# Results of Selection of Target Villages for Micro-Projects

2011/01/15 (Version.3)
JICA Project Team

## 1. Introduction

The Project for Community-Based Sustainable Natural Resource Management (CB-NRM) (hereinafter referred to as "the Project") plans to implement micro-projects in six (6) villages of the project area to promote the natural resource management at the community level as well as to develop the capacity of counterpart personnel for the implementation and management of the CB-NRM activities through on-the-job-training.

The six villages shall be selected from the priority sub-watersheds, namely the Noru sub-watershed in Laclo and the Bemos sub-watershed in Comoro, as stipulated in the Minutes of Meetings signed by JICA and MAF on December 09, 2009. To this end, the JICA Project Team (hereinafter referred to as "the Team") evaluated all villages located in the priority sub-watersheds on the basis of evaluation criteria that the Team set and provisionally selected the target villages as described below.

## 2. Villages Located in the Target Sub-watersheds

The priority sub-watersheds overlap their catchments with a total of 12 villages, five villages in Bemos and seven villages in Noru, respectively.

| Target Sub-watershed | Villages located in the Sub-watersheds |
|---|---|
| Bemos Sub-watershed | Dare, Cotolau, Talitu, Tohumeta, Madabeno |
| Noru Sub-watershed | Faturasa, Fadabloco, Fahisoi (Liquidoe), Fahisoi (Remexio), Hautoho, Maumeta |

## 3. Selection of Target Villages for the Micro Projects

Among the above-listed villages, JICA HQ decided to select Suco Tohumeta and Faturasa where former JICA Study had implemented the pilot projects as the target villages. Hence, the rest of the villages were evaluated to select four (4) villages or two (2) villages each from the priority sub-watersheds.

### 3.1 Basic Concepts to Selection of Target Villages

In order to select the target villages, the JICA Project Team set up evaluation criteria on the base of the following concepts:

- Maximize the effectiveness of CB-NRM activities at both village and sub-watershed levels;
- Remove any foreseeable problems prior to starting the project activities on a village level;
- Ensure the sustainability of the CB-NRM activities even in the post-project period; and
- Maintain and enhance, when feasible, the efficiency of the project activities.

### 3.2 Criteria for Evaluation of Target Villages

In accordance with the basic concepts mentioned in Section 3.1, the Team set the following criteria for the evaluation of the potential villages.

| Criteria | Indicator |
|---|---|
| 1. Geographical contiguity | A village adjacent to Suco Tohumeta and Faturasa is prioritized. The connectivity of three villages in the priority sub-watershed is also prioritized, so that the target villages in each sub-watershed cab be contiguous. |
| 2. Manageability of micro projects | There should be no difficulty expected in managing/operating a micro project in a village. Hence, a village which has an internal conflict between/among communities or any physical disadvantages should be given less priority. |
| 3. Acceptability of the projects by the communities | The Team judged that local communities in a village that has several opportunities to earn cash income will not be interested in CB-NRM. Hence, the more opportunities to generate income a village has, the less priority a village is given. |
| 4. Accessibility to the micro-project area | A village should be accessible from Dili or Aileu through the year. |

## 3.3 Evaluation of the Target Villages

The results of the evaluation of the potential villages are as follows:

**a. Bemos Sub-watershed**

| Village | Results of Evaluation |
|---|---|
| 1. Dare | - The village is contiguous to Suco Tohumeta.<br>- The solidarity of the village seems not so strong.<br>- The village seems to have rather various opportunities to earn cash income, such as tourism.<br>- The village is accessible from Dili throughout the year. |
| 2. Madabeno | - The village is contiguous to Suco Tohumeta.<br>- There seems no concern foreseen at present.<br>- Agriculture and forest resources (including NTFP) are still major sources of income for local communities in the village.<br>- The village is accessible from Dili and Aileu throughout the year. |
| 2. Cotolau | - The village is located in proximity to Suco Tohumeta.<br>- The Bemos river runs through in the middle of the village, so that it might not be easy to operate the project activities at aldeia level simultaneously.<br>- The part of the village next to Dare might have rather various opportunities to generate income like Dare.<br>- The village is accessible from Dili and Aileu throughout the year. |
| 4. Talitu | - The village is located in the outer edge of the sub-watershed.<br>- There seems no concern foreseen at present.<br>- Agriculture and forest resources (including NTFP) seem to be still major sources of income for local communities in the village.<br>- The village is accessible from Dili and Aileu throughout the year. |

The Team judges that Suco Madabeno and Talitu be prioritized and selected as the target villages because their acceptability and manageability seem to be rather higher than those of Suco Dare and Cotulao. Although Suco Talitu is not contiguous to neither Suco Tohumeta nor Suco Madabeno, Suco Talito is considered important from the view point of watershed management of the Bemos River since it is located in the upper part of the sub-watershed.

**b. Noru Sub-watershed**

| Village | Results of Evaluation |
|---|---|
| 1. Fadabloco | - The village is contiguous to Suco Faturasa.<br>- There seems no concern foreseen at present.<br>- Agriculture and NTFP are major source of income in the village. |

| | |
|---|---|
| | - The village is accessible from Dili and Aileu throughout the year. |
| 2. Fahisoi (Remexio) | - The village is located bit farm from Suco Faurasa, but next to Suco Fadabloco.<br>- The other conditions are the same as Fadabloco. |
| 3. Fahisoi (Liquidoe) | - The village is located bit far from Faturasa.<br>- The other conditions are the same as Fadabloco. |
| 4. Hautoho | - The village is located in proximity to Suco Faturasa and next to Suco Fadabloco.<br>- The other conditions are the same as Fadabloco. |
| 5. Maumeta | - The village is located bit far from Faturasa.<br>- The other conditions are the same as Fadabloco. |

The Team evaluates that the five villages have a similar nature except the geographic contiguity, and therefore, judges that Suco Fadabloco and Suco Hautoh be prioritized because they are located in proximity to Suco Faturasa.

## 4. Proposed Target Villages

As described in the former section, the Team proposes that the following sucos be selected as the target villages for participatory land use planning and micro projects of the Project.

Bemos Sub-watershed : Suco Tohuemta, Suco Talitu and Suco Madabeno

Noru Sub-watershed: Suco Faturasa, Suco Fadabloco and Suco Hautoho

**Japan International Cooperation Agency (JICA)**

**Ministry of Agriculture and Fisheries (MAF)**
**Government of the Democratic Republic of Timor-Leste**

# The Project for Community-Based Sustainable Natural Resource Management

## Village and Resource Profiles of the Target Villages (Sucos Madabeno, Talitu, Tohumeta, Faturasa, Fadabloco and Hautoho)

**November 2013**

**NIPPON KOEI CO., LTD.**

# Village and Resource Profiles of the Target Villages
## (Sucos Madabeno, Talitu, Tohumeta, Faturasa, Fadabloco and Hautoho)

### TABLE OF CONTENTS

### LIST OF TABLE

## LIST OF APPENDICES

# 1 Introduction

In order to grasp the socio-economic condition as well as use of natural resources in the six (6) target villages of the implementation of the micro programs, namely, Sucos Madabeno, Talitu, Tohumeta, Faturasa, Fadabloco and Hautoho, the Baseline Survey and Participatory Rural Appraisal (PRA) was conducted in 2011. The survey revealed profiles of village and resource use as described in the following sections.

# 2 Village Profiles

The results of Baseline Survey presented general features of the target villages, which is shown in **Appendix-1** and summarized in the fact sheets as given in **Table 1**. This chapter highlights its results as shown below.

## 2.1 General Features of the Households

The following table shows major features of the households (HHs) in the target villages.

**Major features of the households in the target villages**

| Items | Bemos sub-watershed | | | Noru sub-watershed | | |
|---|---|---|---|---|---|---|
| | **Madabeno** | **Talitu** | **Tohumeta** | **Faturasa** | **Fadabloco** | **Hautoho** |
| a. Language | Tetun and Mambae | Tetun and Mambae | Tetun and Mambae | Tetun and Mambae, some Tetun only | Tetun and Mambae | Tetun and Mambae |
| b. Settlement years | Before 1975/1975-1999 | 1975-1979/ Before 1975 | Before 1975/1999-2002 | Before 1975/1975-1999 | Before 1975/ 1975-1999 | Before 1975/ 1975-1999 |
| c. No. of HH members | 7 .0 persons | 7.1 persons | 7.4 persons | 7.1 persons | 7.3 persons | 6.9 persons |
| d. Average age of HH members | 18.5 years old | 21.7 years old | 17.7 years old | 19.7 years old | 28.4 years old | 21.0 years old |
| e. No. of HH members under working age (14-65 yrs) | 5.7 person | 5.5 person | 4.0 person | 3.0 person | 4.6 person | 3.8 persons |
| f. Features of head of HH | - Occupation: farmer<br>- Education: No graduated from primary school<br>- Organization: no member | - Occupation: farmer<br>- Education: No graduated from primary school<br>- Organization: no member | - Occupation: farmer<br>- Education: No graduated from primary school<br>- Organization: no member | - Occupation: farmer<br>- Education: No graduated from primary school<br>- Organization: farmers group | - Occupation: farmer<br>- Education: No graduated from primary school<br>- Organization: no member | - Occupation: farmer<br>- Education: No graduated from primary school<br>- Organization: no member |
| g. Other HH members | - Occupation: student (42.6 %), farmer (19.5%)<br>- Education: No graduated from primary school (37.3%), active in primary school (29.0%),<br>- Organization: no member (94.4%) | - Occupation: student (50.8%), farmer (16.4%)<br>- Education: no graduated from primary school (31.1 %), active in primary school (27.9%)<br>- Organization: no members (81.7%) | - Occupation: student (45.3%), farmer (22.9%)<br>- Education: no graduated from primary school (35.2 %), active in primary school (31.5%)<br>- Organization: no members (98.7%) | - Occupation: student (38.8%), farmer (30.9%)<br>- Education: no graduated from primary school (52.5 %), primary school graduated (30.9%)<br>- Organization: no members (81.7%) | - Occupation: student (45.7%), farmer (38.0%)<br>- Education: no graduated from primary school (47.3 %), primary school graduated (29.4%)<br>- Organization: no members (94.4%) | - Occupation: student (46.6%), farmer (31.3%)<br>- Education: no graduated from primary school (48.9 %), primary school graduated (28.4%)<br>- Organization: no members (95.4%) |
| h. Absences* (% to total HH) | 2.5 % | 2.1 % | 14.8 % | 20.1 % | 22.3 % | 8.5 % |

Note*: Absence rate indicates the portion of the members living in other place more than 3 months per year.

Most of the HHs in the target villages is composed of around seven (7) members including 3-5 members under working age and settled in the respective village in the Portuguese or Indonesian occupation era.

The villages located in Noru sub-watershed, namely, Faturasa, Fadabloco and Hautoho show higher engagement of household members in farming activities than those in Bemos sub-watershed, i.e., Madabeno, Talitu and Tohumeta, possibly due to the limitation of other livelihood options. It also may relate to the relatively high absence rate of household members of Faturasa and Fadabloco, who could go outside the villages to seek the working opportunities.

## 2.2 Condition for Basic Human Needs

Conditions of the basic human needs in the target villages are summarized as follows.

**Major features of basic human needs in the target villages**

| Items | Bemos sub-watershed | | | Noru sub-watershed | | |
|---|---|---|---|---|---|---|
| | **Madabeno** | **Talitu** | **Tohumeta** | **Faturasa** | **Fadabloco** | **Hautoho** |
| a. Water Sources and accessibility (time to go) | - Dry season (D): Piped gravity water (27 min)<br>- Rainy season (R): Piped gravity water (14 min) | - Dry season (D): Piped gravity water and spring (14 min)<br>- Rainy season (R): Piped gravity water and spring (10 min) | - Dry season (D): Piped gravity water (6 min)<br>- Rainy season (R): Piped gravity water (6 min) | - Dry season (D): Spring s (22 min)<br>- Rainy season (R): Springs (20 min) | - Dry season (D): Spring s and wells (53 min)<br>- Rainy season (R):Springs and wells (39 min) | - Dry season (D): Piped gravity water, springs and wells (34min)<br>- Rainy season (R):Piped gravity water, springs and wells (28 min) |
| b. Water sufficiency | D: Sufficient (78%),<br>R: Sufficient (65%) | D: Sufficient (80%)<br>R: Sufficient (72%) | D: Sufficient (88%)<br>R: Sufficient (92%) | D: Sufficient (70%),<br>R: Sufficient (78%) | D: Sufficient (52%),<br>R: Sufficient (83%) | D: Sufficient (58%),<br>R: Sufficient (78%) |
| c. Water quality | D: Clean (95%)<br>R: Clean (65%) | D: Clean (93%)<br>R: Clean (71%) | D: Clean (100%)<br>R: Clean (66%) | D: Clean (95%)<br>R: Clean (85%) | D: Clean (82%)<br>R: Clean (73%) | D: Clean (88%)<br>R: Clean (70%) |
| d. Food shortage Period | Oct-Feb | Oct-Feb | Dec-Feb | Nov-Feb | Oct-Feb | Nov-Jan |
| e. Frequency of meals (times/day) | Normal (N): 2.9<br>Food shortage (FS): 2.1 | Normal (N): 2.8<br>Food shortage (FS): 1.9 | Normal (N): 3.0<br>Food shortage (FS): 2.2 | Normal (N): 2.9<br>Food shortage (FS): 1.9 | Normal (N): 2.9<br>Food shortage (FS): 2.0 | Normal (N): 3.0<br>Food shortage (FS): 2.3 |
| f. Frequency of consumption of major meals (times/day) | (N→FS)<br>Rice: 2.7→1.5<br>Corn:0.9→0.6<br>Beans:0.5→0.3<br>Cassava: 0.8→0.8<br>Kontas: 0.6→0.6<br>Banana:0.6→0.6 | (N→FS)<br>Rice: 2.2→1.2<br>Corn:0.8→0.4<br>Beans:0.6→0.4<br>Cassava:0.7→0.7<br>Kontas:0.6→0.6<br>Banana:0.6→0.5 | (N→FS)<br>Rice: 2.4→1.5<br>Corn:0.8→0.6<br>Beans:0.4→0.3<br>Cassava: 0.5→0.5<br>Kontas: 0.4→0.4<br>Banana:0.5→0.4 | (N→FS)<br>Rice: 1.8→1.0<br>Corn:0.8→0.7<br>Beans:0.7→0.5<br>Cassava: 0.6→0.5<br>Kontas:0.6→0.5<br>Banana:0.6→0.6 | (N→FS)<br>Rice: 1.8→1.0<br>Corn:1.0→0.7<br>Beans:0.7→0.5<br>Cassava: 1.0→0.8<br>Kontas: 0.7→0.6<br>Banana:0.8→0.7 | (N→FS)<br>Rice: 2.3→2.0<br>Corn:1.1→0.8<br>Beans:0.6→0.4<br>Cassava: 0.8→0.8<br>Kontas: 0.4→0.4<br>Banana:1.4→1.1 |
| g. Major disease | - Children: Malaria and cold<br>- Adults: Cold, malaria and diarrhea | - Children: Cold, malaria and diarrhea<br>- Adults: Malaria, cold and diarrhea | - Children: Cold and malaria<br>- Adults: Cold and malaria | - Children: Cold, malaria and diarrhea<br>- Adults: Cold and malaria | - Children: Cold, malaria and diarrhea<br>- Adults: Cold and malaria | - Children: Malaria and cold<br>- Adults: Malaria and cold |

The target villages except Faturasa and Fadabloco have accessibility to the piped gravity water, while natural spring is the most important water sources in the aforementioned two villages. Besides, HHs in Fadabloco and Hautoho are likely to have difficulties in securing water in terms of accessibility to the water sources and its sufficiency especially in the dry seasons. Besides, the water quality tends to be lower in the rainy seasons in all the villages.

