B. WATER SOURCE SURVEY

1. Development of Potential Surface Water (Reservoir and River)

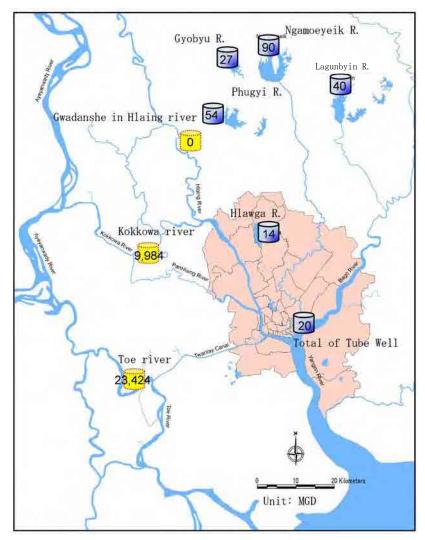

Table B.1 shows the list of water supply sources while Figure B.1 shows the map of water sources around Yangon City. The current water supply source of 215 MGD (977,400 m³/day) are utilized continually. To meet future increased water demand, the potential of Kokkowa river and Toe river as new sources of water are studied. The existing ground water source (20 MGD) shall be gradually abolished after the development of river water source and distribution facilities.

| Name | Water Suppl | ly Volume |
|--|---------------------|-----------|
| Name | m ³ /day | MGD |
| 1) Existing Water Resource | | |
| Gyobyu Reservoir (Surface water) | 121,500 | 27 |
| Hpugyi Reservoir (Surface water) | 243,000 | 54 |

2. Evaluation of Existing Reservoirs

In 2002 JICA-M/P study, the water balance study was carried out for Gyobyu, Phugyi, Hlawga, and Ngamoeyeik reservoirs (drinking water sources) and Lagunbyin reservoir (an exclusive irrigation reservoir). The simulation period was adopted as the last six years (May 1995–December 2000) with a 10-year return period, which covers the severe drought year of 1998. Table B.2 shows the results of analysis of the water balance study in the 2002 JICA study. The capacity of the current reservoir for water supply was recognized as 868,600 m³/day (186.5 MGD) approximately, on condition of maintaining the low water level in each reservoir during the drought year. In addition, it was analyzed that Lagunbyin reservoir will enable to divert 10 MGD for drinking water source.

| Tuble D.2 | Repute of Repervoir via | ter Dulance Study |
|-----------------------------------|-------------------------|---------------------------------|
| Name | Low Water level | Water Supply |
| | Unit: ft | Unit: m ³ /day (MGD) |

|--|---------|
|--|---------|

Source: JICA Study Team

To evaluate the results of water balance study in the 2002 JICA survey, an examination was made for the applicability of the 2002 JICA survey to the existing conditions based on comparing the rainfall data of the previous study with the recent rainfall data. The methods of evaluation are summarized below.

a. Long term fluctuation

The rainfall data used in the 2002 JICA survey rainfall data was compared with the rainfall data of years from 2001 to 2010. As a result of comparison, it is observed that the average rainfall in 2001 to 2010 was higher than the average rainfall in 1965 to 2000. It was also found out that little rainfall during 2001-2010 has not been renewed from any observatories.

b. Non-exceedance probability

In the 2002 JICA study, the probability by annual rainfall has been studied using the rainfall from January to December in Bago, Tharrawaddy, and Kaba Aye. Table B.3 shows the non-exceedance probability of annual rainfall at these stations as estimated by Gumbel's Minimum Values method.

| Table D.5 List of Non Exceedance Trobability Annual Rannah | | | | | | | |
|--|---------|---------|----------|----------|----------|-----------|-----------|
| Station | 2 years | 5 years | 10 years | 20 years | 50 years | 100 years | Number of |

Source: JICA Study Team

The results of water balance study in the 2002 JICA Survey (Table B.2) enabled the utilization of the current surface water supply sources (Table B.1).

3. Evaluation of Potential Water Sources

3.1 Water Flow Measurement Survey

Hlaing (Gwedanshe), Kokkowa, and Toe rivers were initially considered as potential water sources. Bago River was not considered because it has relatively low water availability according to the 2002 JICA survey. Available amounts of water intake from these water sources depend highly on the river flow from January to April which is lowest during dry season. From the river flow data in Hlaing and Bago rivers, the minimum flow is dropping to approximately one-hundredth of the maximum value.

