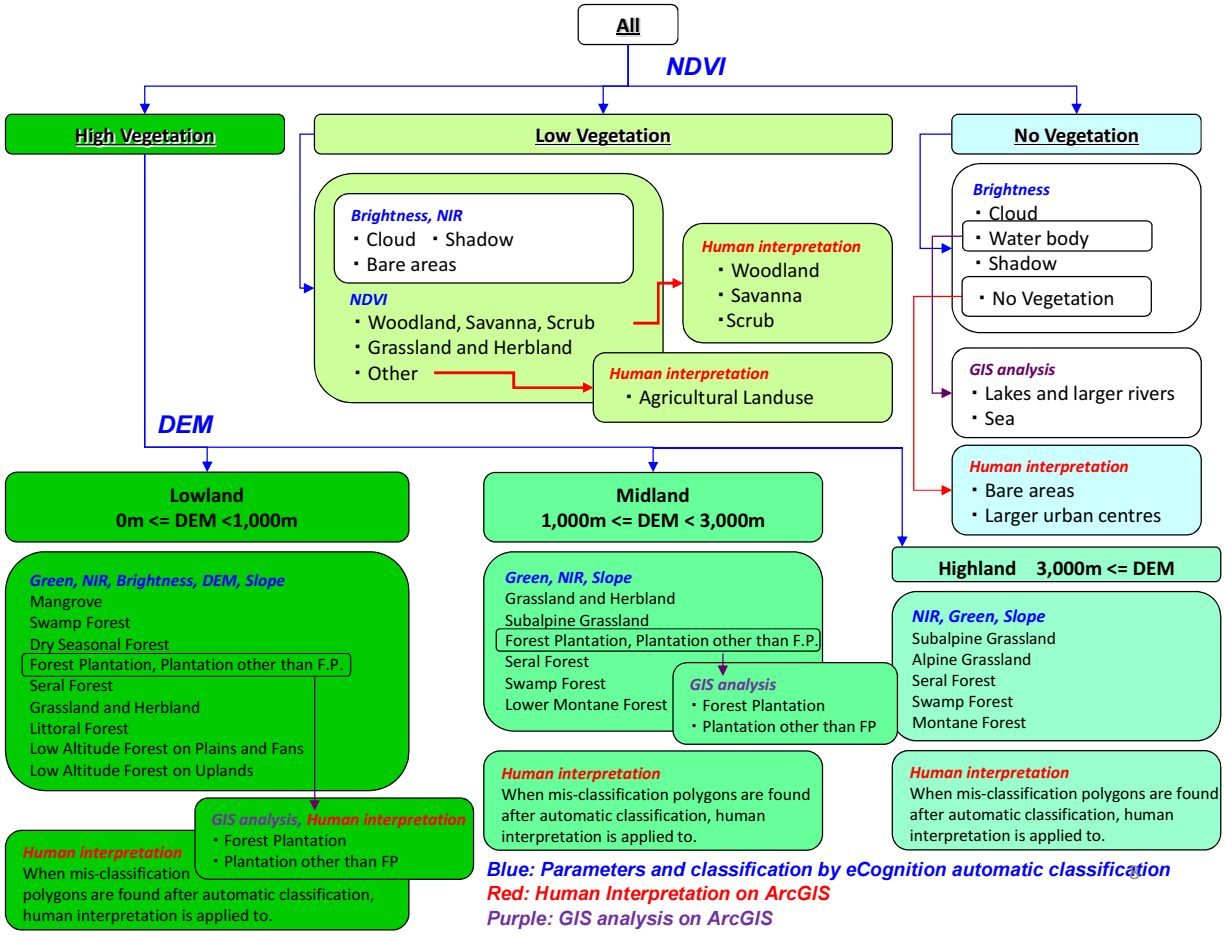

Figure 3-26 Revised Forest Classification Flow Chart

Figure 3-27 Forest Classification Flow Chart Being Reviewed

(d) Confirmation and Correction of Automatic Classification results

The decision was made to use RapidEye satellite images (5 bands), NDVI (vegetation index), DEM (altitude data), Slope (slope angle) and Watershed (watershed boundaries) as the input images for forest classification. These images were entered into each RapidEye tile ID (25 km square), and a segmentation was prepared with eCognition.

The segmentation was used as the minimum classification unit, and the average value of each parameter and standard deviation were calculated from the total pixel value in the segmentation. These values were used for the feature values to perform forest / vegetation classification. The process of performing classification in accordance with the flow chart shown in Figure 3-26 is shown in Figure 3-28.

(1) RapidEye Image

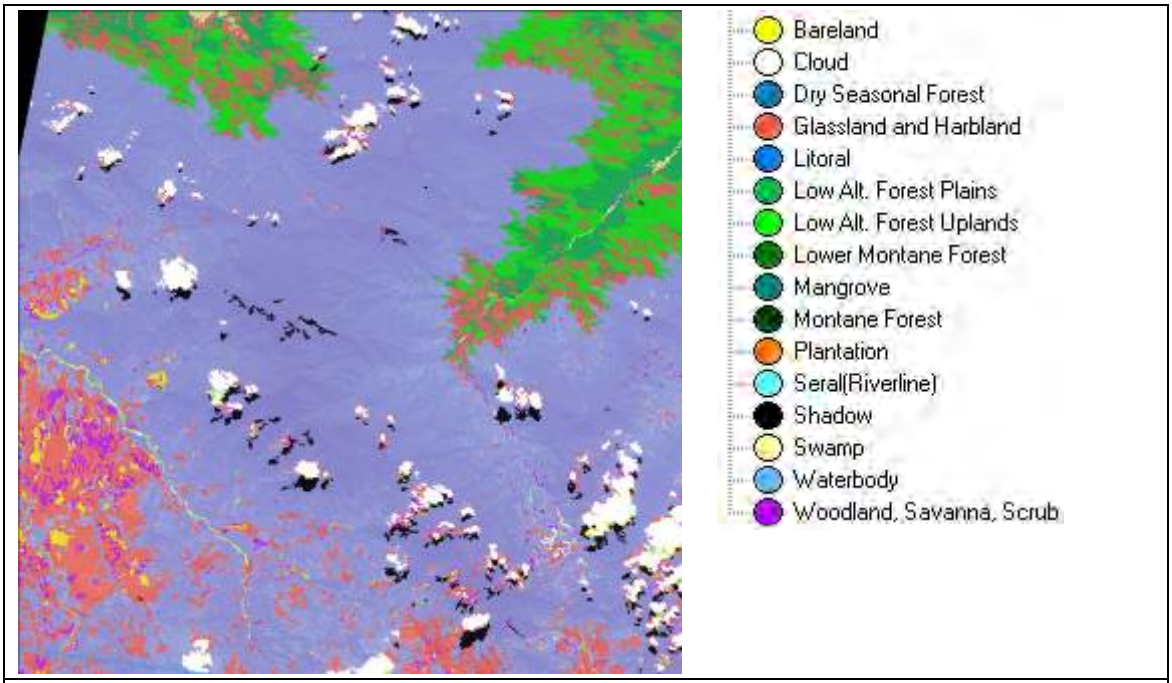
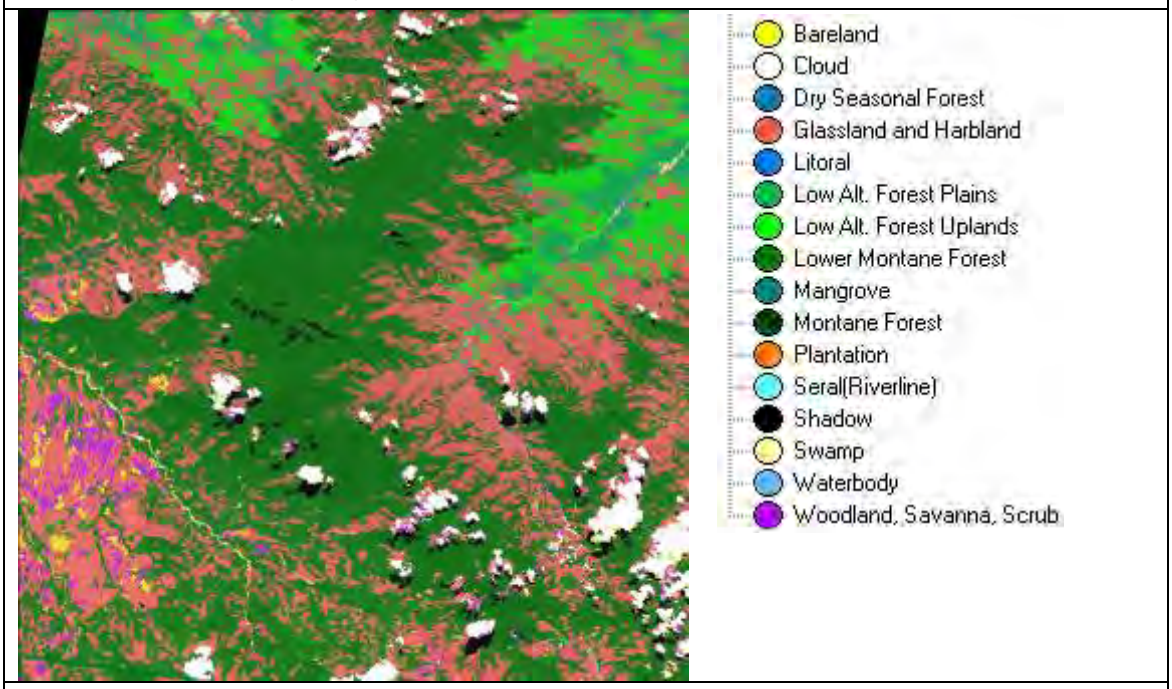
(6) Classification of High Vegetation area

Figure 3-28 Process of Performing Vegetation Classification



(7) Classification of High Vegetation area



(8) Classification of High Vegetation area

Figure 3-28 Process of Performing Vegetation Classification (Continued)

Since there were a number of misclassifications in the classification results after automatic classification was performed, the misclassified locations (polygons) were visually extracted, and the reasons that misclassification occurred were compiled. The table used to extract the misclassifications and reexamine the parameters is shown in Figure 3-29. The process of extraction of the misclassifications

is shown in Figure 3-30. Staff at the FRI (Forestry Research Institute) who are familiar with forests / vegetation were asked to participate in this work, and their knowledge was used extensively. Furthermore, the classification flow parameters were optimized, and automatic classification was attempted again. The automatic classification results before and after the parameters were updated were compared at the project site. These results are shown in Figure 3-31.

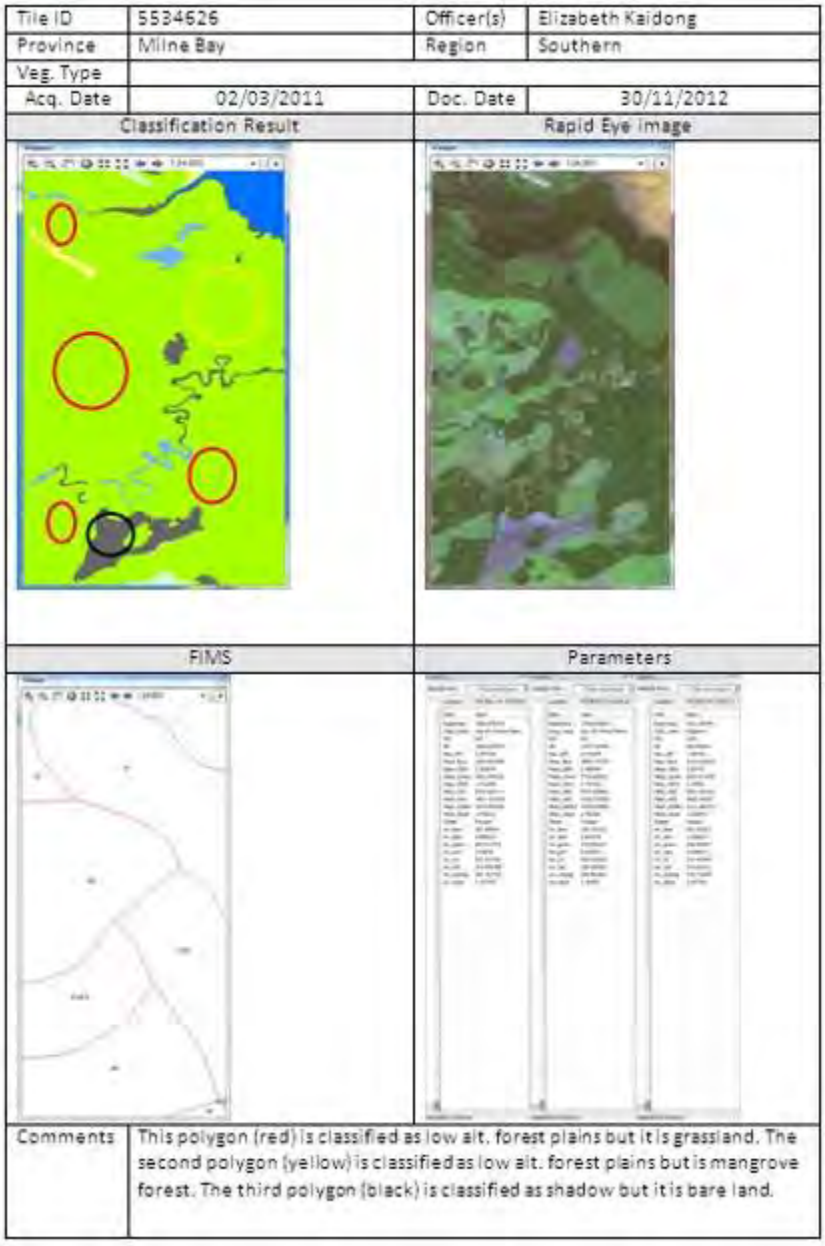


Figure 3-29 Misclassification Extraction Results

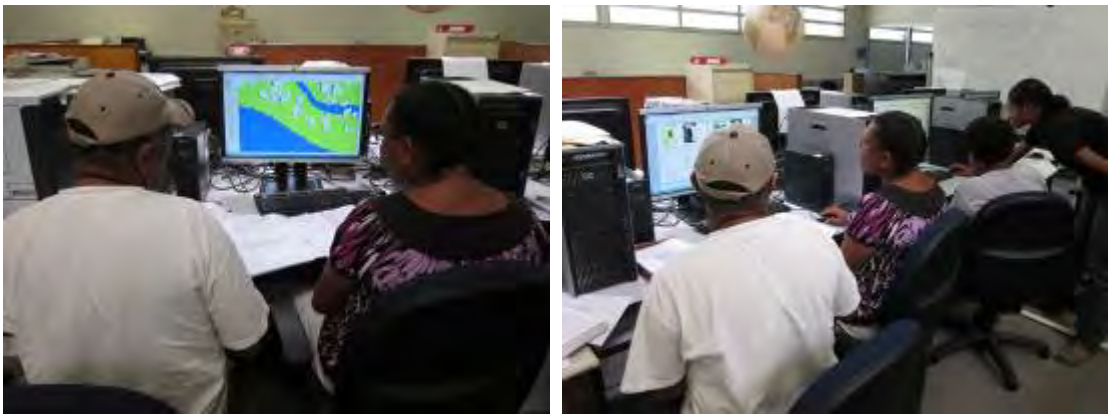

Figure 3-30 Misclassification Being Extracted

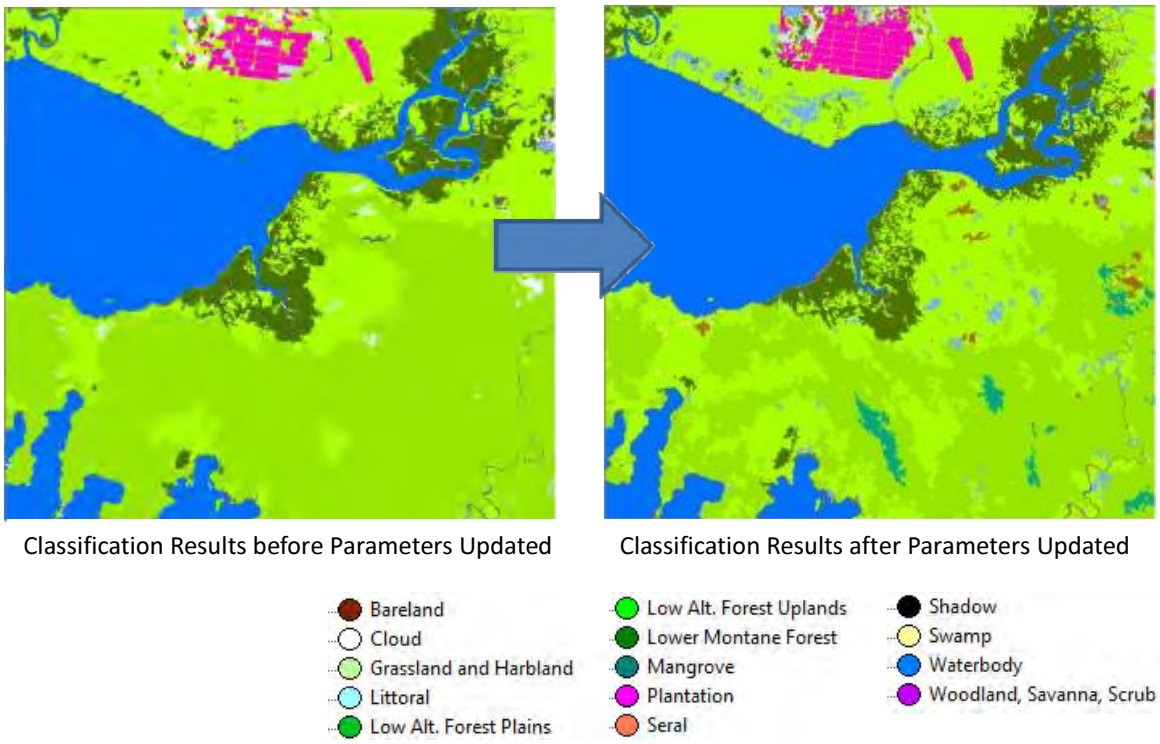

Figure 3-31 Forest Classification Results after Classification Flow / Parameters Updated

It can be seen in Figure 3-31 that while there were a number of misclassifications in the classification results before the parameters were updated such as for Littoral and Dry Seasonal Forest, these misclassifications were reduced after the parameters were updated. This indicates that optimization of the parameters used for classifications and reflecting the characteristics of the region or distribution region in the classification flow leads to enhancement of the classification accuracy.

The results of applying this classification flow to the area around the Central Suau project site in Milne

Bay are shown in Figure 3-32. The area of the diagram is approximately 60km x 100km (corresponds to 12 RapidEye tiles). The FIMS vegetation boundaries were overlaid as red lines in order to evaluate the classification results obtained with automatic classification.

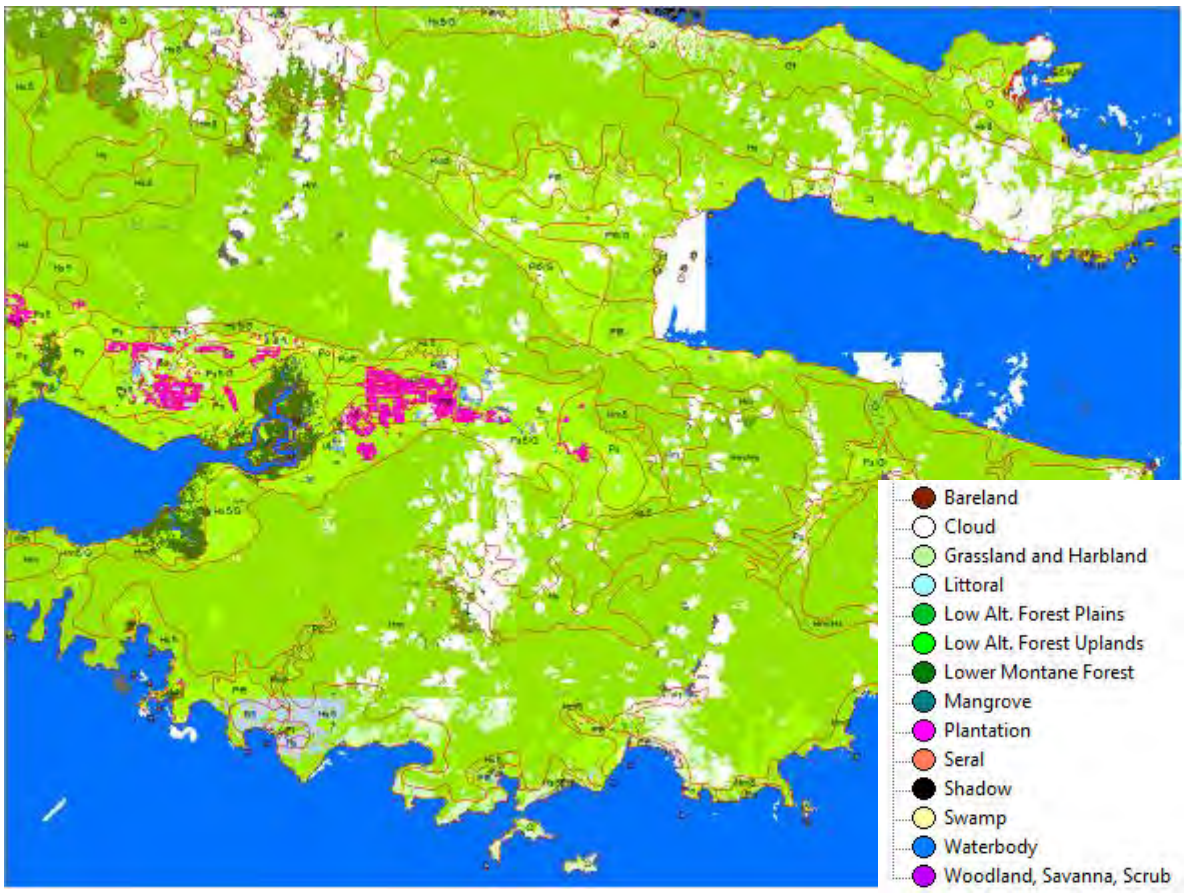

Figure 3-32 Forest Cover Classification Diagram Prepared with Automatic Classification (FIMS Vegetation Boundaries Overlaid with Red Lines)

Due to the fact that preparation of forest cover classification diagrams is being implemented throughout PNG under the GAECC (Technical Assistance), in this project, the focus was on a review of forest cover classification diagram preparation and capacity building at the C/P.

(e) Preparation of Interpretation Cards

Due to the fact that accurate forest classification cannot be performed with automatic classification alone, interpretation correction that consists of visual interpretation by trained staff is required. The C/P prepared interpretation cards (collection of classification case studies) which are required for interpretation. The decision was made to have interpretation cards prepared for each of five vegetation regions after consultation with the C/P and long-term experts. These five vegetation regions are: Central/Milne Bay/Oro Province, Highlands Region, Momase Region, Western/Gulf Province and

Islands Region.

In addition, with respect to the classification items that are required for correction of interpretation in particular, priority order was assigned, and a larger number of interpretation samples were prepared. On the other hand, with respect to classification items for which classification can be performed to a certain extent with automatic classification, a smaller number of interpretation samples was designated as a consideration for the volume of work at the C/P (to maintain balance with normal work conducted).

The interpretation card work progress sheet is shown in Table 3-18. In order to prevent subjectivity by different individuals from being included in the interpretation results, preparation of interpretation cards was performed by two people. An example of interpretation card preparation is shown in Figure 3-33. The decision was made to have the C/P enter the boundary line on the satellite image on the interpretation card in order to enable staff performing interpretation and correction work that are not familiar with the types of vegetation in Papua New Guinea to clearly identify the boundary between classes of forests / vegetation.

3.5.7 Preparation/Usage/Management Manual and Work Flow Design

Preparation of object-based classification manuals used for "3.5.5 Secondary Analysis of Remote Sensing Data" and for "3.5.6 Preparation of Nationwide Forest Cover Maps" was performed in cooperation with the C/P. The manual configuration is described below. Review of Chapter 1 – 2 was conducted during secondary analysis of the remote sensing data, and the specific work flow design was reviewed in coordination with the training in Japan that was implemented under the GAECC.

1. Introduction
- 1) Object-Based Classification
- 2) Region grow
- 3) Algorisms

2. Characteristics of Spectrums
- 1) Characteristics of spectrums for each landcover materials
- 2) Band combinations

3. Defferences between Regular Ver. and Trial Ver. of Develope

4. Start eCognition Developer
- 1) Boot eCognition Developer
- 2) Creat new project
- 3) Image layer mixing
- 4) Split windows

5. Management of Process Tree

6. Segmentation
- 1) Multi-resolution segmentation
- 2) Manage levels of segmentation
- 3) Manage alianses

7. Classification
- 1) Check a characteristics of each layers for each classes
- 2) Adjust a threashold based on the mean value
- 3) Creat class hierarchy
- 4) Classification
- 5) Delete Classification

8. Export a Results

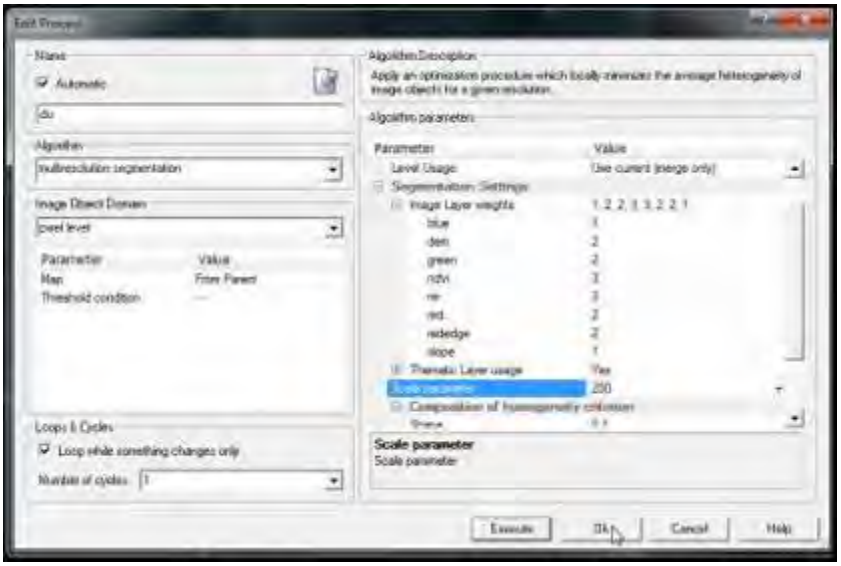

Figure 3-34 Segmentation Setting Screen for Draft Manual (Example)

3.5.8 Required OJT for 3.5.2 – 3.5.7

The results shown in 3.5.2 – 3.5.7 were achieved by implementing the OJT shown in the table below.

Table 3-19 Implementation of OJT

Date	OJT Content	Participating Member
September 26, 2011 (Monday) September 27, 2011 (Tuesday)	Image processing of RapidEye imagery	Mr. Perry (Training in Japan)
September 28, 2011 (Wednesday) September 29, 2011 (Thursday)	Image processing of PALSAR imagery	Mr. Perry (Training in Japan)

January 21, 2013 (Mon.) to January 25 2013 (Fri.)	Follow up Training o Object-based forest Classification (eCognition)	Perry, Samuel, Patrick, Elizabeth

<Phase 2: April 2013 – March 2014>

3.5.9 Confirmation and Evaluation of Outcomes and Issues Concerning Forest Cover Map (Forest Basemap ver.0)

Based on the forest cover classification techniques that were formulated during activities in the first phase, a nationwide forest cover map (Forest Basemap ver. 0) was prepared by means of technical assistance activities under the GAECC.

The National Vegetation Map (prepared based on aerial photographs taken in 1972) used in the FIMS of the PNGFA is shown in Figure 3-35, and the 2012 Forest Basemap (ver. 0) (prepared based on the satellite images taken in 2010 – 2011) prepared in coordination between this project and the GAECC is shown in Figure 3-36. Due to the fact that the base map is currently the cover map, the fact that it does not include farmland (yellow) will be taken into consideration.

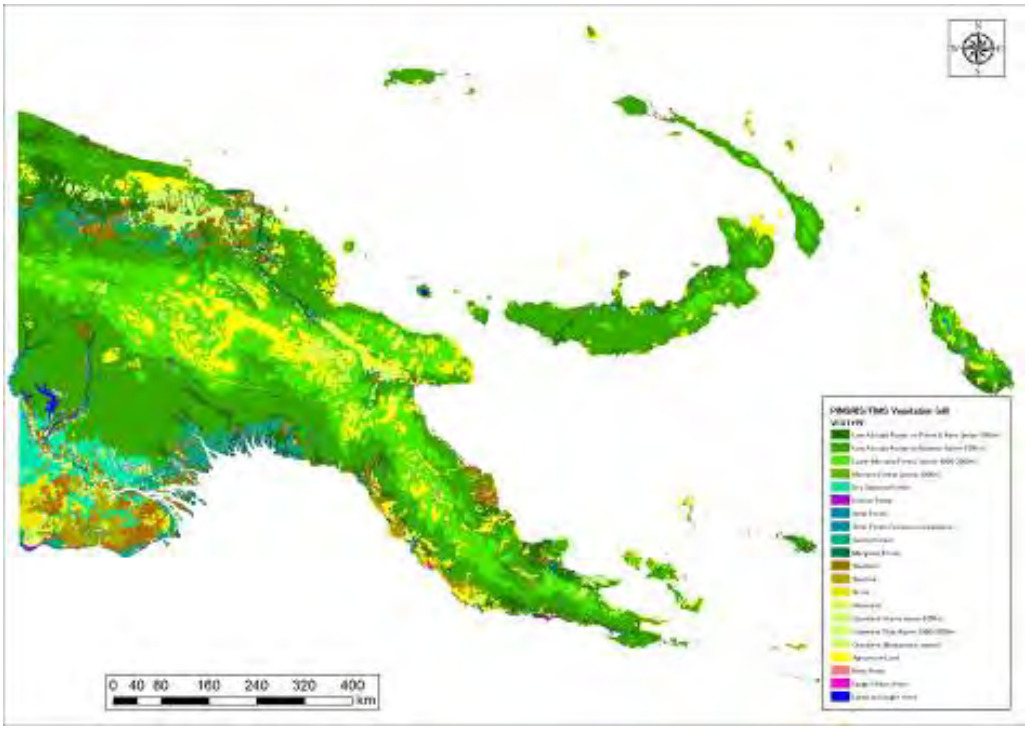

Figure 3-35 National Vegetation Map Used by Forest Authority
(Based on 1972 Aerial Photographs)

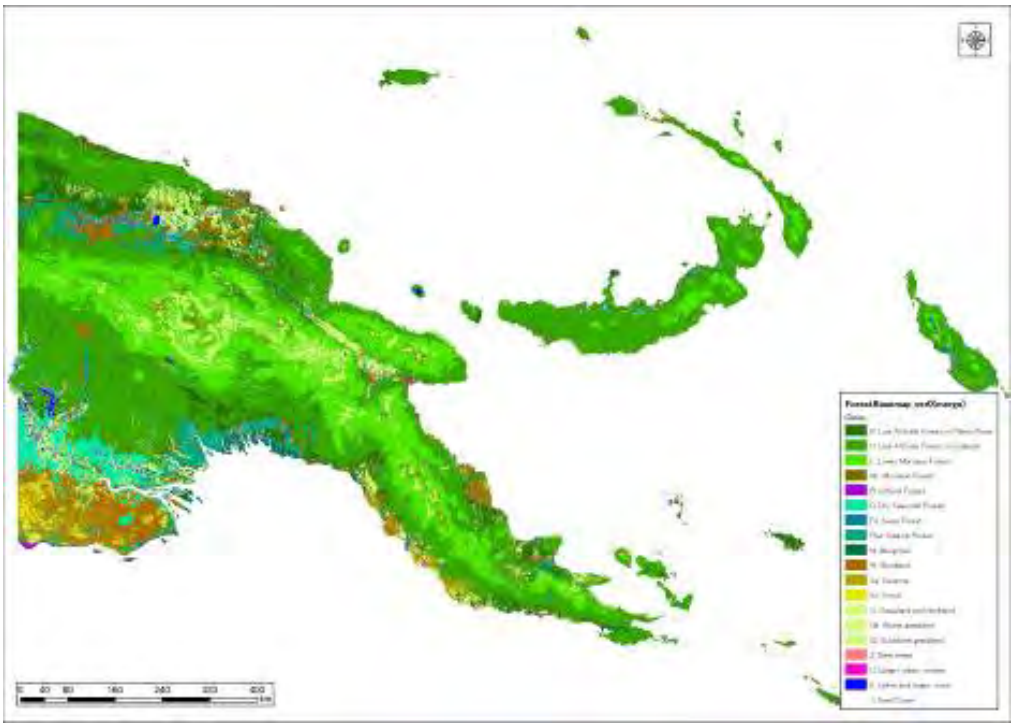

Figure 3-36 2012 Forest Basemap (ver. 0) (Based on 2011-2012 Satellite Images)

A group of five satellites with the same specifications called RapidEye was used to attempt to acquire images with a minimum of clouds during a short period of approximately one year between 2010 and 2011 for the preparation of the 2012 Forest Basemap (ver. 0), but it was inevitable that there were some regions which were covered with clouds throughout the year. Therefore, during this project, radar (SAR) satellite images were used in addition to optical satellite images to supplement classification of forest and non-forest areas for which optical classification was made difficult due to cloud cover.