With regards to the food availability, the food shortage season starts between October and December and ends in January or February in the next year. Among major food items, rice, corn and beans tend to decline its frequency of consumption in food shortage seasons while the root crops such as cassava and kontas, and banana shows rather stable availability throughout a year. Generally, the villages which are relatively close to Dili show higher frequency of consumption of rice, possibly due to more opportunity of income generating to afford to purchase it.

As for health condition, cold, malaria and diarrhea are major diseases which infect both adults and children in the villages.

## 2.3 Land Use

Following table shows estimation of the current use of the land owned by HHs in the target villages.

**Current use of the land owned and used by HH in the target villages**

| Items | Bemos sub-watershed | | | | | | Noru sub-watershed | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Madabeno | | Talitu | | Tohumeta | | Faturasa | | Fadabloco | | Hautoho | |
| | Holding area/ HH | Own rate*[1] | Holding area/ HH | Own rate*[1] | Holding area/ HH | Own rate*[1] | Holding area/ HH | Own rate*[1] | Holding area/ HH | Own rate*[1] | Holding area/ HH | Own rate*[1] |
| **Cultivated** | | | | | | | | | | | | |
| Home garden | 0.1 ha | 100.0 % | 0.1 ha | 93.3 % | 0.3 ha | 100.0 % | 0.3 ha | 95.0 % | 0.02ha | 78.3 % | 0.01ha | 96.7 % |
| Fixed Upland w/o soil conservation | 0.5 ha | 65.0% | 1.2 ha | 75.0 % | 0.5 ha | 45.0 % | 1.5 ha | 83.3 % | 1.7 ha | 91.7 % | 0.7 ha | 61.7 % |
| Fixed Upland with soil conservation | 0.2 ha | 3.3% | 0.0 ha | 1.7 % | 0.0 ha | 1.7 % | 0.5 ha | 25.0 % | 0.2 ha | 15.0 % | 0.2 ha | 15.0 % |
| Coffee Plantation | 1.4 ha | 83.3% | 1.7 ha | 91.7 % | 0.5 ha | 40.0 % | 0.7 ha | 71.7 % | 1.5 ha | 86.7 % | 1.4 ha | 83.3 % |
| Shifting Cultivation | 0.4 ha | 73.3% | 1.5 ha | 66.7 % | 1.1 ha | 86.7 % | 0.03 ha | 1.7 % | n/a*[2] | - | n/a*[2] | - |
| **Un-cultivated** | | | | | | | | | | | | |
| Fallow area for shifting | 1.2 ha | 68.3% | 1.0 ha | 63.3 % | 1.8 ha | 65.0 % | 0.01 ha | 1.7 % | 0.3 ha | 16.7 % | 0.01 ha | 1.7 % |
| Forest | 1.2 ha | 28.3% | 0.2 ha | 28.3 % | 0.2 ha | 20.0 % | 1.1 ha | 55.0 % | 0.5 ha | 26.7 % | 0.3 ha | 20.0 % |
| Grazing area | 0.8 ha | 20.0% | 0.1 ha | 28.3 % | 0.3 ha | 21.7 % | 1.7 ha | 81.7 % | 0.8 ha | 45.0 % | 0.7 ha | 41.7 % |
| **Total** | **5.8 ha** | | **5.8ha** | | **4.4 ha** | | **5.9 ha** | | **5.1 ha** | | **3.3 ha** | |

Note*: 1: Own rate indicates the proportion of the households who own the land of relevant land use.
2: data not available.

The total size of the land owned by household in the target villages ranges from around 3 to 6 ha. Almost all of households some plots of home garden with 0.01 ha to 0.3 ha each in addition to fixed upland farming. Application of soil conservation measures to the upland farms is likely to be limited in most of the villages, especially in those in Bemos sub-watershed.

As for coffee plantation, most of the households in the villages except Tohumeta has plots of plantation with the area around 0.7 to1.7 ha each.

In general, around one-fourth of HHs in the target villages own the forest with the area of 0.3 to 1.2 ha, while half of HHs in Faturasa own forest of 1.1 ha.

Besides, communal area is found only in Fadabloco among the target villages and currently used by 1.7 % of HHs in Fadabloco for the purpose of vegetable farming. Every time when community intends to use the area, s/he needs to ask the church for the permission on land use.

## 2.4 Shifting Cultivation Practices

Major features of shifting cultivation practice in the target villages are shown in the following table.

**Major features of shifting cultivation practices in the target villages**

| Items | Bemos sub-watershed | | | | | | Noru sub-watershed | |
|---|---|---|---|---|---|---|---|---|
| | Madabeno | | Talitu | | Tohumeta | | Faturasa | |
| Advantages of Shifting cultivation | 1st: High production 2nd:Stable production | | 1st: High production 2nd:Stable production | | 1st: High production 2nd:Stable production | | 1st: High production 2nd:Stable production | |
| Disadvantages | 1st:Landslides 2nd :Expansion of forest fires | | 1st: No idea 2nd:Less inputs | | 1st: Deforestation 2nd:Landslides | | 1st: Soil erosion 2nd:Expansion of forest fires | |
| Period of using area before shifting | 1.8 years | | 1.9 years | | 1.9 years | | 2 years | |
| Use of the same site after fallowing the area | Yes (62%) | | Yes (79%) | | Yes (65%) | | No (100 %) | |
| Sign for reusing the area/ necessary period to show the sign | Cassavas left in the farm grow well/. 2.2 years | | Weed and trees grow enough/ 4.3 years | | Weed and trees grow enough/ 2.6 years | | n/a* | |
| Constraints in SC | Limited farm tools | | Limited labor | | Limited labor | | Limited labor | |
| **Shifting Cultivation (SC)** | **Ratio** | **Reason** | **Ratio** | **Reason** | **Ratio** | **Reason** | **Ratio** | **Reason** |
| Willingness to continue SC | Yes (67 %) | High production | Yes (60 %) | Good production | Yes (76 %) | Good production | Yes (100%) | Increase production |
| Willingness to expand SC | No (65 %) | Lack of land | No (67 %) | Lack of labor | No (75%) | Lack of labor | No (100%) | Lack of labor |
| Willingness to expand fixed farming | No (88 %) | Lack of labor | No (93 %) | Lack of labor | No (70 %) | Lack of labor | No (100%) | Lack of labor |

Note: Data was not available for Fadabloco and Hautoho.

*n/a: data is not available

Generally, the HHs of target villages except Fadabloco and Hautoho where the data was not available use the area of shifting cultivation for about two (2) years before moving to the other places. After 2-4 years of its abandonment, they return to the same plot after confirmation of possible recovery of the soil fertility based on the growth of plants in the area.

Most of HHs conducting shifting cultivation considers its advantage as high and stable crop production, which could encourage them to continue the practices. However, few HHs shows their willingness to expand the area for shifting cultivation due to limitation of land and labor. Lack of labor is also one of major constraints for expanding fixed farming area in their own land.

## 2.5 Livelihood and Income/Expenditure Level

### 2.5.1 Income and Expenditure Level

Following table shows the status of annual income and expenditure of HHs in the target villages.

**Average income and expenditure in the target villages**

| Income | Bemos sub-watershed | | | | | | Noru sub-watershed | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Madabeno | | Talitu | | Tohumeta | | Faturasa | | Fadabloco | | Hautoho | |
| | Amount (USD/ year) | % | Amount (USD/ year) | % | Amount (USD/ year) | % | Amount (USD/ year) | % | Amount (USD/ year) | % | Amount (USD/ year) | % |
| Agriculture | 306.8 | 36% | 348.8 | 28% | 197.5 | 10% | 195.4 | 24% | 446.8 | 47% | 294.3 | 39% |
| Livestock | 17.5 | 2% | 46.6 | 4% | 172.9 | 9% | 292.7 | 35% | 100.4 | 11% | 170.8 | 22% |
| Firewood & timber | 13.1 | 2% | 6.9 | 1% | 0 | 0% | 0 | 0% | 0 | 0% | 0 | 0% |
| NTFP | 1.3 | 0% | 34.8 | 3% | 16.8 | 1% | 36.9 | 4% | 3.4 | 0% | 1.1 | 0% |

| Income | Bemos sub-watershed | | | | | | Noru sub-watershed | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Madabeno | | Talitu | | Tohumeta | | Faturasa | | Fadabloco | | Hautoho | |
| | Amount (USD/ year) | % | Amount (USD/ year) | % | Amount (USD/ year) | % | Amount (USD/ year) | % | Amount (USD/ year) | % | Amount (USD/ year) | % |
| Others | 508.4 | 60% | 801.5 | 65% | 1,517.9 | 80% | 304.0 | 37% | 403.0 | 42% | 294.0 | 39% |
| Total | 845.8 | 100% | 1,238.6 | 100% | 1,905.2 | 100 % | 829.0 | 100 % | 953.5 | 100% | 760.3 | 100% |

| Total | 368.9 | 100% | 557.1 | 100% | 741.9 | 100 % | 476.7 | 100 % | 565.6 | 100% | 78.6 | 19% |

Note* n/a: data not available

Annual income of HHs in the target villages ranges between 760 and 1,900 USD and generally those in Bemos sub-watershed is higher than Noru sub-watershed, which may be resulted from accessibility to Dili to have more opportunity of income generating.
In general, the target villages of Noru sub-watershed show more dependency on agriculture and livestock produce as source of income comparing to those of Bemos sub-watershed.
Meanwhile, annual expenditure of HHs is from 417 to 741 USD, which is mainly composed of foods, clothes and education.

### 2.5.2 Agriculture

Major features of the crops produced in the target villages are summarized below.

**Major features of agricultural activities in the target villages**

| Aspect | Madabeno | | Talitu | | Tohumeta | | Faturasa | | Fadabloco | | Hautoho | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **Crops** | **Ratio of HHs produce** | **Yield/ Gross Cropped area** | **Ratio of HHs produce** | **Yield/ Gross Cropped area** | **Ratio of HHs produce** | **Yield/ Gross Cropped area** | **Ratio of HHs produce** | **Yield/ Gross Cropped area** | **Ratio of HHs produce** | **Yield/ Gross Cropped area** | **Ratio of HHs produce** | **Yield/ Gross Cropped area** |
| Maize | 95% | 0.4ton/ha 0.5 ha | 65 % | 0.2ton/ha 0.5 ha | 97 % | 0.1ton/ha 0.8 ha | 100 % | 0.5ton/ha 1.0 ha | 100 % | 0.5ton/ ha 1.0 ha | 98 % | 0.5ton/ ha 1.0 ha |

Note: n/a: data not available

Besides Talitu, almost all the households in the target villages produce maize, cassava and sweet potato. Groundnut is also major crop in the target villages of Noru-watershed as well as Taro in Madabeno and Talitu. In general, production of these crops is low due to the damages caused by animal, pest, rain, drought and wind. In addition, leaf vegetables are also produced by one-fourth of households in Tohumeta.

Almost all the households are using local variety of seeds for cropping. Some of households are applying vegetative materials, such as grass and leaves, and animal dung to improve soil condition at the farm.

The techniques used for post-harvesting in the target villages are still primitive, such as putting seeds of maize above the fire in the houses and leaving runners of cassava and sweet potato in the farm, which may affect the quality of seeds and result in its lost during post-harvesting period.

As for the marketing, selling farm commodities is limited except for coffee, leaf vegetables, clove and fruits. Coffee is sold mainly to CCT.

### 2.5.3 Livestock Management

The following table summarized major features of raising livestock in the target villages.

**Major and average features of livestock in the target villages**

| | Madabeno | | Talitu | | Tohumeta | | Faturasa | | Fadabloco | | Hautoho | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| **Animals** | **% of HHs owning** | **No. of Head** | **% of HHs owning** | **No. of Head** | **% of HHs owning** | **No. of Head** | **% of HHs owning** | **No. of Head** | **% of HHs owning** | **No. of Head** | **% of HHs owning** | **No. of Head** |
| Cattle | 40 % | 0.7 | 15 % | 0.6 | 25 % | 0.8 | 45 % | 1.7 | 33 % | 1.1 | 22 % | 0.9 |

| **Grazing** | **Place** | **Time to go** | **Place** | **Time to go** | **Place** | **Time to go** | **Place** | **Time to go** | **Place** | **Time to go** | **Place** | **Time to go** |
| Cattle | Almost half kept in stall and some doing grazing in forest/grass land | 50 min | Forest/Grass land/Fallow land | 50 min | Almost half kept in stall and others doing grazing in forest/grass land | 30 min | One-third kept in stall and others doing grazing in forest and grassland | 1.7 hrs | Forest/grass land/ fallow land | 1.5 hrs | Half kept in stall and others doing grazing in forest | 1.1 hrs |
| Buffalo | Half kept in stall and some conduct grazing in fallow area | 40 min | Forest/Grass land | 40 min | One-third kept in stall and others doing grazing in grass land and forest | 50 min | Forest/Grassland | 2.8 hrs | Grass land/fallow land/forest | 1.1 hrs | Forest/grass land/fallo ff land | 50 min |
| Goat | Half kept in stall and some conduct grazing in forest | 40 min | One-third kept in stall and others conduct grazing in grass land/forest | 30 min | Almost half kept in stall and others doing grazing in grassland and forest | 30 min | One-third kept in stall and others doing grazing in grass land and forest | 1.4 hrs | Around half kept in stall and others doing grazing in grass land | 50 min | Half kept in stall and others doing grazing in forest | 40 min |
| Horse | Almost half kept in stall and some conduct grazing in forest | 30 min | Half kept in stall and others conduct free grazing in forest/grass land | 40 min | Most kept in stall and others doing grazing in grass land | 30 min | About half kept in stall and others doing grazing in forest | 1.8 hrs | One-third kept in stall and others doing grazing in grass land | 1.2 hrs | Half kept in stall and others doing grazing in forest | 50 min |
| Consumption (eating and loss) | Almost no consumption and loss except the loss of chicken due to disease and few consumption of goat, pig and chicken | | Some lost chicken, pig and goat because of robbery and sickness. Some chicken, goat, pig and cattle are also consumed and sold. | | Some lost, consumed and sold chicken, cattle, goat and pig. Major causes of the reason of lost are diseases, disaster and robbery. | | Some lost, consumed and sold chicken, buffalo, goat, horse, pig and chicken. Major causes of losses are diseases and robbery. | | Some lost, consumed and sold cattle, goat, pig and chicken. | | Some lost, consumed and sold cattle, goat, pig and chicken. | |
| Marketing | Few sale cattle and goat in Dili | | Some sale cattle and few sales goat, pig and chihcken. | | Half of households sale cattle and some sale goat, buffalo and chicken | | Half of HHs sale cattle and chicken, while some sale buffalo, goat, horse and pig | | Around half sale chicken while some also sale cattle, goat, horse and pig, | | Around half sale cattle while some sale also buffalo, goat, horse, pig and chickens | |

The number of households who own livestock as well as the number of livestock owned is higher in the target villages located in Noru sub-watershed, especially Faturasa than those in Bemos sub-watershed. In short, livestock are considered more important in such villages.

With regard to the mode of animal rearing, some HHs control animals, such as cattle, goat and horse while others practice grazing animals in the forest and grass land.

### 2.5.4 Firewood, Timber and NTFPs

Major features of collection of firewood and timber in the target villages are summarized below.