Currently, no water flow but water level is monitored for both rivers. To covert the water level to water flow, the JICA Study team requested MOAI to measure flow rate and cross section of the rivers. The MOAI carried out the measurement in November 2012 in Kokkowa river and in December 2012 in Toe river. Also, to measure the minimum flow rate, measurement was made in March 2013 in both rivers. In addition, planned irrigation plans were confirmed with MOAI. The following are measurement results.

| River | Flow rate (Date) | | | |
|---------|---------------------------------|-----------------------------------|--|--|
| River | 2012 | 2013 | | |
| Kokkowa | 1,941m ³ /s(24 Nov.) | 1,233 m ³ /s (20 Mar.) | | |
| Тое | $2,572m^{3}/s(11 \text{ Dec},)$ | 1,930m ³ /s (18 Mar.) | | |

Source: MOAI

3.2 River Maintenance Flow

While planning water intake from the river, maintenance of minimum flow is considered taking into account the protection of nearby flora and fauna, fishing, and landscape. The definition of normal flow is combined with the maintenance flow, viable water source amount, flow discharge for maintaining normal flow functions of water, and target flow discharge on the management of low water level through the year.

Maintenance flow is the part of flow in river which cannot be utilized as water available for intake from the source. Following its characteristic, it is necessary to assess the distinction of each river and season in terms of fishing, landscape, and saltwater intrusion. However, the available information is insufficient to determine the ideal maintenance flow in this study. In response to this situation, maintenance flow is assumed to be half of the 10-year minimum drought discharge as referred to the Japanese manual. In the case of Japan, there was a tendency where the maintenance flow was between the 10-year average drought discharge and the 10-year minimum drought discharge. Though the characteristics of rivers in Yangon is very different from the rivers in Japan, it is assumed that: 1) Water levels in target rivers use a minimum value in daily fluctuations, and 2) the characteristic of river flow is applicable to its maintenance flow which is lower than the 10-year minimum drought discharge.

The 10-year average drought discharge in the Kokkowa River was estimated using the following processes presented below, as well as the background of available amounts of direct river intake.

| Process | Subject | Remarks |
|---------|---|-----------------------------------|
| А | Set of Basic Condition (River Cross Section of | Refer: Actual river cross section |
| | Target River) | |
| В | Set of Basic Condition (Characteristics of | Target year: 2001-2010 |
| | Minimum Rainfall over the Past 10 years) | |
| С | Set of Cross Section Area (A) and Velocity (V) in | Refer: Measurement of river flow |
| | 10-year minimum drought discharge | discharge on site |
| D | Calculation of 10-year minimum drought discharge | $Q = A \times V$ |
| | (Q) | |

Table B.5 Estimation of 10-year Minimum Drought Discharge in the Kokkowa River

Source: JICA Study Team

3.3 Water Source Evaluation

3.3.1 Hlaing River (Gwedanshe)

Hlaing River's flow (10-year average drought discharge) in the dry season was applied as 11.4 m³/s, the data for Gwedanshe. This is same as the considerations made in the 2002 JICA survey for rainfall from 2001 to 2010. However, the possibility of the Hlaing River's direct water intake in the dry season does not exist. The current water intake facilities for irrigation (2.287 m³/s,) were confirmed near the intake point and alternative irrigation projects (4.67 m³/s, 89.64 MGD) as reported by the MOAI. The maintenance flow in this river, assumed to be 4.0 m³/s, was considered.