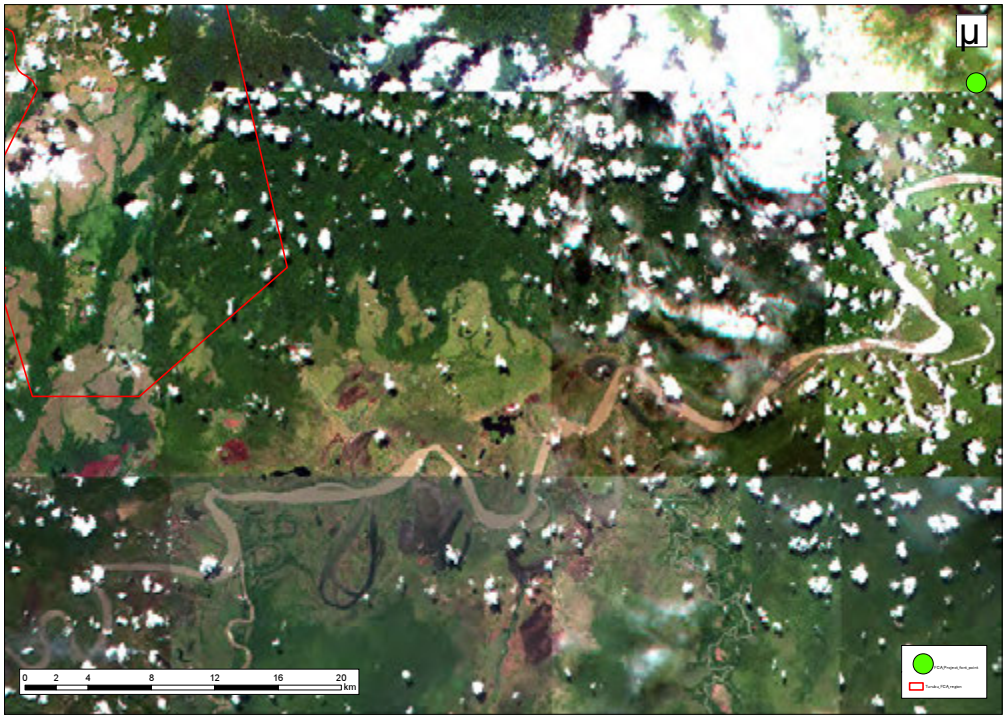

Figure 3-37 Optical Satellite Images Used to Prepare 2012 Forest Basemap (ver. 0)

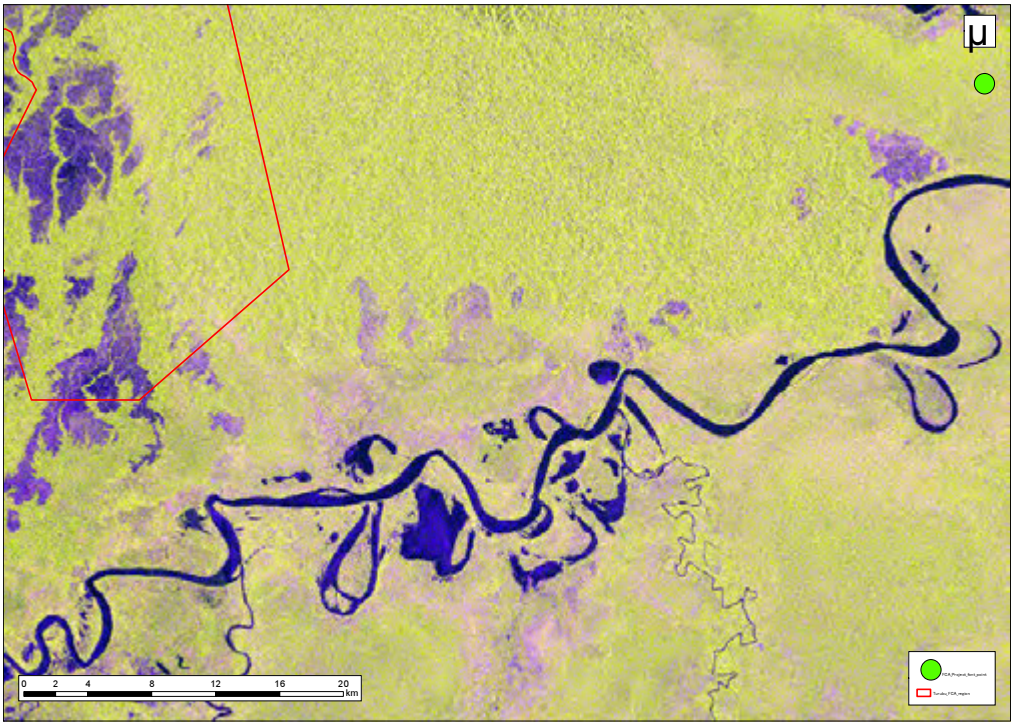

Figure 3-38 Radar Satellite Images Used to Prepare 2012 Forest Basemap (ver. 0)

An enlarged view of the 2012 Forest Basemap (ver. 0) prepared using the optical satellite images in Figure 3-37 and radar satellite images in Figure 3-38 is shown in Figure 3-39. In addition, the vegetation map (based on 1972 photographs) used by the Forest Authority for comparison purposes is shown in

Figure 3-40. For the most part, the image is a good match with Figure 3-37, and when compared with Figure 3-40, it can be verified that it improved the detail of forest classification (water areas also extracted with good precision) that could not be confirmed with the small scale of the national level, and radar images were referred to as supplementary information in areas with clouds to determine forest / non-forest areas.

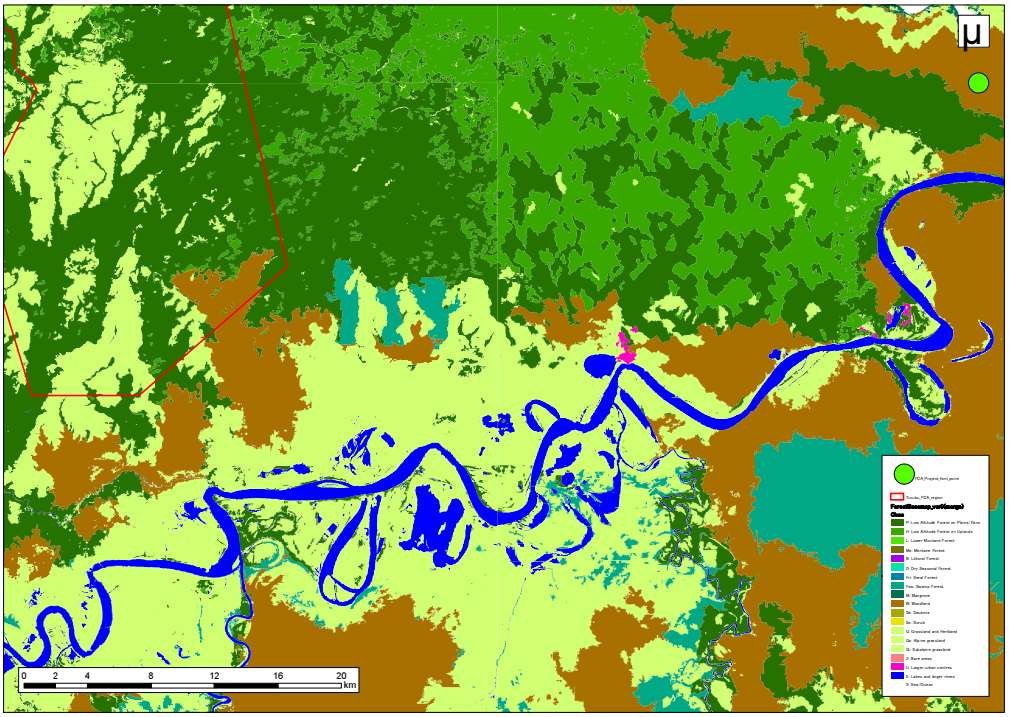

Figure 3-39 Enlarged Image of Prepared 2012 Forest Basemap (ver. 0)

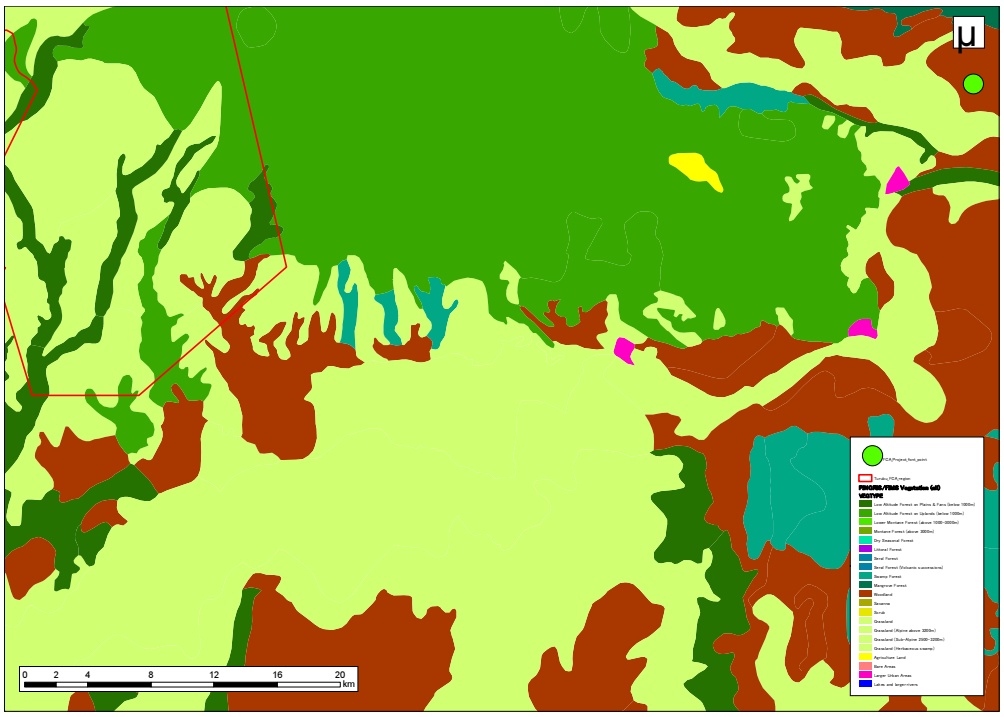

Figure 3-40 Enlarged Image of Forest Authority Vegetation Map (Based on 1972 photographs)

A supplementary image for areas with clouds using a radar satellite (ALOS/PALSAR) is shown in Figure 3-41.

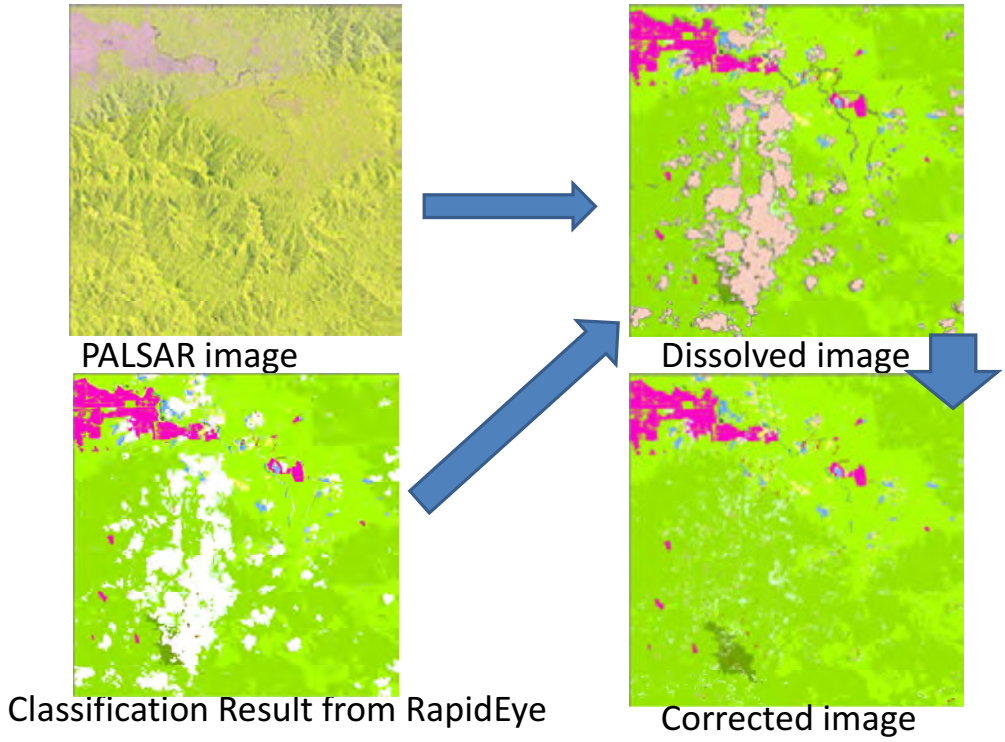

Figure 3-41 Forest/Non-Forest Supplementary Image for Cloud Area Based on ALOS/PALSAR

Furthermore, the 2012 Forest Basemap (ver. 0) that was prepared this time first separates the forest/non-forest areas (including areas with water, clouds or shadows) that can be clearly identified on the satellite image. Regarding the details of the respective categories in forest and non-forest areas, samples were taken from the vegetation map being used by the Forest Authority, and for items for which it was clear they were misclassified, interpreting correction was performed. Although full-fledged accuracy verification is not currently being performed, discussions with the C/P resulted in the conclusion being reached that there will be a focus on making improvements for the issues outlined below.

- Map not being prepared for agricultural-land / Cropland
  - ➢ Physical definition in ver. 0 is Land cover, which does not cover Land use
  - ➢ This is due to the fact that knowledge of the area and supplemental data is required for interpreting of agricultural land
- Differentiation between Woodland, Savanna and Scrub is not clear
  - ➢ Determined that staff at C/P did not necessarily have a common understanding of the above classes

- These are categories that have an impact on classification of forest/non-forest areas in accordance with forest definitions of the IPCC

- Plain Forest and Hill Forest not being effectively classified (in some locations)
  - There are locations where the classification is not natural due to problems with the quality of DEM used for analysis
  - Additional definitions are required since there are many hill forests on the plains in Western Province

Additional ground truthing was carried out to solve the issues above in the project period and to investigate the direction after the project.

3.5.10 OJT to Improve Forest Cover Map by Utilizing Ground Truth

(a) Revision of Interpretation Cards

In 3.5.6 (e), interpretation cards were prepared to correct visual interpretation with the objective of improving the forest cover classification results prepared by means of automatic classification. At the time of preparation, the interpretation cards were regarded as the case studies for individual forest/vegetation types, but during preparation of the interpretation cards with the C/P, the actual types of forest/vegetation in PNG are complicated, and it was found that it is important to have all of the staff at the C/P have the same understanding as to the type of understanding required to conduct interpreting of forest/vegetation. Therefore, a meeting to nurture common understanding was held, discussions were conducted on how all C/P staff members should perform classification, and the decision was made to compile the results as interpretation cards.

- Changing of Image Highlighting Parameters

Up until now, the standard deviation was used as the image highlighting method, and the dispersion parameter was adjusted in order to obtain the optimum color and brightness. However, the bright white color of clouds in PNG where there are many clouds had the impact of making it difficult to interpret dark portions. In order to improve this situation, a change was made with the method called Percent Clip applied from this fiscal year, in which the ratio of the “Bright portion with clouds etc.” and “Dark portion with shadows from clouds, ocean etc.” are specified, consisting of a procedure where the histogram is adjusted with the bright and dark portions removed in order to perform highlighted display. Compared to standard deviation, specifying these parameters (ratio of portions to be excluded) is difficult since image processing experience is required, but image highlighting was performed with Percent Clip to simplify image interpreting. The differences in image highlighting between standard deviation used up until now and Percent Clip are shown in Figure 3-42.

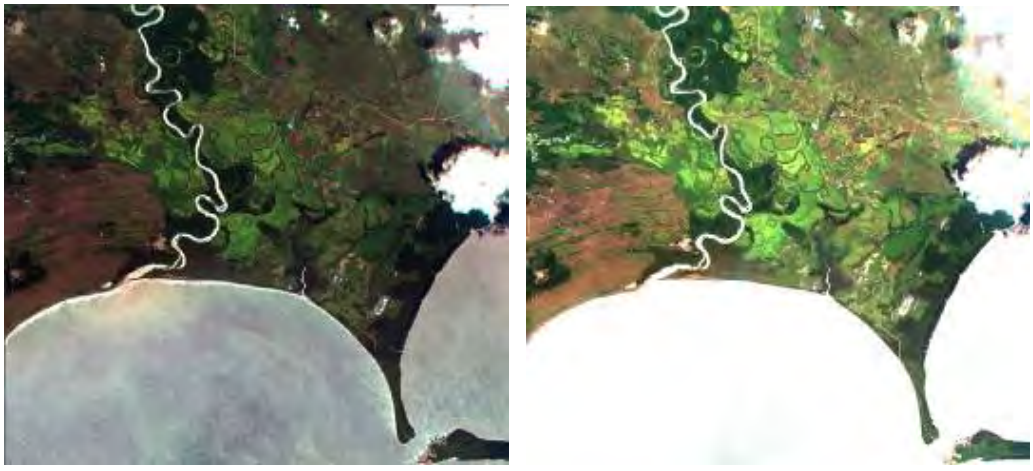

Figure 3-42 Differences in Image Highlighting
(Left: Standard deviation, Right: Percent Clip, Tile ID: 5534418)

- Meeting to Nurture Common Understanding

A meeting to nurture common understanding was held at which how True Color images and False Color images displayed with Percent Clip are used to interpret forest/vegetation types was discussed. A photo of that meeting is shown in Figure 3-43. At this meeting, the new interpretation cards which will be described next were used to conduct a discussion of one and a half to two hours for each location.

Figure 3-43 Photo of Meeting to Nurture Common Understanding

- Preparation of New Interpretation Cards

The outcome of the meeting to nurture common understanding was used to prepare new interpretation cards. An example of a new interpretation card is shown in Figure 3-44. The new interpretation cards are overlaid with the interpreted polygon, and describe the features that are interpreted as that forest/vegetation type (color, brightness, texture, distribution area, etc.), topographic and social background distributed there, classification codes based on knowledge of the C/P, FIMS classification codes, and items that can be read from high resolution images obtained with Google Earth. A comprehensive judgment was made with these items, and the Final Conclusion/Common Understanding was prepared.

The decision was made to prepare these new interpretation cards for each vegetation zone. The priority was set by the C/P, and for 25 zones for which the priority is particularly high, the decision was made to prepare at least one. In addition, for cases where there are types of forest/vegetation that are important and complicated, the decision was made to prepare multiple new interpretation cards for one vegetation zone. The progress management table for the new interpretation cards is shown in Table 3-20.

Up until now, there were differences in forest/vegetation interpreting from remote sensing images within the C/P, but unification of the interpreting standard has been achieved by means of the meeting to nurture common understanding and OJT to prepare the new interpretation cards. It is hoped that the C/P will use the unified standard to update the forest basemap on an ongoing basis in the future.

(b) Implementation of Ground Truth Survey

As discussions of the interpretation cards with the C/P progressed, the request was made that a ground truth survey be implemented in order to proceed with improvement of the interpretation cards and in turn review the 2012 Forest Basemap (ver. 0) due to the fact that the C/P who knows a lot about vegetation in PNG may not have visited certain areas and therefore do not have adequate knowledge of the vegetation in those areas. Consequently, new ground truth survey team members were proposed for this project, and surveys were conducted.

- Western Province (April 29 – May 5)

Due to the fact that the vegetation in Western Province is quite special even for PNG, and the C/P at the PNGFA Headquarters had never visited Western Province, the decision was made to conduct a ground truth survey. There are areas in this region that are called Dry Seasonal Forest, and discussions focused on whether or not these areas could be classified with the satellite images (RapidEye) that are being used this time.

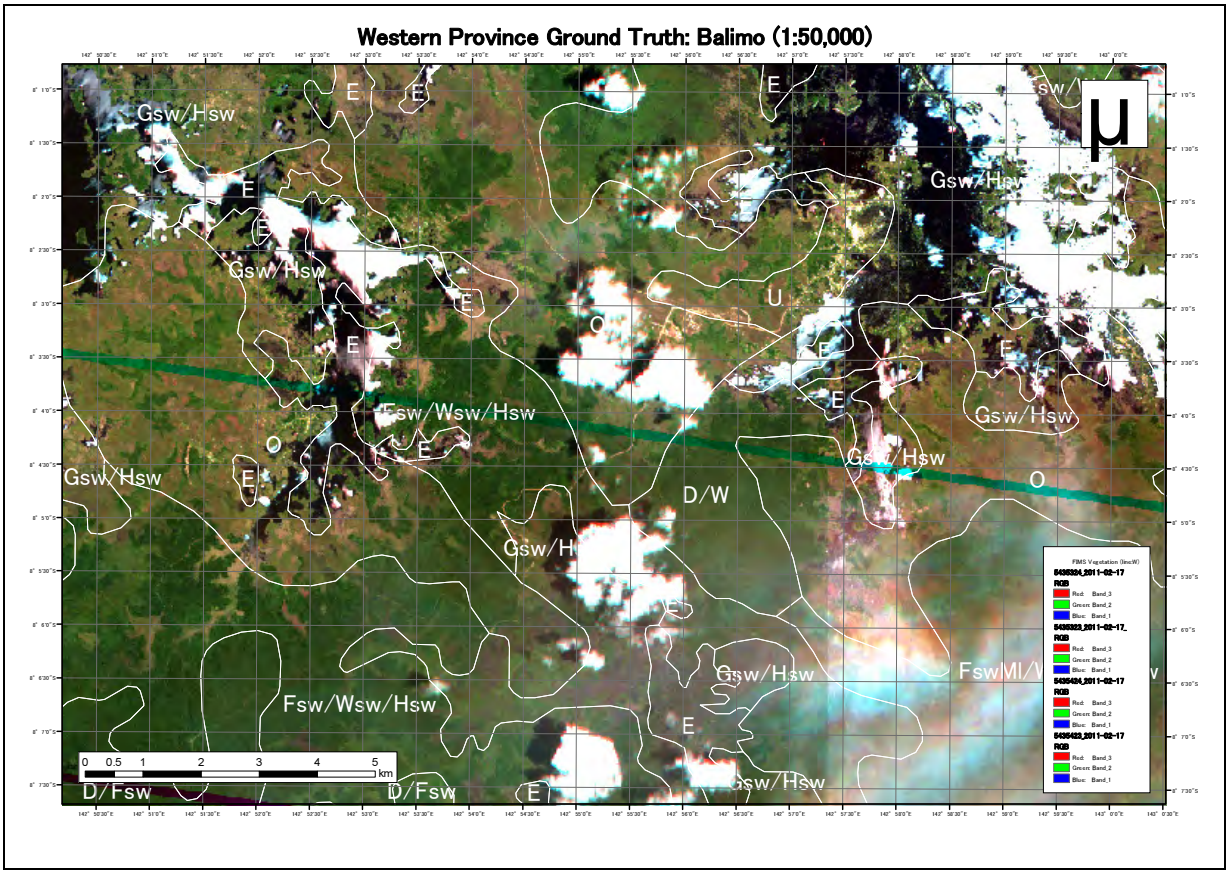

Figure 3-45 Base Map of Ground Truth Survey in Western Province (Around Balimo)

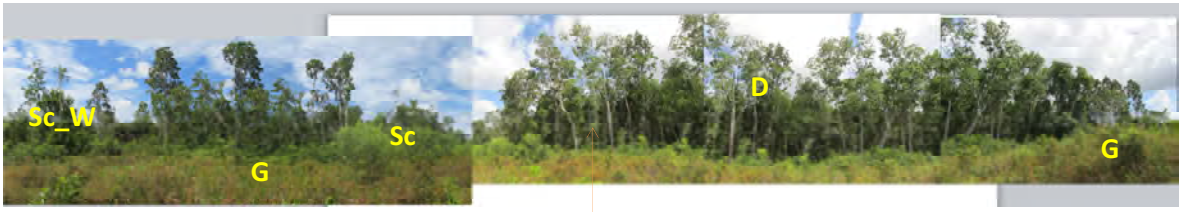
The conclusion was reached that Dry Seasonal Forests could be interpreted by using the species of which they are comprised, but it was confirmed that it was difficult to identify Dry Seasonal Forests with the satellite images used this time. Dry Seasonal Forests can be verified to a certain extent with aerial photographs or high-resolution satellite images, but there are not even adequate images available from Google for this region. Therefore, in order to classify Dry Seasonal Forests, it was confirmed that it was appropriate to first classify forest / non-forest areas, and proceed with interpreting of the range of Dry Seasonal Forest in the FIMS prepared using the aerial photographs although they are old since it takes into consideration the species configuration.



Dry Seasonal Forest (D), Scrub (Sc) , Woodland (W) and Grassland

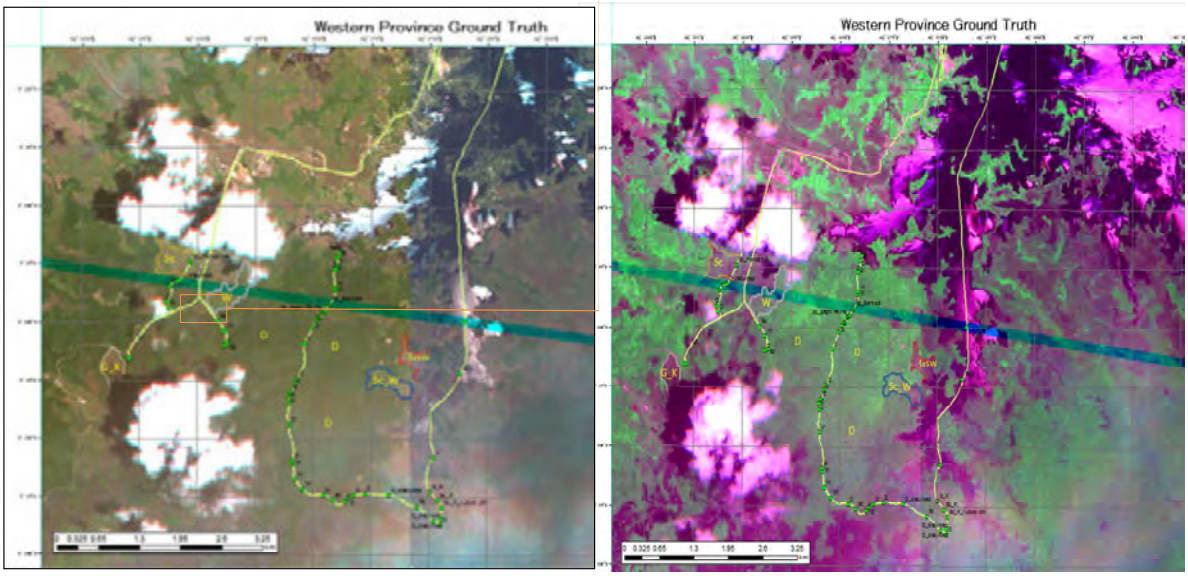


Figure 3-46 Western Province Ground Truth Verification Results
(Including Dry Seasonal Forest Areas)

- Morobe Province/KAINANTU/RAMU (June 24 – July 1)

The C/P took the leading role in this ground truth survey, from planning to implementation. Drawings were prepared using GIS, the survey results were checked with a GPS camera, and the results of technology transfer conducted to date and issues were confirmed.

Figure 3-47 Morobe Province Ground Truth Verification Results (GPS Camera Photograph Displayed on GIS)

- Central Province (July 16)

Checks were conducted in the area around the capital of Central Province to determine the level of identification that could be performed with the satellite images used this time, with a focus on Woodland, Savanna and Scrub related to forest definitions.

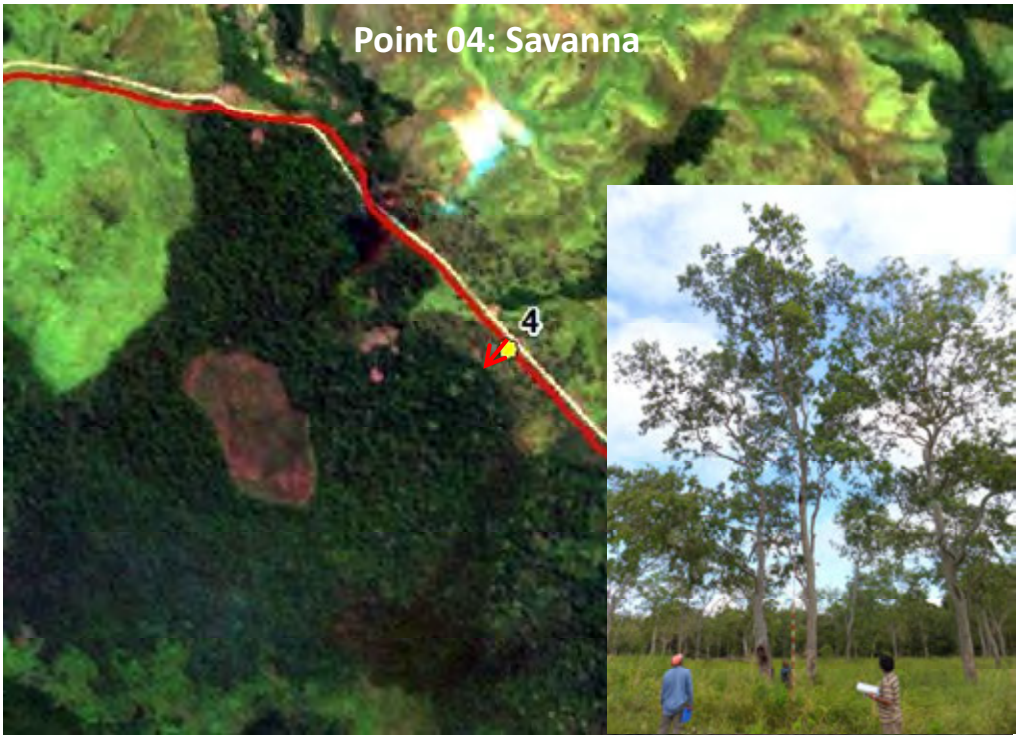

Figure 3-48 Savanna Ground Truth Verification Results

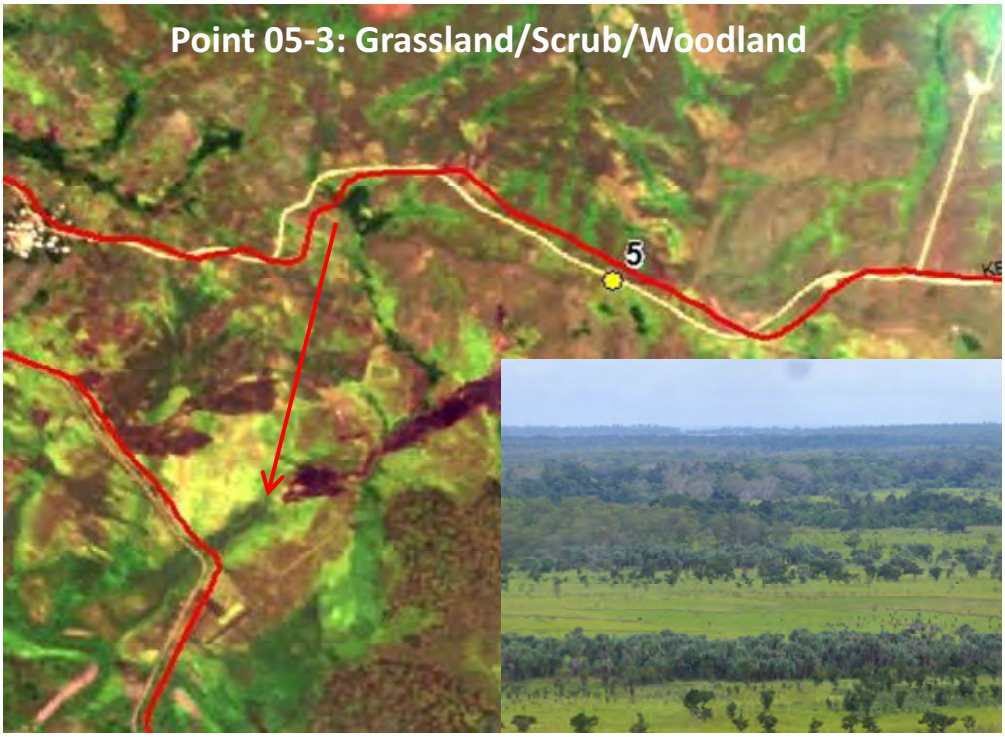

Figure 3-49 Scrub Ground Truth Verification Results

The conclusion was reached that it was clearly difficult to classify Scrub and Grassland with the satellite images (RapidEye) that were used this time. With the forest definitions based on PNGRIS/ RIMS (Minimum area: 1 ha, Crown ratio: 10%, Tree height: 3 m, Details reported in Output 3), using the boundary between Grassland and Savanna or Scrub is being considered for setting the line between Forest/Non-Forest areas. In other words, it was thought that it was difficult to accurately verify / monitor this line with remote sensing and image interpreting, but Savanna only exists in certain areas under certain climate / ecological conditions as a result of people repeatedly burning the areas, and since Scrub is also comprised of similar certain species, it was decided to identify these areas by referring to FIMS and taking the regional characteristics into consideration.

The relationship between the results of this ground truth survey and the forest definitions was organized.

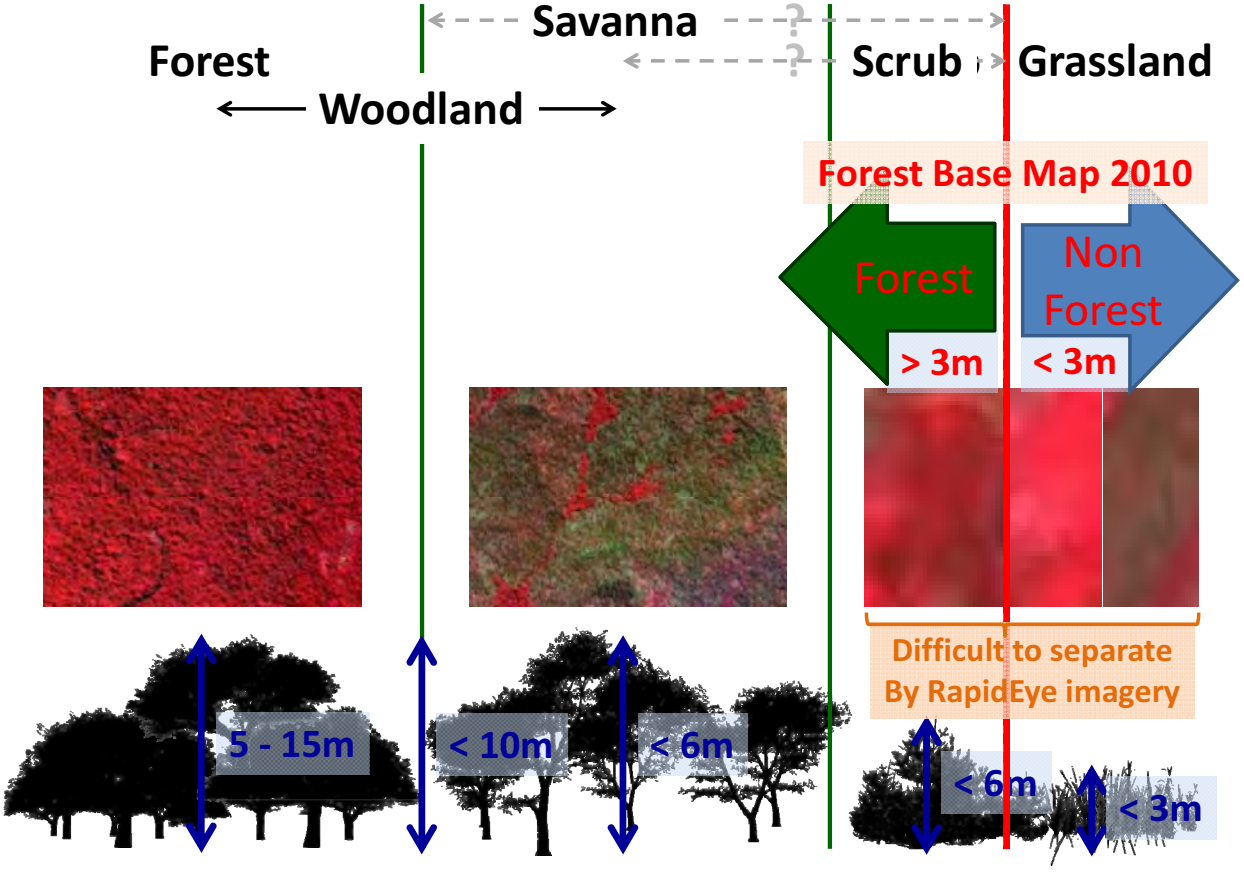

Figure 3-50 Relationship between Ground Truth Verification Results and Forest Definitions

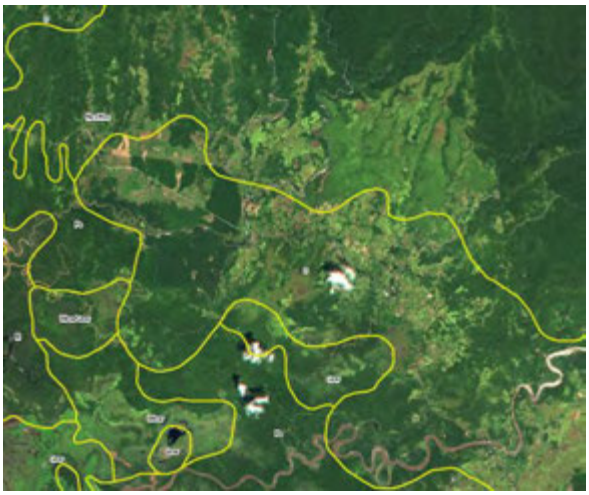
- New Guinea Island Region (August 22 – August 28)

The ground truth survey was conducted with a focus on plantations (both Forest and Agriculture) which are popular in this region. In particular, confirmation was centered around the extent that agricultural GIS information that was newly collected this time called MASP (Mapping Agriculture Systems Project: study results of The Australian National University) can be used.