**Major features of collection of firewood and timbers in the target villages**

| Aspect | Bemos sub-watershed | | | | | | Noru sub-watershed | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Madabeno | | Talitu | | Tohumeta | | Faturasa | | Fadabloco | | Hautoho | |

| No. of bundles or poles /visit | 2.5 bundles /visit | n/a* | 2.5 bundles /visit | 10 poles/ visit (max) | 2.3 bundles/visit | n/a | 3.6 bundles /visit | 5.8 poles /visit | 2.9 bundles/visit | 5.8 poles /visit | 4.4 bundles /visit | 7.4 poles/visit |
| Marketing | No sale | Almost no sale | Almost no sale | No sale | No sale | | No sale | | No sale | | No sale | |

Note* n/a: data not available

Collection of firewood for consumption is a common practice in the households in the target villages. Likewise, timber harvesting for the construction of house has been practiced almost all households in the target villages of Noru sub-watershed, while such practice is rather limited in those of Bemos sub-watershed.

Major species used as firewood and timber are Eucalyptus Urophilla (Ai ru in Tetun), Eucalyptus Alba (Ai bubur), Falcata and Casuarina (Ai kakeu).

The following table also clarifies major features of collection of NTFP in the target villages.

**Major features of collection of NTFPs in target villages**

| Aspect | Bemos sub-watershed | | | | | | Noru sub-watershed | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | Madabeno | | Talitu | | Tohumeta | | Faturasa | | Fadabloco | | Hautoho | |
| | Bamboo | Honey | Tua Mutin*[2] | Bamboo | Tua Mutin | Nil | Bamboo | Honey | Bamboo | Honey | Bamboo | Honey |

| Marketing | Some sell bamboo in Dili | | All HHs which produce tua mutin sell it mainly in Dili. | | All HHs which produce tua mutin sell it mainly in Dili | | Few HHs sell Bamboo in Dili<br>Most of HHs which produce honey sell it mainly in Dili | | Most HHs which produce honey sell it mainly in Dili | | Some HH who produce bamboo sell them in Dili | |

Note* 1:data not available, 2: Tua Mutin: traditional palm wine

In general, bamboo, honey and tua mutin are main NTFPs produced in the target villages. The target villages in Bemos sub-watershed, especially Tohumeta, are likely to have less practice in NTFP production, comparing to those in Noru sub-watershed. It is possibly due to limitation of available natural resources in the locality or more opportunity of income generating because of its accessibility to Dili.

# 3 Resource Use Profile

PRA revealed the main features of use of natural resources in the target villages as presented in **Appendix-2** and summarized in the following sections.

## 3.1 Land Use Characteristics

The land use characteristics in the target villages were identified through the discussions made in resource mapping and filed observations in transect walking in PRA. Major findings are highlighted below.

**Land Use Characteristics of the Target Village**

| Suco | Major Characteristics |
|---|---|
| Fadabloco | a. The village is situated between Suco Faturasa and Hautoho.<br>b. Many houses are located on the ridges of hills where the roads run through.<br>c. Natural forests of Eucalyptus Europhia (Ai Ru) and Eucalyptus Alba (Ai Bubur), permanent farms, and coffee plantations are mainly observed in the hilltop, while the hillside and the bottom of hill are used for shifting cultivation, coffee plantation, and animal grazing.<br>d. Eucalyptus Alba (Ai Bubur) is the major tree species prevailing in the village. Albisia (Ai Samutuku) and Casuarina (Ai Kakeu) are also found in the valleys in the village with coffee trees.<br>  <br>e. Honey and tua can be collected in coffee plantations, especially those with Albisia.<br>f. Eucalyptus Alba (Ai Bubur) forests stand in a rather drying condition, and therefore, it is prone to forest fire.<br>g. The communities use the gentle to steep sloping areas for agricultural purposes, such as permanent farms, shifting cultivation farms, coffee plantations, and animal grazing.<br>h. Free animal grazing is the common practice in rearing large livestock animals, although there are several animal pens or fenced areas set up by the communities.<br>i. Gully erosion and land slides are commonly observed in the hilltop as well as hillside.<br>j. There is a paddy field along the river.<br>k. Aldeia Releu is isolated from other aldieas by the river. According to the participants from aldeia Lieu, they need to walk for 3~4 hours to get to the suco office from aldeia Releu.<br>k. There is an area owned and used by households in Suco Hautoho in the village. Besides, there are also some families from Suco Hautoho living in the village. |
| Faturasa | a. The village is bordered on the north and south by Suco Tolataqueu and Suco Fadabloco, and on the east |

| Suco | Major Characteristics |
|---|---|
| | and west by Sub-district Laclo and Suco Asumau, respectively.<br>b. Houses are mainly located on the ridges of hills in the area, especially along the main roads.<br>c. Natural forests of Eucalyptus Alba (Ai bubur) are extended in the foot of slopes and along the rivers, especially the Laclo and Uhululi river.<br>d. Some coffee plantations are found along valleys in the village.<br>e. There are gully erosions found in the village, especially in Aldeia Kaisasu and along the main road passing through the village.<br>f. Animal grazing is practiced mainly in the natural forests.<br>  |
| Hautoho | a. The village is bordered on the north and south by Suco Fahisoi and Sub-district Liquidoe, and on the east and west by Suco Fadabloco and Suco Maumeta, respectively.<br>b. Accordingly, there are two detached areas, which constitute Aldeia Remehei, in the territory of Suco Fadabloco.<br>c. Houses are mainly located on the ridges of hills in the area, especially those that the main road passes through.<br>d. Natural forests of Eucalyptus Alba (Ai Bubur) mainly spread in the foot of hills, especially along the Mausa river, while farms for shifting cultivation are widely distributed in the hillsides in the village.<br>  <br>e. Some citrus and Casuarina trees with or without coffee trees are also found in the areas for shifting cultivation. Accordingly, there used to be coffee trees planted with Casuarina trees, but coffee planted far from water sources died down, and therefore, the areas are used only for crop production.<br>f. The existing coffee plantations are mainly found in the valleys in the village.<br>g. Natural forests are generally used for animal grazing. |
| Madabeno | a. The village is bordered by Suco Aisrimori, Talitu, Kotolau, and Tohumeta.<br>b. The part of the village (the area between the Bemos river and national road) is located in the catchment of the Bemos river.<br>c. The households in the village seem to rather disperse in the village.<br>d. Coffee plantations with Albisia (Ai Samutulu) widely stretch from the hilltop to hillside in the village, especially in Aldieas Remapati and Bilumahato.<br>e. Natural forests are rather limited in the village. The major species found in natural forests are Eucalyptus Alba (Ai Bubur) and Europhia (Ai Ru). In particular, Eucalyptus Europhia is dominant in the catchment of the Bemos river.<br>  <br>f. Non-timber forest products (e.g., root crops, wild crops, tua, and honey) and firewood are harvested in natural forests and coffee plantations.<br>g. Areas for shifting cultivation are found in the hillsides, especially in the areas between Aldeias Bilumahato and Lissimori. |
| Talitu | a. The village is broadly composed of three parts, i) the northern hill from the national road which contains the territories of Aldeia Talitu and Casa Manatutu, ii) the catchment of the Bemos river (right and left banks of the river) which contains the territories of Aldiea Quelau and Fatukhun, and iii) the southern slope from the national road which is the part of Aldeia Fatukhun.<br>b. Many communities in the village reside along the national road.<br>c. Coffee plantations mixed with clove trees extensively cover the hillsides in Aldeia Talitu and Quelau, while the same is rarely found in Aldeia Casa Manatutu and Fatukhun.<br>d. Houses, permanent farms, and Eucalyptus Europhia (Ai Ru) forests prevail in the hilltops in the catchment of the Bemos river. |

| Suco | Major Characteristics |
|---|---|
| | e. Natural forests (Eucalyptus Europhia and and Alba), animal grazing, and shifting cultivation are the dominant land uses in Aldeia Fatukhun, while natural forests (Eucalyptus Alba) and shifting cultivation are the major ones in Aldeial Casa Manatutu.<br>f. There are fishponds and paddy fields along the river in aldeia Fatukhun.<br>e. There are several sacred forests in addition to other types of sacred place (e.g., sacred stones, sacred springs, sacred mountains, and sacred houses) in the village.<br>  |
| Tohumeta | a. The village is located within the catchment of the Bemos river.<br>b. Communities live along the manin road passing through the village. In the Portuguese times, they lived near their farms, but they were forced to stay along the main road by the Indonesian government.<br>c. Natural forests of Eucalyptus Alba (Ai Bubur) are mainly distributed along the Bemos river, especially in the right bank of the river, while those of Eucalyptus Europhia (Ai Ru) are mainly found in the upper parts of the hills in the village.<br>d. Areas for shifting cultivation are widely distributed in the village. Maize, cassava, taro, and beans are the major crops planted under the shifting cultivation system.<br>e. Many communities have permanent farms and vegetable gardens near houses.<br>f. Fruits (Jackfruit, banana, and papaya) and other industrial plants (coconut, tua metan, bamboo, and betal nut) grow around water sources.<br>g. There are many water springs which are used for watering vegetables an other domestic purposes in the village. There is also the existing piped watering system constructed by NGO.<br>h. Communities use natural forests of Eucalyptus Alba for firewood collection and animal grazing. |

Source: JICA Project Team (2011)

## 3.2 Historical Changes of Natural Resources and Agricultural Products

The current conditions and historical changes of natural resources as well as agricultural products in the target villages were confirmed through the session of "trend analysis" in the target villages. Some remarkable changes and features in the target villages are summarized below.

**Historical Changes of Natural Resources and Agricultural Products in the Target Villages**

| Suco | Seasonal Changes |
|---|---|
| Fadabloco | a. The yield of maize has declined as the soil fertility in the farm has become low, while those of other crops, such as sweet potato and cassava, have been unchanged since 1975.<br>b. In the Portuguese era, few people raised buffalo. In the Indonesian times, many households were able to have cattle with the assistance of the government. After independence, the number of cattle has declined due to a lack of feed and wide expansion of Chromolaena odorata in the grazing area.<br>c. The participants believed that the forest cover in the village has gradually increased owing to the government support (e.g., provision of seedlings) and favorite climatic conditions since 2002.<br>d. Forest fires have constantly occurred in the village, although there has been no drastic increase of forest fire in and after the Indonesian era. |
| Faturasa | a. The average yield of maize in the Indonesian times was estimated at about half as the same in the Portuguese era. It is speculated that improper application or overdose of chemical fertilizer might be one of the causes of low productivity. The yield of maize has gradually increased since 2001.<br>b. Honey production used to be high until 1999, but it had drastically declined due to the leaf disease of host trees (Eucalyptus Alba). Accordingly, the production has recovered recently, but the volume of collection has been still low owing to the fear of accident.<br>c. Deforestation or forest degradation had progressed between 1975 and 2007 due to the high incidence of forest fires and expansion of shifting cultivation farms. Since the village regulations were in place in 2008, the existing forests have been gradually recovering.<br>d. Likewise, there used to be many forest fires before 2007, especially in the Indonesian times (1975-1999). There has been no forest fire from 2008.<br>e. The communities have faced the significant post harvest loss of maize due to weevil since 1999. |
| Hautoho | a. The production of maize has declined due to the civil war in the Indonesian times, especially from 1975 to 1978, and crop damage caused by strong winds and rodent. In 2011, the communities were not able to plant maize due to long rain. |

| Suco | Seasonal Changes |
|---|---|
| | b. The production of sweet potato has increased since 1999 owing to favorable market conditions. However, the production has declined from 2009 to 2011 due to the pro-longed rainy season.<br>c. The production of cassava has been kept high since the Portuguese times.<br>b. The community started planting coffee in the Indonesian times using wildlings in the existing coffee plantations. The production of coffee was very low in 2011 owing to long rains.<br>c. The production of vegetables also started in the Indonesian times, and vegetable farms have been gradually expanded in the village, especially in the areas close to the water sources. Recently, more households have engaged in vegetables as they were not able to produce maize in 2010.<br>d. In the Portuguese times, the villages was fully covered with forests. Deforestation started in the Indonesian time due to the frequent forest fires caused by the military operations, but the deforestation rate has declined since 2002 as the incidence of forest fires has been reduced.<br>e. There were wild fires caused by unknown people even in the Portuguese times. The participants feel that the frequency of forest fires has been reduced since independence. |
| Madabeno | a. The production of maize has decreased due to the decline of soil fertility, fluctuated/unstable rainfall patterns, and domestic turmoil in the country. However, the yields of other croups, such as cassava, sweet potato, and taro have been unchanged since 1975.<br>b. The communities used to harvest honey in the Portuguese era, but the collection of honey is not popular in the village at present since they have other sources of income and the collection of honey is considered dangerous.<br>c. The village used to be covered with a full of natural forests in the Portuguese era. Deforestation had progressed from 1975 due to the following reasons: i) forests were burned by the Indonesian army to fight against the resistant guerrillas; ii) local communities committed illegal logging; and iii) local communities also burned forests for hunting. However, the tendency of deforestation has declined after the deployment of forest guards in 2008.<br>d. There used to be few forest fires in the Portuguese era as Tara Bandu was effective. The incidence of forest fires had drastically increased in the Indonesian times by the intervention of the Indonesian army. Accordingly, the occurrence of forest fire in the village has declined since the revival of Tara Bandu in 2010. |
| Talitu | a. The production of upland crops (e.g., maize and cassava) has declined since 1975. The reasons behind the decrease of maize production are the decline of soil fertility in the farms, the conversion of upland farms to coffee and clove plantations, and a shortage of laborers for cropping.<br>c. On the other hand, the production of clove has increased especially in aldeia Talitu and Quelau from the Indonesian times thanks to the agricultural extension services of the Indonesian government. Pepper and vanilla plantations has also expanded since the independence with the technical and material assistance from NBCA/CCT.<br>d. The communities in aldeia Talitu and Quelau purchase the staple crops in the market using the earnings generated from cash crops, namely coffee, clove, pepper, and vanilla.<br>e. As the plantations of coffee and clove have expanded, the areas covered with natural forests have been reduced gradually. Illegal logging and forest fires especially in the Indonesian times also accelerated the deforestation.<br>f. Accordingly, there was no wild/forest fire in the Portuguese era owing to the strict control by the local authority. The incidence of wild fires was quite high in the Indonesian times, but it has declined from 2002. The communities have consciously protected their plantation from any damage. |
| Tohumeta | a. The production of maize and cassava has decreased since 2002 as the villagers started working for government projects, while that of vegetable has increased owing to the assistance from the government and NGOs since the Indonesian times.<br>b. The production of mango has gradually increased owing to the increase of mango trees with the technical assistance from the Indonesian government and self-effort made by the communities.<br>c. Forest covered almost all the areas of the village in the Portuguese time. Deforestation has progressed since the Indonesian times due to the increase of population and incidence of wild fires. The participants pointed out that a number of seedlings were planted in 2008 and 2009 with the assistance of the NGO and JICA.<br>d. The incidence of wild fire in the Portuguese times was almost nil due to the strong enforcement of Tara Bandu regulations. The communities started freely burning the areas for clearing their farms and hunting wild animals in the Indonesian times. as the Indonesian army burned forests in the village for operations.<br>e. The available of water sources has been kept high since the Portuguese times. |

## 3.3 Seasonal Changes in Agricultural and Socio-Economic Activities

Seasonal changes in agricultural, cultural and socio-economic activities in the target villages, which were identified in the session of "seasonal calendar" in PRA are summarized below.