3.3.2 Kokkowa River

a. <u>Set of Basic Condition (River Cross Section of Target River)</u>

Figure B.2 shows the river cross section of Kokkowa River, which was obtained from the MOAI. The

cross section area was approximately $2,170 \text{ m}^2$ at a water level of 2.89 ft in the river which was close to the minimum water level in the past

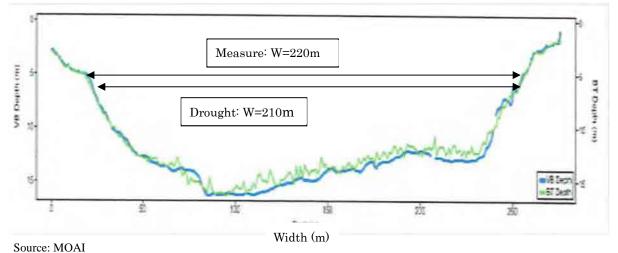

Figure B.2 Cross Section at Pan Taing in Kokkowa River

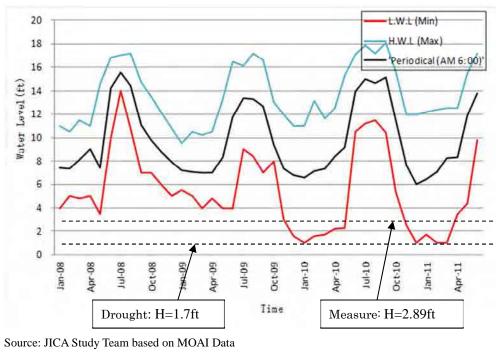

Figure B.3 Water Level at Pan Taing, Kokkowa River (2008 – 2011)

b. Set of Basic Condition (Characteristics of Minimum Rainfall over the Past 10 years)

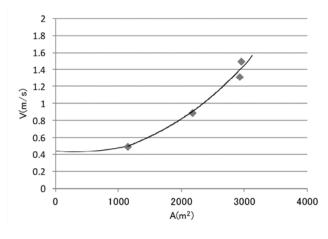

The annual minimum rainfall occurred in 2010 during the period of 2001-2010. Table B.6 shows the water level changes from January 2008 to August 2011 (including 2010) in Kokkowa River. Maximum water level (rainy season) was 18.0 ft, the 355th day water level was 1.7 ft and the minimum water level (dry season) was 1.0 ft. The low water level in 2010 was the lowest. So, the 10-year minimum drought flow is assumed to occur in 2010, when the minimum rainfall occurred over the past ten years.

| | | | | | • | | Unit: ft |
|----------|------|----------------------|-----------------------|-----------------------|-----------------------|-----|----------|
| | Max | 95 th day | 185 th day | 275^{th} day | 355^{th} day | Min | Mean |
| FY 2008 | 17.2 | 10.0 | 8.0 | 6.2 | 4.5 | 3.5 | 8.8 |
| FY 2009 | 17.2 | 10.3 | 7.0 | 5.8 | 4.0 | 3.0 | 8.0 |
| FY 2010 | 18.1 | 12.2 | 6.0 | 3.6 | 1.7 | 1.0 | 7.6 |
| FY 2011* | 17.2 | 12.2 | 7.2 | 4.5 | 1.2 | 1.0 | 8.1 |

| Table B.6 Water Level in Kokkowa River (FY 2008-2011) | 2011) |
|---|-------|
|---|-------|

*FY2011: August 2010 – July 2011 Source: JICA Study Team

- c. Set of Cross Section Area (A) and Velocity (V) for 10-year minimum drought discharge
- Water level in case of the 10-year minimum drought discharge was assumed as 1.7 ft. from the above.
- River width in case of the 10-year minimum drought discharge was assumed as 210 m.
- The cross-sectional area in case of the 10-year minimum drought discharge was assumed as 780 m², (A= ÷ A'2,170 H(2.89-1.7)ft x W(210 + 220) m / 2)
- Flow rate of the 10-year minimum drought discharge is shown as the relationship between the cross-sectional area (A) and the velocity (V) (see Figure B.4) taken from the results of the cross-sectional survey in Figure B.2. Thus, the flow rate in the dry season was assumed as 0.5 m/s which is about one-third of the HWL during rainy season.