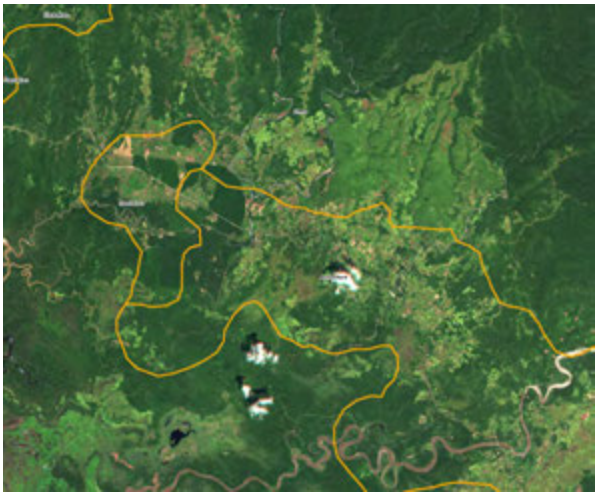
Satellite Imagery of Plantation and Farmland Area on NGI

Farmland and Plantation Confirmed in the Field

Figure 3-51 Confirming Farmland and Plantations by Ground Truth



Farmland Information of PNGRIS and Latest Satellite Imagery



Farmland Information of MASP and Latest Satellite Imagery

Figure 3-52 Comparison between Existing Farmland Information and the Latest Satellite Images

The ground truth results indicated that land use, including farmland, kept changing drastically and both MASP and PNGRIS information was already out of date. As pointed out in the results, this was a problem which required change. However, the old information was found to be valuable referential data to know which piece of land had been used for agricultural purposes. Through the survey we also checked whether DAL prepared or maintained the latest agricultural information, and found out that the only nation level information DAL had was PNGRIS.

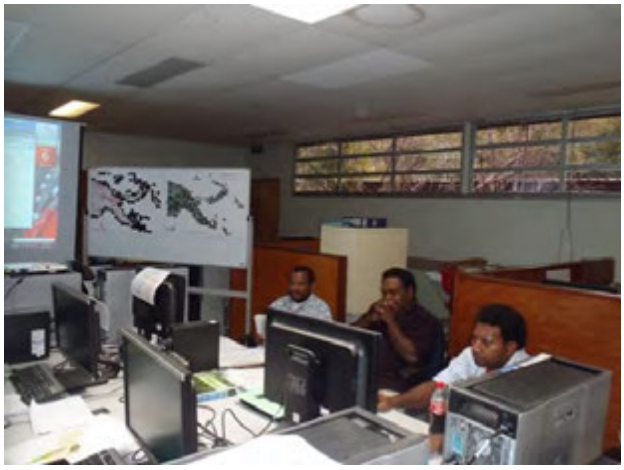
Plans call for the holding of a workshop in October that will focus on activities to add agricultural information to the 2012 Forest Basemap (ver. 0) to which regional staff will be invited, at which time these results will be used for reference.

3.5.11 Farmland Information Development with Regional Organizations

Discussions were held on farmland information with the C/P and long-term experts. Farmland sometimes look like bare land (after harvest or slash-and-burn), a grass field (farm crops) or a forest (plantation). This confused remote sensing and even consultants and PNGFA HQ officers had difficulties in interpreting how land is used, and made the development difficult. the C/P were busy with other projects at the same time, and they were not able to work solely on this project.

Consequently, it was decided to develop farmland information by organizing a workshop for satellite imagery interpretation/GIS training of local staff to utilize the knowledge of local organizations and to develop the capability of local staff to promote the use of materials and equipment procured in the GAECC. The target area was divided into three parts and the activities for each part took three weeks, namely, two weeks for the operations and one week for the preparation and summary by the C/P headquarters. Accordingly, a total of nine weeks were required for the activities.

Headquarter staff training local staff in the use of GIS



Development of farmland information by local and headquarter staff

Figure 3-53 Workshop for Improvement of Forest Basemap (Farmland Information Development)

Although the farmland information to be developed in this workshop is not authorized by the national government and it was developed only to improve the forest basemap information, since it is the first national-level farmland information after the development of the PNGRIS and MASP, it may become valuable farmland information for PNG in the future. As the GAECC has provided satellite imageries and simple GIS also to the Department of Agriculture and Livestock, it is expected that this information will be used as a reference and that the program as a whole will contribute to the management of farmland information in PNG.

For the development of farmland information, in addition to the latest satellite imageries (RapidEye), photographs with location information captured by GPS before the workshop and knowledge of the regional and district office staff of the locality, super-high resolution satellite images of

GoogleEarth/Bing Map, existing farmland information (MASP and PNGRIS) and topography data (DEM: Digital Elevation Model) were utilized as reference data.

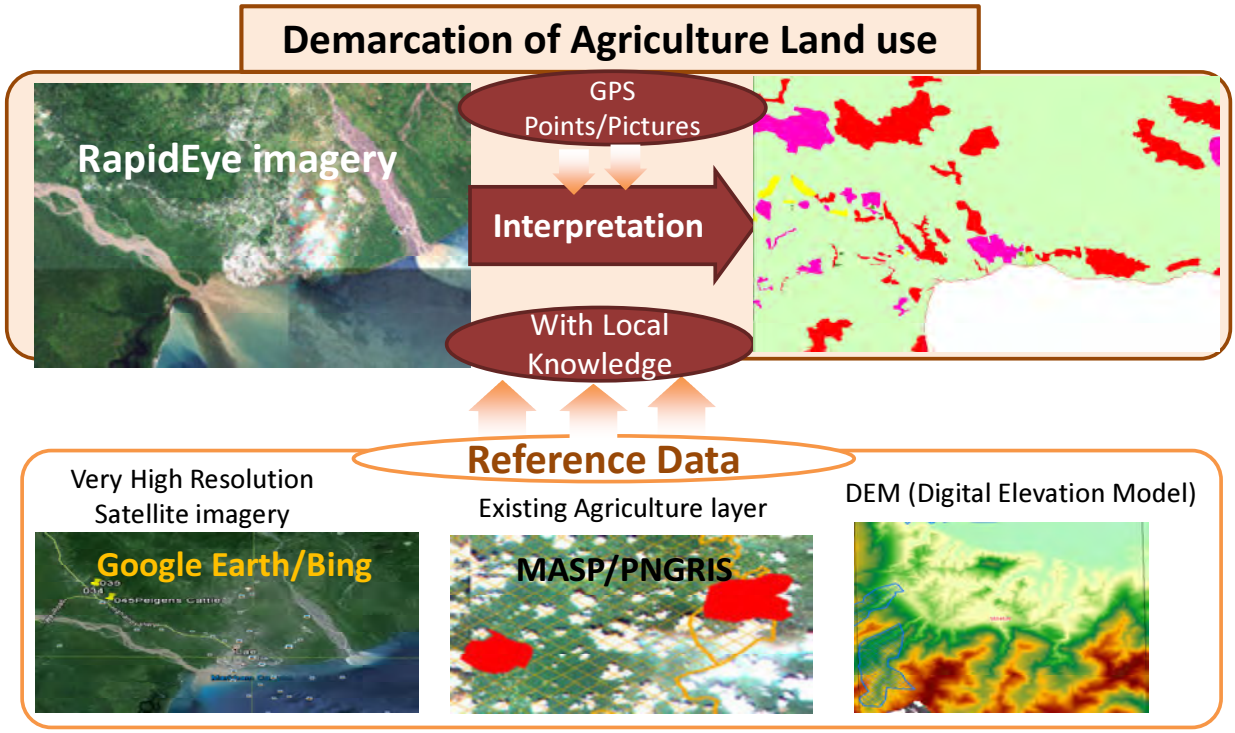


Figure 3-54 Information and Reference Data Used for Farmland Information Development

Also, with respect to the development of farmland information, or potential farmland information, to be exact, on the basis of local knowledge, GIS and remote sensing viewpoints and definitions of the existing farmland information, information to be developed in this workshop was defined and the classification groups and codes were also defined.

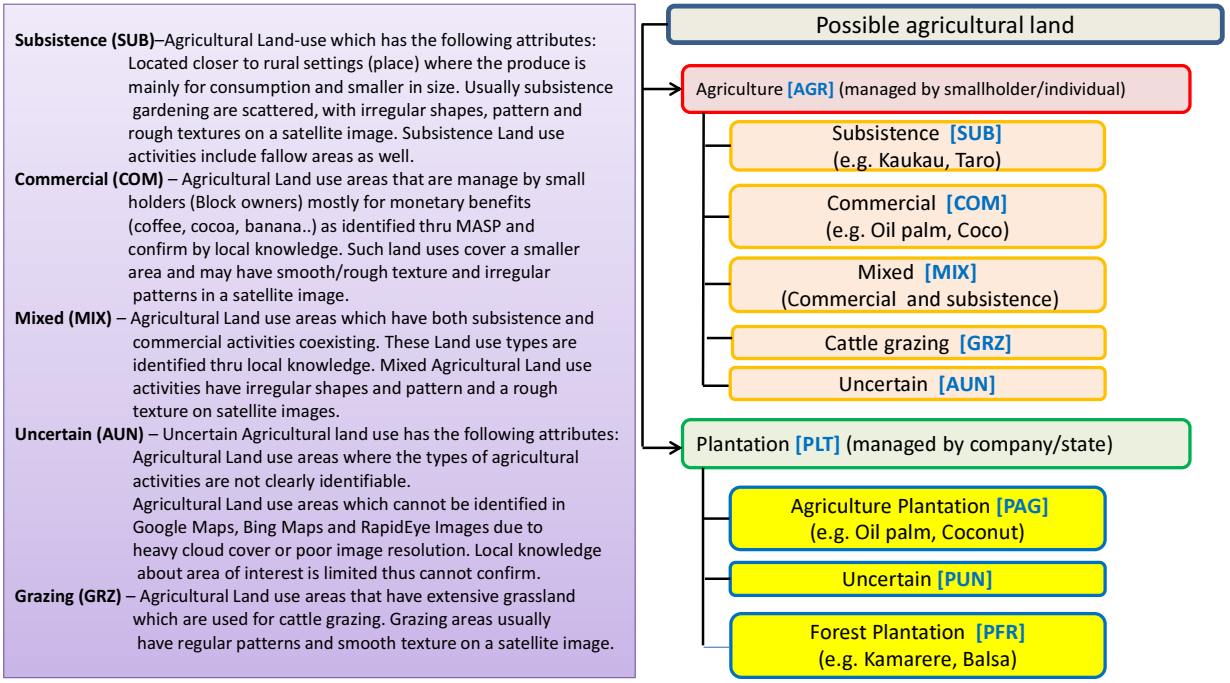

Figure 3-55 Definition of Farmland Information Items and Classification Groups/Codes

The original forest cover map (forest basemap ver.0) and a sample of the forest cover map with farmland information developed through the workshop (forest basemap ver.1 prototype) (West New Britain Island) are shown below.

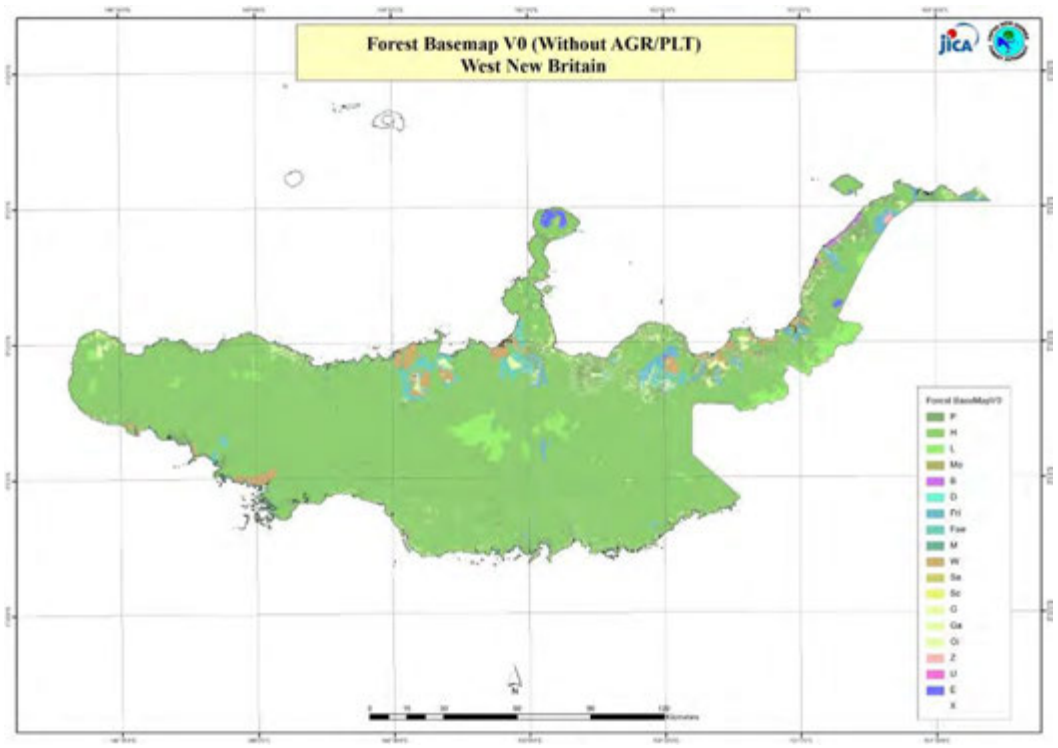

Figure 3-56 Sample of the Original Forest Cover Map
(Forest Basemap ver.0) (West New Britain Island)

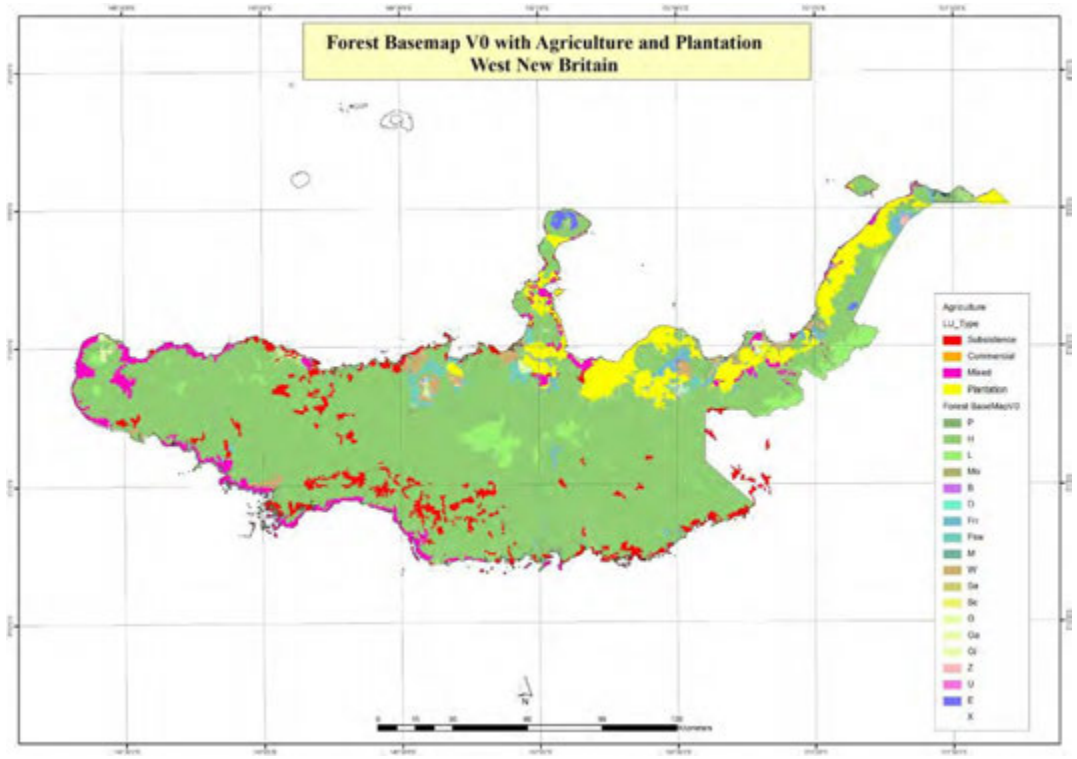

Figure 3-57 Sample of the Forest Cover Map with Farmland Information
(Forest Basemap ver.1 Prototype) (West New Britain Island)

Based on the developed farmland information, classes of the forest basemap ver. 1 were reorganized into farmland, plantation farmland and plantation forest land. Thus, the forest basemap ver.1 was completed.

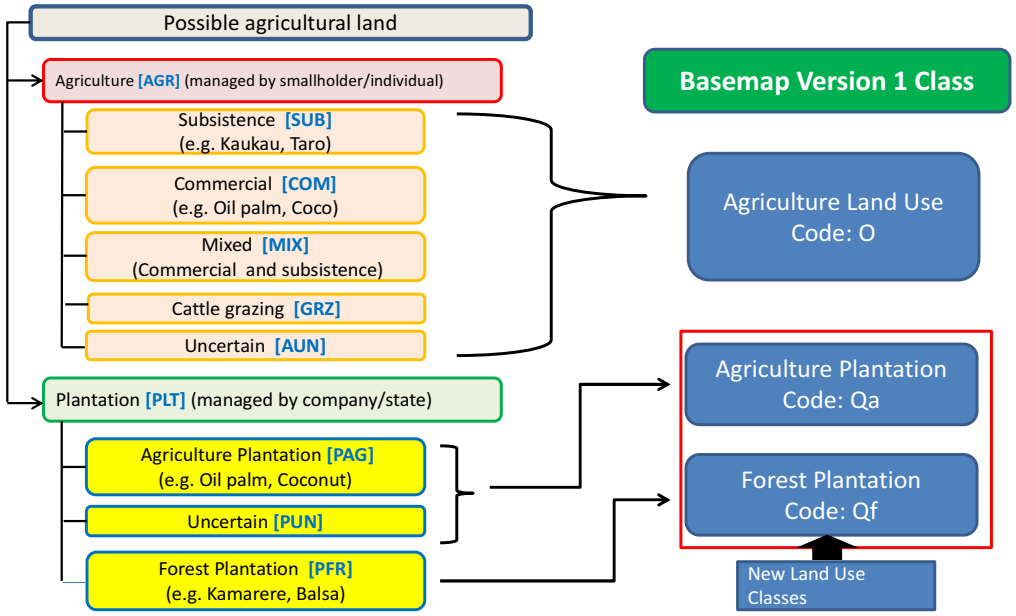

Figure 3-58 Development of Forest Basemap (ver.1) with integration of Agriculture Information

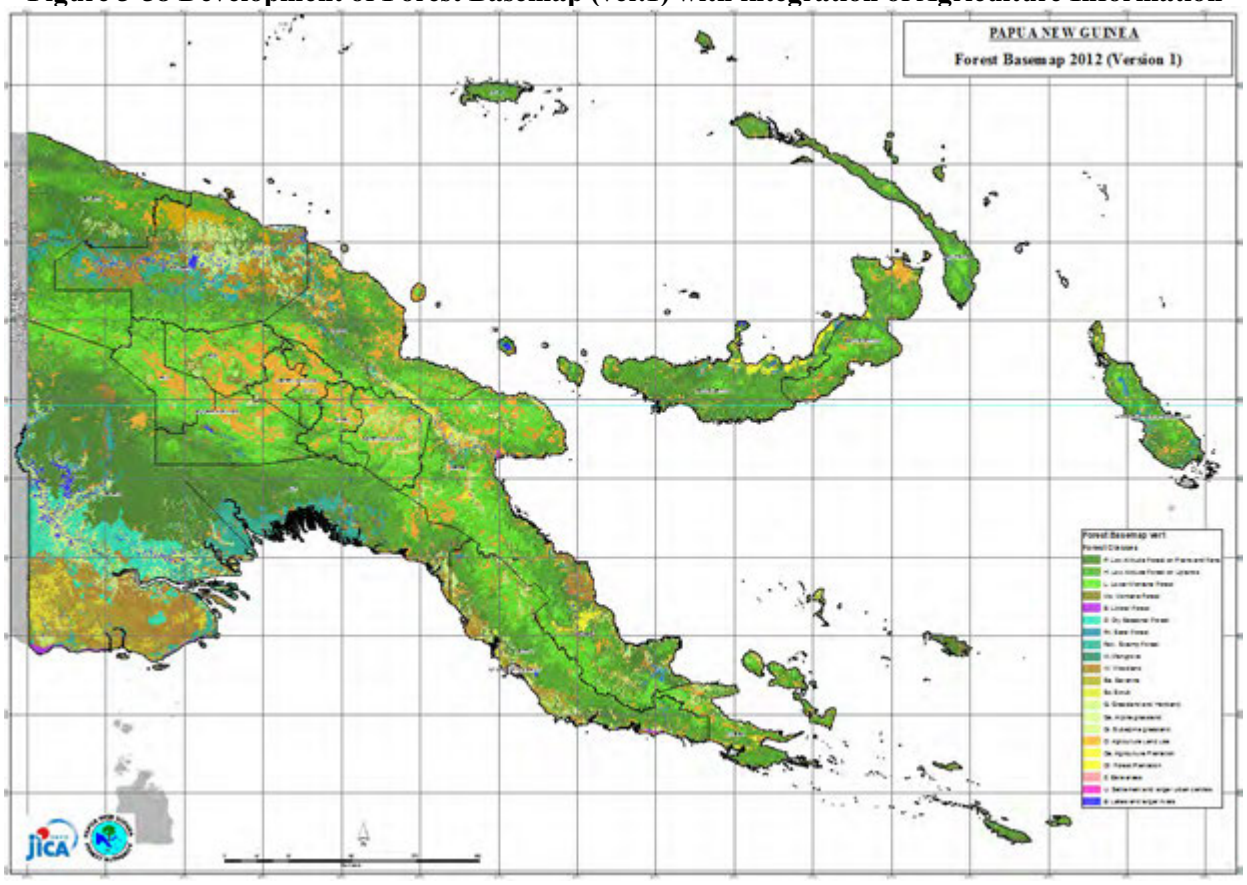

Figure 3-59 Completed PNG Forest Basemap (ver.1)(Agriculture information is integrated)

3.5.12 Discussion/OJT Concerning Preparation of Past Forest Cover Map Using Existing Data

(a) Review of Existing Satellite Data

The only past satellite data that exists is LANDSAT data, and this is the same around the world. Therefore, confirmation was performed as to the status of the past LANDSAT data in PNG. In order to cover the entire nation of PNG, 42 scenes are required, and since it takes a lot of work to perform ortho correction, as a general rule, ortho converted data that is available from the United States Geological Survey (USGS) free of charge was used.

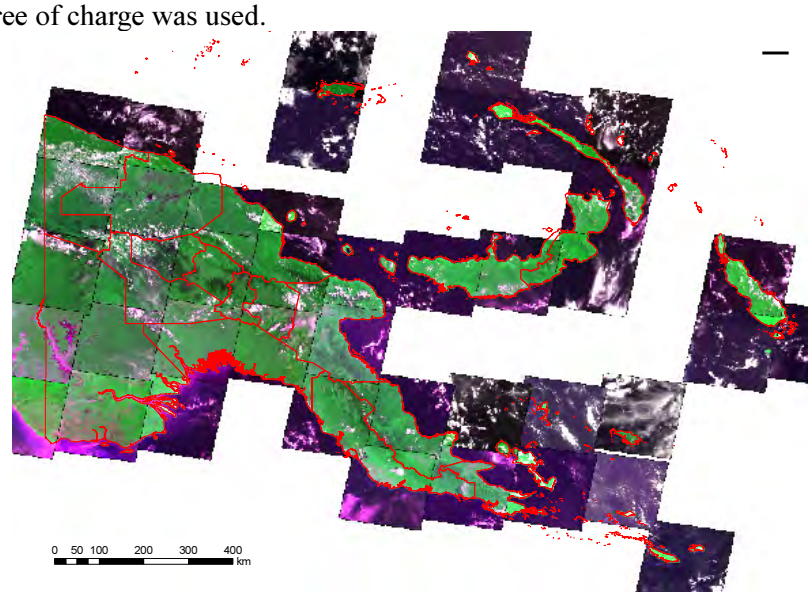

Figure 3-60 Status of PNG LANDSAT 1990 Data

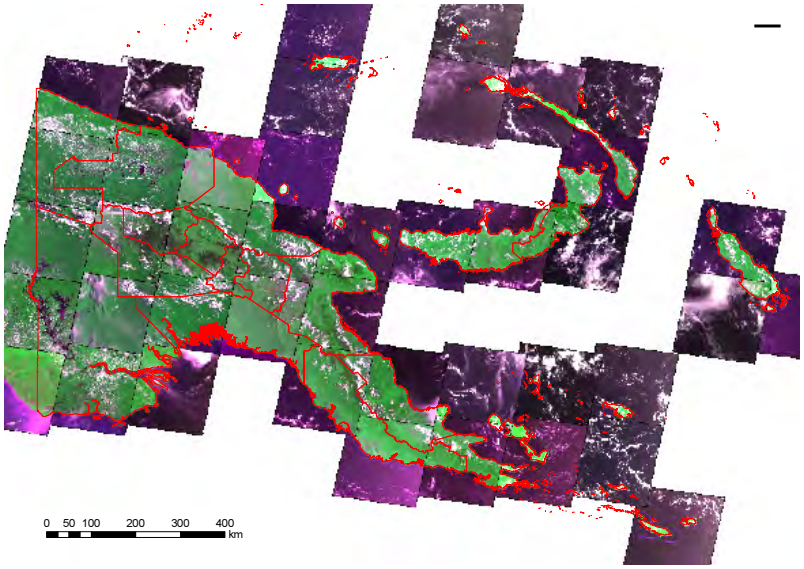

Figure 3-61 Status of PNG LANDSAT 2000 Data

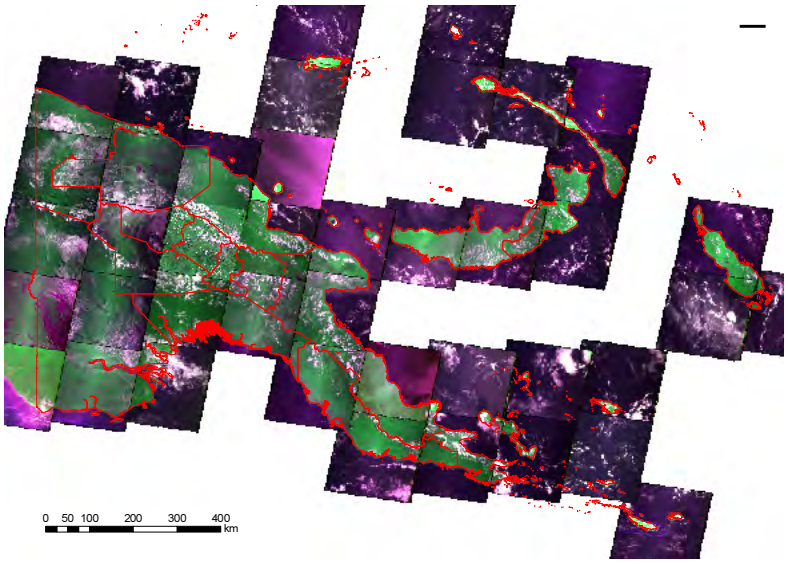

Figure 3-62 Status of PNG LANDSAT 2005 Data

The following data was collected/downloaded, and organized together with an Index Map on the PNGFA server. It is called 1990, 2000 and 2005 data, but it is actually data from 1990 and multiple years before and after yet near 1990.

- LANDSAT 1990: TM (MS: 30 m): 42 scenes
- LANDSAT 2000: ETM+ (Pan:15 m, MS:30 m): 42 scenes
- LANDSAT 2005: ETM+ (Pan:15 m, MS:30 m): 42 scenes

Upon checking the image quality, it was found that on the whole images with a minimum of clouds had been selected, but due to the impact of a portion of the sensors breaking down on LANDSAT No. 7 in 2002, there are No Data lines on stripes, meaning that these images are not suitable for classification and analysis. Therefore, the judgment was made that it would be appropriate to use the 1990 and 2000 data for the past forest cover map (For 2005, image interpretation is recommended rather than remote sensing).

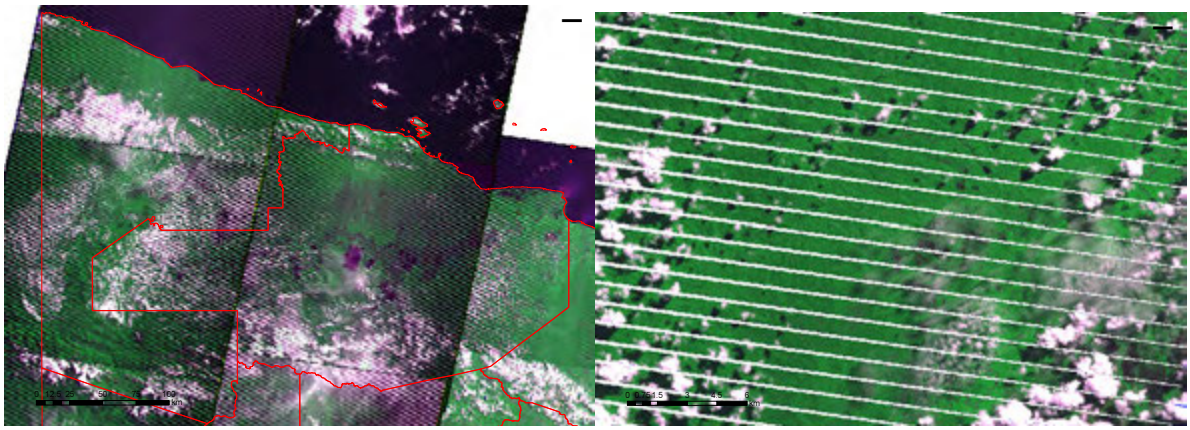

Figure 3-63 Status PNG LANDSAT 2005 Data (Enlarged: Stripes)

(b) Review of Existing Survey Results

The results of the survey concerning past forest cover maps were reviewed with the cooperation of the long-term expert, and a discussion was held with the C/P. During analysis of long-term trends in forest cover in PNG that was conducted in 2011 by Winrock International using multiple data resources, the changes in forest areas that was reported between 1975 and 2010 were organized. The values are compared in accordance with the following data: ① Research results of UPNG, ② Values reported to FAO from PNG government, ③ Values adopted by FAO, and ④ Research results of Hansen and others (University of Maryland).

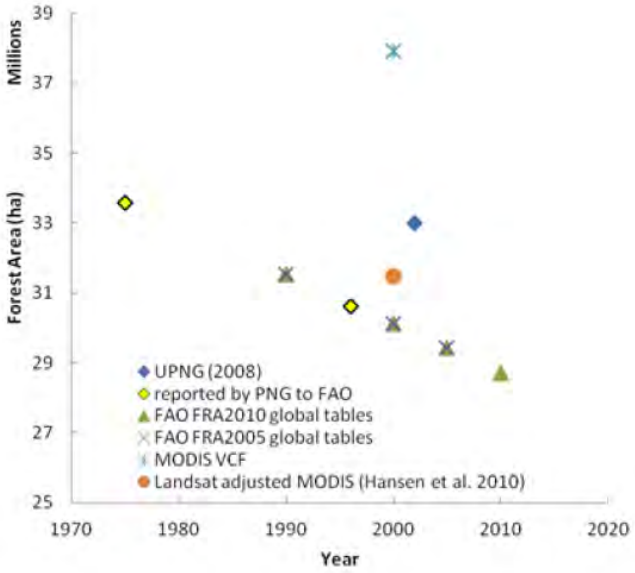

Figure 2: Trends in forest cover over time in Papua New Guinea according to multiple data sources.

Figure 3-64 Long-Term Change Trends in Forest Cover in Papua New Guinea Based on Multiple Data Sources in PNG

Source: Rapid Assessment of the political, legal and institutional setting, Papua New Guinea Winrock International

The values reported to the FAO by the PNG government (PNGFA) that were adopted can be thought to be simply interpolated / extrapolated in 1990, 2000, 2005 and 2010 using the values at the two points in time of 1975 (prepared by interpreting aerial photographs) and 1996 (using data after this and Landsat TM images). On the other hand, the values from Sharman and others at UPNG as well as from Hansen and others only indicates the values at one point in time, and are both larger than the forest area figures of the PNGFA and FAO.

The differences in the values are most likely caused by differences in forest definitions and differences in the data used. The UPNG judges between forest/non-forest area using information that can be

analyzed / interpreted with LANDSAT, regardless of the forest definition range determined by IPCC (example: crown ratio of 10 – 30%). On the other hand, the Forest Authority identifies forest/non-forest areas based on the PNGRIS/FIMS definitions prepared using aerial photographs obtained in 1972.

In addition, the forest definitions for UNFCCC report (details reported in Output 3) were discussed in PNG, but when the crown ratio is between 10 – 30%, while this satisfies the PNGRIS/FIMS Woodland forest definition, Other Woodlands in the FAO FRA are treated as non-forest areas in the same manner as for Savanna and Scrub.

Table 3-21 Comparison of Forest Basemaps (ver. 0) Based on IPCC-GL, FRA2010 and PNGRIS/FIMS

IPCC 2006 GL AFOLU	FAO FRA2010 PNG CR	Forest and Non-forest in Forest Base Map 2010	No.	Vegetation type in Forest Base Map 2010	Condition	Code
Forest land	Forest	Forest	1	Low Altitude Forest on Plains and Fans	below 1,000m	P
			2	Low Altitude Forest on Uplands	below 1,000m	H
			3	Lower Montane Forest	above 1,000m	L
			4	Montane Forest	above 3,000m	Mo
			5	Dry Seasonal Forest	in Western Prov.	D
			6	Littoral Forest		B
			7	Seral Forest		Fri
			8	Swamp Forest		Fsw
Depending on national definition of forest and thresholds chosen	Other wooded land (Non Forest)		9	Woodland		W
			10	Savanna		Sa
			11	Scrub		Sc
Grassland	Other land	Non-forest	12	Grassland and Herbland		G
			13	Alpine grassland	above 3,200m	Ga
			14	Subalpine grassland	2,500m - 3,200m	Gi
Forest land	Forest	Forest	15	Mangrove		M
Cropland	Other land	Non-forest	16	Agricultural Land Use		O
Wetlands	Inland Water Bodies		17	Lakes and larger rivers		E
Other Land	Other land		18	Bare areas		Z
Settlements			19	Settlements and larger urban centres		U
Forest land	Forest	Forest	20	Forest Plantation		-
Depending on national definition of forest and thresholds chosen	Other land	Non-forest	21	Plantation other than forest plantation		-

In other words, since all of these results / output were not prepared with the same definitions / conditions, it became clear that they could not be compared as is. After the 2012 Forest Basemap that is currently being developed is completed, past forest cover maps need to be reorganized using uniform definitions / techniques.