**Seasonal Changes in Agricultural, Cultural and Socio-economic Activities in the Target Villages**

| Suco | Seasonal Changes |
|---|---|
| Fadabloco | a. Cutting/slashing trees and grasses starts in July and August, and the field is burned in September.<br>b. May and June are the peak harvest season of coffee, while four months from May to August are the harvest season of citrus.<br>c. A shortage of food is the main concern for the communities in December and January, while the water shortage is their another concern in August and September.<br>d. The village is prone to wild fires in August and September. |
| Faturasa | a. Cutting and slashing grasses and trees are conducted in July and August, followed by burning in September and October. After planting of seeds of annual crops in November and December, crops except sweet potato are harvested in February and March. Sweet potato is harvested in May and other biennial tubers (cassava and taro) are from August to October.<br>b. Harvesting season of coffee is between June and August, while that of citrus is May and June.<br>c. Honey is collected in May and June, while tua mutin can be harvested throughout a year.<br>d. Communities in the village face a shortage of food from November to February until they can harvest maize in March. In particular, January is the leanest month among four months of the food shortage period.<br>e. On the other hand, it is hard for the communities to get drinking and domestic water between August and October, especially in October. |
| Hautoho | a. Land preparation is conducted between July and October, and among others, burning the area starts in August and continues until October. In general, food crops as well as other crops (3.g., pineapple and orange) are planted in October and November.<br>b. The harvest seasons of the major crops produced in the village are: i) March and April for Maize, ii) May-July for Pigeon pea, iii) August and September for tube crops, iv) May-July for Orange, and v) all the year for pineapple.<br>c. Honey is collected mainly in May and June, while there is no specific season for collection of Tua Mutin.<br>d. Three months from November to January is considered as the food shortage season, while a shortage of water starts in August and lasts until October. |
| Madabeno | a. Farms for shifting cultivation are burned in September and October, and then, annual crops are planted in November and December in general.<br>b. Coffee is harvested from May to September, while vegetables are produced between September and November.<br>c. The communities face a shortage of food from December to February and a shortage of water from August to October, respectively.<br>d. The village is prone to fires from July to October. |
| Talitu | a. Cutting/slashing grasses for shifting cultivation starts in June and the same areas are burned in September and October. Planting of annual crops starts in November.<br>b. Coffee is harvested for two months in June and July.<br>c. The communities face a shortage of food between December and March, while the scarcity of water supply is a big concern between August and November.<br>d. The village is prone to fires from August to November. |
| Tohumeta | a. Land preparation is done from July to October, namely cutting/slashing grasses in July and August and burning in September and October.<br>b. Seeding of upland crops is the main activity in November and December, while the harvest seasons of the crops varies with types of crop, such as maize in April and May, sweet potato in May and June, and peanut in May.<br>c. Coffee is harvested for two (2) to three (3) months from June to August.<br>d. The communities grow and produce vegetables from June to September. |

Source: JICA Project Team (2011)

## 3.4 Prevailing Farming and Land Management Practices

Prevailing farming practices and customary norms on land use in the villages were confirmed through the separate group discussions by male and female participants. Some highlights in the discussions are also summarized below.

**Prevailing Farming Practices and Land Management System in the Target Villages**

| Suco | Prevailing farming practices |
|---|---|
| Fadabloco | **Prevailing farming practices**<br>a. The shifting cultivation that the communities currently practice is not literally the same as they used to do before. They set aside several plots for farming and use one of them for producing annual crops in a rotating manner.<br>b. Maize, cassava, sweet potato, taro, yam, beans, and banana are the major crops planted under the shifting cultivation system. After harvesting of annual crops in the first year, the farm is left fallow and used for |

| Suco | Prevailing farming practices |
|---|---|
| | production of biennial crops, such as cassava and banana.<br>c. The advantage of the shifting cultivation system is to be able to recover the soil fertility in the farms, while the disadvantages are that: i) the location of the farms are far from the houses; ii) land preparation is time-consuming and laborious; and iii) burning the area might cause a wild fire.<br>d. Accordingly, one household has one (1) to seven (7) plot/s for shifting cultivation and the average size of one plot ranges from 0.5 to 1.0 ha/plot.<br>**Current land management system**<br>a. There is no landless or tenant household in the village. Every household owns their lands.<br>b. There is no government land in the village, but each aldeia sets a certain area apart from private lands to produce offering to church.<br>c. No land in the village can be sold to anyone.<br>d. Anyone, even a person outside the village, can use or rent part of the land in the village with permission of an owner of the land, but only for production of annual crops.<br>e. The land is inherited along the male line.<br>f. A family that own 5-7 ha is considered as a large land owner, while a family that has 0.5 – 1.0 ha is categorized as a small land owner.<br>g. There is no written regulation on the use of land in the village. |
| Faturasa | **Prevailing farming practices**<br>a. Many households are currently practicing a shifting cultivation system, which uses several plots for producing annual and biennial crops in a rotating manner. Accordingly, no one open or clear forests for farming at present.<br>b. There are two types of farming system in the village, namely i) short-term shifting cultivation system and ii) fixed/permanent farming.<br>c. Under the shifting cultivation system, annual crops (e.g., maize, cassava, sweet potato, beans, etc.) and biennial crops (e.g., cassava and banana) are simultaneously planted in the same plot. After harvesting annual crops, the communities leave the farm fallow and harvest the biennial crops from time to time.<br>d. The advantages of the shifting cultivation system are: i) high productivity owing to high soil fertility in the first year and ii) rather low labor requirement in land preparation as compared to that for the improved permanent farming (such as terrace making). On the other hand, the disadvantages are: i) less production in the second year due to soil erosion, ii) frequent crop damage by animals/rodent, and iii) high potentiality for forest fires.<br>**Current land management system**<br>a. Most of the lands in the village are owned by Uma Lisans (heads of kinship groups/clan families). One Uma Lisan exists in each aldeia. However, there is no landless household.<br>c. Many households used to use the lands owned by the head of kinship groups without charge, but they can grow only annual crops.<br>d. In 2010, the heads of kinship groups recognized the land use rights of the tenant farmers. At present, the tenants can plant perennial crops/trees in the lands and use the same lands for free for several generations/forever, although the land ownership of the lands still remain at the land owners.<br>e. As a result, one household own two to several plots for shifting cultivation at present. |
| Houtoho | **Prevailing farming practices**<br>a. Many communities in the village except those living in Aldeia Rebutu practice a shifting cultivation system which uses several fixed plots for producing upland crops in a rotating manner.<br>b. Communities in Aldeia Rebutu currently use only one or two plots for producing upland crops due to the limitation of farmland. Hence, they practice a fixed farming system in a way.<br>c. Several crops, such as maize, cassava, taro, kontas, beans (pigeon pea, koto moruk, and rehe) are generally grown under shifting cultivation, while only maize and red beans are grown in permanent farms.<br>d. Advantages of shifting cultivation are to: i) make the abandoned areas fertile; ii) secure stable production; iii) utilize slope areas for crop production; iv) keep some food crops in the fallow lands; and v) be able to harvest farm crops in the farms when preparing the same lands. Its disadvantages are the facts that: i) it requires hard works in its operations; ii) there is a need to plant leguminous crops to make soil fertile; iii) surface soils in the farms are washed away during the raining season; iv) the plots for shifting cultivation are far from their houses; and v) crops grown in the plots are often damaged by animals.<br>e. The average size of the plot is about 1 ha/plot and the average number of plots is three (3) plots/family raging from one (1) to five (5) plots/family in Aldeia Remehei and Aibutihun.<br>f. The average size of the permanent farm in Aldeia Rebutu is one (1) ha or more.<br>f. One plot is used for farming for a maximum of two (2) years.The fallow period is three (3) to four (4) years on average, although it depends on the number of plots owned by a household.<br>**Current land management system**<br>a. All the lands in the village used to be owned by 11 heads of kinship groups (uma lisans), namely three in Aldeia Aibutihun, seven in Remehei, and one in Rebutu.<br>b. At present, all the communities in the village hold their own lands, as the heads of kinship groups had distributed their lands to the members of the respective groups before. |

| Suco | Prevailing farming practices |
|---|---|
| | c. The areas remaining as Eucalyptus forests in Aldeia Aibutihun is still owned by one leader in the aldeia. In such an area, anyone can cut trees for house construction with permission from Chef de Suco and Chef de Aldeia, but no one can use the same for farming without permission from the owner (the leader of kinship group).<br>d. No government land exists in the village, but there is a land managed and used by Church. The area is considered as a common land that can be used for production of offerings to church and as a temporary farm for those who need to produce food crops.<br>e. The lands in the village cannot be rent to any communities except family members to prevent any issues/disputes over land.<br>f. Only annual crops or short-terms crops can be grown in the rented land. |
| Madabeno | **Prevailing farming practices**<br>a. Communities practice a shifting cultivation system using two to several plots for production of upland crops with a certain fallow period in a rotating manner.<br>b. In addition to farms for shifting cultivation, they also have permanent farms.<br>c. The average size of a plot for shifting cultivation ranges 0.5 to 1.0 ha/plot, while that for permanent farm is 0.2 to 0.4 ha/plot.<br>d. The major farming practices under both systems are similar, namely i) slashing (including cutting trees for shifting cultivation), ii) burning the slashed stuff in the field, iii) planting, iv) weeding, and v) harvesting.<br>e. When the height of the weed covering the plot becomes more than 2 meters in the fallow period, the area can be reused for farming.<br>f. Disadvantages of shifting cultivation are the possibilities of causing: i) deforestation, ii) decrease of big trees, iii) shortage of water, iv) landslide, v) forest fire, and vi) increase of crop damage by rodent, while the same of permanent farming is the low crop yield.<br>**Current land management system**<br>a. All the households in the village own enough farmlands for farming. There is no landless household in the village.<br>b. There is no government land or communal land in the village. All the lands in the village belong to either households or kinship groups in the village.<br>c. A family that faces a shortage of food can use a land owned by someone with permission of an owner of the land, but only for production of annual crops.<br>d. The land is inherited along the male line.<br>e. The village developed the village regulations in writing with a Tara Bandu ceremony in 2010. |
| Talitu | **Prevailing farming practices**<br>a. Like in the other target villages, communities do not literally practice the swidden farming, but practice a shifting cultivation system using several fixed plots for farming in a rotating manner.<br>b. Under the current farming system, several crops, such as maize, cassava, beans, taro, banana, etc., are simultaneously planed in the same plot in the first year. The area is laid fallow for several years after harvesting annual crops.<br>c. One household owns two (2) to five (5) plots for shifting cultivation on average. The size of the plot is estimated at 0.4 ha/plot to 1.6 ha/plot.<br>d. Disadvantages of shifting cultivation are that: i) it requires more laborers for land preparation than the permanent farming does; ii) it may cause a shortage of water, landslide, soil erosion, and forest fire; iii) crops in the farms are susceptible to crop damage by rodent; and iv) the farms are far from the residential areas and it usually takes one to four hours from a house to the farm.<br>e. Disadvantages of permanent farming are i) low fertility and ii) difficulty in controlling weeds.<br>f. High yields of crops in the first year and easiness in weed control are the major advantages of shifting cultivation, while easy access to farms is the advantage of permanent farming.<br>**Current land management system**<br>a. Most of the households in the village have their own lands.<br>b. Some households rent farms from other households to produce staple crops, such as maize and cassava. However, they are not allowed to plant perennial crops and trees in the rented lands. In general, a tenant can use the same land from one to five years.<br>c. No government land exists in the village, but there is a communal land in Aldeia Talitu. Such a land are used by households who need to produce their food crops.<br>d. Although Tara Bandu (the customary norms) has not been revived yet, the village has traditional rules on the use of natural resources including land. |
| Tohumeta | **Prevailing farming practices**<br>a. Shifting cultivation is the prevailing farming sytem in the village. However, the areas for shifting cultivation have gradually decreased. It has been difficult for communities to secure laborers needed for management of shifting cultivation farms as their children go to school in the daytime.<br>b. Several fixed plots are used for cropping in a rotating manner under the shifting cultivation system.<br>c. Communities have two types of farm, i) area for shifting cultivation and ii) fixed farm/home garden. The former is located far from their houses, while the latter is usually developed in the vicinity of their houses. |

| Suco | Prevailing farming practices |
|---|---|
| | d. Maize, cassava, and banana are the major crops planted under the shifting cultivation system, while several crops (e.g., maize, cassava, taro, sweet potato, and kontas) are planted in the fixed farms.<br>e. Disadvantages of shifting cultivation are: i) high likelihood of crop damage caused by rodent and monkey; ii) likelihood of occurrence of forest/wild fires; iii) high labor requirement in the operations; and iv) likelihood of soil erosion/landslide.<br>f. Communities feel that it would be difficult to continue shifting cultivation, but they also believe that they need to continue it for securing daily food as well as their lands.<br>**Current land management system**<br>a. Every household in the village has its own lands for farming (shifting cultivation and permanent farming) and houses. There is no landless in the village.<br>b. Communities can use someone's land only for production of short-term crops, such as cassava, maize, and sweet potato, with permission of an owner of the land. But planting of trees and perennial crops are not allowed in such a land.<br>c. Traditionally, a father of bride can offer his land to a groom who comes from other villages but stay in the village. The ownership of such a land still remain at the bridge's parent but the new couple can use the land for surviving.<br>d. The land is inherited in the male line.<br>e. One household holds four (4) plots for farming on average. |

Source: JICA Project Team (2011)

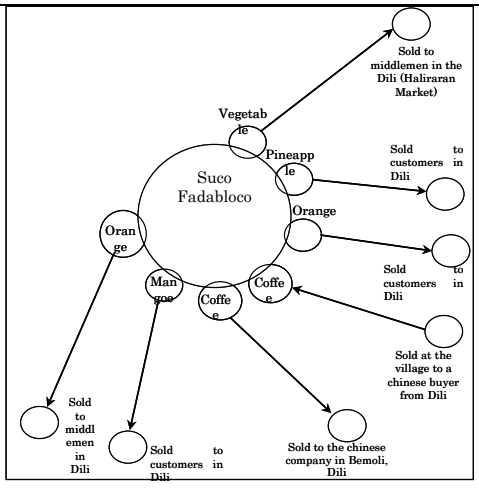
## 3.5 Major Potential Natural Resources for Livelihood Improvement

The major agricultural products and natural resources relevant to livelihoods of local communities and their marketing conditions in the respective target villages are summarized as follows.