Source: JICA Survey Team Figure B.4 Relation Between the Cross Section (A) and Velocity (V) of Kokkowa River

d. Calculation of the 10-Year Minimum Drought Discharge

 $\left\{\begin{array}{l} Q \min K = A \ x \ V \ \rightleftharpoons \ 1,045 \ m^3/s \\ A = 2,090 \ m^2: \ Cross-sectional \ area \ for \ the \ 10-year \ average \ drought \ discharge \\ V = 0.5 \ m/s: \ Velocity \ for \ the \ 10-year \ average \ drought \ discharge \end{array}\right.$

e. Flow Measurement on 20 March 2013, the Drought Period

Flow was measured as 1,233m³/s at the water level of 0.23ft which is nearly the same as the estimated

value. Flow measured on 24 November 2012 was 1,941 m³/s at a water level of 2.89 ft.

f. <u>Water Intake Amount for YCDC</u>

Water amount available for YCDC is at least 520 m³/s, half of the 10-year minimum drought discharge, considering the river maintenance flow and water required for other irrigation projects of MOAI. Total of 153 MGD (12.0m³/s) water is planned for irrigation schemes according to MOAI, 10.12MGD for Pantaing Sluice (1), 52.85MGD for Pantaing Sluice (2), 47.98MGD for Khunnaingtan Sluice, and 42.47MGD for Chaungnyiako Sluice.

3.3.3 Toe River

The 10-year minimum drought discharge was estimated using the same process as used in case of the Kokkowa River.

Figure B.5 shows the river cross section of Kokkowa River, which was obtained from the MOAI. The underwater cross section area was approximately $2,170 \text{ m}^2$ at the water level of 2.89 ft which was close to the minimum water level in the past

a. Set of Basic Condition (River Cross Section of Target River)

Figure B.5 shows the cross section at the proposed intake point in the Toe River measured on 11 December 2012. This cross section area was determined as $4,340 \text{ m}^2$ at the water level of 60 cm, which was almost the lowest water level.

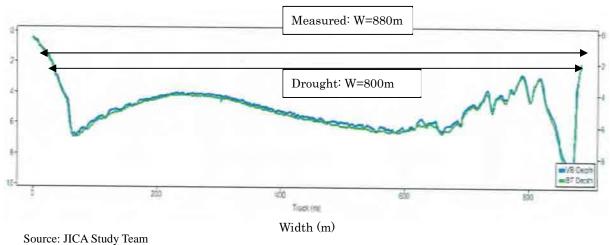

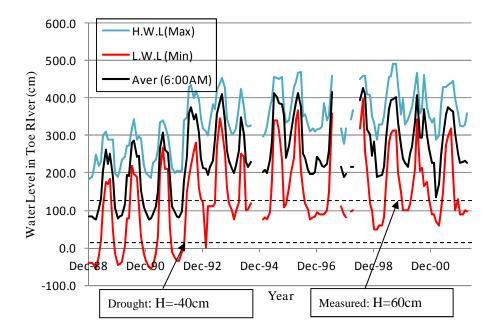

Figure B.5 Cross Section in Toe River

Source: JICA Study Team based on MOAI Data Figure B.6 Water Level at Pann Hlaing, Toe River (1989-2002)

b. Set of Basic Condition (Minimum Drought Flow Discharge)

Ten-year drought flow is estimated assuming it occurred in 2010 same as in case of the Kokkowa River. However, water level data in 2010 was not available so that water level data continuously available (between January 1989 and April 2002, March 2011 and August 2012) was alternatively used.

- Water level data between January 1989 and April 2002 is shown in Table below. Water level data of 355th day and minimum was not estimated due to lack of data during dry period.
- The highest water levels in the years ranged from 354 to 486 cm while the lowest ranged from 80 to 300 cm according to the latest data (between March 2011 and August 2012). These levels are similar to the past records (January 1989 to April 2002). So all data were judged effective.
- The lowest and the 355th day water levels were -46 cm and -40cm, respectively, both in 1989 during period from January 1989 to April 2012. Thus, -46 cm water level was judged as a 10-year drought water level.

| | | | | | | | unit . cm |
|---------|-----|----------|-----------|-----------|-----------|-----|-----------|
| | Max | 95th day | 185th day | 275th day | 355th day | Min | Mean |
| FY 1989 | 273 | 190 | 46 | -20 | -40 | -46 | 77.1 |

Source: JICA Study Team based on MOAI Data

c. Set of Cross Section Area (A) and Velocity (V) for 10-year minimum drought discharge

- Water level for the 10-year minimum drought discharge was lower by 1 m than the water level measured on 11 December 2012. Width is assumed as 800 m.
- The flow velocity of 0.6 m/s was measured on 11 December 2012 which is regarded as low flow discharge. So, this flow velocity is also the same as for 10-year drought flow.