(c) Discussion on Sharing of UPNG Results (2002 Forest Map)

The only organization that has prepared a forest map on a nationwide level in PNG after PNGRIS is the UPNG, and cooperation with UPNG related to past forest maps was deliberated during this project.

However, due to the fact that the carbon accumulation estimation project proposed by UPNG with the support of the EU was not approved, and there are points for which it does not agree with the policies/plans being pursued by the Forest Authority, the UPNG decided to review cooperation with the Forest Authority, and the "Sharing of Data" under this project was returned to the drawing board. Due to the differences in forest definitions described earlier, they have the concern that this will lead to their own results being negated, and repeated discussions were held, but the decision was made to give up doing this during this project.

Based on the results of (a), (b) and (c), since it was determined through discussion with the C/P that it is extremely difficult to develop past forest cover maps on a national level, the decision was made to conduct development of past forest cover maps in the REDD+ pilot project region that is being pursued in PNG.

3.5.13 Studies on Stratification from the Viewpoint of Carbon Stock in Forest Cover Types

(a) Review of Existing Data

In order to deliberate which type of carbon accumulation estimation method is feasible, the data for which it may be possible to use for estimation of carbon accumulation was reviewed.

- Relationship of PSP and FIMS Vegetation Map

A PSP obtained from the Forest Research Institute (FRI) was overlaid with FIMS vegetation map / Forest Zone, and the relationship was analyzed.

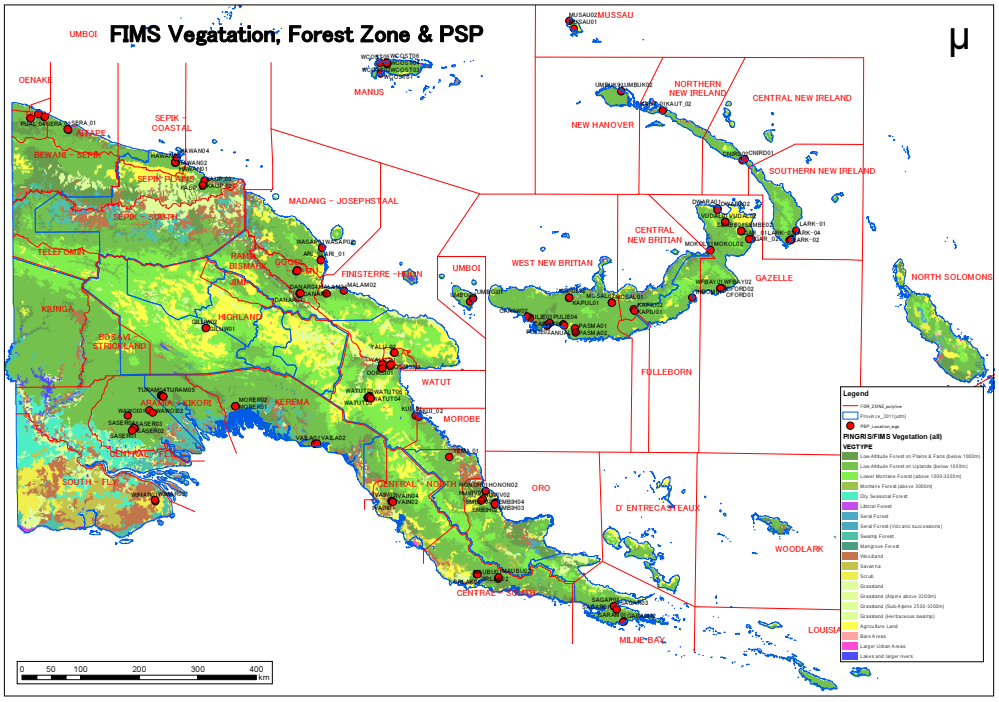

Figure 3-65 Relationship of PSP and FIMS Vegetation Map / Forest Zone

It can be seen that data only exists for Plain Forests in low-lying areas after logging is performed and for Hill Forests, and many other vegetation types are not covered (Figure 3-65) since there are many locations which PSP was originally established to prepare a restoration model for Secondary Forests in PNG. In addition, the analysis results for the relationship of PSP and FIMS vegetation types is shown in Table 3-22.

Table 3-22 Relationship of PSP and FIMS Vegetation Types

Vegetation	SUM	WES	GUL	CEN	NCD	MIL	NTH	SHY	ENG	WHY	SIM	EHY	MOR	MAD	ESK	WSK	MAN	NIR	ENB	WNB	NSL

- Relationship of Concessions and FIMS Vegetation Map

The relationship was analyzed by overlaying the PSP with the FIMS vegetation map and logging concession (relationship of inventory survey to evaluated resource volume) area. This shows that logging activities are being performed in Plain Forests in many low-lying areas or Hill Forests (Figure 3-66).

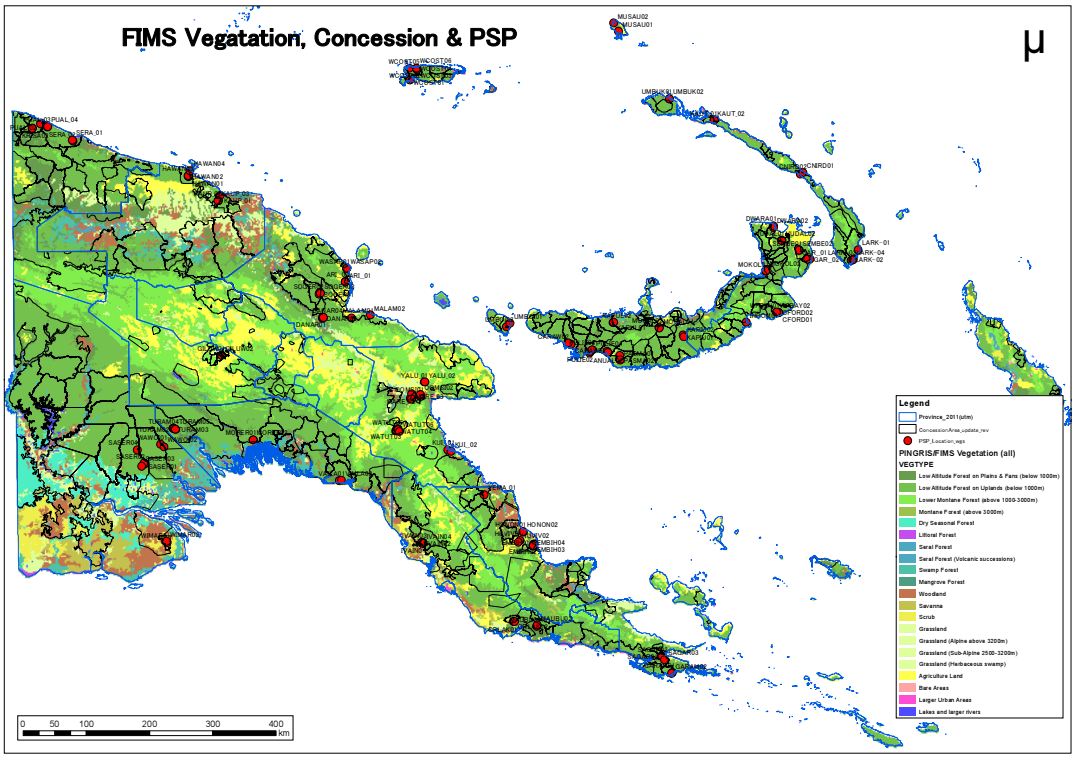

Figure 3-66 Relationship of PSP and FIMS Vegetation Map / Logging Concessions

On the other hand, since the Forest Authority is not currently entering position information in the FIPS database in which inventory survey data before concessions are awarded is stored, the only way is to link with the concession name and the survey name. But out of a total of 109 groups of survey data, a link can be made for approximately 60 groups of data. However, in any case, in the current status, only the data for Plain Forests in low-lying areas or Hill Forests is available.

Table 3-23 Relationship Between Number of Logging Concessions in Each Province and FIPS Surveys

• REDD+ Pilot Survey Area Data

In the Central Suau area in Milne Bay Province which is one of the REDD+ pilot survey areas being pursued by the Forest Authority in PNG, aircraft data was obtained under the GAECC in order to deliberate techniques to supplement the limited volume of ground survey information, and detailed ground surveys were conducted under this project to perform analysis. Therefore, information was organized / analyzed in order to review techniques to expand data available in this area into a wider area.

A map that organizes the data that is available in the area is shown in Figure 3-67. An explanation of the legend is provided below.

Large blue frame:	Aircraft radar (GeoSAR) acquisition range
Small light blue frame:	Aircraft LiDAR data acquisition range
Red ▲ mark:	Location of detailed ground survey
Red ● mark:	Location of PSP (Permanent Sample Plot)
Yellow line:	FIPS (Concession survey) Strip Line
Pink line:	Logging concession
Background image:	FIMS vegetation map overlaid on topographical information

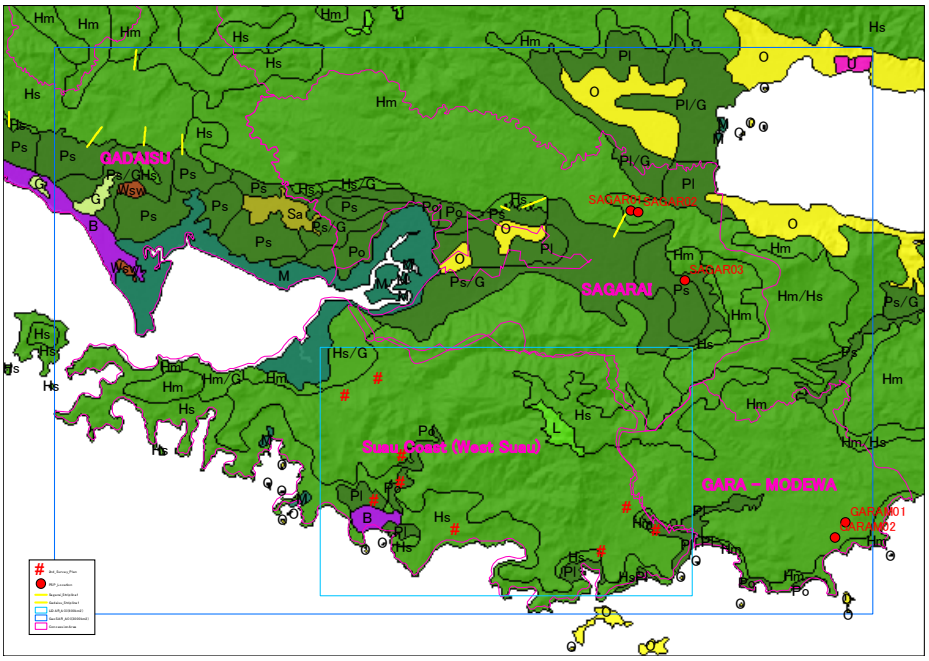

Figure 3-67 Data Available in Central Suau Area (Details described earlier)

The vegetation types determined in the ground survey conducted in the Central Suau area are shown in red in Table 3-24. A survey was attempted for vegetation type L (altitude of 1,000 meters or more), but could not be conducted due to the difficulty of accessing the location. Therefore, the current status is that information for low-lying plain forests (P) and hill forests (H) must be used as the basis.

Table 3-24 Zone Names and Vegetation Types in Milne Bay Province, Timber Volume (m3/ha), Survey Points (Red)

- Timber Volume Information Defined by FIMS

The FIMS contains timber volume figures that were calculated for each vegetation type in the forest zones in accordance with the results of the ground inventory survey that could be obtained when the system was developed. These figures are shown in a diagram in Figure 3-68. In addition, a diagram of figures on a national level is shown in Figure 3-69. From the results of a review of existing data and surveys, this is the only data that evaluates the forest resource volume on a national level in PNG.

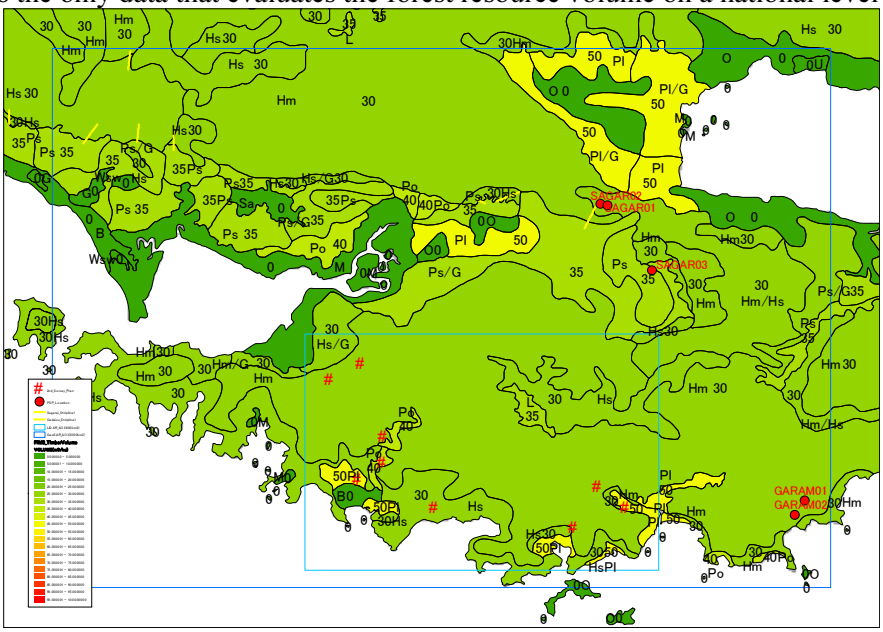

Figure 3-68 FIMS Timber Volume Map in Central Suau Area (For Each Vegetation Type)

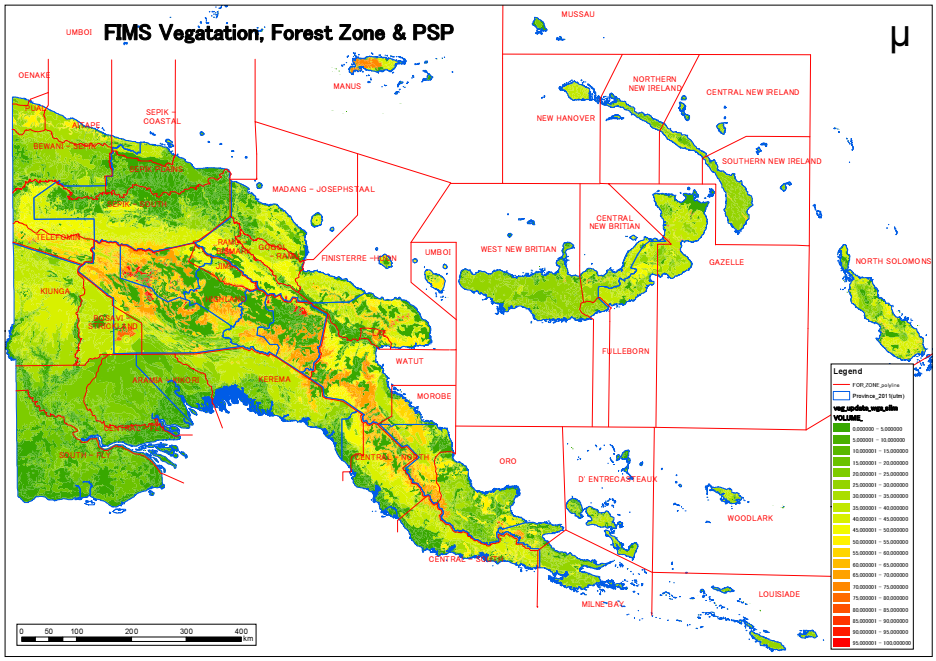

Figure 3-69 National FIMS Timber Volume Map (For Each Forest Zone / Vegetation Type)

(b) Organization of review results and measures taken in this project

It was ascertained that with respect to both the inventory data (FIPS) and the fixed sample plot (PSP) retained by the PNGFA, only the data of logging areas (mostly consisting of plain forests) are available and that statistical significance is not fully ensured with respect to the method of setting plot location. Also, as summarized in Table 3-25, two studies have been mainly conducted using these information, but it was considered that such studies were insufficient as preparations aimed at making an international report at the Tier 2 level, using the forest basemap (ver.1) developed in this project.

Table 3-25 Situation of Existing Data Organization and Results and Issues of Past Studies

5 carbon pool	Available data of PNG forest	Issues
Above Ground Biomass (AGB)	Bryan et al (2010) estimated average AGB using 22 unlogged forest data and 35 logged forest data of PNG.	✓ Average of all types of forest cannot apply to Tier2 level estimation.
	Fox et al (2010) estimated forest carbon in lowland forest using 125 permanent sample plots (PSPs).	✓ Forest carbon of other forest types is not estimated. ✓ Locations of PSPs can be biased.
Below Ground Biomass (BGB)	Scarce	
Litter	Scarce	
Dead wood	Scarce	
Soil Organic Matter	Scarce	

As a result of discussions with the C/P, long-term experts and the UN-REDD/FAO advisors based on the review results described above, it was concluded that the following two measures should be taken in accordance with the target scope.

A) Estimation of forest carbon stock at the national level

The most basic and robust estimation should first be carried out using the activity data of the forest basemap ver. 1 (area by forest type) and the IPPC default value, aiming to develop basic data for the FRA2015 report and the study of national forest inventory supported by the UN-REDD and EU/FAO.

B) Estimation of forest carbon stock in pilot areas

Detailed ground survey should be carried out in the areas where the PNGFA is conducting the REDD+ pilot survey (as it is possible to enter these areas) to estimate the amount of biomass. At the same time, using the aircraft data procured in the GAECC, carbon stock estimation should be carried out on a trial basis to identify the issues to be resolved to expand the target area in the future.

3.6 Activities Related to Output 2

Output 2: National level forest resource data base is improved

3.6.1 Obtaining Grasp / Analyzing Existing Data Concerning Forest Resources

(a) Initial Analysis of FIMS

Since the existing FIMS will be used as the base for the forest resource database, work began with obtaining a grasp of FIMS data and performing an analysis. Due to the fact that there were not detailed documents concerning the FIMS database design and other details, the "FIMS User Guide" and actual data were collected, and it was verified that there are the data items shown in Table 3-26.

Table 3-26 Outline of FIMS Existing Data (Prepared Based on FIMS User Guide and Actual Data)

Data Item	Explanation
Forest Mapping Unit(FMU)	An area of forest or other vegetation type mapped as a unique polygon in the 1:100,000 forest inventory mapping series. FMUs are numbered 1 --->n for each Province.
Concession Area	Concession Area
Protected Area	Protected Area under the Flora and Fauna Act (e.g. Wildlife Management Areas, National Parks, Catchment Management Areas).
Slope(Extreme)	land with over 30 degree dominant slope.
Altitude	land over 2400m altitude.
Karst	land with polygonal karst landform.
Inundation(Extreme)	land permanently or near permanently inundated extending over more 80% of the area of that land.
Mangroves	land covered by mangroves.
Inundation(Serious)	land with dominant slope of 20-30 degrees and sub-dominantslope over 30 degrees and with high to very high relief.
Slope/Relief	Slope/Relief
Logged_NotLandUse	areas logged and left to regenerate.
Logged_LandUse	areas logged and subsequently converted to other forms of non-forest forms of land use.
LandUse_NotLogged	areas cleared (but not logged commercially) and subsequently converted to other non-forest land use.
Logged_And_Luse	areas cleared (but not logged commercially) and subsequently converted to other non-forest land use.

Data Item	Explanation
Forest Zone	Forest Zone

(b) Secondary Analysis of FIMS

The FIMS data structure was organized as a UML class diagram, taking primary analysis of the collected materials into consideration. The results are shown by the following items.

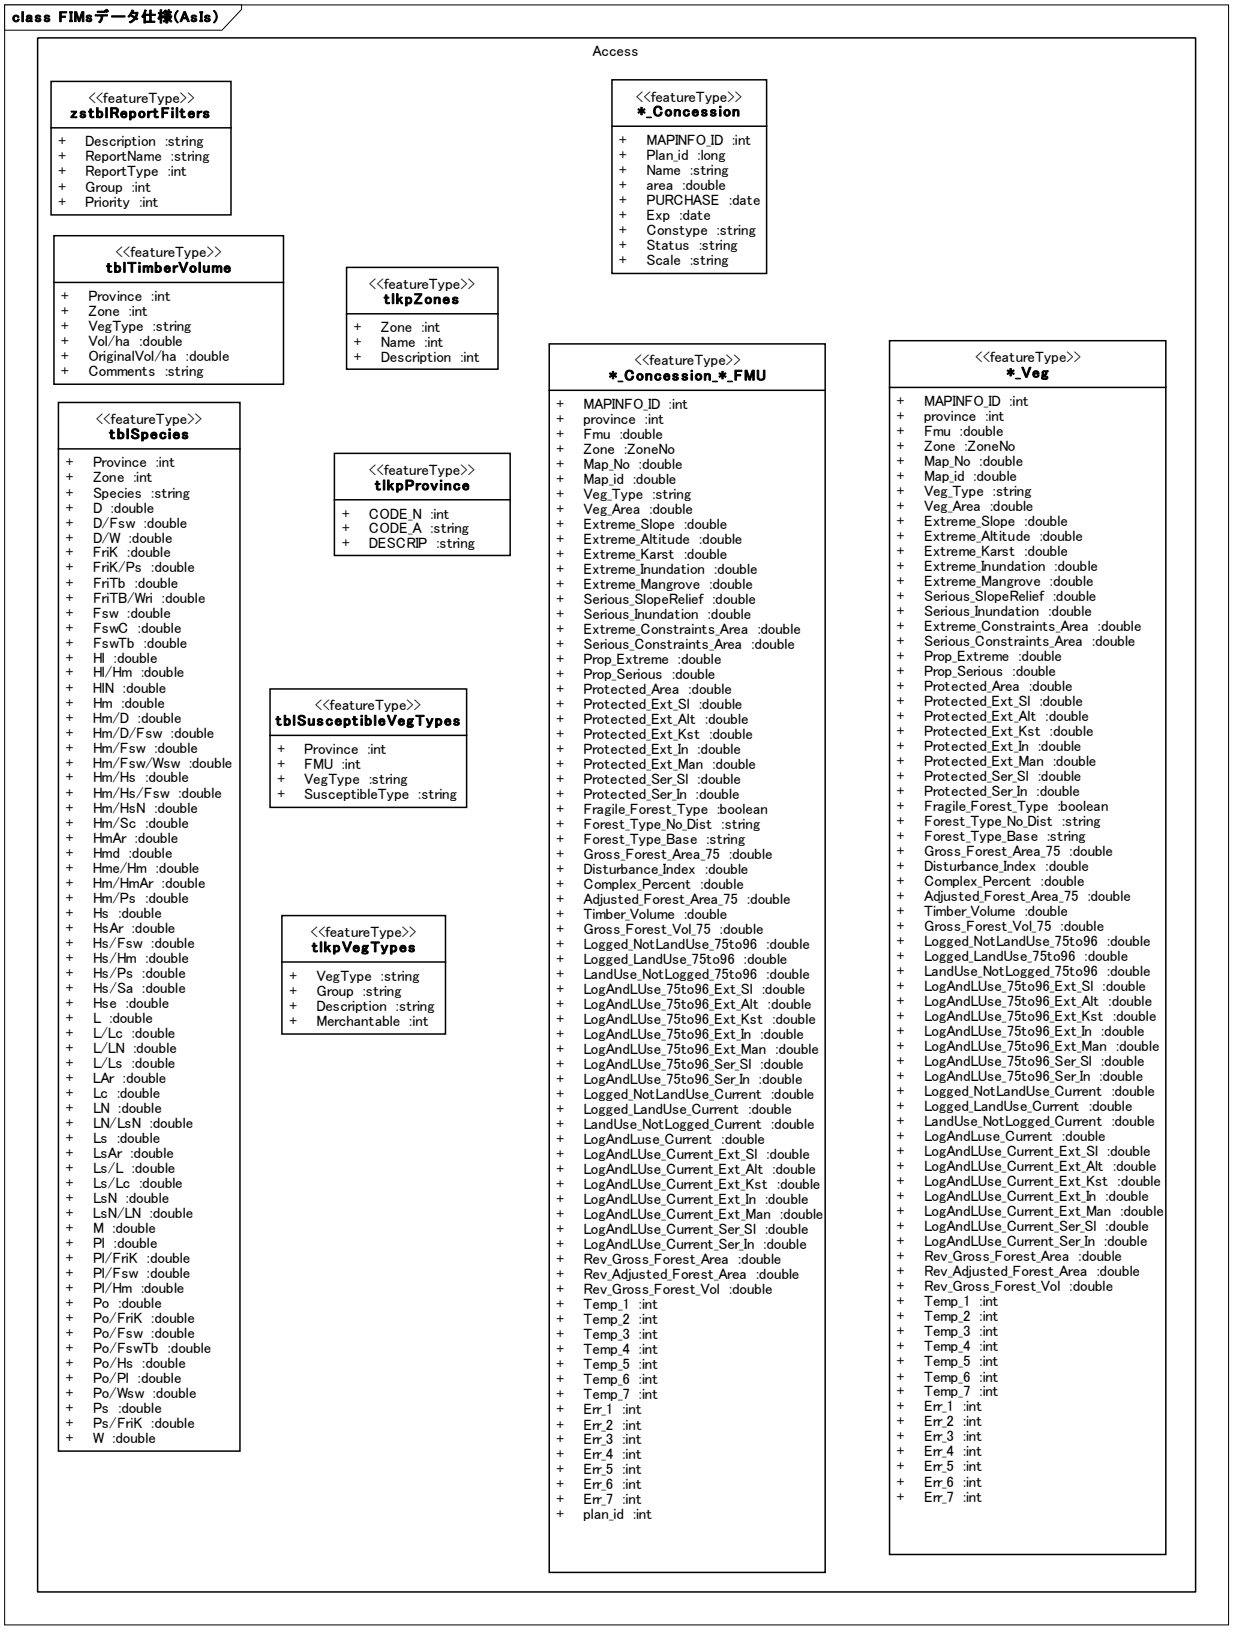

Figure 3-70 UML Class Diagram for Existing FIMS (Access Portion)

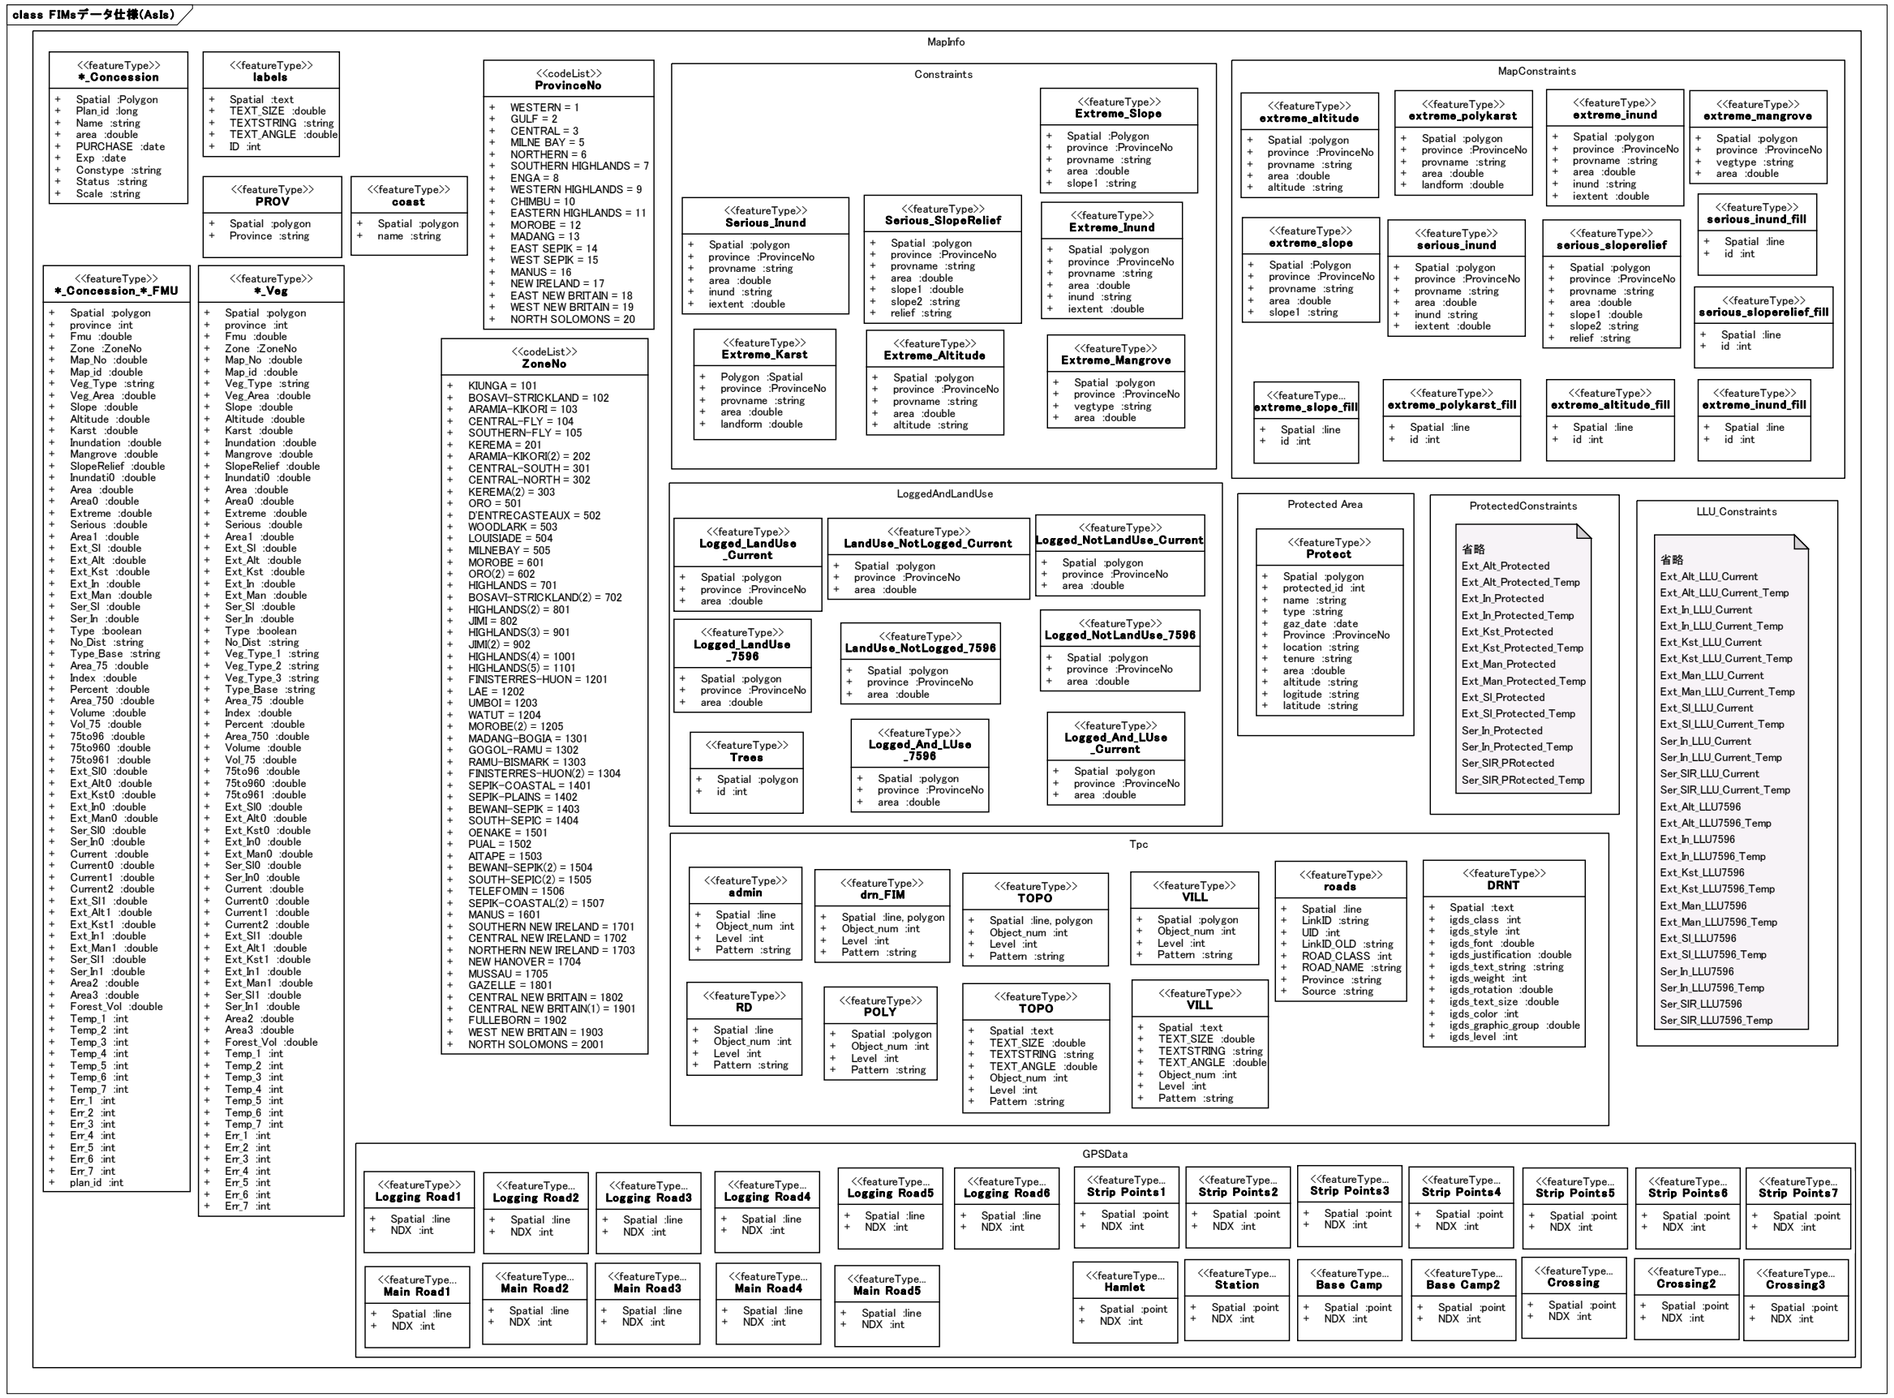

Figure 3-71 UML Class Diagram for Existing FIMS (MapInfo Portion)

(c) Analysis of FIPS

Work was performed in the same manner to obtain a grasp of data for the FIPS and analyze the data. As for the FIPS, there were not detailed documents concerning the FIPS database design and other details, the "FIPS User Manual" and actual data were collected, the content was checked, which resulted in obtaining a grasp of the data structure and content shown in Figure 3-72.