**Marketing Conditions of the Major Commodities in the Target Villages**

**a. Fadabloco**

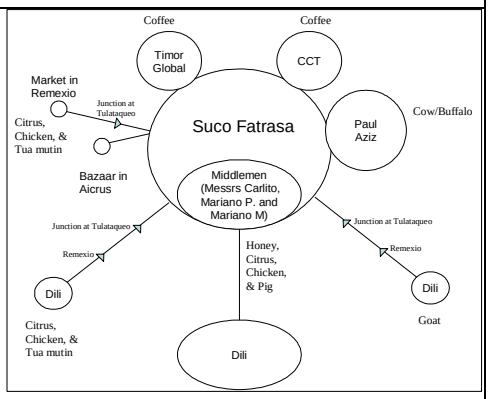
| Topics | Descriptions |
|---|---|
| List of important products/resources | ➢ Had identified a number of agricultural products and natural resources available in the village, male and female community members selected the following resources/products as important ones for their livelihoods.<br><table><tr><td>Group</td><td>Priorities (in the order of priority from highest to lowest)</td></tr><tr><td>Male</td><td>1. Coffee, 2. Vegetables, 3. Orange, 4. Mango, 5. Pineapple</td></tr><tr><td>Female</td><td>1. Tua, 2. Vegetables, 3. Chicken, 4. Pig, 5. Coffee, Orange, and Pineapple</td></tr></table>➢ The male participants considered the total sale as the most important factor, while the stable and long-period cash flow seemed to be the most important factor for the female participants. |
| Market Conditions of the Major Products | ➢ Coffee is mainly sold to a Chinese middleman at US$ 0.25/kg in cherry or US$ 1.25/kg in parchment. Vegetables are sold to the middlemen at US$ 0.5/bundle in Hariraran market in Dili, while Orange, Mango, and Pineapple are sold at US$ 1.0/bundle or piece in the markets in Dili.<br>➢ The communities have two ways to carry the products/commodities to Dili, namely:<br>1. One hour walking to Remexio and taking the public transportation to Dili (@ US$ 1/person/one-way trip)<br>2. Two hours walking to Liquidoe and taking the public transportation to dili (@ US$ 2.5/person/one-way trip with additional charge for the products) |



**Market Flows of the Products in Fadabloco**

**b. Faturasa**

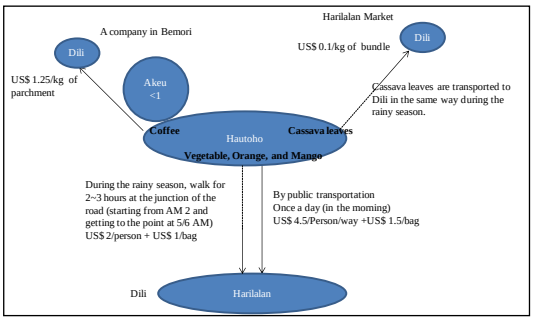
| Topics | Descriptions |
|---|---|
| List of important products/resources | ➢ Both male and female community members identified a number of agricultural products and natural resources available in the village. Among others, the following resources were selected as important ones.<br>Group: Male — 1. Coffee, 2. Cattle, 3. Pig, 4. Chicken, 5. Citrus<br>Group: Female — 1. Water, 2. Land, 3. Cassava, 4. Maize, 5. Tree<br>➢ Male members consider the marketability as well as price of the products as the crucial factors in judging the importance of the products, while the relevance to their lives is the essential factor for female members. |
| Market Conditions of the Major Products | ➢ Coffee is sold to either Timor Global or CCT.<br>➢ Honey, chicken, and pig are sold to the middlemen living in the village.<br>➢ Likewise, citrus is mainly sold to the middlemen living in the village. Some are also sold at the bazaar/market in Aicrus and Remexio.<br>➢ Cattle and buffalo are sold to the slaughterer (Mr. Paul Aziz). |



**Market Flows of the Products in Faturasa**

**c. Hautoho**

| Topics | Descriptions |
|---|---|
| List of important products/resources | ➢ The five most important resources/products were identified by male and female community members among a number of agricultural products and natural resources available in the village.<br>Group: Male — 1. Cassava, 2. Maize, 3. Orange, 4. Coffee, 5. Pig<br>Group: Female — 1. Vegetables, 2. Cassava, 3. Coffee, 4. Citrus, 5. Mango<br>➢ The male members gave higher priority to food crops, while the female members considered the marketability and length of growth period of the crops as important factors for their judgment. |
| Market Conditions of the Major Products | ➢ The products except coffee are sold at the Harilalan market in Dili.<br>➢ The transportation of farm products from the village to Dili costs US$ 4.5/way for a person and US$ 1.5/way for one bag.<br>➢ Coffee is mainly sold to the buyer (named Akeu) who visits the village during the harvest season. There are some communities who bring and sell coffee to a company in Dili.<br>➢ The major problems/concerns on marketing are: i) poor road condition; ii) lack of public transportation services; iii) lack of bargaining power; and iv) existence of many competitors in the market. |



**Market Flows of the Products in Hautoho**

### d. Madabeno

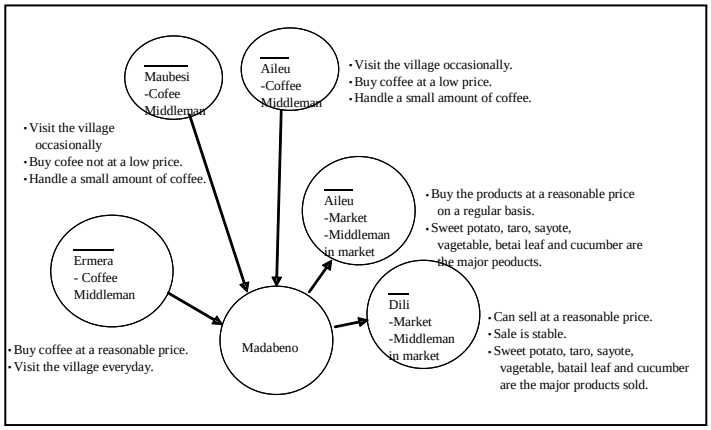
| Topics | Descriptions |
|---|---|
| List of important products/resources | ➢ The following are the most important agricultural products and natural resources selected by male and female community members among those available in the village. |

| Group | Priorities (in the order of priority from highest to lowest) |
|---|---|
| Male | 1. Coffee, 2. Maize, 3. Cassava, 4. Sweet Potato, 5. Tua Mutin |
| Female | 1. Maze, 2. Cassava, 3. Sweet potato, 4. Coffee, 5. Vegetables |

➢ Marketability of the products/resources is the most important factor for the male participants to prioritize the important products/resources.

➢ The female participants gave priority to food crops than cash crops. Among others, maize was ranked as the most important crop as it was the main staple crop.

| Topics | Descriptions |
|---|---|
| Market Conditions of the Major Products | ➢ Coffee is sold to middlemen at the village in the form of either cherry or parchment. The farmgate prices of cherry and parchment in 2010 are US$ 0.3/kg and US$ 1.5/kg, respectively.<br>➢ Agricultural crops, such as sweet potato, cassava, vegetables, taro, sayote, and cucumber, are sold at the roadside stand or in Halilaran/Taibesi markets in Dili.<br>➢ Tua and betal leaves are sold in the market in Aileu.<br>➢ The transportation cost is rather expensive. One way trip to Dili or Aileu from Madabeno by mini truck costs US$ 1.5/person and US$ 0.5/sack in 2010. |



**Market Flows of the Products in Madabeno**

### e. Talitu

| Topics | Descriptions |
|---|---|
| List of important products/resources | ➢ Among 12 agricultural products and three natural resources identified as available resources in the village, communities selected the following agricultural products as the five most important ones. |

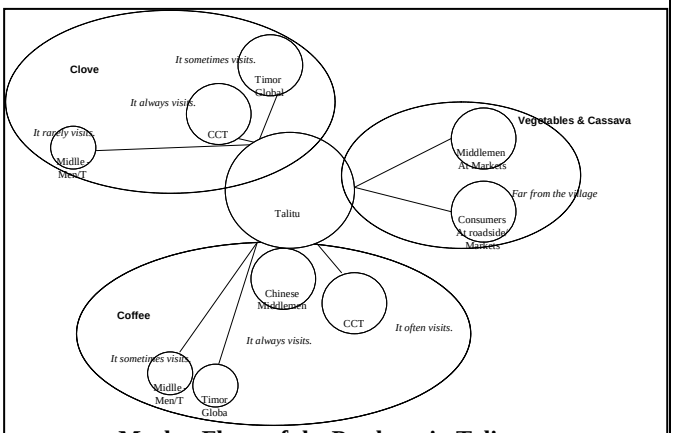
| Priorities (in the order of priority from highest to lowest) |
|---|
| 1. Cassava (as a key staple crop), 2. Maize (as a key staple crop), 3. Coffee (as a main source of income), 4. Vegetables (as a short-term crop), 5. Clove (as another source of income) |

Market Conditions of the Major Products

➢ The marketing conditions of the major crops are summarized below.

| Products | Items | Outlines |
|---|---|---|
| Coffee | Outlets | CCT, Timor Global, Middlemen |
| | Place of sale | Each aldeia (at the main road) |
| | Price (2010) | US$ 0.25/kg (cherry) and UUS$ 1.25/kg (parchment) |
| | Hauling method | On foot / Human power to the main road |
| Clove | Outlets | CCT, Timor Global, Middlemen |
| | Place of sale | Dili (CCT and Timor Global) and village |
| | Price (2010) | US$ 5/kg (@ CCT) and UUS$ 4.5/kg (@ Timor Global) |
| | Hauling method | Public transportation to Dili |
| Vegetables | Outlets | Middlemen and consumers |
| | Place of sale | At the main road and markets in Dili |
| | Hauling method | Public transportation and/or on foot to Dili |
| Cassava | Outlets | Middlemen and consumers |
| | Place of sale | Markets in Dili |
| | Price (2010) | US$ 5/sack at markets in Dili |
| | Hauling method | Public transportation and/or on foot to Dili |

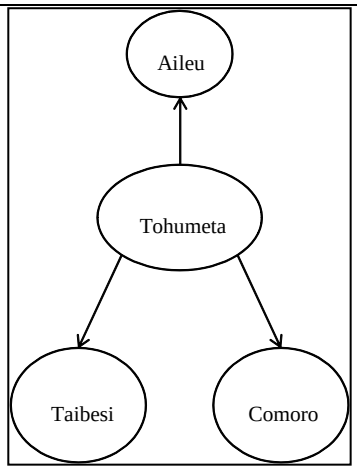
| Topics | Descriptions |
|---|---|
| | ➢ The marketing flows of the above-listed products are shown below. |



**Market Flows of the Products in Talitu**

**f. Tohumeta**

| Topics | Descriptions |
|---|---|
| List of important products/resources | ➢ A total of 12 natural resources and agricultural products were identified as important resources. Among others, cassava, banana, and timber were selected as the most important ones followed by vegetables and fruits based on the evaluation in terms of production, frequency of marketing, time needed, and labor requirement.<br>➢ The communities evaluated that cassava, banana, and timber were highly produced in the village, and could be easily sold at the market. |
| Market Conditions of the Major Products | ➢ Cassava is mainly brought to and sold in Taibesi market. The price of fresh cassava was US$ 0.5/bunch in 2007, while that of dried cassava was US$ 0.25/bunch in the same year. Since there is no specific buyer who comes to the village to buy it, the communities need to bring the product to the market.<br>➢ Banana is sold at Comoro and Taibesi markets. The communities carry bunches of banana putting them in sacks. The price of banana was US$ 0.25~0.5/bunch in 2007. In general, they consider that the price of banana is low due to low quality.<br>➢ Vegetables are also sold in Comoro and Taibesi markets. The ommunities hang and carry vegetables (50~70 bunches/person) to the markets. The price of vegetables ranged from US$ 0.1 ~ 0.4/bunch in 2007. They have some contacts among the buyers in the markets.<br>➢ Communities also bring their products to Aileu market, but the frequency is not as high as they bring them to those in Dili. In general, the selling prices in Aileu are cheaper than those in Dili. |



**Market Flows of the Products**

Source: JICA Project Team (2011)

## 3.6 Institutions/Organizations working for/relating to the Target Villages

Village institutions and organizations working for the target villages were identified through the venn diagram method. The method also revealed the importance of the institutions/organizations as well as the proximity from the village or accessibility to the institutions as summarized below.

| Suco | Relevant institutions/organizations |
|---|---|
| Fadabloco | ➢ Church, Sub-district Administrative Office in Remexio, and Clinic are considered important and close to the village.<br>➢ The Ministry of Social Solidarity and National Directorate for Sanitation and Water Suppy are also considered important but the accessibility to them are considered rather farer.<br>➢ A private company or middleman named Akeu is also regarded as an important organization/person since it has bought coffee and supported the communities by fixing the road and providing rice to some households in the village.<br>  |
| Faturasa | ➢ USC Canada Timor-Leste (NGO), Department of Health (Clinic), Veterinary service (a village volunteer) and Church are considered important as well as easy to access in 2007.<br>➢ Belum was also considered important and the proximity to such an organization was rather close at the time of the survey in 2007.<br>➢ Besides, the National Police and Sub-district Administrative Office are important for the lives of the communities, but they are considered far from the village.<br>  |
| Hautoho | ➢ Church and primary school are the most important and closest organizations to the community.<br>➢ Government organizations, such as MAF, Ministry of Health, Water and Sanitation are considered also important but the service coverage does not seem sufficient.<br>➢ Although several NGOs, such as Plan, Boro-Mori, NFT and CWS have been implementing the activities in the area of education, sanitation and agriculture in the community, their support seems to be limited.<br>  |
| Madabeno | ➢ Suco Council and Church are the most important and closet organizations for the village.<br>➢ The government organizations, namely the Ministry of Health (clinic), State Secretary for Veterans, PNTL, Ministry of Administration, Interior and Territory, Ministry of Social Solidarity, are also considered important since these organizations supported the communities in the village.<br>➢ There are some NGOs (e.g., World Vision, Plan International, and other local NGos) working in the village, but the support from those organizations seems to be limited.<br>  |

| Suco | Relevant institutions/organizations |
|---|---|
| Talitu | ➢ The communities consider that key government organizations (i.e, the Ministry of Social Solidarity, Ministry of Education, Ministry of Health, Ministry of Agriculture and Fisheries, Ministry of Administration, Interior and Territory, National Directorate for Sanitation and Water Supply) are easy to access but their supports/services given to the village are limited.<br>➢ On the other hand, they seem to appreciate the supports given by the NGOs, such as Plan International, HAFOTI, and Bili Maharu. But their support is not permanent or continuous.   |
| Tohumeta | ➢ Tokoh Adat (elder's group), Ministry of Health (mobile clinic) and Suco Council are considered as key important organizations in the community. Among them, Tokoh Adat functions as decision maker in solving internal conflicts in the village.<br>➢ World Vision has assisted the community in the area of education, health and agriculture.<br>➢ Government organizations, such as Ministry of Education, Ministry of Social Solidarity and MAF are considered important but their involvement in the development of the community seem to be still limited.   |

## 3.7 Natural Resource Management in the Target Villages

Customary and/or current rules on natural resource management in the target villages, which were discussed in the plenary discussions on the same topic in PRA are summarized below.