d. Calculation of the 10-Year Minimum Drought Discharge

 $Q \min T = A \times V \rightleftharpoons 2,448 \text{ m}^3/\text{s}$

 $A = 4,080 \text{ m}^2$: Cross-sectional area in case of the 10-year drought discharge

V = 0.6 m/s: Velocity for the 10-year drought discharge

e. Flow Measurement on 18 March 2013, the Drought Period

Flow was measured as 1,930 m^3 /s at a water level of 52 cm which is nearly the same as the above estimated value. Flow measured on 11 December 2012 was 2,573 m^3 /s at a water level of 60 cm.

f. Water Intake Amount for YCDC

Water amount available for YCDC is at least 1,220 m³/s, half of the 10-year minimum drought discharge, considering the river maintenance flow. There are no irrigation projects around here.

The followings are attached to Annex.

၂၀၁၂ ခုနှစ်၊သြဂုတ်လ (၁၃)ရက်

ရန်ကုန်တိုင်းဒေသကြီး၊ ထန်းတပင်မြို့၊ ကုက္ကိုဝမြစ်နှင့် ကတွယ်ဖြတ်မြောင်းတွင် (River Surveyor M9) ဖြင့် မြစ်ရေစီးဆင်းမှု တိုင်းတာရရှိသည့် အစီရင်စံစာ

၁။ နိဒါန်း

ကတွယ်ဖြတ်မြောင်းသည် ရန်ကုန်တိုင်းဒေသကြီး၊ ထန်းတပင်မြို့နယ်၊ အညာစုကျေးရွာ အနီးတွင် တည်ရှိ ပါသည်။ ပန်တိုင်ဒေါင့်ကြီးတာကတွယ်ကွေ့တွင် ကမ်းစားနှုန်းများပြားမှုကြောင့် ကတွယ်ဖြတ်မြောင်းအား ၁၉၉၄ ခုနှစ်တွင် ပေ (၃၀) အကျယ်၊ အနက် (၁၀) ပေ ဖြင့် စတင် ဖေါက် လု**ပ်ခဲ့ပြီး ၁၉၉၆ ခုနှစ်တွင် ထပ်မံ၍** ပေ (၅၀) အထိ ရရှိရန် ချဲ.ခဲ့ပြီး ၁၉၉၉ ခုနှစ်မှ ၂၀၀၁ ခုနှစ်အထိ ရေလမ်းထိန်းသိမ်းရေးဌာနခွဲမှ သောင်တူးစက်များဖြင့် အနက်ရရှိအောင် ဆောင်ရွက်ခြင်းတို့ကို ဆောင်ရွက်ခဲ့ပါသည်။ ယခုအခါတွင် ဖြတ်မြောင်းမှာ ပိုမိုဖွံ့ဖြိုးမှုဖြစ်လာခဲ့ပြီး မြစ်ရေစီးဆင်းမှု ရေပမာဏ၏ အကျိုးသက်ရောက်မှု သိနိုင်ရန်အတွက် River Surveyor M9 ဖြင့် သွားရောက် တိုင်းတာခဲ့သည်ကို အစီရင်ခံစာ တင်ပြရခြင်း ဖြစ်ပါသည်။

၂။ ခရီးစဉ်

စလဗေဒဌာနခွဲမှ လက်ထောက်ညွှန်ကြားရေးမှူးနှင့်အဖွဲ့သည် (၁၀.၈.၂၀၁၂)နေ့ နံနက် (၇:၃၀) နာရီတွင် ရန်ကုန်မှ ထွက်ခွာလာပြီး နံနက် (၉:၃၀) တွင် အညာစု ကျေးရွာအနီးသို့ ရောက်ရှိပါသည်။ နံနက်(၁၀:၀၀)နာရီတွင် ဖြတ်မြောင်း အပေါ် ဘက် ကုက္ကိုဝမြစ် (RD 7800') တွင်လည်းကောင်း၊ ကတွယ်ဖြတ်မြောင်းအလယ် (RD 12500 ft) နှင့် D/S ဘက် (RD 29600 ft) တွင်လည်းကောင်း၊ စသည့်နေရာများတွင် စက်လှေကို အသုံးပြုကာ (River Surveyor M9) ဖြင့် တိုင်းတာပါသည်။ ကုက္ကိုဝမြစ် နှင့် ကတွယ်မြစ်ဖြတ်မြောင်းတွင် တိုင်းတာခဲ့သည့် နေရာပြ မြေပုံကို (နောက်ဆက်တွဲ-၁) တွင် ဖေါ်ပြထားပါသည်။ နေ့လည် (၁:၀၀) နာရီတွင် တိုင်းတာမှုပြီးခဲ့ ပါသည်။