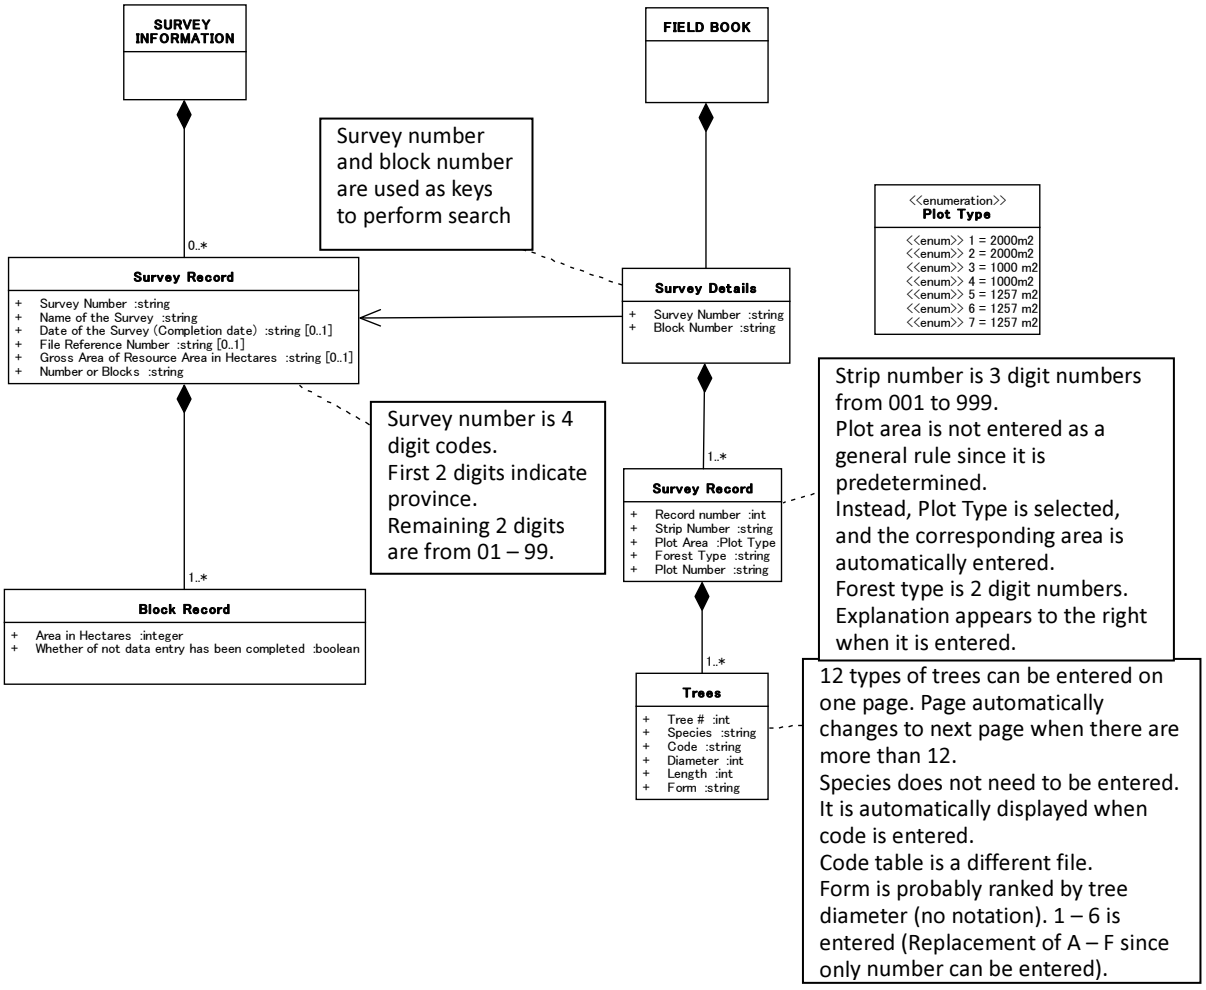

Figure 3-72 Grasping Outline of Existing FIPS Data (Image of UML Class Map)

	A	B	C	D	E	F
1						
2	Data Structure					
3	Feature(layer)	Attribute(table)	#MapInfo attribute name	Value type	Definition	Domain(allowable attribute value)
4	Forest Mapping Unit(FMU)				An area of forest or other vegetation type mapped as a unique polygon in the 1:100,000 forest inventory mapping series. FMUs are numbered 1 --->n for each Province.

9		Map_id	MAP_ID		1:100,000 sheet id	
10		Veg_Type	VEG_TYPE		Vegetation type	Classification of vegetation types. A total of 58 forest and other vegetation types are distinguished, and of these 35 are forest types. The further four types deal with land use, urba[illegible]reas, bare areas and lakes.
11		Veg_Area	VEG_AREA		Vegetation area (hectares)	
12		Extreme_Slope	SLOPE		Extreme physical limitations - slope (ha) - derived from PNGRIS overlay slope1> 30 degrees (slope1>5)	

Figure 3-73 Detailed Analysis of Grasp / Analysis of Existing Data

In the future, the data related to forest resources that are respectively managed by the FIMS system and FIPS system will be integrated in order to create a forest resource database that can be used more easily and effectively. In particular, the data managed in the FIPS does not have information that indicates the location on the ground (latitude / longitude), and is not mapped out on the ground which is a problem.

Therefore, the decision was made to have discussions with the C/P on the integration methods to be used for the FIMS and FIPS data in the format indicated in Table 3-28.

Table 3-28 Discussion of Methods Used to Integrate Position Information into FIPS Data

Method			Good point	Bad point	note
Add GPS information	Measured by GPS equipment in field survey.	Once in every plot		have to be measured in field survey.	
		Once in every strip			
		Once in every block			
Digitize on GIS map	Point data	Every plot			
		Every strip			
		Every block			
	Line data	Every strip			
		・・・			
Relate to the information made with GIS	Input the information that relate to the place into FIMS, then relate to that information with the coordinates.	Province			
		Block			
		・・・			

A review was conducted of whether or not data should be newly added in the future to the forest resource data that is managed by the existing systems. Sample Logging Plans that are submitted by forest logging companies were collected for this review, and the content on these plans was verified.

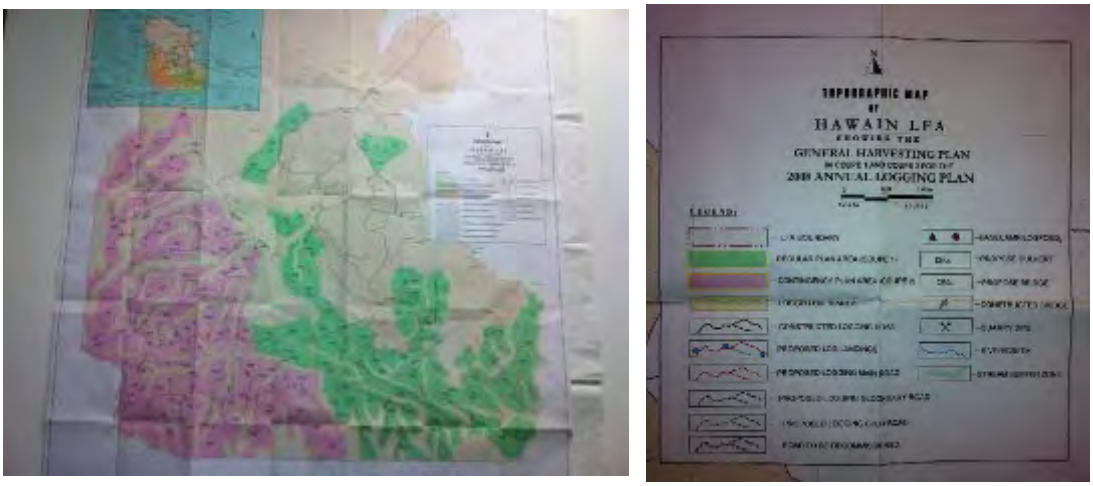

Figure 3-74 Sample Logging Plan

This resulted in discovering the relationship that is organized in Figure 3-75, indicating that such items as “Set-up Area”, “Coupe Area” and “ALP (Annual Logging Plan) Area” should be included in the forest resource data that is managed in the future.

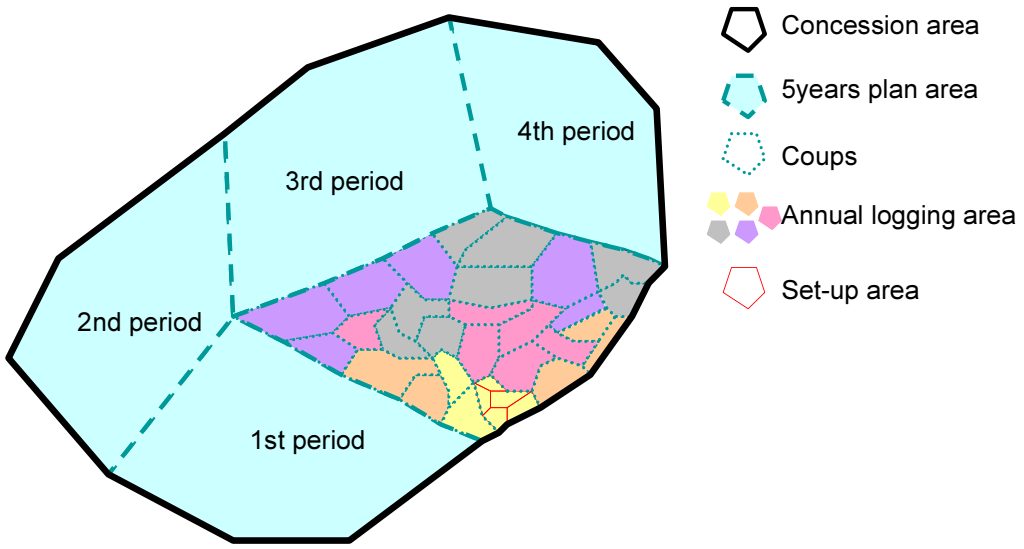

Figure 3-75 Spatial Location Relationship in Concession Areas

3.6.2 Basic Design of Forest Resource Database

The basic design of the forest resource database proceeded in the next step with the main objective of clarifying the work flow (work analysis) of the work that is currently being performed.

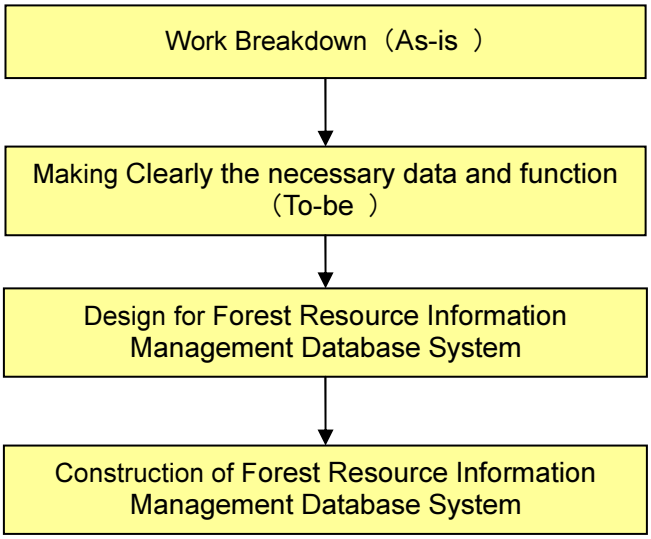

Figure 3-76 Basic Design Procedure for Forest Resource Database (Work Analysis Method)

The scope and basic component of the forest resource database (draft) determined in the first field survey in accordance with the information collected are shown in Figure 3-77 and Figure 3-78.

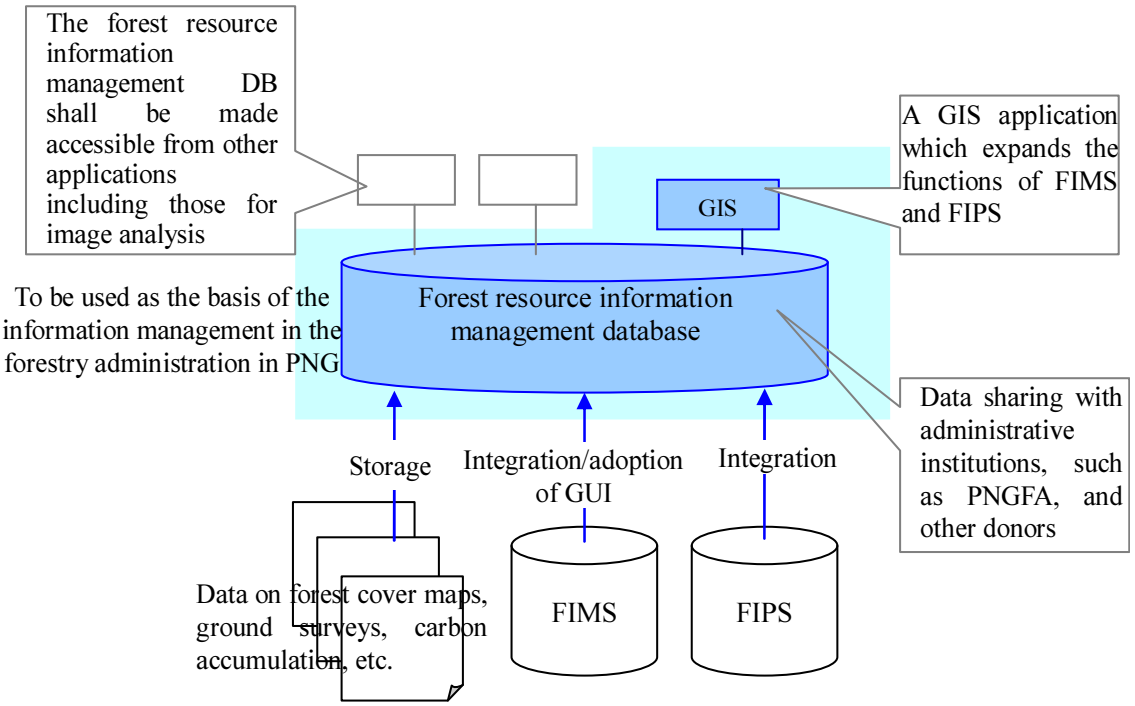

Figure 3-77 Scope of Forest Resource Database (Draft)

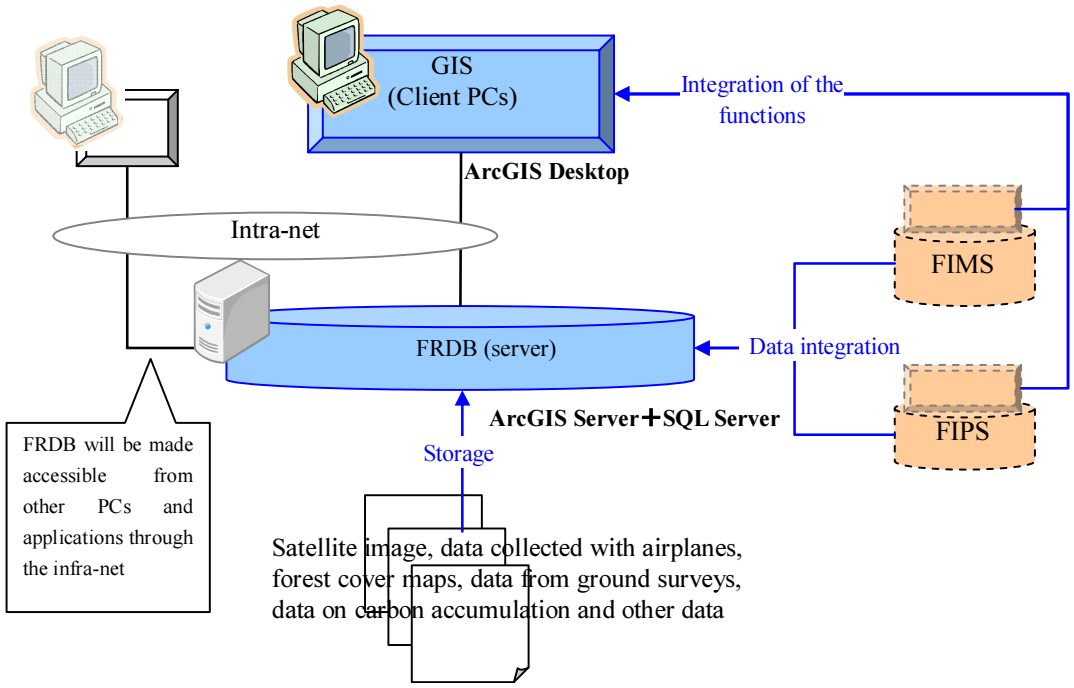

Figure 3-78 Basic Configuration of Forest Resource Database (Draft)

Implemented activities are described as follows.

(a) Breakdown of Work (Detail Analysis of Current Work Contents) (As-Is)

(1) and (2) in the above flow were implemented during activities conducted in this fiscal year.

(1) Discussions with all parties involved in overall concession work flow

(2) Detailed discussions with persons in charge of each type of work

Discussions were held with involved parties on the current breakdown of work with the objective of achieving the following effects.

- Enable involved parties as a whole to understand the overall concession work flow (Enable staff to obtain a grasp of flow of work performed by other staff).
- Facilitate clarification of problem points with current work flow and sharing with involved persons.
- Review ideal Forest Resource Database (ideal system) to enable FIMS (Forest Resource Database) improvement policy to be determined.

These review methods are methods that are generally used for system development, and will serve as reference for standard procedures when the C/Ps proceeds with improvements to the system in the future.

During activities conducted in this fiscal year, the current work flow was verified. Work will proceed on the basic design while having discussions with the C/P on the points in the work flow that should be improved in the future.

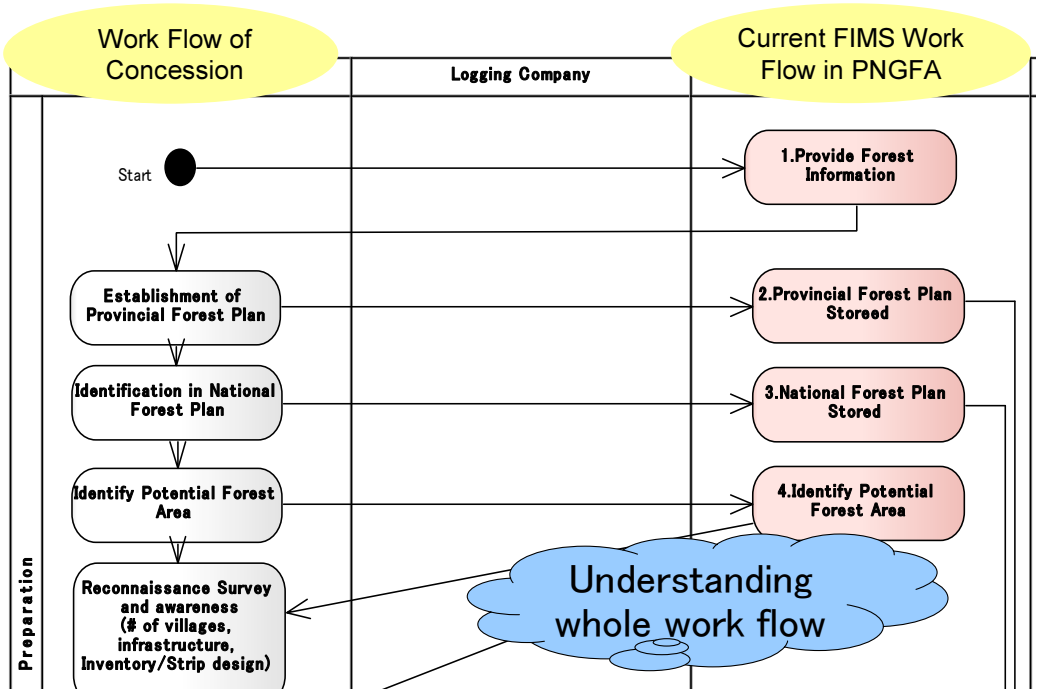

Figure 3-79 Image Organizing Work Flow

Table 3-29 Use Case Organization Table

sequential serial number	Use case (As Is)							What are there between "AS IS" and "TO BE"
	Work	Who	When	for What	Input Data(Information)	Output Data	Function	
FA1	Sequence for Provide Forest Information(FIMS)	FIMS administrator to Senior Plan Supervisor	Every five years (It takes a couple of hours each provinces)	To make Provincial Forest Plan	Protected area data from DEC Logged area from Company	Paper Maps Spreadsheet data (each province)	Mapinfo Access	Viewing & Printing (not editing) for Managers by LAN "Current" in report changes to concrete year
FA2	Sequence for Provincial Forest Plan	Senior Plan Supervisor	Every five years based on Section 49 of Forestry Act 1991 (as amended)	Requirement of the Act. Review of plan.	Relevant stakeholder's consultations. Previous Provincial Forest Plans. Paper Maps and spreadsheet data of each province	Revised Provincial Forest Plan. New concession area(proposed area) Expired concession area(checked) Protected area	Map stored in FIMS. #New concession area(proposed area)(new) #Expired concession area(update) #Protected area(not often)	
FA3	Sequence for National Forest Plan	Senior Plan Supervisor	Every five years based on Section 49 of Forestry Act 1991 (as amended)	Requirement of the Act. Review of plan.	Provincial Forest Plans.	Revised National Forest Plan.	Map stored in FIMS.	
FA4	Sequence for Identify Potential Forest Area	Senior Management and Manager of Inventory and Mapping	Based on National Forest Plan impact project area	For development of new timber project.	Maps of proposed concession area from FIMS	Timber resource information from FIPS.	Resource acquisition	History of Potential Forest area boundary should be stored in FIMS for record purpose.
FA5	Sequence for forest inventory (in potential area identified in NFP) Sequence for Confirm Potential Timber Resource Volume	Senior Inventory Officer	After the area identified in NFP according to the priority and plan identified in Provincial Forest Plan. ASAP as resource available.	To determine merchantable volume, or timber potential.	Field survey data	Timber volume from sampling assessment.	Data stored in FIPS. Information provided to the local consultation.	
FA6	Sequence for Select FMA Area for Development	FIMS administrator	Based on 5 year plan	To determine merchantable volume, or timber potential.	Sketched Map by Inventory Section	FMA polygon	Map digitizing. Mapinfo (Attribute are automatically calculated)	"Current" in report changes to concrete year
FA7	Sequence for identifying Landgroups Sequence for formation of ILG for FMA project (FIMS)	Acquisition team and manager	After the inventory report received.	Finalizing FMA boundary.	Inventory report. Paper Map	FMA boundary.	FMA boundary established in FIMS. Generate report including mapping information and timber volume.	
FA8	Sequence for map to Managements: Reference for Boundary demarcations	MD to FIMS administrators	2 times / month (Forest management agreement stage)	To determine the concession boundary for forest management agreement	Request (sketch maps)	Maps #concession area(updated from proposed concession area)	Changing concession boundaries (Map digitizing.)	Viewing & Printing (not editing) for Managers by LAN
FA9	Sequence for NFS Evaluation	Project branch team and manager	After 5 year plan, annual plan, basecamp plan, and log ponds plan or accomplishment report with ALP received.	Consistency of the plan. Control monitoring purposes.	Map form and report form from FIMS.	To achieve the project annual allowable cut and timber permit conditions.	Control and monitor the logging plan.	
FA10	Sequence for Updating logged over area in Concession Area for calculating remaining resource	FIMS administrator	After the logging plan (5-years, annual, set-up plan) received.	To update logged over area	Logged over area by ALP	-	Map digitizing.	Changes between plan and implementation result to be justified. To store annual coupe plan area by 5years plan and set-up plan area by ALP/ Set-up plan.To receive plans from logging company on time.To receive GIS data from logging company.To customize report format.Viewing & Printing (not editing) for Managers by LAN
FA11	Sequence for FAD							
FA12	Sequence for Waste assessment							
FA13	Sequence for SGS Evaluation	SGS						
FA14	Sequence for Post Logging Inventory Survey (Before the completion of the Project)				Logged over area map from FIMS.			
FA15	Sequence for Submit Report of Current Forest Inventory to the Management		When the management decision or the operating company requested to verify remaining timber resources					
FA16	Managements: Any FIM Maps and Reports: Reports upon request	PNGFA officer to FIMS administrators	5 times / month	To report	-	Maps & reports	Generating Maps & Reports	Viewing & Printing (not editing) for Managers by LAN

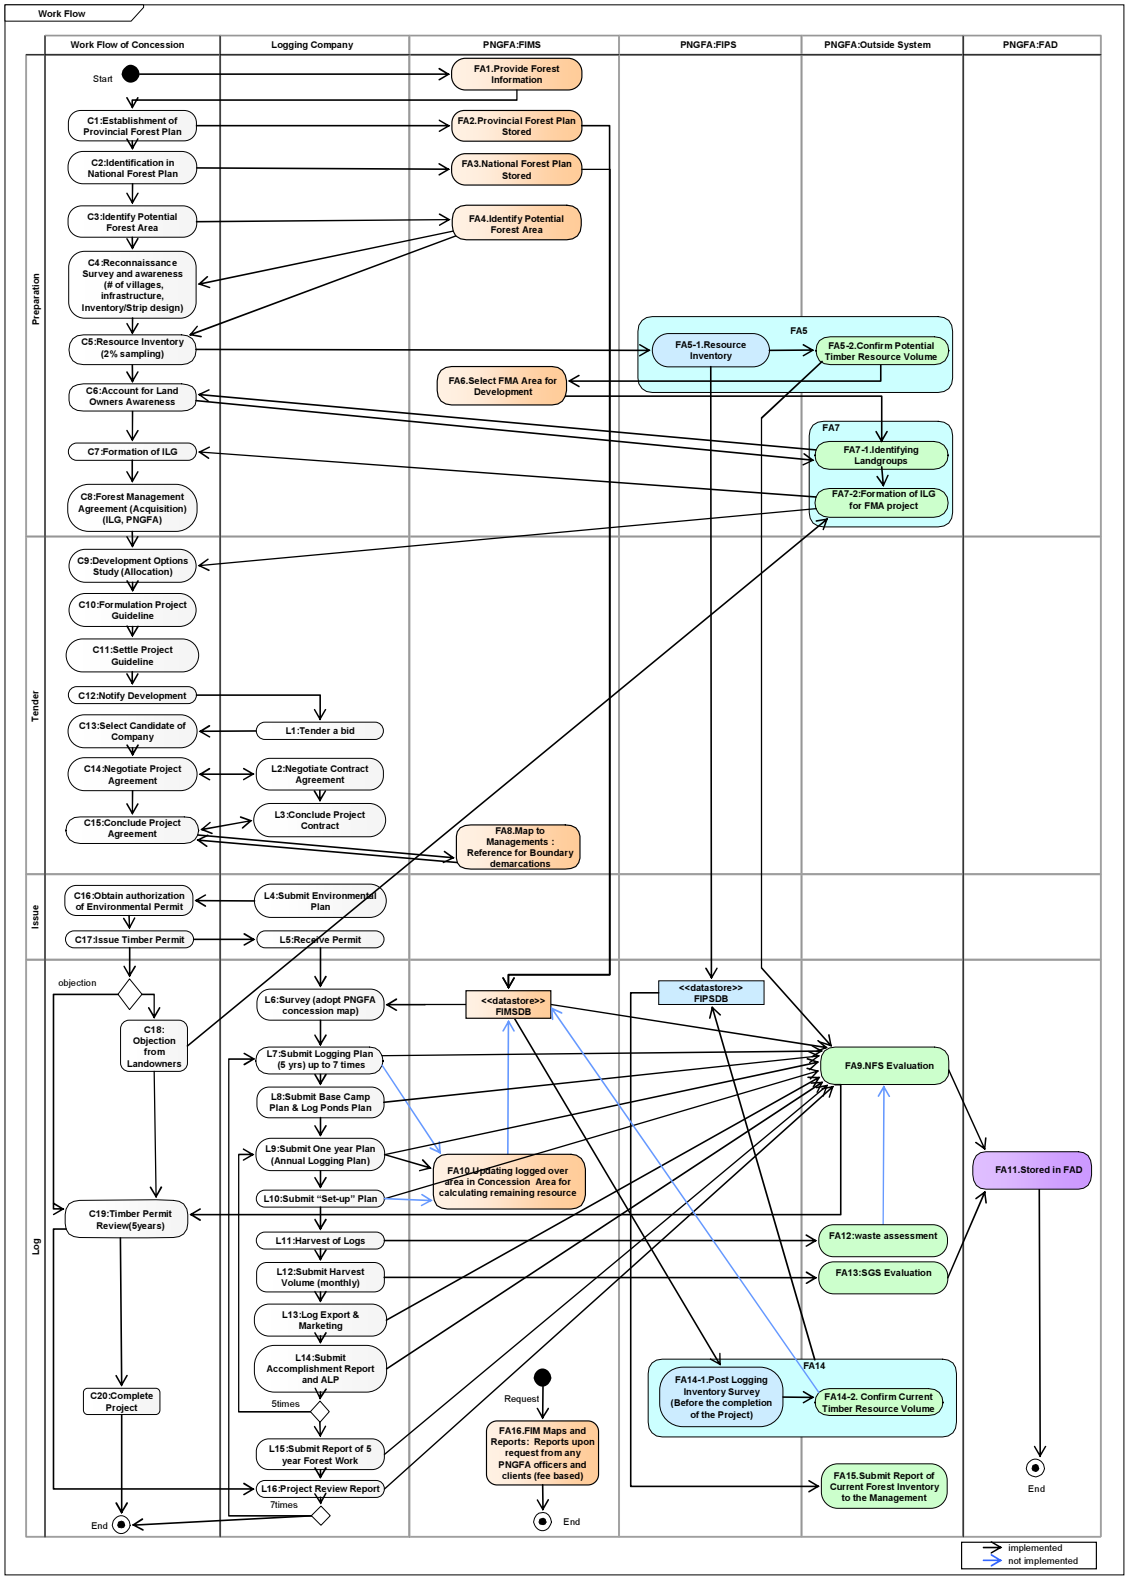

Figure 3-80 Overall Concession Work Flow Prepared with C/P (Revised)

(b) Examination of Required Data and Functions (To-Be)

Taking the results of work flow organization into consideration, the exchange of information was discussed with the respective parties, which led to the necessity of the blue arrows shown in Figure 3-80 as areas that require improvement.

In addition, regarding the linkage of FIMS and FIPS data, it was recognized that improvement needed to be made at two times: After Resource Inventory (FA5 in Figure 3-80), and After Post Logging Inventory Survey (FA14 in Figure 3-80). Organization of the data resulted in the recognition that measures need to be implemented so that the forest resource volume managed in the FIMS and the forest resource volume estimated by the inventory survey can be compared After the Resource Inventory and After the Post Logging Inventory Survey.

(c) Design of Forest Resource Database

The forest resource database was designed, taking the above review into consideration.

The database development was implemented in 2 steps as shown in Table 3-30.

The development of the database as such is implemented under the GAECC that was ongoing separately. Therefore, this Project was intended to build up the technology necessary for development and operation/maintenance and review the requirements from the counterparts.

Table 3-30 Database Development Procedure

Step	Development
Step 1	The existing functions of FIMS and FIPS are replaced in the new version as they are. [FIMS] (existing) MapInfo ==> ArcGIS [FIPS] (existing) FoxPro ==> Access
Step 2	The response to the requirements for FIMS and FIPS is made. The integrated operating environment for FIMS and FIPS is developed.

i) Design in Step 1

The design to replace the existing functions of both FIMS and FIPS was made.

The designed results were wrapped up as the Basic Design Documents for FIMS and FIPS individually.

In the replacing work for FIMS, there is no basic change in data architecture and contents because the existing FIMS functions are replaced in the new system as they are. In replacing them in the ArcGIS version, the items were reviewed.

As a result of the review, the ArcGIS version of data specifications (UML-class diagram) is shown in Figure 3-82.

- Integration of Data that is Retained in Both Access and MapInfo

With the existing FIMS, two types of software are being used (Access and MapInfo), and the data is retained in both software systems (Refer to Figure 3-70 and Figure 3-71). However, with the ArcGIS version that is replacing these software systems, the data will only be retained in the ArcGIS system. Consequently, data items that are duplicated by Access and MapInfo were integrated into single data items.

Specifically, the data items shown in Table 3-31 were integrated.

Table 3-31 Content of Changes to Data Structure in Replacement Version

Current FIMS（MapInfo）		Replaced FIMS（ArcGIS）
Software	Name of Data	Name of Data after integrated
MapInfo	*_Concession	ConcessionArea
Access	*_Concession	
MapInfo	*_Concession_*_FMU	Concession_FMU
Access	*_Concession_*_FMU	
MapInfo	*_Veg	FMU
Access	*_Veg	

Note: “*” in the data names indicates the province name or concession number.

- Accommodation of Description Procedure in Accordance with ArcGIS Data Structure Description Rules

With ArcGIS, due to the fact the data structure description rules are determined by the UML class diagram, the description procedure was changed in accordance with those rules. As shown in Figure 3-81, with ArcGIS, data of planimetric features that have spatial attributes is separated into Features (graphics) and ObjectClasses (attributes).

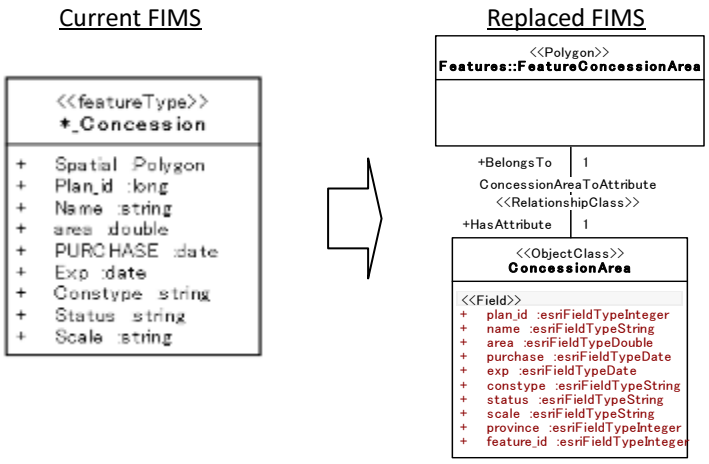

Figure 3-81 Changes In Accordance with ArcGIS Data Structure Description Rules

- Deletion of Temporary Data / Temporary Fields

With the existing FIMS, data to record the intermediate results of space analysis by MapInfo exists (data in ProtectedConstraints folder and below and LLU_Constraints folder and below). In addition, "*_Veg" and "*_Concession_FMU" in MapInfo have fields entitled Temp_1 – 7 and Err_1 – 7 that are used as space analysis fields. Since these are all intermediate results for space analysis and do not need to be retained as data, these results have been deleted.