**Customary Rules on Natural Resource Management in the Target Villages**

| Suco | Prevailing farming practices |
|---|---|
| Fadabloco | **Customary Rules on Natural Resource Management**<br>a. In the Portuguese era, Tara Bandu was effective in regulating the use of natural resources by local communities in the village. Tara Bandu prevented local people from cutting trees illegally and entering the someone's area without permission.<br>b. The regulations of Tara Bandu were not written and inherited orally.<br>c. The regulations/rules implemented in the Portuguese era were not implemented in the Indonesian times. Many local communities cut trees and burn forests since the Indonesian army did the same.<br>d. Most of the communities have forgotten the rules of Tara Bandu.<br>e. The village leaders have advised the communities to observe the government regulations, but many of them have not followed the regulations.<br>**Village Structure on Natural Resource Management**<br>a. In the Portuguese era, Uma Lisan (a head of kinship group/clan) was responsible for management of natural resources in the respective territories.<br>b. In the Indonesian times, Kepala Desa (Chief of Village) had the overall responsibility for natural resource management in the village.<br>c. Chef de Suco with the support from Chefs de Aldeia takes the leading role in natural resource management in the village at present.<br>**Intention to Develop the Village Regulations**<br>a. Chef de Suco stated that the village should develop its own regulations in writing to control natural resources in the village. Other communities in the village agreed with his idea of developing the village regulations through a series of dialogues among the communities in the village. |

| Suco | Prevailing farming practices |
|---|---|
| Faturasa | **Customary Rules on Natural Resource Management**<br>a. Tara Bandu was effective in protecting forests and other natural resources in the Portuguese era, but it was disregarded in the Indonesian times.<br>b. The reasons why Tara Bandu was effective in the Portuguese era are that: i) the government enforced the law strictly and ii) there was community police in the village.<br>c. On the other hand, the reasons why Tara Bandu was not effective in the Indonesian times are that: i) the law enforcement of the government was weak, ii) the Indonesian army burned forests to fight against querrillas, iii) there was no community police, iv) people did not make firebreak lines when burning the fields, and v) burning became a common practice for grazing.<br>d. Since the revival of Tara Bandu with the formulation of the village regulations in 2008, there has been no forest fire or illegal cutting. The incidence of crop damage caused by animals has also declined.<br>**Village Structure on Natural Resource Management**<br>a. The suco council has responsibility to implement the village regulations. Any issues shall be first discussed and settled at aldeia level. In case the issue can not be solved at the aldeia level, it shall be handled at suco level.<br>**Intention to Develop the Village Regulations**<br>a. The village leaders stated that they intended to revise the regulations by adding the articles concerning i) the cost sharing for arbitration and ii) the right to kill an animal that enters a farm and damages crops in a farm. |
| Hautoho | **Customary Rules on Natural Resource Management**<br>a. In the Portuguese times, there were few villagers who stayed away from the village and were not aware of Tara Bandu regulations. Hence, there had been sometimes wild fires in the village.<br>b. Tara Bandu regulations in the Portuguese times were not written and a kind of oral tradition in the village.<br>c. There was only one Cablonda (suco police) in the village, who was responsible for enforcement of the regulations; it was difficult to control all the activities of local communities in three aldeias.<br>d. Tara Bandu regulations were not effective during the Indonesian occupation. Instead, there were some notices given by the Indonesian government on the prohibition of illegal cutting and wild fire .<br>e. The notices were also not effective in protecting forests as the Indonesian army burned the areas to capture guerrillas and many local communities also committed illegal activities during the times.<br>f. Currently, there is no Tara Bandu refulations in the village.<br>g. The village leaders have kept informing local communities of the government regulations every month in the general meetings of suco, however some communities do not follow the orders of the leaders.<br>**Any existing cases in which those rules were implemented**<br>a. In 2002, there was a big wild fire that ended up in burning many farms and houses in Aldeia Remehei. A ceremony was held to remind local communities of the necessity to take precautions against fires.<br>b. A case of crop damage caused by animals is to be solved by the mutual discussion between the relevant parties with the presence of the village leaders.<br>c. The village leaders have not imposed any penalty on persons committed illegal cutting or any activities causing a wild fire so far. They have just given warnings to those who committed the illegal activities.<br>**Intention to Develop the Village Regulations**<br>a. The participants as well as Chefe de Suco showed their willingness to develop their own village regulations to manage their lands and forests wisely and sustainably. |
| Madabeno | **Customary Rules on Natural Resource Management**<br>a. Tara Bandu in the Portuguese era was very strong and everyone in the village observed its rules. In fact, anyone who violated the rules was strictly punished or fined.<br>b. The effectiveness of Tara Bandu became very weak in the Indonesian times since the communities were not allowed to gather for a meeting and many Uma Lisans were destroyed/burned by the Indonesian army.<br>c. At the same time, the communities considered that they could cut and burn trees, even sacred ones, as the Indonesian army did the same.<br>d. After the independence, the communities realized that they needed to revive the customary rules and therefore developed the Tara Bandu regulations in writing in 2010.<br>e. Since the village regulations were developed without sufficient consultations with local communities and dissemination of the village regulations was also insufficient, the enforcement of the regulations is still limited.<br>**Village Structure on Natural Resource Management**<br>a. The suco council is responsible for implementation of the Tara Bandu regulations. The tasks of the council are to: i) prevent a dispute over land and other natural resources, ii) protect natural resources from illegal exploitation, and iii) solve any issues and disputes in the village.<br>b. In case a dispute occurs in the village, the issue shall be handled by Lianain in aldeia. If the issue can not be solved, the council takes over it. |

| Suco | Prevailing farming practices |
|---|---|
| Talitu | **Customary Rules on Natural Resource Management**<br>a. Tara Bandu in the Portuguese era was strong enough to regulate the activities of the communities in the village. The strong law enforcement of the government enhanced the effectiveness of Tara Bandu.<br>b. Tara Bandu banned: i) cutting trees illegally, ii) doing any activities causing forest fires, iii) stealing agricultural products from the farms and iv) harvesting agricultural, forestry and fishery resources before the harvesting seasons.<br>c. Although Tara Bandu was effective in the Indonesian era, its effectiveness was not as strong as it was in the Portuguese era.<br>d. The Indonesian army burned forests to fight against guerrillas disregarding the Tara Bandu regulations. It caused the weakening of the effectiveness of Tara Bandu among the communities.<br>e. Accordingly, Tara Bandu still exists in the minds of the communities in the village, but its effectiveness is still weak.<br>f. The village leaders have advised the communities to observe the rules of Tara Bandu, but many of them have not followed.<br>**Village Structure on Natural Resource Management**<br>a. In the Portuguese era, Liurai (local ruling family or local king) managed and solved the issues in the village.<br>b. Kepala Desa (Chief of Village) was responsible for all the administrative matters in the village in the Indonesian times.<br>c. At present, the suco council headed by Chef de Suco has responsibility to protect natural resources and solve / mediate any issues in the village. |
| Tohumeta | **Customary Rules on Natural Resource Management**<br>a. Tara Bandu was effective in the Portuguese era in terms of prohibition of entering others' lands, wild fires, illegal cutting and free grazing.<br>b. In the Indonesian times, Tara Bandu was not effective any longer, but there were the government regulations on illegal cutting and free grazing. Local communities generally obeyed the government regulations owing to the presence of the military in the village.<br>c. Communities who were not familiar with Tara Bandu as well as the regulations given by the Indonesian government committed the illegal activities between 2002 and 2007.<br>d. The village regulations were in place in 2008, but there have been some illegalities found in the village. The regulations seem to have not been properly enforced. Accordingly. no fine or penalty has been imposed on any violations so far.<br>e. Communities in the neighboring villages are not aware of the village regulations of Tohumeta.<br>**Village Structure on Natural Resource Management**<br>a. Leader of Uma Lisan is responsible for solving i) domestic troubles, ii) land disputes, and iii) issues/problems between families. Chefe de Aldeia is responsible for solving the issues/problems in Aldeia level and those which cannot be solved by the Leader of Uma Lisan. Chefe de Suco has the responsibility for solving any issues in Suco as well as those which cannot be solved by Chefe de Aldeia.<br>b. The suco committee for the village regulations still functions at present and hold a meeting every 3 months.<br>**Intention to Develop the Village Regulations**<br>a. The village regulations need to be reinforced to make them more effective and enforceable. |

# Table-1 (1) Fact sheet on socio-economic and agriculture situations in Suco Madabeno

| Items (unit) | Data |
|---|---|
| 1. General | |
| (1) Administrative section | Aileu District, Laulara Sub-district |
| (2) Number of sub-villages (aldeias)*1 | 6 sub-villages (Aldeia Manehalo, Lismori, Bilumahatu, Desmananhata, Remapati and Manufoni) |
| (3) Total area*1 (sq km) | 11.54 |
| (4) Total population*1 (person) | 1,473 |
| (5) Total number of household (HH) s*1 | 327 |
| (6) Major languages | Tetun and Mambae |
| 2. General features of HHs | |
| (1) Settlement years of HHs (% of HHs to total) | Before 1975 (48.3%), 1975-1999 (31.7%), 1999-2002 (8.3 %), 2002-2010 (8.3 %), After 2010 (1.7 %) |
| (2) Number of HH members (person) | 7.0 |
| (3) Average age of HH members (years old) | 18.5 |
| (4) Number of members under working age (14-65 years old) (person) | 5.7 |
| (5) Features of head of HHs | ・Occupation: farmer (71.7%)<br>・Education: No graduated from primary school (56.7%)<br>・Organization: Group of traditional leaders (3.3%), Village committee (3.3%), Religious organization (5.0%), Farmers Group (6.7%), No member (73.3%) |
| (6) Food shortage Period | October - February |
| (7) Frequency of meals (times/day) | ・Normal (N): 2.9<br>・Food shortage (FS): 2.1 |
| (8) Frequency of consumption of major meals (times/day) | (N→FS)<br>Rice: 2.7→1.5, Corn:0.9→0.6, Beans:0.5→0.3, Cassava: 0.8 →0.8, Kontas: 0.6→0.6, Banana:0.6→0.6 |
| 3. Land use in the village | |
| (1) Area of land owned by HH (ha/HH) | ・Total holding size: 5.7<br>・Home garden: 0.1, Fixed upland without soil conservation: 0.5, Fixed upland with soil conservation: 0.2, Shifting cultivation: 0.4, Coffee plantation: 1.4, Fallow area for shifting cultivation: 1.2, Forest: 1.2, Grazing place: 0.8 |
| (2) HHs owing the land (% of HHs owing the land to total) | Home garden: 100%, Fixed upland without soil conservation: 65 %, Fixed upland with soil conservation: 3.3%, Shifting cultivation: 73.3 %, Coffee plantation: 83.3 %, Fallow area for shifting cultivation: 68.3 %, Forest: 28.3 %, Grazing place: 20.0 % |
| (3) Shifting cultivation practices – Period of using area before shifting (years) | 1.8 |
| (4) Shifting cultivation practices – Fallow period (years) | 2.2 |
| (5) Shifting cultivation practices – use of the same site after fallowing the area | Yes (85 %) |

# Table-1 (1) Fact sheet on socio-economic and agriculture situations in Suco Madabeno

| Items (unit) | Data |
|---|---|
| 4. Livelihood and income/expenditure | |
| 4.1. Income and expenditure | |
| (1) Annual income (USD/HH) | ・Total income: 845.8<br>・Breakdown:<br>Selling maize: 11.5, Selling tubers 47.5, Selling coffee 219.4, Selling fruits: 28.4, Selling livestock products: 17.5, Selling timber: 11.8, Selling NTFP: 1.3, Salary from permanent job: 281.0, Wage from temporary job: 55.3, Private business: 61.6, Remittance from family members: 68.7 and Others(e.g., subsidies): 41.8. |
| (2) Annual expenditure (USD/HH) | ・Total expenditure: 368.9<br>・Breakdown:<br>Food: 218.5, Health: 16.1, Education: 24.04, Clothes: 66.8, Firewood or other fuels: 43.5 |
| (3) Investment of productive and fixed assets (USD/HH) | ・Total amount: 33.9<br>・Breakdown:<br>Livestock: 0.8, Housing(improvement/repair): 14.7, Household appliance: 16.8, Private business: 1.6 |
| 4.2. Agriculture | |
| (1) Major crops (Mode of cropping and % of HHs responding to total) | Maize (Mix: 95% and No planting: 5 %),<br>Cassava (Mono: 1.7 %, Mix: 83.3% and No planting 8.3 %),<br>Sweet potato (Mono: 1.7 %, Mix: 86.7 % and No planting: 1.7 %), Taro (Mix: 35%), Coffee (Arabica: Mix: 6.7%, Separated: 71.7%), |
| (2) Major fruits (% of HHs planting) | Mango (78%) and Banana (77%) |
| (3) Gross cropped area (ha/HH) | Maize: 0.5, Cassava: 0.9, Sweet potato: 0.5, Taro: 0.2, Coffee (Arabica): 0.6 |
| (4) Volume of seed applied/Number of trees planted for coffee and fruits | Maize: 47.8 kg/ha, Cassava: 0.8 bunches/ha, Sweet potato: 9.2 bunches/ha, Taro 27.1 kg/ha, Coffee (Arabica) 488.2 trees/HH, Mango 6.7 trees/HH, Banana 10.7 trees/HH |
| (5) Seeds (type, availability and source) | ・Type: Local variety<br>・Volume: Sufficient/not sufficient but still available.<br>・Seed source: Most of seeds used is derived from their own reserves, except those of cassava procured outside their village. |
| (6) Fertilizers/Insecticide | No organic/chemical fertilizers, insecticides and fungicides are applied. |
| (7) Major causes of crop damages | Animals, pest, heavy rain and wind |
| (8) Yield of major crops (kg/ha) | Maize: 369.3, Cassava: 274.1, Sweet potato 337.4, Taro: 166.5, Coffee (Arabica): 569.7 |
| (9) Mode of post-harvesting | Put above the fire for maize |
| (10) Volume of lost during post-harvesting (% of volume lost during post-harvesting to total production) | Maize: 6.6, Cassava: 3.2 Sweet potato: 4.0, Taro: 5.8, Coffee (Arabica): 0.1, Mango: 16.5, Banana: 11.3 |
| (11) HHs selling crops (% of HHs selling) | Maize: 16 %, Cassava: 16 %, Sweet potato: 15 %, Taro 19%, Coffee (Arabica): 92 %, Mango: 47 %, Banana: 59 % |

# Table-1 (1) Fact sheet on socio-economic and agriculture situations in Suco Madabeno

| Items (unit) | Data |
|---|---|
| (12) Unit price of major crops (USD/kg) (2011) | Maize: 0.5, Cassava: 0.1, Sweet Potato: 0.1, Taro: 0.1, Coffee (Arabica): 0.9, Mango: 1.0, Banana: 1.2 |
| (13) Annual sales of major crops (USD/HH) (2011) | Maize: 11.5, Cassava: 8.5, Sweet potato 16.7, Taro: 2.3, Coffee (Arabica): 219.7, Mango 20.6, Banana: 5.7 |
| (14) Major markets for selling crops | ・Coffee: Mostly taken to CCT collection point<br>・Fruits: Sold in the community and/or taken to Dili or sub/district bazaar<br>・Others: Taken to Dili or sub/district bazaar |
| 4.3. Livestock | |
| (1) Number of livestock owned (head/HH) | Cattle: 0.7, Buffalo: 0.2, Goat: 2.3, Horse: 0.2, Pig: 1.7, Chicken: 3.7 |
| (2) Grazing area (% of HHs grazing in the area) in rainy seasons | ・Cattle: Kept in stall (55%), Forest (20%),<br>・Goat: Kept in stall (50%), Grass land (32%) |
| (3) Grazing area (% of HHs grazing in the area) in dry seasons | ・Cattle: Kept in stall (58%), Forest (21%),<br>・Goat: Kept in stall (50%), Grass land (27%) |
| (4) HHs selling livestock (% of HHs selling) | Cattle: 4.2 %, Goat: 2.8 % |
| (5) Unit price of major livestock (USD/head) (2011) | Cattle: 250 USD/head, Buffalo: 250 USD/head, Goat 25 USD/head |
| (6) Annual sales of livestock (USD/HH) (2011) | Cattle: 8.3 USD/HH, Buffalo: 8.3 USD/HH, Goat: 0.8 USD/HH |
| (7) Major markets for selling livestock | Taken to Dili |
| 4.4. Firewood and timber | |
| (1) Major tree species for fire wood (% of HHs using trees for firewood) | Ai ru (51 %), Ai samtuku (21 %), Ai bubur (13 %), Casuarina (11%), Others (4%) |
| (2) Time to collection site for firewood (minutes) | 54.2 |
| (3) Frequency of firewood collection (times/week) | 3.6 |
| (4) Major timber species (%) | Ai ru (100 %) |
| (5) Frequency of timber harvesting (times/month) | 1.9 |
| (6) HHs selling timber (% of HHs selling) | 5.0 |
| (7) Annual sales of timber (USD/HH) | 11.8 USD/HH |
| (8) Major markets for selling timber | Sold in community as well as to traders coming to the village |
| 4.5. NTFP | |
| (1) Major NTFPs (% of HHs producing) | Bamboo (13 %), Honey (2 %) |
| (2) Harvest season of NTFP | Bamboo: May to Aug, Honey: Feb to Apr |
| (3) HHs selling NTFPs (% of HHs selling to HHs producing) | Bamboo (25 %), Honey (0%) |
| (4) Annual sales of NTFP (USD/HH) (2011) | 1.3 USD/HH |
| (5) Major markets for selling timber | Taken to Dili |