၃။ တိုင်းတာဆောင်ရွက်ခြင်း

ကုက္ကိုဝမြစ်၊ အညာစုကျေးရွာအနီးတွင် စက်လှေဘေးမှ M9 ကို ဝါးလုံးနှင့်ကြိုး အသုံးပြု၍ ဆွဲပြီး မြစ်ကို ဖြတ်ကာတိုင်းပါသည်။ မြစ်ရေစီးဆင်းမှုအလျင် (1.502 m/sec) (4.9 ပေ/စက္ကန့်) ခန့်သာရှိပြီး စက်လှေဖြင့် တိုင်းတာရာတွင် အဆင်ပြေပါသည်။ ၎င်းနောက် ကတွယ်ဖြတ်မြောင်း အတွင်းဘက် ဆင်းလာကာ (RD 12500 ft)ခန့်တွင် စက်လှေဖြင့် M9 ကို ဝါးလုံး/ကြိုးဖြင့် ဆွဲကာ ကန့်လန့်ဖြတ် တိုင်းတာပါသည်။ ရေစီးနှုန်းအလျင် (1.319 m/sec) (4.3 ပေ/စက္ကန့်) ရှိနေသဖြင့် ဖြတ်မြောင်းကို ကန့်လန့်ဖြတ် တိုင်းရာ၌ စက်လှေကို ရေစီးအရှိန်ဖြင့် မျောပါမသွားစေရန်

B-12

ထိန်းသိမ်းပြီး (၅၊ ၆) ကြိမ် တိုင်းတာနိုင်ခဲ့ပါသည်။ ဖြတ်မြောင်း D/S ဘက်ရှိ (RD 29600 ft) ခန့်တွင် ထပ်မံတိုင်းတာခဲ့ရာ မြစ်ရေစီးဆင်းမှုအလျင် (0.5 m/sec) (1.6 ပေ/စက္ကန့်)ခန့်ရှိပါသည်။ ၄။ တိုင်းတာရရှိမှုရလဒ်သုံးသပ်ချက်

River Surveyor M9 ဖြင့် ဖြတ်မြောင်းအထက် ကုက္ကိုဝမြစ်၊ U/S (အညာစု ကျေးရွာ အနီး) (R.D 7800 ft)၊ ၊ ကတွယ်ဖြတ်မြောင်းအတွင်း (R.D 12500 ft)၊ ဖြတ်မြောင်းအထွက် (R.D 29600 ft)၊ စသည့် (၃)နေရာတွင် တိုင်းတာရရှိခဲ့သော အချက်အလက်များမှာ အောက်ပါ အတိုင်း ဖြစ်ပါသည်။

| SR. No | Station | Width (m) | Area (m ²) | Mean Speed (m/s) | Total Discharge(Q) (m ³ /sec) | Total Discharge(Q) (ft ³ /sec) |

မြတ်ရက်- ကတွယ်ဖြတ်မြှောင်း၏ (၁၀.၈.၂၀၁၂) ရက်နေ့ရှိ ရေမှတ်သည်(၁၅) ပေ ဖြစ်ပါသည်။ အထက်ပါ တိုင်းတာတွေ့ရှိချက်အရ ကတွယ်ဖြတ်မြှောင်းထဲ မဝင်မီ ကုက္ကိုဝမြစ်၏ ရေ ထုထည်စီးနှုန်း(Q)သည် 4423.886≅4424 m³/sec ရှိပြီး ဖြတ်မြောင်းထဲတွင်ရှိ ရေထုထည် စီးနှုန်း(Q)သည် ပျမ်းမျှ 3852 m³/sec ရှိ၍ ဖြတ်မြောင်းအထွက်၏ အထက်ဘက် ကုက္ကိုဝမြစ် D/S ဘက်နေရာတွင် 570.758≅571 m³/sec ရရှိပါသည်။ သို့ဖြစ်၍ ကတွယ်ဖြတ်မြောင်းသည် လက်ရှိ အခြေအနေအရ စီးဆင်းနေသည့် ကုက္ကိုဝမြစ်၏ (၈၇%) ဖြတ်သန်းစီးဆင်းနေကြောင်း တွေ့ရှိ သုံးသပ်ရပါသည်။