- Data Managed in Database and Distinction of Display Data

The existing FIMS data includes some data that is only used for display purposes (For example, data in Labels, PROV, coast and Tpc folders and below, data in GPSData folder and below). Due to the fact that these data are not used for the respective FIMS functions, the decision was made to distinguish this data from other data.

Furthermore, regarding the data in the MapConstraints folder and below, even though these data items are for display purposes and are not used by the respective FIMS functions, since these data items have a stronger relationship to the data managed by FIMS compared to the other items, the decision was made to handle these data items separate from the display data as a result of discussions with the C/P.

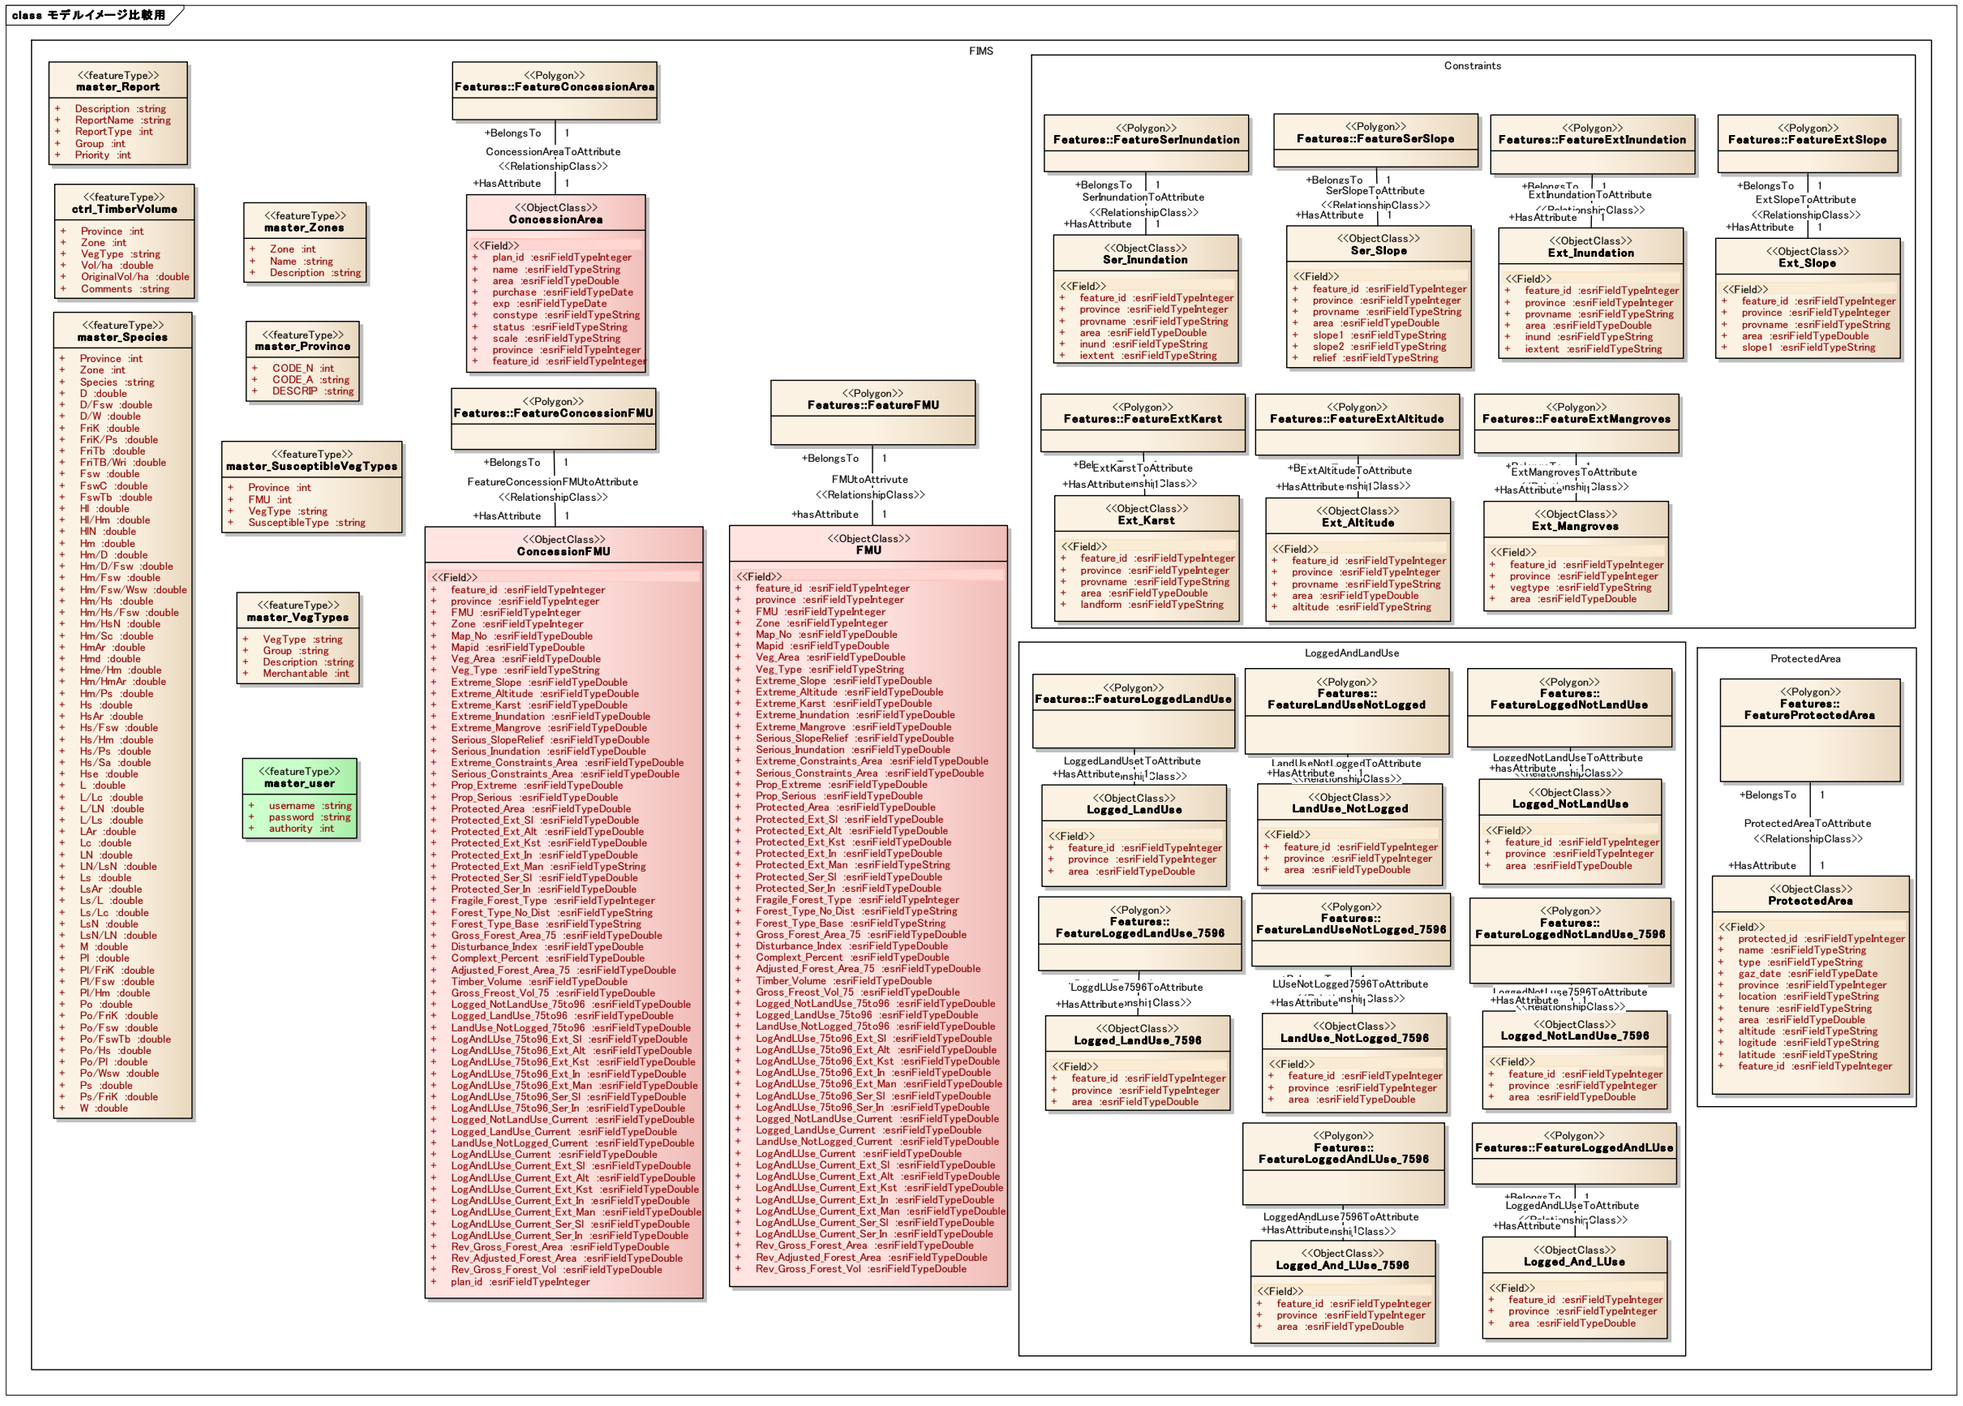

Figure 3-82 FIMS ArcGIS Version UML Class Diagram

ii) Design in Step 2

The necessity for improvement in the system in which the existing functions are replaced was examined.

The matters related to data integration in FIMS and FIPS are discussed in the next section.

- Change in Report Form in FIMS

The report form in FIMS is shown in the red frame in Figure 3-83 and the changes from 1975 up to the present (Current) can be calculated. However, the following problems were pointed out by the counterparts:

- What time point is indicated by “Current” is unclear.
- After 1975, the data was updated in 1996, 2002 and 2009, and they desired to comprehend the data changes for each period.

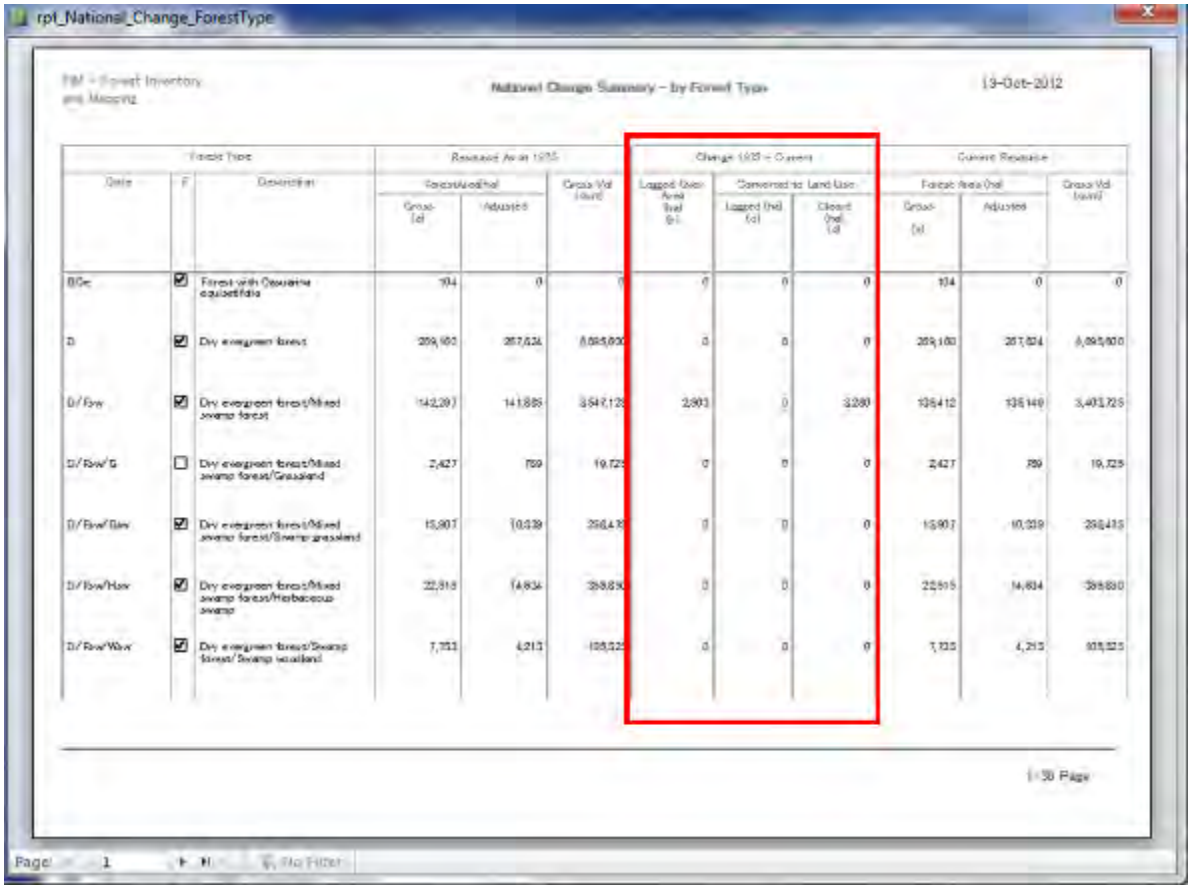

Figure 3-83 Current FIMS Report Window

If the results of comparison with each data updating year are inserted in the report, there is insufficient space in the report form, but it is necessary to insert the results of comparison whenever the data is updated in future. FIMS is designed to overwrite the data in updating and the past data is cleared when it is updated. Therefore, the past data exists only in the report that is outputted on paper. In this situation,

the method in which the report information stored as PDF can be browsed in association with each concession was examined, to allow the report in each updating year to be checked.

It was decided that for the “Current” time, not only the output date, but also the final updating date was indicated.

For registering the PDF, the system in which the file uploading function is provided in the Concession Attribute Input Window to register the report whenever it is saved, as shown in Figure 3-84 was discussed.

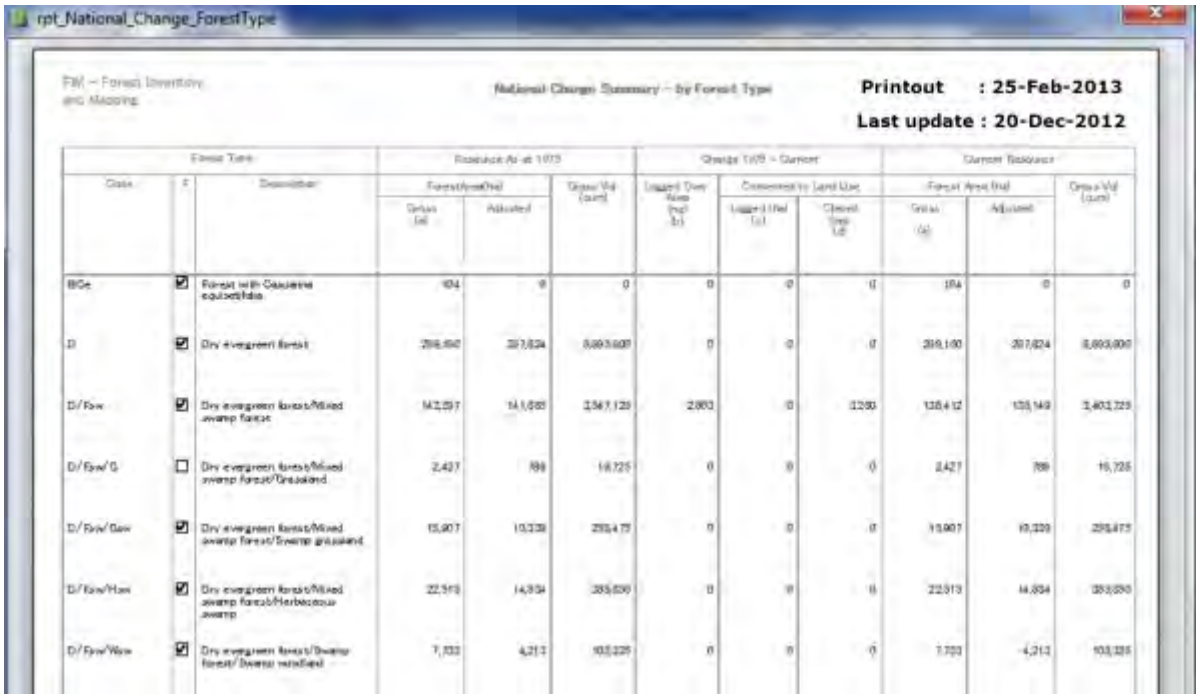

Figure 3-84 Correction Plan for FIMS Report Window

Figure 3-85 Image of Registration of Report in File

- FIPS: Addition of measured/calculated results of diameter class 10 to 19cm

The request for adding the measured/calculated results of the diameter class of 10 to 19cm in the existing report form was made from the counterparts. To respond to this request, the revised report form was planned as shown below.

Table 3-32 Report Form Necessary to Add the Diameter of 10 to 19cm (Draft)

No.	Name of Report	Response	No.	Name of Report	Response
1	MasterControlFile	Not needed	15	Table3_Whole	Needed
2	ForestTypeList	Not needed	16	Table4_SingleBlock	Needed
3	SpeciesListAlphabetical	Not needed	17	Table4_Whole	Needed

- FIPS: Preparation of Report to meet various evaluation methods

It is necessary to output the report on the inventory survey results created by various evaluation methods to meet the concession conditions. It is difficult to use only the existing FIPS report form and it is desired to develop a system to evaluate the survey results in a flexible manner.

In these circumstances, the function to allow the calculated results by FIPS to be outputted in the Excel or CSV format was discussed.

Table 3-33 Example of Forest Volume Calculation by Species Group

Species	Log Form Volume (m^3)					Basal Area	Total Vol	Gross Vol/ha	Comp %
Group	A	B	C	D	E	(m^2)	(m^3)	(m^3)	
1	334.680	463.760	259.207	4.953	7.684	142.603	1070.284	11.866	39.671
2	61.074	103.377	56.407	0.000	0.000	32.161	220.859	2.449	8.19
3	172.970	302.225	154.679	3.113	1.065	80.383	634.053	7.029	23.50
4	201.327	353.722	203.609	10.526	3.511	98.502	772.694	8.566	28.64
Total	770.052	1223.085	673.902	18.592	12.260	353.648	2697.890	29.910	100.000

3.6.3 Development of Database Linking Forest Cover Maps and Ground Data

Taking the results of efforts to grasp and analyze the existing data related to forest resources and results of the basic design of the forest resource database into consideration, review and organization of the database linked to the forest cover map and ground data were performed.

Based on the discussions on the entire concession workflow with the counterparts, the data integration method between FIMS and FIPS was examined. The results are shown in Figure 3-92 and Figure 3-93.

This method allows that the timber volumes managed by the existing FIMS are monitored in the 2 stages when the inventory survey is completed and when the survey after cutting down the trees is completed and that the potential timber resource volumes (cuttable forest resource volume and remaining forest resource volume) are displayed on the same window.

In realizing the data integration between FIMS and FIPS, the following points should be taken into consideration:

- As there are some differences in the range and the quality of survey between the FIMS data and the FIPS data, for instance, the method of replacing part of the FIMS data with the FIPS data is undesirable.
- The operation of FIMS and that of FIPS are made by the respective operators and their scopes of responsibility and workflows are established individually. Therefore, any change involving in an alteration of their workflows is undesirable.
- To display the FIPS data on the FIMS windows, it is necessary to add the coordinate information measured by GPS to FIPS.

Based on the above considerations, the practical data integration method applicable to each of FIMS and FIPS was discussed and examined.

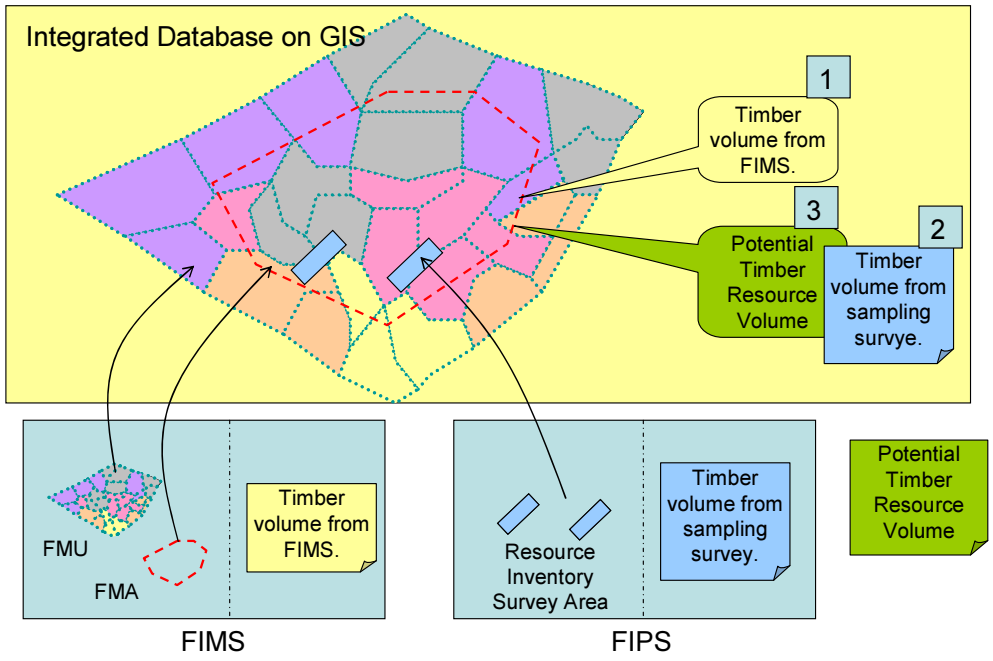

Figure 3-92 Image of FIMS and FIPS Integrated Operation at the end of inventory survey

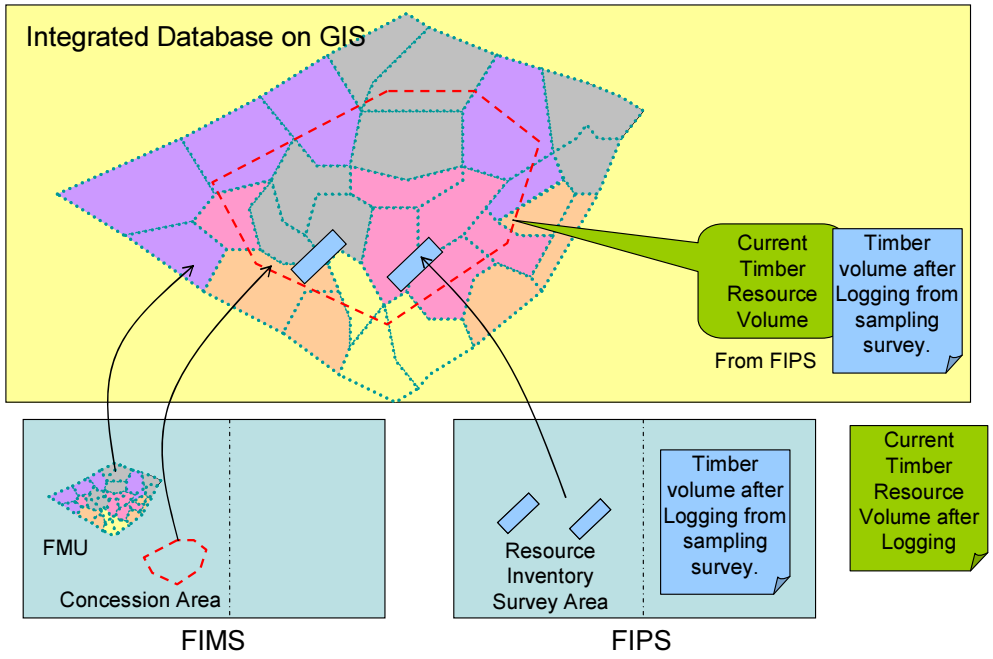

Figure 3-93 Image of FIMS and FIPS integrated operation at the end of survey after tree-cutover

(a) FIMS

i) Display of inventory survey data

The site and the results of the inventory survey which are stored in FIPS are displayed. The display images are shown in Figure 3-94 and Figure 3-95.

FIMS is designed to allow both the forest volume estimated by FIMS and the forest volume presumed by the field survey to be compared and browsed on the Main Window.

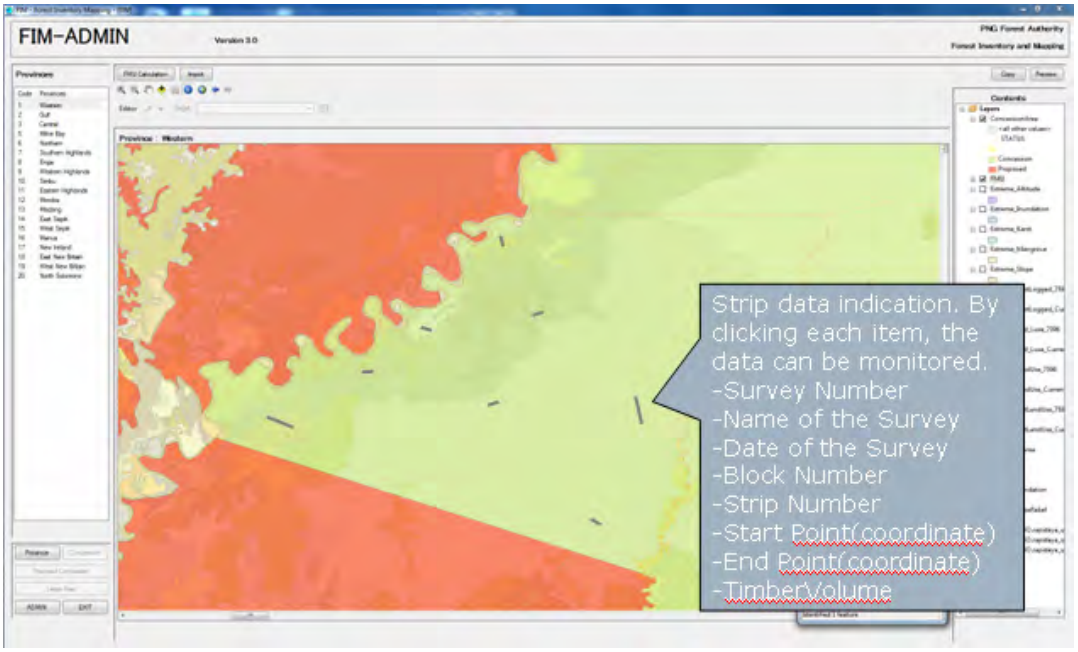

Figure 3-94 Display image of Inventory strip line on Large Map Window

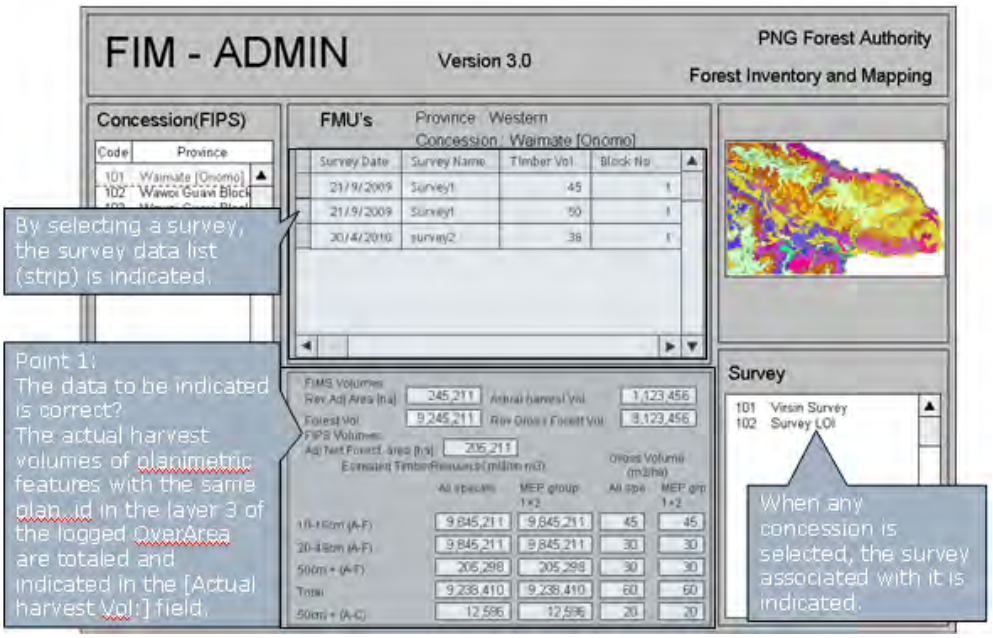

Figure 3-95 Display image of calculated results in inventory survey on Main Window

ii) Storage of actual harvest volume

It is important for the system to allow not only the FIMS-estimated forest volume and the forest volume presumed by the field survey to be compared, but also the actual harvest volume to be monitored. The annual report on actual harvest volumes is issued by the logging company at present. The cutover areas are registered as GIS data only for their ranges in the FIMS in the current workflow. Therefore, the method of registering actual harvest volumes at the time of cutover areas registration was also discussed.

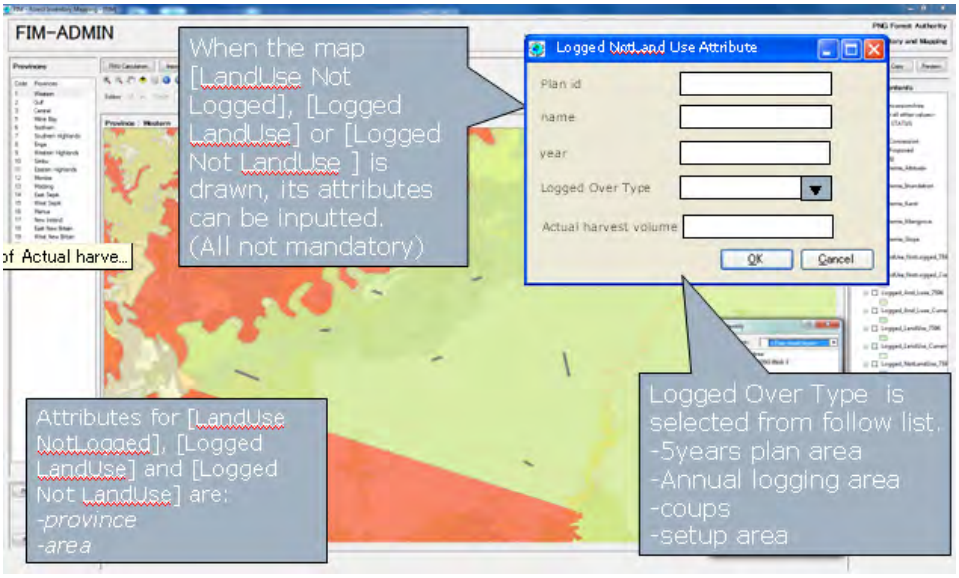

Figure 3-96 Image of registration of actual harvest volume

iii) Import of FIPS data

As the users are different between FIMS and FIPS, both systems are designed as independent systems as mentioned previously. In data integration, it was decided to collect the information in FIMS and import the FIPS data into FIMS under the Manager's authority.

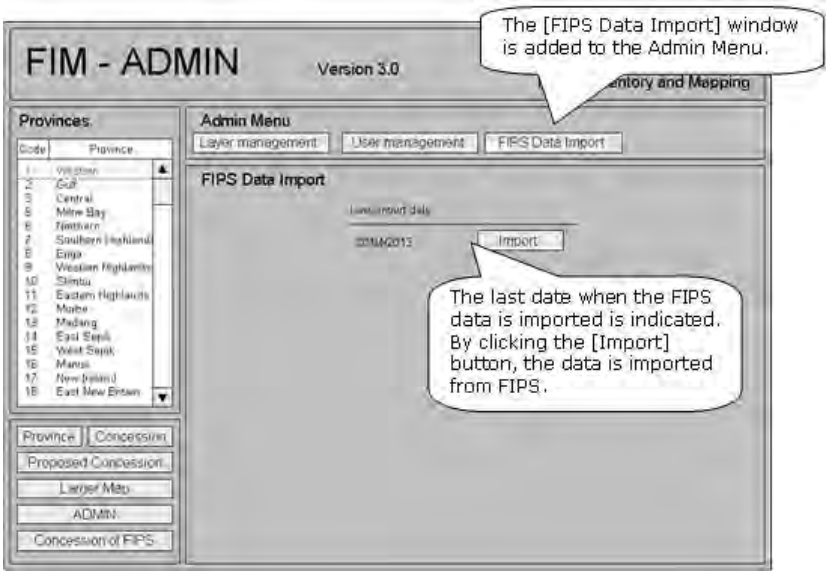

Figure 3-97 FIPS data importing method

The FIPS data to be imported into FIMS is the data which is comparable with the forest resource volume data registered in FIMS.

Strip line	Plan_id
	Survey Number
	Name of the Survey
	Date of the Survey
	Block Number
	Strip Number
	Volume
	Start Point(coordinate)
	End Point(coordinate)
Survey Summary	Plan_id
	Survey_Number
	Name_of_the_Survey
	Adj_Net_Forest_Area
	10-19_m3_per_ha
	20-49_m3_per_ha
	50Over_m3_per_ha
	Total_m3_per_ha
	50Over2_m3_per_ha
	10-19_grp1-2_m3_per_ha
	20-49_grp1-2_m3_per_ha
	50Over_grp1-2_m3_per_ha
	Total_grp1-2_m3_per_ha
	50Over2_grp1-2_m3_per_ha

iv) Data association between FIMS and FIPS

The inventory survey is made per concession. Therefore, the method of associating the FIPS information with the concession of the FIMS was adopted. Two association methods were considered:

- The ID of the FIMS concession is bestowed on the FIPS survey data to associate both sets of data with the common ID.
- The coordinate information on the start point and stop point of the survey is bestowed on the FIPS survey data and spatial analysis is made to determine which concession area (polygon) in FIMS the FIPS data belongs to on the GIS in order to associate it with the relevant concession.

As the concession areas are not duplicated at present, the latter method has an advantage that it is not needed to input new items of information. However, if a new cutover of trees is made in the past concession in which the cutover of trees has been finished, it is impossible to determine which time of survey the cutover of the trees is to be associated with, only based on the positional information. Thus, the former method of association with the Plan ID of the FIMS concession was finally adopted.

(b) FIPS

i) Addition of positional information of the survey

Since FIMS is the system having positional information, FIPS is required to have positional information for association with each other. In the inventory survey, the GPS devices that were provided in the separate Grant Aid project will be carried by the surveyors, allowing easy acquisition of positional information.

Each plot position at which the detailed survey is made is automatically determined on each strip line. Therefore, it was decided to newly register only the coordinate values of the start and the stop points of each strip line.