| Items (unit) | Data |
|---|---|
| 4. Livelihood and income/expenditure | |
| .1. Income and expenditure | |
| (1) Annual income (USD/HH) | ・Total income: 1238.6<br>・Breakdown:<br>Selling tubers 25.0, Selling coffee 217.5, Selling fruits/tree crops: 106.3, Selling livestock products: 46.6, Selling NTFP: 34.8, Selling handicraft/cottage industries products: 40.0, Salary from permanent job: 600.5, Wage from temporary job: 39.8, Private business: 51.2, Remittance from families: 51.2 and Others(e.g., subsidies): 18.8. |
| (2) Annual expenditure (USD/HH) | ・Total expenditure: 557.1<br>・Breakdown:<br>Food: 352.1, Health: 9.4, Education: 54.0, Clothes: 77.0, Firewood or other fuels: 64.6 |
| (3) Investment of productive and fixed assets (USD/HH) | ・Total amount: 34.7<br>・Breakdown:<br>Farm machinery/tools 0.4, Housing(improvement/repair): 17.8, Household appliance: 15.8, Private business: 0.7 |
| 4.2. Agriculture | |
| (1) Major crops (Mode of cropping and % of HHs responding to total) | Maize (Mix: 65% and No planting: 33.3 %),<br>Cassava (Mono: 3.3 %, Mix: 78.3% and No planting 18.3 %),<br>Sweet potato (Mix: 61.7 % and No planting: 38.3 %), Taro (Mix: 46.7%, No plant: 45.0 %), Coffee (Arabica: Mix: 1.7%, Separated: 91.7%), |
| (2) Major fruits/tree crops (% of HHs planting) | Mango (58.3 %), Banana (58.3 %), Clove (20.0 %) |
| (3) Gross cropped area (ha/HH) | Maize: 0.5, Cassava: 0.6, Sweet potato: 0.5, Taro: 0.2, Coffee (Arabica): 1.3 |
| (4) Volume of seed applied/Number of trees planted for coffee and fruits | Maize: 26.1 kg/ha, Cassava: 11.4 bunches/ha, Sweet potato: 6.3 bunches/ha, Taro: 33.3 kg/ha, Coffee (Arabica): 1,220.5 trees/HH, Mango: 7.2 trees/HH, Banana: 17.8 trees/HH, Clove: 6.2 trees/HH |
| (5) Seeds (type, availability and source) | ・Type: Local variety<br>・Volume: Sufficient/not sufficient but still available.<br>・Seed source: Most of seeds used is derived from their own reserves, except some of maize seeds delivered by government. |
| (6) Fertilizers/Insecticide | No organic/chemical fertilizers, insecticides and fungicides are applied. |
| (7) Major causes of crop damages | Animals, heavy rain, pest and wind |
| (8) Yield of major crops (kg/ha) | Maize: 239.9, Cassava: 377.7, Sweet potato 314.3, Taro: 57.4, Coffee (Arabica): 224.3 |
| (9) Mode of post-harvesting | Put above the fire for maize |
| (10) Volume of lost during post-harvesting ( % of volume lost during post-harvesting to total production) | Maize: 4.2, Cassava: 3.7 Sweet potato: 2.3, Taro: 10.3, Coffee (Arabica): 0.0, Mango: 14.0, Banana: 21.4, Clove: 5.7 |
| (11) HHs selling crops (% of HHs selling) | Maize: 0.0 %, Cassava: 8.2 %, Sweet potato: 5.4 %, Taro 53.6 %, Coffee (Arabica): 85.0 %, Mango: 14.0 %, Banana: 21.4 %, Clove 18.3 % |

## Table- 1 (2) Fact sheet on socio-economic and agriculture situations in Suco Talitu

| Items (unit) | Data |
|---|---|
| (12) Unit price of major crops (USD/kg) (2011) | Cassava: 0.5, Sweet Potato: 0.1, Taro: 0.1, Coffee (Arabica): 1.2, Mango 1.5, Banana: 1.2, Clove: 5.0 |
| (13) Annual sales of major crops (USD/HH) (2011) | Maize: 0.0, Cassava: 4.8, Sweet potato 2.7, Taro: 17.5, Coffee (Arabica): 212.9, Mango 7.4, Banana: 12.1, Clove: 77.5 |
| (14) Major markets for selling crops | ・Coffee: Mostly taken to CCT collection point<br>・Fruits: Taken to Dili or sub/district bazaar and/or sold in the community<br>・Others: Mostly taken to Dili and some sold at sub/district bazaar. Clove is also sold to the traders coming to the village. |
| 4.3. Livestock | |
| (1) Number of livestock owned (head/HH) | Cattle: 0.6, Buffalo: 0.3 Goat: 1.4, Horse: 0.1, Pig: 2.5, Chicken: 4.6 |
| (2) Grazing area (% of HHs grazing in the area) in rainy seasons | ・Cattle: Forest (38%), Grassland (25%), Fallow paddy field (25%), Kept in stall (13 %)<br>・Buffalo: Forest (43%), Grassland (43%), Kept in stall (14 %),<br>・Goat: Grass land (36%), Kept in stall (32%), Forest (25%), Fallow paddy field (7%) |
| (3) Grazing area (% of HHs grazing in the area) in dry seasons | ・Cattle: Forest (38%), Grassland (25%), Fallow paddy field (25%), Kept in stall (13 %)<br>・Buffalo: Forest (29%), Grassland (43%), Kept in stall (14 %), Fallow paddy field (14%)<br>・Goat: Grass land (39%), Kept in stall (32%), Forest (21%), Fallow paddy field (7%) |
| (4) HHs selling livestock (% of HHs selling) | Cattle: 22.2 %, Goat: 7.1 %, Pig: 4.3 %, Chicken: 4.3 % |
| (5) Unit price of major livestock (USD/head) (2011) | Cattle: 329.0, Goat: 80.0, Pig: 87.5, Chicken: 30.0 |
| (6) Annual sales of livestock (USD/HH) (2011) | Cattle: 28.8, Goat: 7.1, Pig: 5.8, Chicken: 4.8 |
| (7) Major markets for selling livestock | Sold in community/to the traders coming to the suco, and/or taken to Dili |
| 4.4. Firewood and timber | |
| (1) Major tree species for fire wood (% of HHs using trees for firewood) | Ai ru (37 %), Ai samtuku (38 %), Ai bubur (18 %), Casuarina (5%), Ai na (2 %), Others (1%) |
| (2) Time to collection site for firewood (minutes) | 54.6 |
| (3) Frequency of firewood collection (times/week) | 3.6 |
| (4) Major timber species (%) | Ai ru (100 %) |
| (5) Frequency of timber harvesting (times/month) | 1.5 |
| (6) HHs selling timber (% of HHs selling) | 0.0 |
| (7) Annual sales of timber (USD/HH) | 0 USD/HH |
| (8) Major markets for selling timber | - |

## Table- 1 (2) Fact sheet on socio-economic and agriculture situations in Suco Talitu

| Items (unit) | Data |
|---|---|
| 4.5. NTFP | |
| (1) Major NTFPs (% of HHs producing) | Tua Mutin (17 %), Bamboo (10%) |
| (2) Harvest season of NTFP | Tua Mutin: Aug to Dec, Bamboo: June to Nov |
| (3) HHs selling NTFPs (% of HHs selling to HHs producing) | Tua Mutin (100 %), Bamboo (0%) |
| (4) Annual sales of NTFP (USD/HH) (2011) | 34.8 USD/HH |
| (5) Major markets for selling timber | Taken to Dili |

Note*1: Progress Report (1), JICA Project Team, 2011

## Table-1 (3) Fact sheet on socio-economic and agriculture situations in Suco Tohumeta

| Items (unit) | Data |
|---|---|
| 1. General | |
| (1) Administrative section | Aileu District, Laulara Sub-district |
| (2) Number of sub-villages (aldeias)*1 | 3 sub-villages (Aldeia Tohumeta, Berleumeta and Acaderu) |
| (3) Total area*1 (sq km) | 7.67 |
| (4) Total population*1 (person) | 743 |
| (5) Total number of household (HH) s*1 | 111 |
| (6) Major languages | Tetun and Mambae |
| 2. General features of HHs | |
| (1) Settlement years of HHs (% of HHs to total) | Before 1975 (53.3 %), 1975-1999 (15.0 %), 1999-2002 (18.3 %), 2002-2010 (13.3 %), After 2010 (0.0 %) |
| (2) Number of HH members (person) | 7.4 |
| (3) Average age of HH members (years old) | 17.7 |
| (4) Number of members under working age (14-65 years old) (person/HH) | 4.0 |
| (5) Features of head of HHs | ・Occupation: farmer (85.0%), salary worker (10.0 %), wage labor (5.0 %)<br>・Education: No graduated from primary school (73.3 %), Graduated from primary school (16.7 %), Graduated from high school (5.0 %)<br>・Organization: Group of traditional leaders (3.3%), Village committee (1.7%), Women's union (1.7%), Farmer's group (1.7%), Religious group (1.7 %), No member (83.3%) |
| (6) Food shortage Period | December - February |
| (7) Frequency of meals (times/day) | ・Normal (N): 3.0<br>・Food shortage (FS): 2.2 |
| (8) Frequency of consumption of major meals (times/day) | (N→FS)<br>Rice: 2.4→1.5, Corn:0.8→0.6 Beans:0.4→0.3, Cassava: 0.5→0.5, Kontas: 0.4→0.4, Banana:0.5→0.4 |
| 3. Land use in the village | |
| (1) Area of land owned by HH (ha/HH) | ・Total holding size: 4.7<br>・Home garden: 0.3, Fixed upland without soil conservation: 0.5, Shifting cultivation: 1.1, Coffee plantation: 0.5, Fallow area for shifting cultivation: 1.8, Forest: 0.2, Grazing place: 0.3 |
| (2) HHs owing the land (% of HHs owing the land to total) | Home garden: 100.0 %, Fixed upland without soil conservation: 45.0 %, Fixed upland with soil conservation: 1.7 %, Shifting cultivation: 86.7 %, Coffee plantation: 40.0 %, Fallow area for shifting cultivation: 65.0 %, Forest: 20.0 %, Grazing place: 21.7 % |
| (3) Shifting cultivation practices – Period of using area before shifting (years) | 1.9 |
| (4) Shifting cultivation practices – Fallow period (years) | 2.6 |
| (5) Shifting cultivation practices – use of the same site after fallowing the area | Yes (75 %) |

## Table-1 (3) Fact sheet on socio-economic and agriculture situations in Suco Tohumeta

| Items (unit) | Data |
|---|---|
| 4. Livelihood and income/expenditure | |
| 4.1. Income and expenditure | |
| (1) Annual income (USD/HH) | ・Total income: 1,905.2<br>・Breakdown:<br>Selling maize: 1.9, Selling vegetables: 24.9, Selling tubers: 23.0 Selling coffee: 62.5, Selling fruits/tree crops: 85.2, Selling livestock products: 172.9, Selling NTFP: 16.8, Salary from permanent job: 544.5, Wage from temporary job: 637.2, Private business: 279.8, Remittance from family members:50.4 and Others(e.g., subsidies): 6.0. |
| (2) Annual expenditure (USD/HH) | ・Total expenditure: 741.9<br>・Breakdown:<br>Food: 469.2, Health: 8.6, Education: 83.7, Clothes: 88.0, Firewood or other fuels: 57.5, Social Activity: 34.9 |
| (3) Investment of productive and fixed assets (USD/HH) | ・Total amount: 209.6<br>・Breakdown:<br>Livestock: 23.2, Housing(improvement/repair): 74.5, Household appliance: 34.3, Transportation means: 60.9, Private business: 16.7 |
| 4.2. Agriculture | |
| (1) Major crops (Mode of cropping and % of HHs responding to total) | Maize (Mix: 96.7% and No planting: 3.3 %),<br>Cassava (Mono: 6.7 %, Mix: 90.0 % and No planting 3.3 %),<br>Sweet potato (Mono: 3.3 %, Mix: 86.7 % and No planting: 10.0 %), Taro (Mix: 26.7%, No plant: 73.3 %), Leaf vegetables (Mono: 13.3 %, Mix: 15.0 %), Coffee (Arabica: Mix: 8.3%, Separated: 28.3%, No planted 63.3 %), |
| (2) Major fruits/tree crops (% of HHs planting) | Banana (86.7 %), Mango (85.0 %), Coconuts (65.0 %) |
| (3) Gross cropped area (ha/HH) | Maize: 0.8, Cassava: 0.8, Sweet potato: 0.8, Taro: 0.2, Leaf vegetables: 0.2, Coffee (Arabica): 0.3 |
| (4) Volume of seed applied/Number of trees planted for coffee and fruits | Maize: 20.8 kg/ha, Cassava: 9.9 bunches/ha, Sweet potato: 4.4 bunches/ha, Taro: 25.8 kg/ha, Leaf vegetables: 0.5 kg/ha, Coffee (Arabica): 140.0 trees/HH, Mango: 7.3 trees/HH, Banana: 32.4 trees/HH, Coconuts: 6.8 trees/HH |
| (5) Seeds (type, availability and source) | ・Type: Local variety<br>・Volume: Sufficient/not sufficient but still available. Some HHs face lack of seeds of maize and peanuts.<br>・Seed source: Most of seeds used is derived from their own reserves, except some seeds of maize, cassava, sweet potato and vegetables are delivered by government and NGOs. |
| (6) Fertilizers/Insecticide | Most of HHs is not using organic/chemical fertilizers, insecticides and fungicides though some HHs are applying organic fertilizer to leaf vegetables, cassava and sweet potato. |
| (7) Major causes of crop damages | Animals, pest, disease, heavy rain and wind |
| (8) Yield of major crops (kg/ha) | Maize: 147.2, Cassava: 397.7, Sweet potato 104.6, Taro: 127.5, Leaf vegetables: 183.3, Coffee (Arabica): 180.3 |
| (9) Mode of post-harvesting | Put above the fire for maize while kept the vegetable seeds in jerry can |