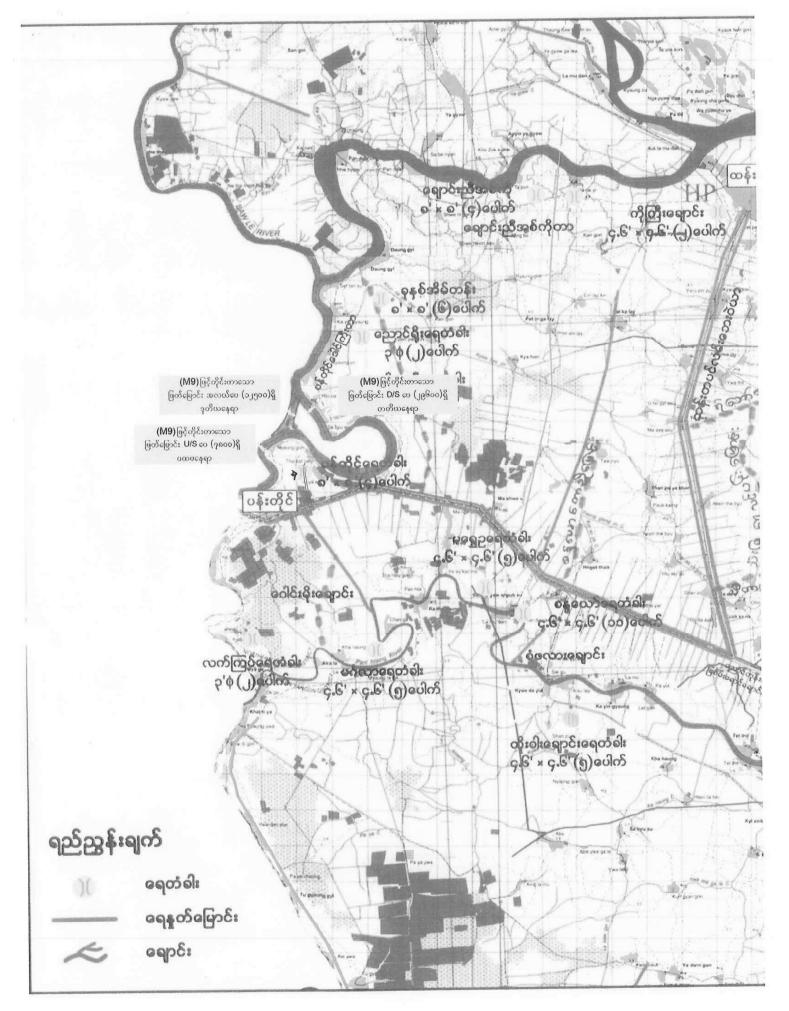

B-13

၅။ နိဂုံး

အထက်ဖေါ်ပြပါ တိုင်းတာတွေ့ရှိချက်များအရ ထန်းတပင်မြို့၊ ကတွယ်ဖြတ်မြောင်းတွင် ကုက္ကိုဝမြစ်၏ စီးဆင်းနေသည့် ရေစီးဆင်းမှု၏၈၇ ရာခိုင်နှုန်းသည် ဖြတ်မြောင်းအတွင်းသို့ စီးဆင်း ဖြတ်သန်းနေပါသဖြင့် Function ကောင်းကြောင်း သုံးသပ်တင်ပြ အစီရင်စံအပ်ပါသည်။

ထန်းတပင်မြို့၊ ကုက္ကိုဝမြစ်၊ ကတွယ်ဖြတ်မြောင်းတွင် River Surveyor M9 ဖြင့် မြစ်ရေစီးဆင်းမှု တိုင်းတာရာတွင် လိုက်ပါသည့် အရာထမ်း၊ အမှုထမ်းများစာရင်း