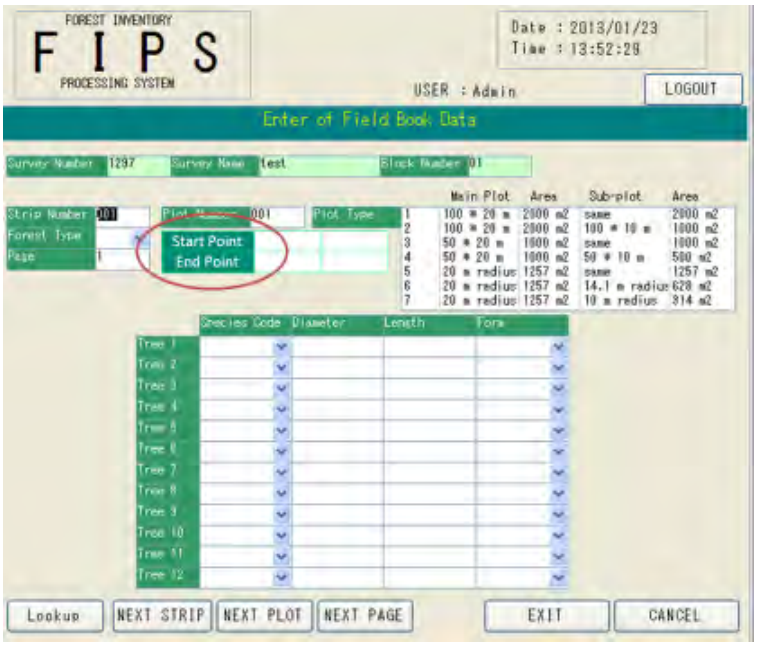

Figure 3-98 FIPS coordinate value registering window (draft)

ii) Installation method for association with FIMS

The database (DB) installation method for association between FIMS and FIPS was examined.

Three layout methods for association were discussed as shown in Table 3-34.

It is unnecessary for workers to do the survey work simultaneously, but Plan ③ was evaluated as the most suitable in considering the data management. As there is the need for the method as a data input and calculation tool in Papua New Guinea, it was decided to examine the common use with the input tool from the external source based on Plan ③.

Table 3-34 FIPS DB layout method for association with FIMS

Plan	Method	Advantage	Disadvantage
①	The FIPS DB is installed on Client PC. The tables associated with FIMS are only transferred to the SQL Server.	A PC which is not operated in a networking environment can be used (carried to field surveys). ※ To reflect the data on the SQL Server, it is necessary to recalculate it on the PC under a networking environment.	The management of the latest data is complicated because the data from Client PC is finally required to be integrated into one Access file.
②	The FIPS DB is installed in the common folder on the server PC. The FIPS in the common folder is directly operated from Client PC. The tables associated with FIMS are only transferred to the SQL Server.	The latest data can be obtained from any Client PC because the Access file is managed from one point. A PC which is not operated in a networking environment can be used. (However, it is necessary to do the data reflecting work in connecting to the network.)	Two or more workers can use the DB simultaneously.
③	The FIPS DB from which all the tables are transferred to the SQL Server is installed on Client PC.	As the exclusive control by the SQL Server is available, the database can be operated safely by two or more workers simultaneously. Data backup and restoration are easily made.	As it is mandatory to log in to the SQL Server, a PC which is not operated in a networking environment cannot be used.

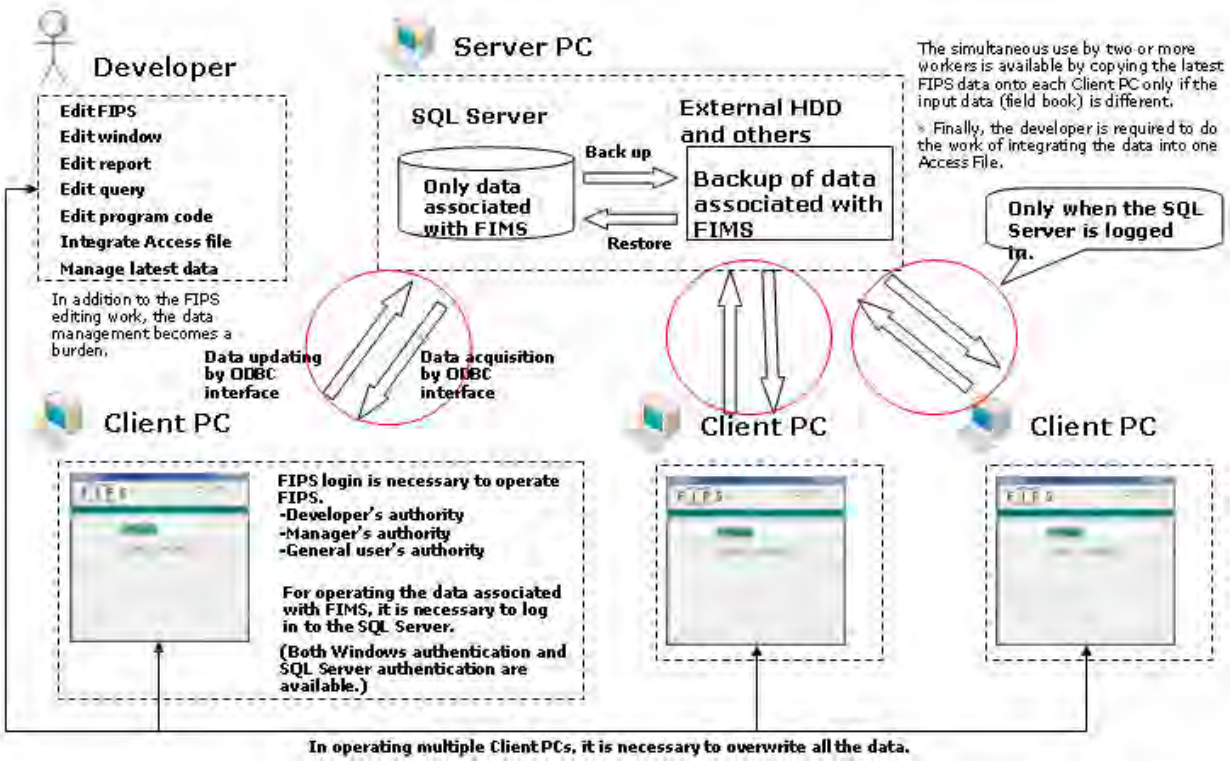

Figure 3-99 FIPS DB Installation Method 1 for Association with FIMS

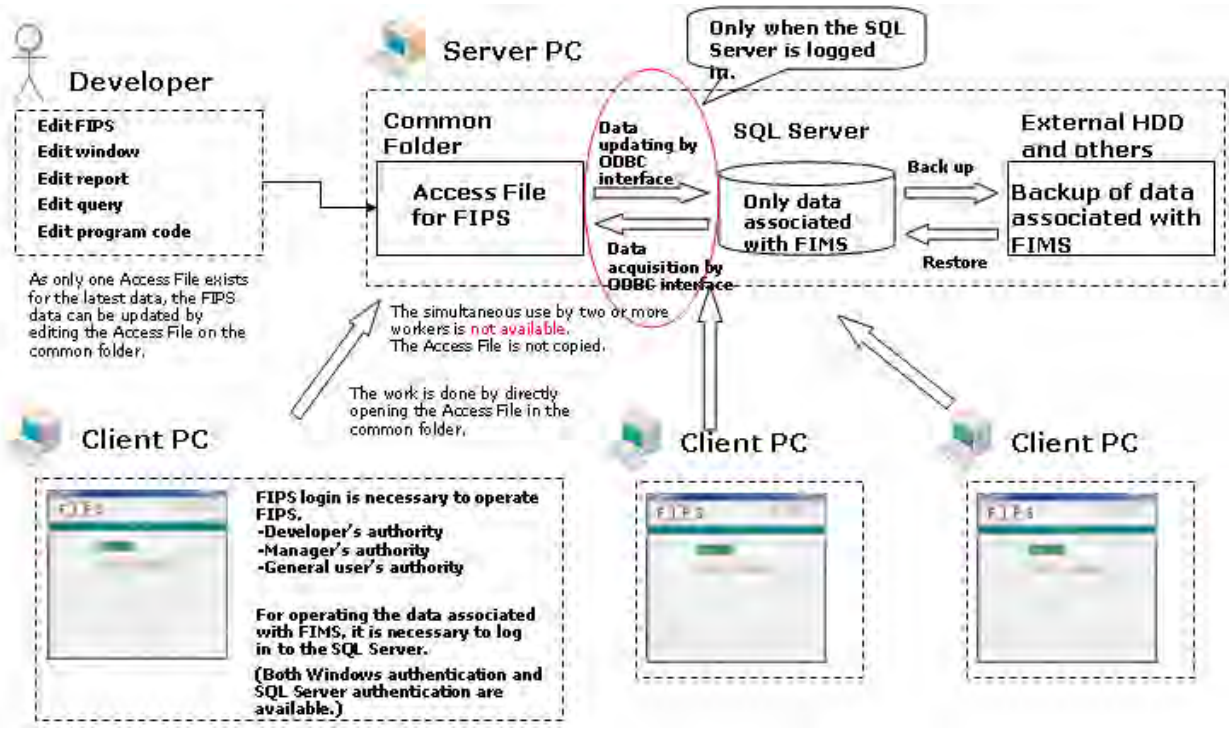

Figure 3-100 FIPS Installation Method 2 for Association with FIMS

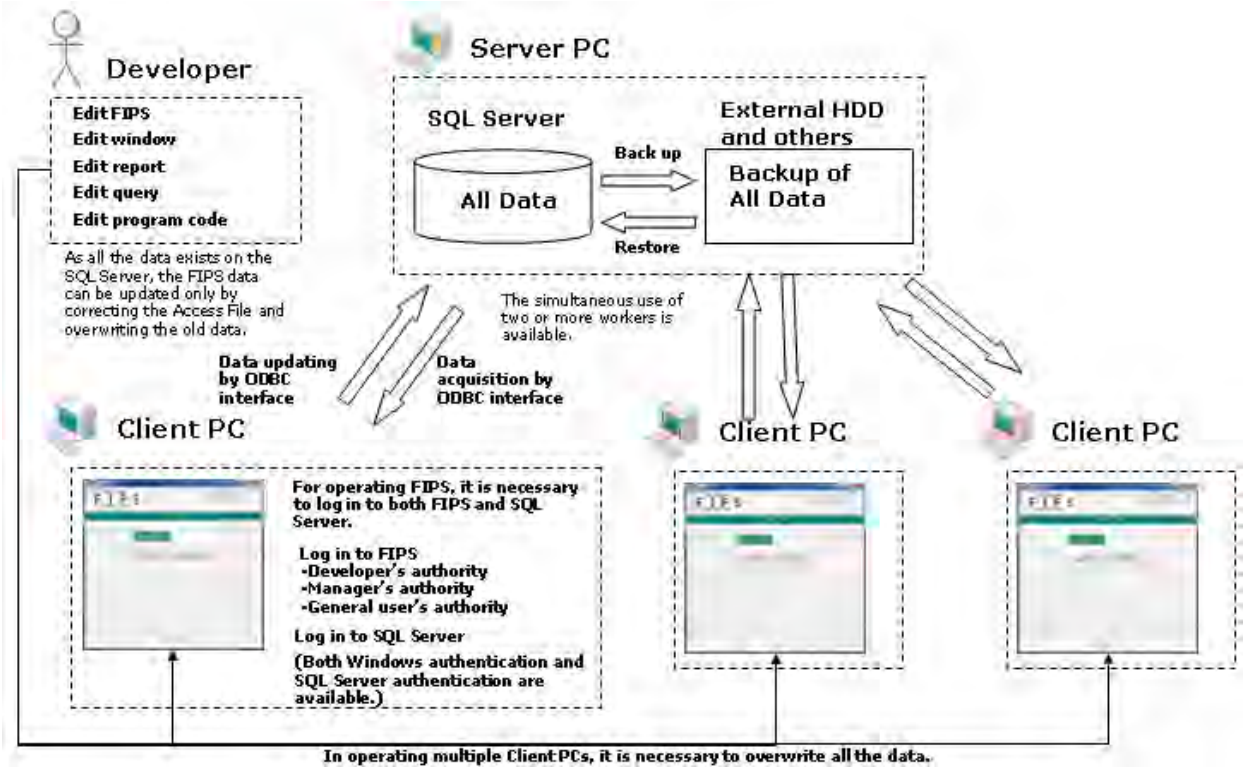

Figure 3-101 FIPS Installation Method 3 for Association with FIMS

3.6.4 OJT Required for 3.6.1 – 3.6.3

The results shown in 3.6.1 – 3.6.3 were achieved by implementing the OJT shown in the table below.

Table 3-35 Implementation of OJT

Date	OJT Content	Participating Members
October 14, 2011 (Friday) 10:00 – 12:00	Analysis of Concession Work	All members

3.6.5 OJT Concerning Operation and Management of Improved Version Forest Resource Database

In preparation for operation of the improved version database (developed with the GAECC), discussions with the counterpart and OJT were implemented for the work procedure using the FIMS and FIPS.

(a) Discussion and OJT Concerning Operation of FIMS

i) Registration/Updating of Logged Over Areas

In order to perform logged over area registration/updating work, map digitizing will be performed using the "Logged Over Area" and "Planned Area" indicated on the Annual Logging Plan map submitted by the logging companies to the PNGFA, reflecting the information in the forest resource database. By reflecting the information concerning the logged over area, accurate forest stock figures can be calculated with the FIMS.

Due to the fact that this work has been the main work that the counterpart has been performing using the existing FIMS, the decision was made to make this the first work when starting up the FIMS.

In order to review operation of logged over area registration/updating work using the new FIMS, the operation procedure used up until now was verified and issues were organized together with the counterpart. The operation procedure used up until now is shown in Figure 3-102.

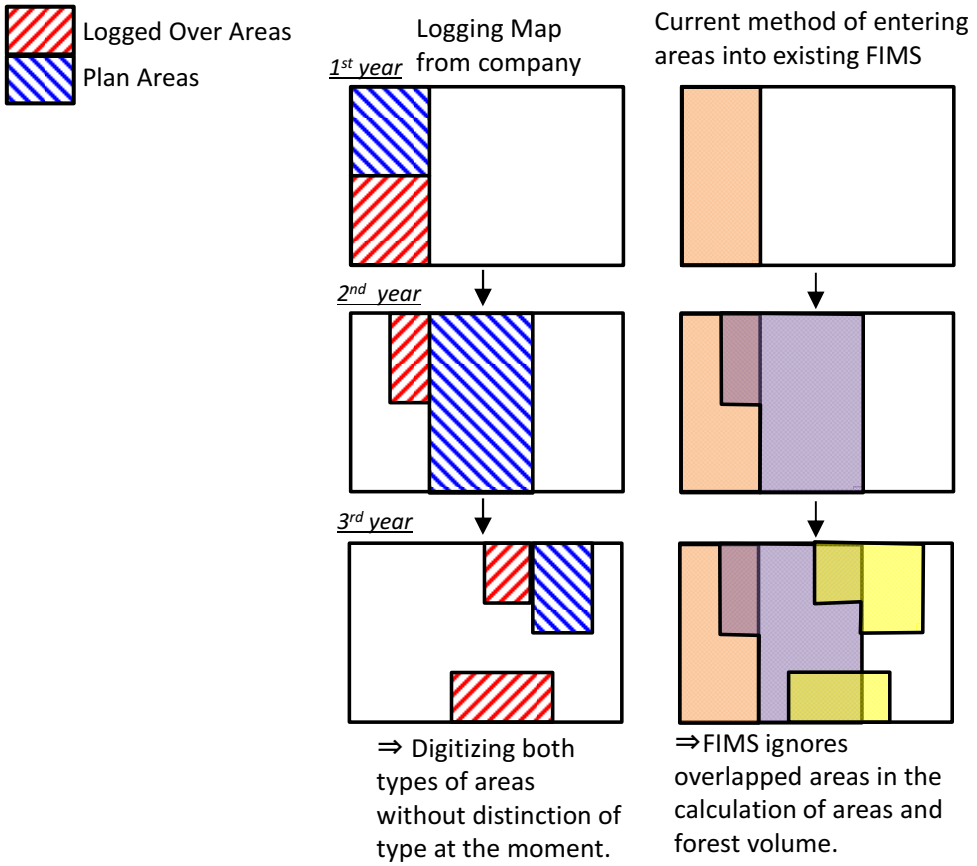

Figure 3-102 Logged Over Area Entry (Registration/Updating) Procedure Used Until Now

It was found that the counterpart was performing logged over area entry work using the existing FIMS without differentiating between the “Logged Over Area” and “Plan Area” (next fiscal year) indicated in the Annual Logging Plan map.

Due to the fact that obtaining a grasp of the area that is actually logged the next fiscal year as well as the volume harvested with respect to the plan area in the report made by the logging company is important for the PNGFA in order to conduct forest management in PNG, the decision was made to use the operation procedure shown in Figure 3-103.

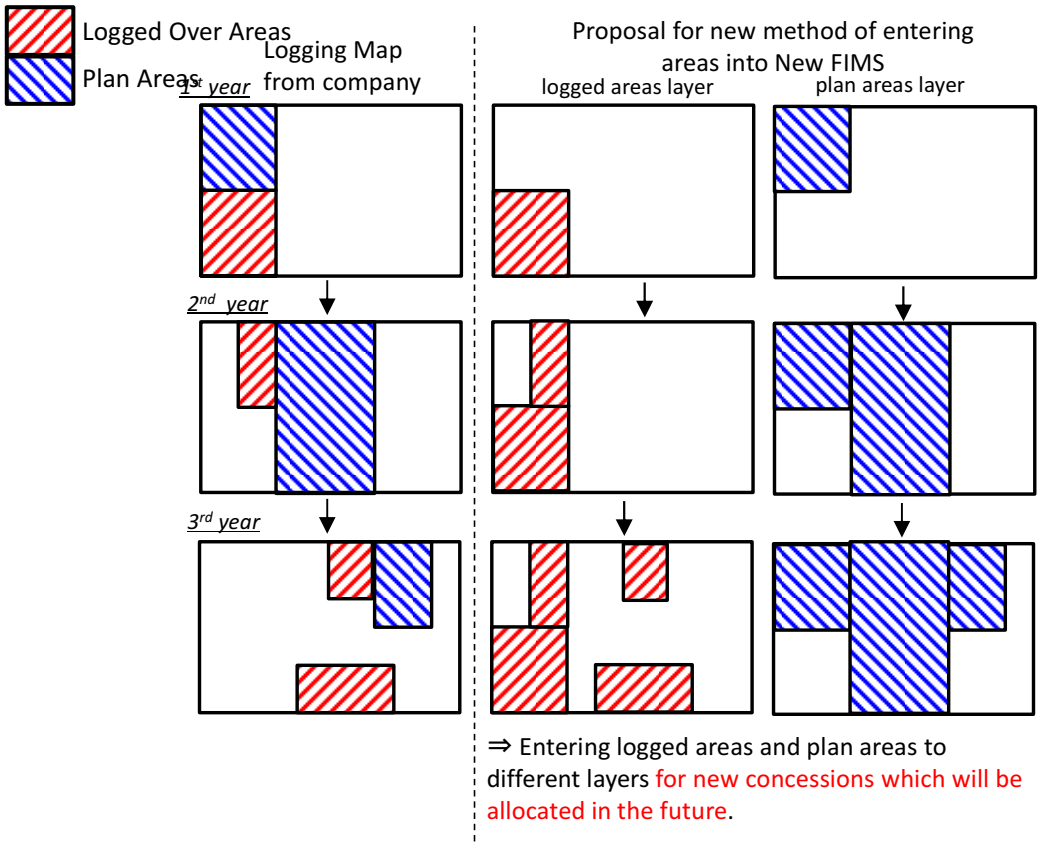

Figure 3-103 New Logged Over Area Entry (Registration/Updating) Procedure

Points of Proposal for new method

- New FIMS can enter actual harvest volume information which is submitted by company into Logged and land-use areas layer.
- It is important to distinguish logged areas from plan areas.
- If you enter an actual harvest volume by each logged area when you digitize, it is more useful for PNGFA. You can compare an actual harvest volume with estimated volume.

※it might be difficult to apply this method to the areas entered already.

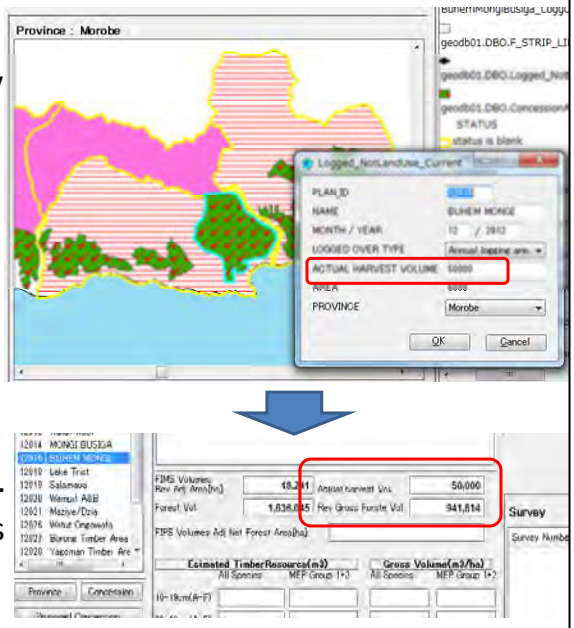

Figure 3-104 Key Points of Logged Over Area New Entry Procedure

ii) OJT in Updating Work for Improved Version Forest Resource Database

In order to establish the work procedures for the improved version forest resource database, updating work was performed on the "Logged Over Areas", "Planned Areas" and "Concession Areas".

There are two methods to update the database as shown below. Discussions were held with the counterparts about the characteristics unique to each of these two methods.

Table 3-36 Updating Methods for Forest Resource Database

Method	Procedures	Characteristics
Method 1: Import of MapInfo-formatted data (conventional method)	(1) Digitize the maps on the digitizing board to create graphics (2) Enter the attributes of the digitized data on the existing FIMS (MapInfo) that has been used (3) Convert the data format to one that the new FIMS can import (4) Update the database by importing the data into the new FIMS	- Both the new and existing FIMSs can be operated and a certain period of time can be allocated for verification. - Maps can be viewed as a whole when the digitizing board is used and graphics can be created efficiently. - However, the accuracy of the positioning deteriorates as the tracing precision becomes coarser.
Method 2: Scanning of maps and entry of data on FIMS	(1) Scan the maps using the A0 scanner (2) Geometrically correct the images scanned with ArcGIS (3) Import the images into the new FIMS (4) Update the database by entering the graphics and attributes in the new FIMS	- Drawings such as the Annual Logging Plan can be digitized for storage. - Since graphics are digitized on the monitor, work efficiency deteriorates more than when it is done on the digitizing board. - Drawings can be enlarged, enabling acquisition of more accurate positions.

When OJT was implemented, data entry had already been performed by the counterparts using the digitizing board and, therefore, OJT was implemented initially with the above method 1.

The database was updated with method 2, using the Annual Logging Plan maps (PASSISMANUA INLAND LFA) that had not been entered on the digitizing board.

In implementing OJT, a work manual was prepared for use when updating the forest resource database.

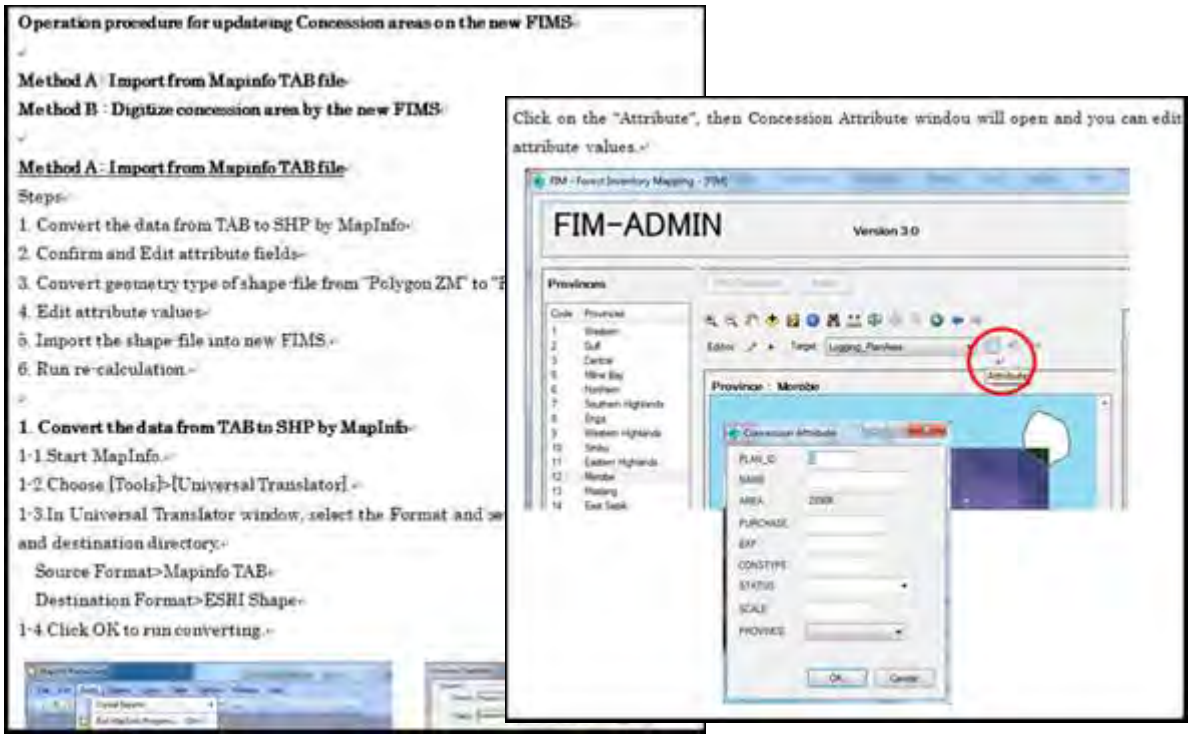

Figure 3-105 Work Manual Prepared for FIMS Training (excerpt)

The content of the FIMS database updated through OJT is shown below.

Table 3-37 Content of Database Updated through OJT

Updated Data	Province Name	Logged Over Area

iii) OJT Concerning Maintenance and Operation of the Improved Version Forest Resource Database (FIMS)

OJT in configuration of the improved version forest resource database (FIMS) was implemented for the managers of the improved version database.

The improved version forest resource database (FIMS) is stored in the ArcGIS GeoDatabase compiled in the SQL server. In order to access the improved version database, it is necessary to acquire a domain user ID which is provided for the staff at the PNGFA.

When this project was completed, the following four individuals were designated as database managers with access right to the SQL server. The database can be accessed from a total of 6 workstations located at the Inventory & Mapping Branch on which ArcGIS is installed.

- Constin Bigol
- Perry Malan
- Patrick La'a
- Jehu Antiko

The SQL server has a standard interface (ODBC: Open Database Connectivity) to allow access to the database. In order to enable the trainees to understand the mechanism of the database, OJT was implemented in how to access the database with software other than FIMS and how to utilize the data stored in it. The content of OJT is shown below.

- Access to the database from ArcMap10/ArcCatalog10
  - Creation of direct connection
  - Displaying of maps using ArcMap10/ArcCatalog10
  - Editing of maps and attributes using ArcMap10
- Access to the database from Microsoft Access 2010
  - Creation of Access database files
  - Setting of ODBC connection
  - Displaying of database (attributes) using Access
  - Preparation of reports using Access (refer to 0)

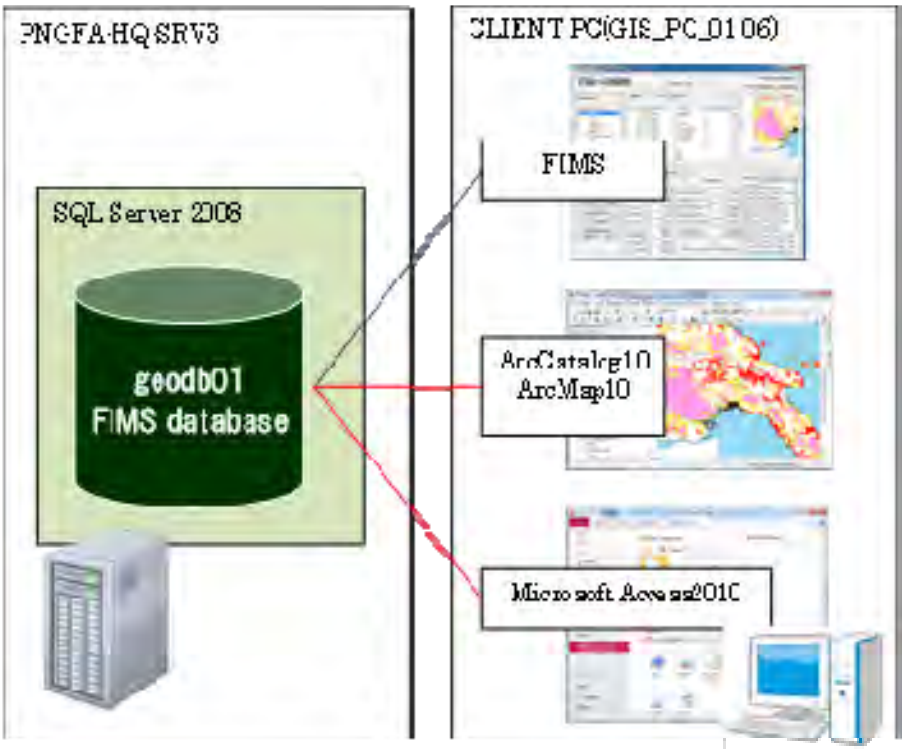

Figure 3-106 Configuration of FIMS Database

(b) Discussions and OJT Concerning Operation of FIPS

i) Registration Procedure from Existing Spreadsheet (Excel File)

The field survey results from recent years are managed with Excel files rather than directly registering them in the existing FIPS. Therefore, a manual was prepared for the transfer of the field survey results that have been recorded in Excel files being used by the counterpart into the new FIPS, and training was implemented.

Operation procedure for importing survey results into new FIPS

New FIPS provides two options to enter the survey results (field book data).

Method 1) Enter data to FIPS directly (existing function)

Method 2) Import from Excel spreadsheet (new function)

→This manual is showing Method 2.

Steps

1. Enter information for a new survey
2. Input the field book data into an excel spreadsheet
3. Import the field book data from the excel spreadsheet into new FIPS
4. Run calculation, print reports and output to excel file

1. Enter information for a new survey

1-1.Start FIPS.

Click FIPS-Startup on the desktop, input ID and PASSWORD, then main window will open. If Security warning appears, Click on "Options" and select "Enable this content".

Figure 3-107 Manual Used for FIPS Training (Excerpt)

Before the project

- Old FIPS had the only way to enter field book data into the system directly. It was not efficient enough.
- Some results of survey were managed in excel spread sheet.

Achievement

- New FIPS makes it possible to import field book data from excel spread sheet, which makes it easier to update the FIPS database.

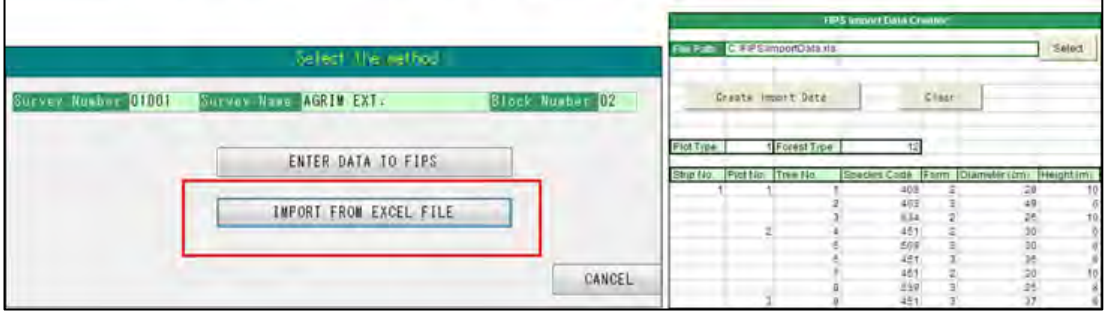

Figure 3-108 Excel Data Importing Function of FIPS

Two new functions were added to the improved FIPS, a function to import the excel files that had been used by the counterparts on a daily basis and a function to enter Field Book Data directly in FIPS. As the result, it became possible to update the FIPS database more efficiently than before.
The content of the database updated through OJT (field survey results) is shown below.

Table 3-38 Content of FIPS Database Updated through OJT

Province Name	Field Survey Name
Western	MAKAPA TRP LOI
Gulf	TURAMA BLK 1 EXT. (UNLOGGED)
	TURAMA BLK 1 EXT. (LOI)
Central	BAINA TA (UNLOGGED)
	IVA INIKA LOI

ii) Review of FIPS Database

Through reviews conducted with the counterparts concerning the content of the new FIPS database, problems were identified and discussions were held on measures to solve the problems. Although the old FIPS is no longer in operation, a comparison was made using previously printed out hard copies of reports that had been kept in storage.
The field surveys in which problems were identified are shown in Table 3-19 along with the results of discussions on measures to solve them.

Table 3-39 Results of Review of FIPS Database

Province Name	Field Survey Name (Survey ID)	Problem	Response
Western	SEMABO T.A	All data/Results OK Area is different from original	Change area figure. Field book data was updated on 15/11/1993.
	TAPILA -WIPIM	Not recorded, missed. Original Results copy in file * Check data	Enter servey detail. Field Book data is existing in FIPS.
	KAMULA DOSO	Data incomplete, can't print results * Check data	The old FIPS has lost field book data of this survey. method1: Delete this survey record method2: Leave it. If We find the copy of field book data, we can re-enter it. This filed book data might had been deleted on the old FIPS.
	WA/GUAVI LOI	Results different from original original Blks 2 & 3 results Currently only Blk 1 * Check data	Old FIPS has had only field book data of Blk 1. method1: Delete this survey record method2: Leave it. If We find the copies of field book data for Blks 2 & 3, we can re-enter them.
Gulf	(2001)	No survey record on both original and current	No Data on the old FIPS.
Central	LOI/KUPIANO	No data Original no file copy (could have been lost) * Check data	The old FIPS has lost field book data of this survey. method1: Delete this survey record method2: Leave it. If We find the copy of field book data, we can re-enter it.
	BONUA MAGARIDA	Data/Results OK but 2 different areas * check area figure	Change area figure. Field book data was updated on 12/11/1990
	EDEVU TA	Area figure different on original All data/Results OK	Change area figure if necessary. …There are two copies on the file.
	HAUNAKALANA	Empty Original - result on file	Enter servey detail. New FIPS is showing "empty" in survey name.
	(3007)	Missing - no survey name	No Data on the old FIPS.

	NAUMANEHA TA	No data Original Results on file	The old FIPS has lost field book data of this survey. method1: Delete this survey record method2: Leave it. If We find the copy of field book data, we can re-enter it.
	CLOUDY BAY	Original 3 Blocks- Results on file Current- only 2 blocks Data/results OK * Check data for missing one	The old FIPS has lost the field book data of blk3. If we find the copy of field book data for blk3, we can re-enter it. This filed book data might had been deleted on the old FIPS. ⇒Leave it
Milne Bay	(4002)	Empty same as in Original ⇒No copy in file	Enter servey detail. New FIPS is showing "empty" in survey name. Old FIPS has the field book data of blk1. The old FIPS has lost the field book data of blk2. The filed book data of blk2 might had been deleted on the old FIPS. ⇒Leave it
	WEST SUAU	All data/Results OK * Year of survey should be 2010 not 1910	Change Date of Survey in Survey details. ⇒Changed survey name from WEST SUAU to CENTRAL SUAU
Oro(Northern)	IOMA 4 LOI	Data/Results OK Original Survey name is .. IOMA BLOCK 4 * Change to original name	Change survey name.
	IOMA BLK 4	No data Original - No file copy	No Data on the old FIPS.
	IOMA BLK 4 LOI	No data Original - No file copy	No Data on the old FIPS.
	HUVIVI MONGE	No data	No Data on the old FIPS.
	MUSA PONGANI	No data/ no results Original- on file copy * check data	The old FIPS has lost field book data of this survey. method1: Delete this survey record method2: Leave it. If We find the copy of field book data, we can re-enter it. This filed book data might had been deleted on the old FIPS.

	IOMA BLK 5	Original- this survey number is ...IOMA BLK 5 with hard copy results on file * check original data	No Data on the old FIPS.
Southern Highlands	(6006)	Missing-Original/Current	No Data on the old FIPS.
	(6007)	Missing-Original/Current	No Data on the old FIPS.
	POROMA KUTUBU	All data/Results OK * Correct year of survey.. Not 1911.. Should be 2011	Change Date of Survey in Survey details.
Eastern Highlands	WAGAVE	No data Original- copy on file * check data	No Data on the old FIPS.
Western Highlands	JIMI	Data ok but check volume original total is.. 172.861, new is.. 172.092	New FIPS has the field book data which has been in old FIPS. The field book data of JIMI was updated on 02/06/1993. ⇒Leave it.
Sandaun (West Sepic)	PALAI 1	Data/Result different from original copy * Correct result ⇒Different Volume	New FIPS has the field book data which has been in old FIPS. The field book data of PALAI was updated on 30/08/1993. ※This survey was held on 16/09/1996???
	YEFTIM	No data Original- copy on file	The old FIPS has lost field book data of this survey. method1: Delete this survey record method2: Leave it. If We find the copy of field book data, we can re-enter it.
	KABORE	No data Original- copy on file	No Data on the old FIPS.
	PALA 2	No data Original- copy on file	The old FIPS has lost field book data of this survey. method1: Delete this survey record method2: Leave it. If We find the copy of field book data, we can re-enter it. This filed book data might had been deleted on the old FIPS.

	WES	No data Original- copy on file	The old FIPS has lost field book data of this survey. method1: Delete this survey record method2: Leave it. If We find the copy of field book data, we can re-enter it. This filed book data might had been deleted on the old FIPS.
	AMANAB -5	No data Original- copy on file	The old FIPS has lost field book data of this survey. method1: Delete this survey record method2: Leave it. If We find the copy of field book data, we can re-enter it.
	AMANAB - 6	No data Original- copy on file	The old FIPS has lost field book data of this survey. method1: Delete this survey record method2: Leave it. If We find the copy of field book data, we can re-enter it.
East Sepik	(11004-11006)	Missing Original- results on file * Check data	No data on the old FIPS
	ARAPESH	Missing Original- results on file	Enter servey detail. Field Book data is existing in FIPS.
	NUNGS /BUNGAS	Missing Original- results on file	The old FIPS has lost field book data of this survey. method1: Delete this survey record method2: Leave it. If We find the copy of field book data, we can re-enter it.
	MARIENBERG	Missing Original- results on file	Enter servey detail. Field Book data is existing in FIPS.
	(11010)	Missing- Original & New	No data on the old FIPS
	KIUNGA	No data Original- No record	The old FIPS has lost field book data of this survey. method1: Delete this survey record method2: Leave it. If We find the copy of field book data, we can re-enter it. This filed book data might had been deleted on the old FIPS.

Morobe	MAZIYE	All data/Results OK * Check area figure, not same from original copy	Change area figure. Filed book data was updated on 14/09/2009. ⇒Leave it
	WATUT/ONGA WA	Missing Original- Result on file * Check data	No data on the old FIPS
West New Britain	KANDRIAN 1	All data/Results OK ⇒Original has only 1 block copy(whole). Old FIPS has 5 Blocks record.	The survey name should be changed? ⇒Leave it. Confirm to Constin.

Manus	JAHA - LFA	No data Original- result on file	The old FIPS has lost field book data of this survey. method1: Delete this survey record method2: Leave it. If We find the copy of field book data, we can re-enter it. This filed book data might had been deleted on the old FIPS.
Enga	SAU TARU	Missing Original- result on file * Check data	No data on the old FIPS

Also, correspondence between the field survey areas registered in FIPS and the concession areas registered in the FIMS database was confirmed with the counterparts.

Linkage between the two databases is possible when the Plan IDs of the concession areas are entered for the field surveys recorded in the new FIPS. Thanks to this function, the forest volume of the concession areas projected separately in FIPS and FIMS can now be compared.

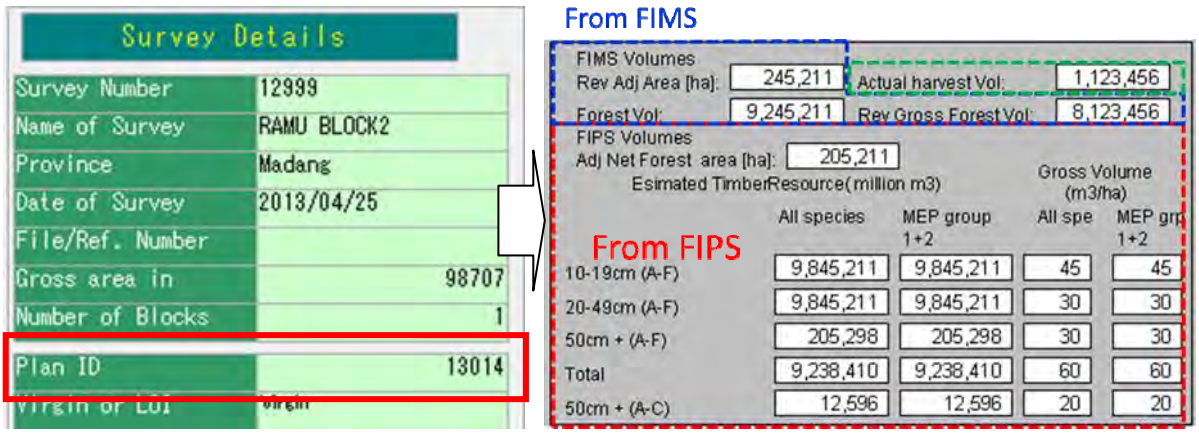

Figure 3-109 Linkage of FIPS and FIMS

The correspondence between the field survey names in FIPS and the concession areas in FIMS is shown in Table 3-40.

Table 3-40 Correspondence between Field Survey Names in FIPS and Concession Areas in FIMS

iii) OJT in Maintenance and Operation of Improved Version Forest Resource Database (FIPS)

OJT in configuration of the improved version forest resource database (FIPS) was implemented for the staff in charge of operation of FIPS. The improved version database (FIPS) is stored in the SQL server located in the ICT Branch, like the FIMS database.

When this project was completed, the following three individuals were designated as database managers. The database can be accessed from the computers of these three database managers and a total of 6 workstations located in the Inventory & Mapping Branch.

- Constin Bigol
- Ledino Saega
- Samuel N. Gibson

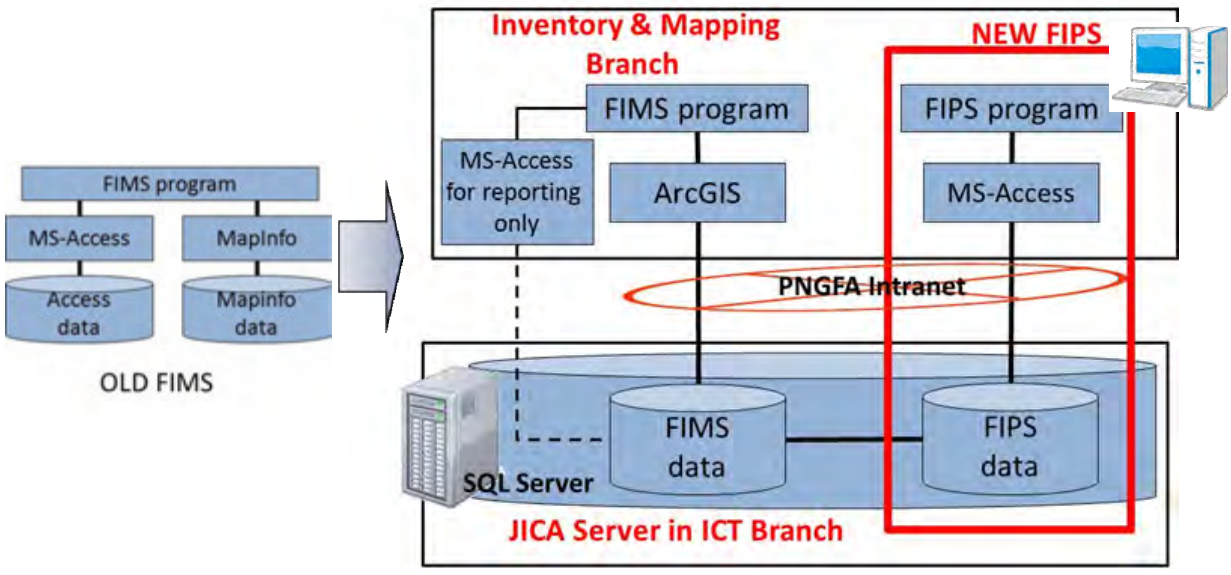

Figure 3-110 Configuration of FIPS Database

3.6.6 OJT in Database Design (Identification of Requirements) and Report Preparation Skills

In order to deepen understanding of the characteristics of the improved version forest resource database, discussions were held concerning the database configuration. In addition, in order to increase the number of opportunities to actually utilize the improved version database, it was decided to prepare and operate a system to allow users to browse the improved version database via Web browsers.

OJT was also implemented for database managers so that they can acquire skills to prepare simplified reports utilizing the improved version database.

(a) Enhancement of Understanding of the Improved Version Forest Resource Database

It was found that, among the counterparts, there were no common definitions of the forest data stored in the improved version forest resource database.

Based on the above finding, discussions were held with the counterparts concerning the correspondence between the technical terminology used in the National Forest Plan and the content of the improved version forest resource database.

For some of the forest data, no clear definitions have been established yet and the counterparts will continue to review the definitions.

Table 3-41 Definitions of Major Data Stored in Improved Version Forest Resource Database

Layer		Remarks
FMU		FMU has an area of each vegetation type and an overlapped area among each other layers.
Concession Area		FIMS distinguish an existing concession area and a proposed concession area.
Extreme Constraints	Extreme Slope	> 30°Slope
	Extreme Altitude	> 2,400m Altitude
	Extreme Karst	Tower Karst
	Extreme Inundation	> 80% Inundated
	Extreme Mangrove	Mangroves
Serious Constraints	Serious Slope Relief	20-30°Slope and very high to high relief
	Serious Inundation	> 50% Inundated

Protected Area		Areas gazetted as protected under the Flora and Fauna Act and consequently a constraint to logging.
Logged Area	Logged_NotLandUse Area	Areas logged and left to regenerate
	LandUse_NotLogged Area	Areas logged and subsequently converted to other forms of non-forest forms of land use
	Logged_LandUse Area	Areas cleared (but not logged commercially) and subsequently converted to other non-forest land use

Table 3-42 Definitions of Forest Area Data Stored in Improved Version Forest Resource Database

Forest Area Type	Remarks
Gross Forest Area(‘75)	Total area of FMU except the FMU which has zero timber volume. (For example : “G” or “O” has zero timber volume.)
Adjusted Forest Area(‘75)	Gross forest area may contain areas of disturbance and areas of non-forest vegetation in complex with forest areas. Adjusted forest area is calculated by deducting non-forest areas and reducing the disturbed areas by the percentage disturbance. Formula: GrossForestArea*(Disturbance_Index/10)*(Complex_Percent/100) (for example) Hm8 : Disturbance_Index=8 Hm/Wsw : Complex_Percent=65
Revised Gross Forest Area(current)	An area subtracting Logged Areas(Logged_NotLandUse, LandUse_NotLogged, Logged_LandUse) from Gross Forest Area(‘75)
Revised Adjusted Forest Area(current)	Formula: Revised GrossForestArea*(Disturbance_Index/10)*(complex_Percent/100)

Table 3-43 Results of Discussions concerning Relationship between Improved Version Forest Resource Database and National Forest Plan

Item	Definition in National Forest Plan	Content of Improved Version Forest Resource Database
(A) Production Forest	Identified as timber production areas in the long term	Existing concession area
(A-1)Acquired Operable	(unclear)	Existing concession area excluding Acquired Inoperable (A-2).
(A-1.1)Logged • Logged_NotLandUse Area • LandUse_NotLogged Area • Logged_LandUse Area		Logged area
(A-2)Acquired Inoperable	(unclear)	Extreme constraints and Protected Area in existing concession area
(B) Future Product Forest	(unclear)	Proposed concession area
(B-1) Net Forest Area	(unclear)	Proposed Concession area excluding extreme constraints (B-2).
(B-2) Non Forest & Inoperable	(unclear)	Extreme constraints and Protected Area_in proposed concession areas

(C) Reserve Forest	Not yet otherwise classified, but upon which a decision will be reached later	Forest area excluded (A)Existing Concession, (B)Proposed concession, (D)Protection Area, (E)Afforest (F)Other Areas
(C-1) Potential Forest	(unclear)	Reserve Forest outside of Mountain Forest & Inundated (C-2)
(C-2) Mountain Forest & Inundated	(unclear)	Extreme Altitude(> 2,400m Altitude) and Extreme Inundation(> 80% Inundated) outside of Concession Area
(D) Protection Forest	By virtue of their location, topographic constraints, and ecological, cultural, or environmental considerations.	Gazetted protected Area stored in FIMS (updated from DEC)
(E) Afforest & Salvage Area	Afforest : Predominantly anthropogenic grassland areas	FMU_vegetationType=G, Gf, Gr, Grf, Gsw, Gri, Gv (GrassLand)
	Salvage Area : Forest to be cleared for other uses	FCA, Mining, (LNG)
(F) Other Areas	Area taken up by other land-use including urban settlements, agriculture and so forth	FMU_vegetationType=O(agricultural land use) , E(Lakes and large rivers), Z(Bare areas), U(Larger urban centers)

Table 3-44 Content of Major Confirmed Matters

Item	Question	confirmatory result
(A) Production Forest	Does Acquired Operable Area include serious constraints?	YES
(B) Future Product Forest	Does Net Forest Area include serious constraints?	YES
(C) Reserve Forest	Does Mountain Forest & Inundated include serious inundation?	YES&No
(D) Protection Forest	Protected area in FIMS has not been updated. How can we the change of Protection Forest?	From new data from DEC
(E) Afforest & Salvage Area	FMU in FIMS has not been updated since start using FIMS. How can we get the change of afforest?	Further Discussion
(F) Other Areas	FMU in FIMS has not been updated since start using FIMS. How can we get the change of other areas?	Further Discussion

Table 3-45 Comparison of Forest Terminology (currently being confirmed by the counterparts)

Forest Classification(in National Forest Plan)	Forest Resource Of Papua New Guinea	PNG's Forest Resource Base
Gross Area	Total Land Area	Total Land Area
-(Total Forest Area)	-Total Forest Area	-Total Forest Area
--(Production Forest Area)	--Production Forest Area	--Production Forests
---Forest Production	---Concession Areas	---Acquired Areas
	----Current Concession	
----Acquired Operable	-----Under Timber Permits	----Under Timber Permits
----Acquired Inoperable	-----Unallocated Areas	
	----Expired Concession	

---Future Production Forest	---Potential Forest Production Areas	---Available Areas
----Net Forest Area		
----Non Forest & Inoperable		
--Reserve Forest	--Reserve Forests	--Reserve Forests
---Potential Forest		
---Mountain Forest & Inundated		
--Protection Forest	--Protection Forest	
-Afforest & Salvage Area	-Non Forest Area	-Non Forest Area
-Other Areas	-Other Area	-Other Area

(b) Enhancement of Understanding of Improved Version Forest Resource Database via Web Browser Map

Until this project started, access to the FIMS and FIPS databases was limited and was only available through the specific computers of specific officials.

The improved version forest resource database developed with the GAECC, however, is accessible via applications other than FIMS and FIPS.

It was also decided to promote shared use of the improved version forest resource database among the counterparts by establishing an environment to allow access via Web browsers.

In establishing the Web Browser Map, discussions were held with the Project Director, Project Advisor and Project Manager to identify and organize the requirements.

Table 3-46 Requirements for Web Browser Map

Requirements	
Purpose	To Share FIMS map within PNGFA HQ
Access means	Access to the improved version forest resource database is possible via Web browsers on computers on which no ArcGIS is installed.
	No access to the map through Internet from outside. (Accessible only from inside PNGFA HQ)
Databases disclosed	Concession Area : Plan ID, Name, Status (concession or proposed)
	FMU :

	PROVINCE_CODE, FMU_ID, ZONE_CODE, Vegetation_Type, Timber Volume (vol/ha) No FMU area data will be disclosed because the forest volume of a given area can be estimated if the timber volume and the total area are known. Access to projected forest volumes will be available only to FIMS & FIPS officials and decision makers.
	Rapid Eye Image (Satellite Image)
Officials with access right	MD, 5 directors and staff of Inventory & Mapping Branch, REDD and Climate Change Branch

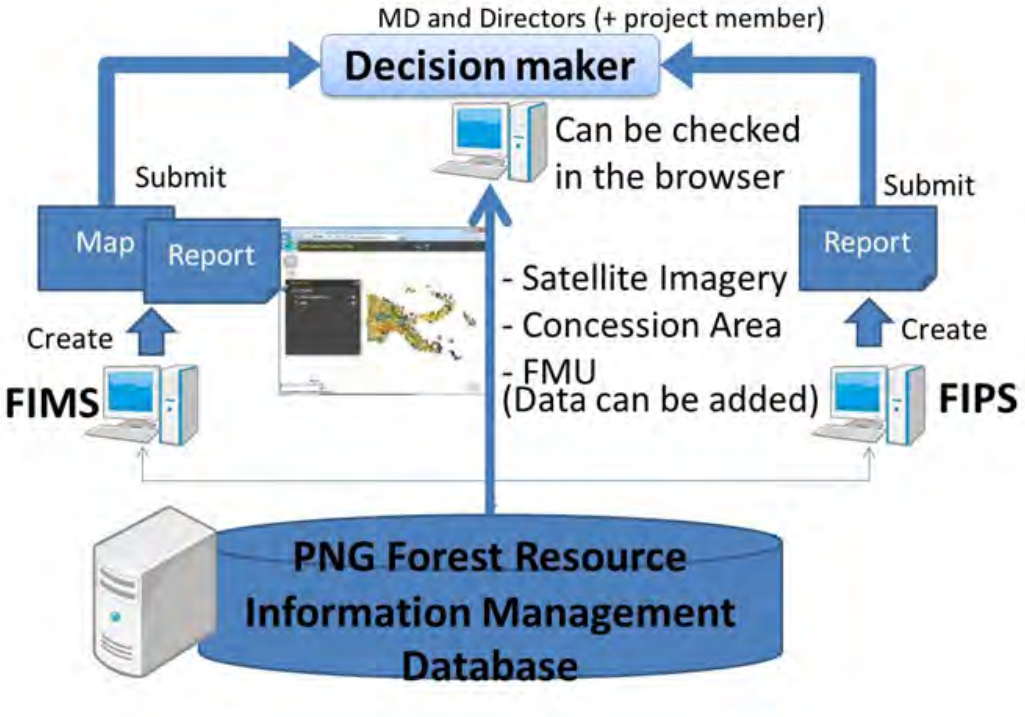

Figure 3-111 Concept of Web Browser Map

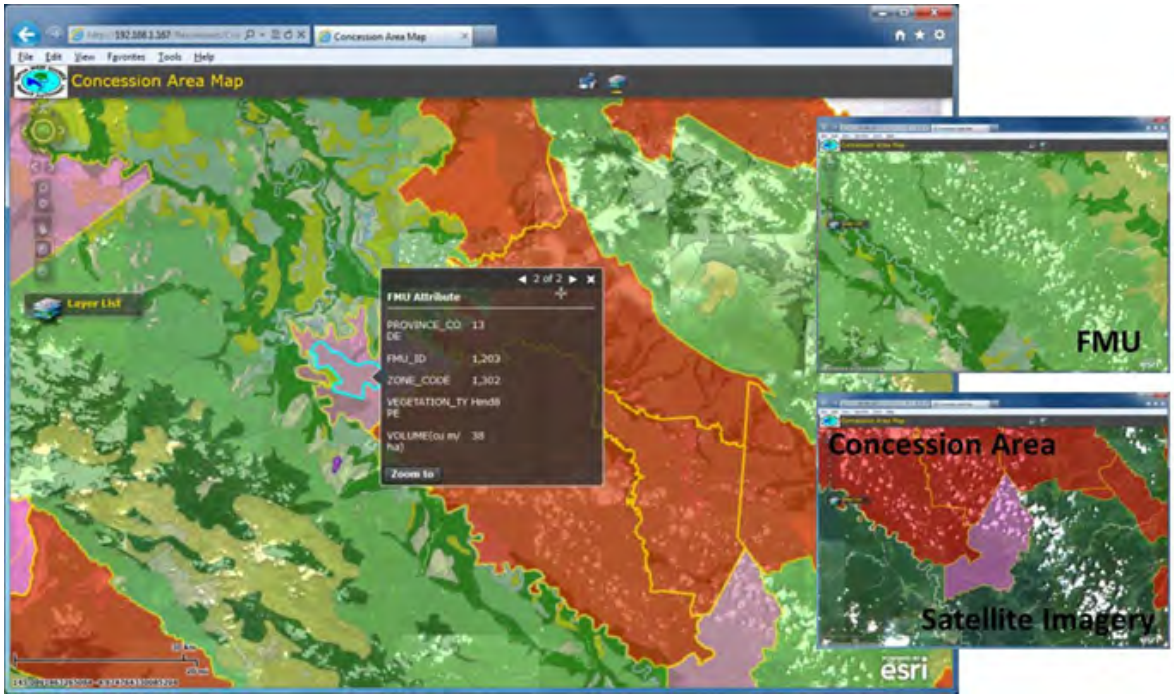

Figure 3-112 Image of Web Browser Map

(c) OJT in Report Preparation Skills

OJT was implemented for database managers so that they could acquire skills to prepare simplified reports on their own, utilizing the improved version forest resource database.

The improved FIMS and FIPS have a reporting function but the form of the output reports cannot be changed. The output reports contain rather a large amount of information, mainly technical data, and therefore, it is difficult for staff who are not familiar with FIMS and FIPS to understand the content of the reports.

On a daily basis, the counterparts are requested to submit reports in a simplified tabular form and composed of only specific data items extracted from the database.

OJT was implemented in how to prepare reports utilizing SQL (Structured Query Language) and Microsoft Access. In implementing OJT, a textbook and practice questions for SQL learning were prepared. In addition, through OJT, the counterparts' understanding of the components of the improved version forest resource database was deepened further.

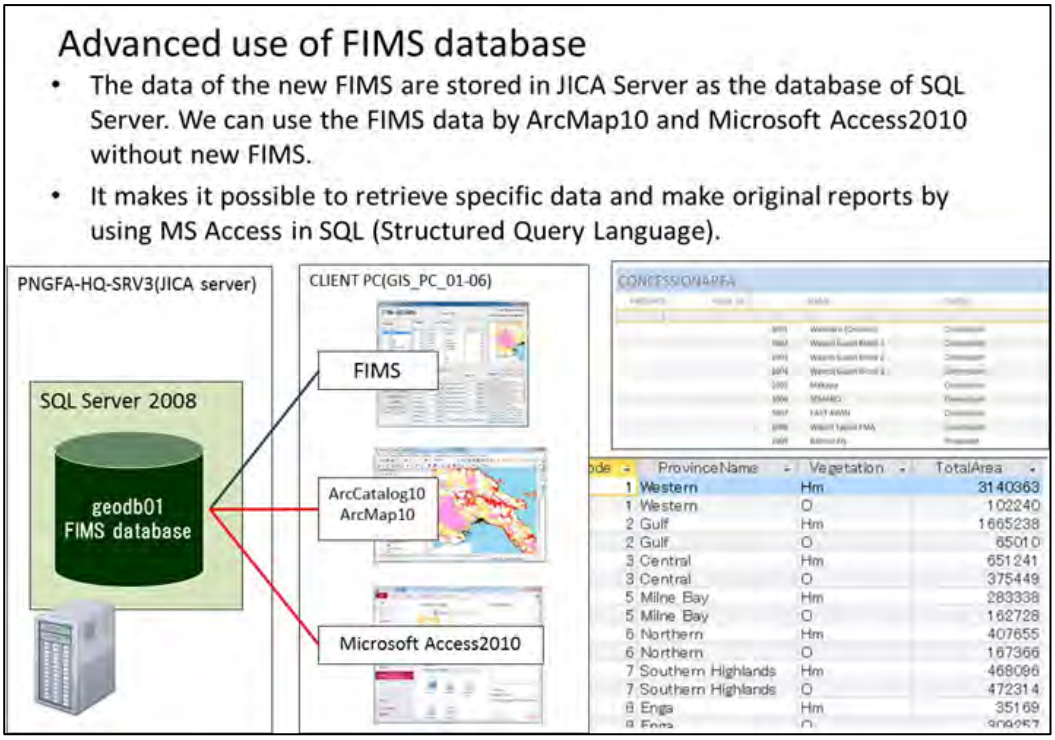

Figure 3-113 Utilization of Improved Version Forest Resource Database

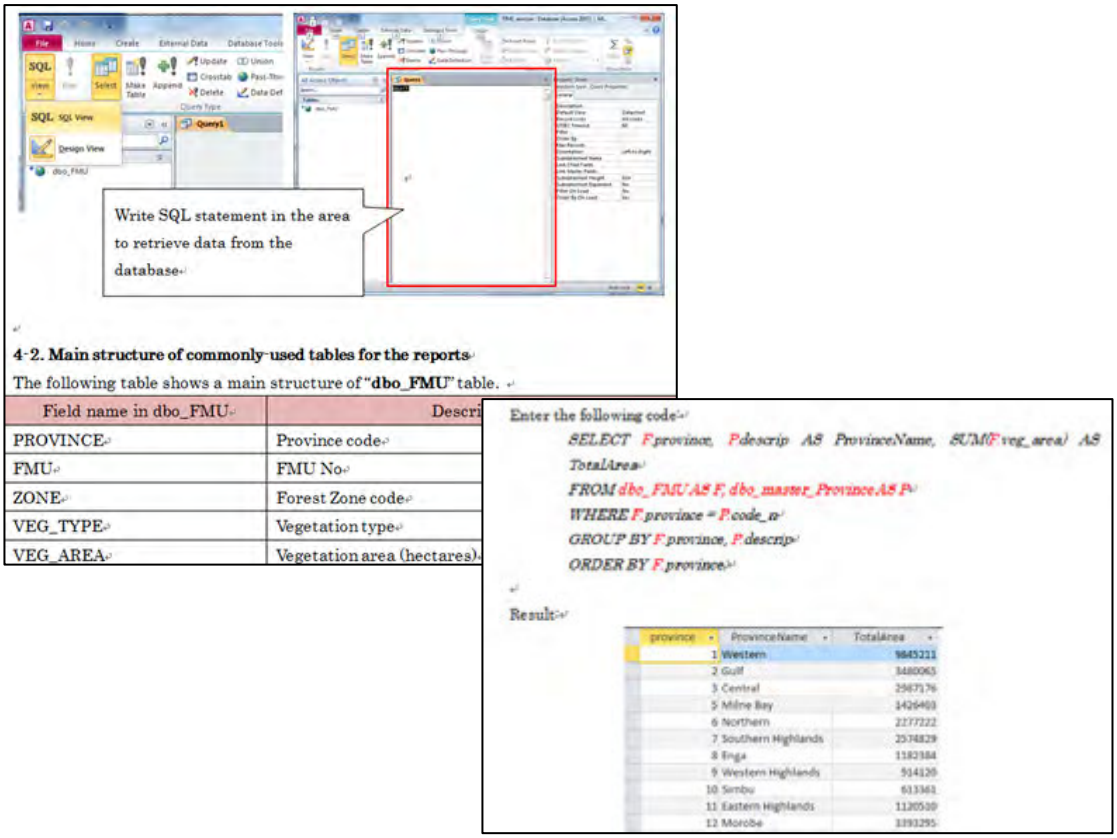

Figure 3-114 Textbook Used in OJT in Report Preparation Skills (excerpt)

(d) OJT Implementation Schedule

The outputs described in (a) to (c) above were achieved through the OJT and discussions listed below.

Date	Content of OJT/Discussions	Participants
November 20, 2013 (Wednesday) 14:00-15:00	SQL training	Patrick, Jehu
November 21, 2013, (Thursday) 15:00-16:00	SQL training	Patrick, Jehu
November 27, 2013 (Wednesday) 11:00-12:30(Wednesday) Dec. 4, 2013	Discussion on forest terminology (technical terms)	All participants
February 6, 2014 (Thursday) 9:30-12:00	SQL training	Perry, Jehu
February 6, 2014 (Thursday) 13:30-14:00	SQL training	Constin
February 6, 2014 (Thursday) 14:00-16:00	SQL training	Perry, Jehu
February 6, 2014 (Thursday) 18:15-19:00	Discussion on Web Browser Map	Constin
February 7, 2014 (Friday) 9:00-9:45	Discussion on Web Browser Map	Amos
February 28, 2014 (Friday) 16:00-17:00	Discussion on Web Browser Map	Turia

3.6.7 Discussion and Trial Implementation of New Resource Assessment Using Improved Forest Cover Map

- Issues carried over to Phase 2

FIMS also has a function to estimate the forest volume of commercial tree species. For this forest volume, the Forest Mapping Unit (FMU) data stored in the improved version forest resource database is used.

The FMU data has information of "Timber Volume (cu m/ha)" and its area (ha), and forest volume can be calculated by multiplying them.

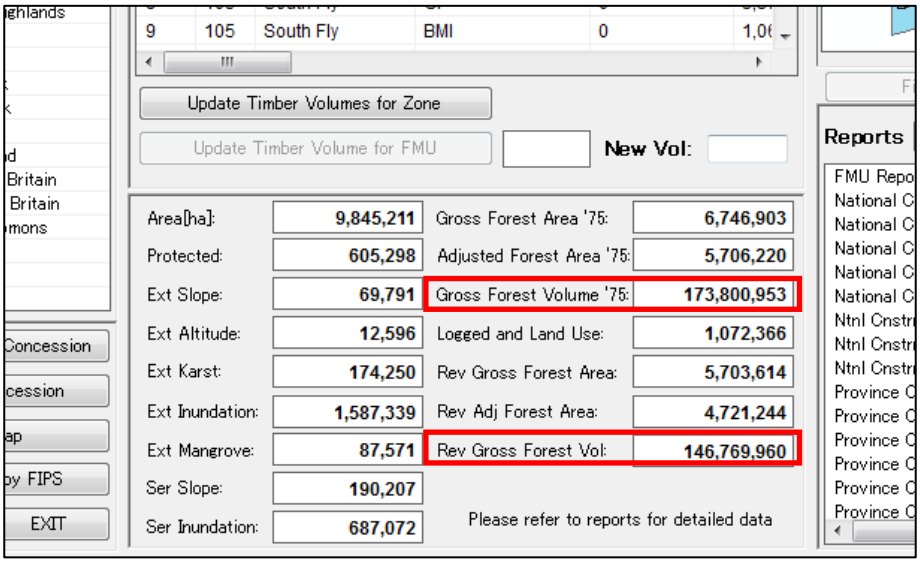

Figure 3-115 Forest Volume of Commercial Tree Species Estimated by FIMS

The entire land of PNG has been divided into 42 zones in a way that forest ranges following the same trend are in the same zone. With respect to the Timber Volume values allocated to the FMU, values of different zones, even if they are of the same vegetation type, may be different.

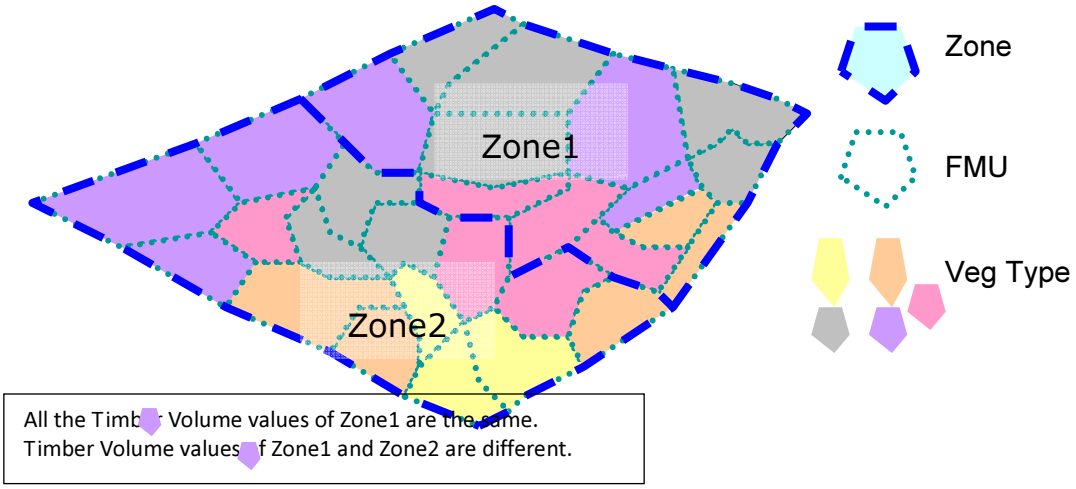

Figure 3-116 Relationship between FMU, Vegetation Type and Zones

The FMU data has been carried over from the former FIMS. As the data has never been updated since the PNGFA started to use it, the data may be diverged from the actual status.

Accordingly, with respect to the project of the next phase, the counterpart has requested us to estimate the forest volume in PNG using the national forest cover map improved in this project.

Also, as logged over areas where logging of the forest started more than 35 years ago (concession areas) also exist, it is necessary to improve the estimation function of FIMS, considering the need for forest regeneration. Issues that should be studied for the next phase project are as follows:

- Further improvement of the improved forest cover map
  - Setting of Timber Volume values (cu m/ha) for each vegetation data comprising the improved forest cover map just as they are set for the FMU (including the study of method)
  - Setting of Timber Volume in consideration of the forest characteristics of PNG, based on the concept of the zones (including study of the method)
- Further improvement of FIMS
  - Development of the function to capture and display the improved forest cover maps (including study of the database specifications)
  - Development of the function to estimate forest volume using the improved forest cover maps and the function to output report
  - Development of the function to compare forest volumes estimated by using the FMU and the improved forest cover maps
  - Development of the function to estimate forest volume in consideration of regenerated forests where logging was carried out several decades ago (including study of use cases, requirement definitions and database specifications)