## Table-1 (3) Fact sheet on socio-economic and agriculture situations in Suco Tohumeta

| Items (unit) | Data |
|---|---|
| (10) Volume of lost during post-harvesting (% of volume lost during post-harvesting to total production) | Maize: 4.1, Cassava: 1.2 Sweet potato: 2.5, Taro: 1.9, Leaf vegetables: 0.4, Coffee (Arabica): 1.5, Mango: 6.0, Banana: 0.6, Coconuts: 33.8 |
| (11) HHs selling crops (% of HHs selling) | Maize: 3.3, Cassava: 25.0, Sweet potato: 8.3, Taro 6.3, Leaf vegetables: 70.6, Coffee (Arabica): 25.0, Mango: 43.3, Banana: 53.3, Coconuts: 6.7 |
| (12) Unit price of major crops (USD/kg) (2011) | Maize: 0.8, Cassava: 0.3, Sweet Potato: 0.4, Taro: 0.5, Leaf vegetables: 1.1, Coffee (Arabica): 1.5, Mango 0.5, Banana: 0.6, Coconuts: 0.3 |
| (13) Annual sales of major crops (USD/HH) (2011) | Maize: 1.6, Cassava: 19.5, Sweet Potato: 3.3, Taro: 0.8, Leaf vegetables: 40.5, Coffee (Arabica): 62.6, Mango 43.5, Banana: 40.5, Coconuts: 2.3 |
| (14) Major markets for selling crops | ・Coffee: Mostly taken to Dili and some to CCT collection point<br>・Fruits: Mostly taken to Dili and some taken sub/district bazaar and/or sold in the community<br>・Others: All the production of staple crops and vegetables are taken to Dili |
| 4.3. Livestock | |
| (1) Number of livestock owned (head/HH) | Cattle: 0.8, Buffalo: 0.2 Goat: 2.5, Horse: 0.2, Pig: 2.9, Chicken: 9.5 |
| (2) Grazing area (% of HHs grazing in the area) in rainy seasons | ・Cattle: Kept in stall (40 %), Grassland (33 %), Forest (27 %)<br>・Buffalo: Grassland (33 %), Kept in stall (33 %), Forest (17 %), Fallow paddy field (17 %)<br>・Goat: Kept in stall (58 %), Grass land (27 %), Forest (15 %) |
| (3) Grazing area (% of HHs grazing in the area) in dry seasons | ・Cattle: Kept in stall (40 %), Grassland (40 %), Forest (20 %)<br>・Buffalo: Grassland (33 %), Kept in stall (33 %), Forest (33 %),<br>・Goat: Kept in stall (46 %), Grass land (33 %), Forest (15 %), Fallow paddy field (6 %) |
| (4) HHs selling livestock (% of HHs selling) | Cattle: 53.3 %, Buffalo: 16.7 %, Goat: 33.3 %, Pig: 13.2 %, Chicken: 27.3 % |
| (5) Unit price of major livestock (USD/head) (2011) | Cattle: 376.3, Buffalo: 500.0, Goat: 62.7, Pig: 143.6, Chicken: 11.7 |
| (6) Annual sales of livestock (USD/HH) (2011) | Cattle: 94.1, Buffalo: 8.3, Goat: 31.4, Pig: 31.1, Chicken: 17.5 |
| (7) Major markets for selling livestock | Sold in community/to the traders coming to the suco, and/or taken to Dili |
| 4.4. Firewood and timber | |
| (1) Major tree species for fire wood (% of HHs using trees for firewood) | Ai ru (48%), Ai samtuku (32 %), Ai bubur (6 %), Teak (1%), Others (13%) |
| (2) Time to collection site for firewood (minutes) | 45.0 |
| (3) Frequency of firewood collection (times/week) | 2.4 |
| (4) Major timber species (%) | Ai ru (100 %) |
| (5) Frequency of timber harvesting (times/month) | 4.2 |
| (6) HHs selling timber (% of HHs selling) | 0.0 |

## Table-1 (3) Fact sheet on socio-economic and agriculture situations in Suco Tohumeta

| Items (unit) | Data |
|---|---|
| (7) Annual sales of timber (USD/HH) | 0 USD/HH |
| (8) Major markets for selling timber | - |
| 4.5. NTFP | |
| (1) Major NTFPs (%% of HHs producing) | Tua Mutin (5 %) |
| (2) Harvest season of NTFP | Nov to Apr |
| (3) HHs selling NTFPs (% of HHs selling to HHs producing) | Tua Mutin (100 %) |
| (4) Annual sales of NTFP (USD/HH) (2011) | 16.8 USD/HH |
| (5) Major markets for selling timber | Taken to Dili |

Note*1: Progress Report (1), JICA Project Team, 2011

## Table-1 (4) Fact sheet on socio-economic and agriculture situations in Suco Faturasa

| Items (unit) | Data |
|---|---|
| 1. General | |
| (1) Administrative section | Aileu District, Remexio Sub-district |
| (2) Number of sub-villages (aldeias)*1 | 4 sub-villages (Aldeia Fakulau, Kaitaso, Berliso and Remerhei) |

| (2) Major fruits/tree crops (% of HHs planting) | Mango (90.0 %), Banana (98.3 %), Citrus (51.7 %) |
| (3) Gross cropped area (ha/HH) | Maize: 1.0, Cassava: 1.0, Sweet potato: 1.0, Groundnuts: 1.0, Leaf vegetables: 0.01, Taro: 0.02, Coffee (Arabica: 0.6, Robusta: 0.2) |
| (4) Volume of seed applied/Number of trees planted for coffee and fruits | Maize: 27.5 kg/ha, Cassava: 199.2 stick/ha (8.0 branch/ha), Sweet potato: 692.5 stick/HH (6.9 branch/ha), Groundnuts: 10.3 kg/ha, Taro: 130.0 kg/ha, Coffee (Arabica): 367.7 trees/HH, Coffee (Robusta): 102.5 trees/HH, Mango: 8.8 trees/HH, Banana: 16.3 trees/HH, Citrus: 3.8 trees/HH |
| (5) Seeds (type, availability and source) | ・Type: Local variety and some improved seeds only for maize<br>・Volume: Sufficient/not sufficient but still available. Some HHs face lack of seeds of cassava and sweet potato.<br>・Seed source: Most of seeds used is derived from their own reserves. |
| (6) Fertilizers/Insecticide | Most of HHs considers they are using organic fertilizers, such as grass, leaves (Albizia and Casuarina) and animal dung. |
| (7) Major causes of crop damages | Pest, animal, disease, drought, heavy rain and wind |
| (8) Yield of major crops (kg/ha) | Maize: 461.8, Cassava: 473.4, Sweet potato 357.5, Taro: 500.0, Leaf vegetables: 200.0, Coffee (Arabica): 204.8, Coffee (Robusta): 105.0 |

## Table-1 (4) Fact sheet on socio-economic and agriculture situations in Suco Faturasa

| Items (unit) | Data |
|---|---|
| (9) Mode of post-harvesting | Put above the fire for maize while kept the cassava and sweet potato in farm |
| (10) Volume of lost during post-harvesting (% of volume lost during post-harvesting to total production) | Maize: 7.3, Cassava: 7.9, Sweet potato: 9.4, Groundnuts: 6.8, Leaf vegetable: 5.0, Taro: 8.3, Coffee (Arabica: 9.3, Robusta: 7.3), Mango: 12.8, Banana: 8.6, Citrus: 8.9 |
| (11) HHs selling crops (% of HHs selling) | Maize: 18.3, Cassava: 20.3, Sweet potato: 14.0, Groundnuts: 50.0, Leaf vegetable: 0.0, Taro: 0.0, Coffee (Arabica: 46.7, Robusta: 11.9), Mango: 90.0, Banana: 98.3, Citrus: 51.7 |
| (12) Unit price of major crops (USD/kg) (2011) | Maize: 0.8, Cassava: 0.7, Sweet potato: 0.5, Groundnuts: 21.6, Coffee (Arabica: 1.3, Robusta: 1.2), Mango: 0.6, Banana: 0.8, Citrus: 0.9 |
| (13) Annual sales of major crops (USD/HH) (2011) | Maize: 8.1, Cassava: 11.8, Sweet potato: 5.1, Groundnuts: 25.2, Coffee (Arabica: 56.5, Robusta: 20.6), Mango: 12.5, Banana: 8.9, Citrus: 36.5 |
| (14) Major markets for selling crops | ・Coffee: Mostly taken to Dili and CCT collection point, while some sold at the sub/district bazzar<br>・Fruits: Taken to Dili and sub/district bazaar, and sold in the community. In case of citrus, traders are coming to suco.<br>・Others: Staple crops harvested are taken to sub/district bazzar and sold to the traders coming to the suco. Some are also taken to Dili. |
| 4.3. Livestock | |
| (1) Number of livestock owned (head/HH) | Cattle: 1.7, Buffalo: 1.2 Goat: 3.4, Horse: 1.2, Pig: 2.9, Chicken: 9.5 |
| (2) Grazing area (% of HHs grazing in the area) in rainy seasons | ・Cattle: Forest (52 %), Kept in stall (33 %), Grassland (11 %)<br>・Buffalo: Forest (57 %), Grassland (29%), Kept in stall (10 %),<br>・Goat: Kept in stall (36 %), Grass land (33 %), Forest (21 %)<br>・Horse: Kept in stall (45 %), Forest (29%), Grass land (16 %) |
| (3) Grazing area (% of HHs grazing in the area) in dry seasons | ・Cattle: Forest (56 %), Kept in stall (30 %), Grassland (11 %)<br>・Buffalo: Forest (62 %), Grassland (24%), Kept in stall (10 %),<br>・Goat: Kept in stall (36 %), Grass land (31 %), Forest (24 %)<br>・Horse: Kept in stall (48 %), Forest (32%), Grass land (10 %) |
| (4) HHs selling livestock (% of HHs selling) | Cattle: 55.6 %, Buffalo: 28.6 %, Goat: 14.3 %, Horse: 22.6 %, Pig: 15.0 %, Chicken: 54.4 % |
| (5) Unit price of major livestock (USD/head) (2011) | Cattle: 271.7, Buffalo: 266.7, Goat:70.0, Horse: 141.4, Pig: 141.1, Chicken: 13.3 |
| (6) Annual sales of livestock (USD/HH) (2011) | Cattle: 117.3, Buffalo: 67.5, Goat: 19.5, Horse: 21.5, Pig: 25.3, Chicken: 38.8 |
| (7) Major markets for selling livestock | Sold in community/to the traders coming to the suco, and/or taken to sub/district bazzar and/or Dili |
| 4.4. Firewood and timber | |
| (1) Major tree species for fire wood (% of HHs using trees for firewood) | Ai ru (27%), Ai bubur (45 %), Ai samtuku (20 %), casuarina (5%), Ai na (2%), Others (2%) |
| (2) Time to collection site for firewood (minutes) | 58.0 |
| (3) Frequency of firewood collection (times/week) | 3.3 |
| (4) Major timber species (%) | Ai bubur (45%), Ai ru (38 %), casuarinas (9%), Ai kakeu (7%), Ai samtuku (1 %) |

## Table-1 (4) Fact sheet on socio-economic and agriculture situations in Suco Faturasa

| Items (unit) | Data |
|---|---|
| (5) Frequency of timber harvesting (times/month) | 5.3 |
| (6) HHs selling timber (% of HHs selling) | 0.0 |
| (7) Annual sales of timber (USD/HH) | 0 USD/HH |
| (8) Major markets for selling timber | - |
| 4.5. NTFP | |
| (1) Major NTFPs (%% of HHs producing) | Bamboo (70%), Honey (67%), Mushroom (7%), Ratan (3%) |
| (2) Harvest season of NTFP | Bamboo : Feb-Mar, Honey : Apr-May, Mushroom : Oct-Mar, Ratan : Aug-Sep |
| (3) HHs selling NTFPs (% of HHs selling to HHs producing) | Bamboo (2%), Honey (85%), Mushroom (100%), Ratan (0%) |
| (4) Annual sales of NTFP (USD/HH) (2011) | Bamboo :0.8 USD/HH, Honey: 36.1 USD/HH, Mushroom: n/a |
| (5) Major markets for selling timber | Taken to sub/district bazzar and/or Dili. In case of Honey, some traders are coming to suco. |

Note*1: Progress Report (1), JICA Project Team, 2011

*2: The respondents are likely to consider "shifting cultivation" as slash and burn practices, not rotating farming.

| (8) Frequency of consumption of major meals (times/day) | (N→FS)<br>Rice: 1.8→1.0, Corn:1.0→0.7 Beans:0.7→0.5, Cassava: 1.0→0.8, Kontas: 0.7→0.6, Banana:0.8→0.7 |
| 3. Land use in the village | |
| (1) Area of land owned by HH (ha/HH) | ・Total holding size: 5.1<br>・Home garden: 0.02, Fixed upland without soil conservation: 1.7, Fixed upland with soil conservation: 0.2, Coffee plantation: 1.5, Fallow area for shifting cultivation: 0.3, Forest: 0.5, Grazing place: 0.8 |
| (2) HHs owing the land (% of HHs owing the land to total) | Home garden: 78 %, Fixed upland without soil conservation: 92 %, Fixed upland with soil conservation: 15 %, Shifting cultivation*2: 0 %, Coffee plantation: 87 %, Fallow area for shifting cultivation: 17 %, Forest: 27 %, Grazing place: 45 % |
| (3) Shifting cultivation practices*2 – Period of using area before shifting (years) | No practice of shifting cultivation |
| (4) Shifting cultivation practices*2 – Fallow period (years) | ditto |
| (5) Shifting cultivation practices*2 – use of the same site after fallowing the area | ditto |

## Table-1(5) Fact sheet on socio-economic and agriculture situations in Suco Fadabloco

| Items (unit) | Data |
|---|---|
| 4. Livelihood and income/expenditure | |
| .1. Income and expenditure | |
| (1) Annual income (USD/HH) | ・Total income: 953.5<br>・Breakdown:<br>Selling maize: 2.4, Selling vegetables: 62.6, Selling tubers: 24.2, Selling coffee: 167.9, Selling fruits/tree crops: 189.7, Selling livestock products: 100.4, Selling NTFP: 3.4, Selling handicraft/other industry products: 4.4, Salary from permanent job: 99.1, Wage from temporary job: 48.4, Private business: 76.7, Remittance from family members: 43.7 and Others(e.g., subsidies): 130.7 |
| (2) Annual expenditure (USD/HH) | ・Total expenditure: 565.6<br>・Breakdown:<br>Food: 227.5, Health: 5.6, Education: 78/0, Clothes: 109.3, Firewood or other fuels: 21.2, Social Activity: 124.0 |
| (3) Investment of productive and fixed assets (USD/HH) | ・Total amount: 373.6<br>・Breakdown:<br>Livestock: 27.5, Farm machinery/tools: 3.6, Housing(improvement/repair): 30.1, Household appliance: 29.1, Land: 0.8, Transportation means: 4.0, Private business: 34.2, Others: 244.3 |
| 4.2. Agriculture | |
| (1) Major crops (Mode of cropping and % of HHs responding to total) | Maize (Mix: 100.0 %),<br>Cassava (Mono: 2 %, Mix: 97 %, No plant: 1%),<br>Sweet potato (Mix: 95 % and No planting: 5 %),<br>Red bean (Mono: 15%, Mix: 15%, No plant: 10%)<br>Soybean (Mix: 13%)<br>Groundnuts (Mono: 20%, Mix: 3%) |
| (2) Major fruits/tree crops (% of HHs planting) | Banana (95 %), Mango (93 %), Citrus (80 %), |
| (3) Gross cropped area (ha/HH) | Maize: 1.0, Cassava: 1.0, Sweet potato: 0.9, Red bean: 0.3, Soybean: 0.1, Groundnuts: 0.2, Coffee (Arabica): 0.9, Coffee (Robusta): 0.3 |
| (4) Volume of seed applied/Number of trees planted for coffee and fruits | Maize: 25.4 kg/ha, Cassava: 204.2 stick/ha, Sweet potato: 486.7 stick/ha, Red bean: 2.1 kg/ha, Soybean: 0.6 kg/ha, Groundnuts: 1.8 kg/ha, Coffee (Arabica): 829.7 trees/HH, Coffee (Robusta): 230.8 trees/HH, Banana: 23.2. tree/HH, Mango: 10.4 tree/HH, Citrus: 8.9 tree/HH |
| (5) Seeds (type, availability and source) | ・Type: Local variety<br>・Volume: Sufficient/not sufficient but still available.<br>・Seed source: Most of seeds used is derived from their own reserves. |
| (6) Fertilizers/Insecticide | Most of HHs considers they are using organic fertilizers, such as grass, leaves (Albizia and Casuarina) and animal dung. |
| (7) Major causes of crop damages | Pest, disease, heavy rain, wind, animal, disease and drought |
| (8) Yield of major crops (kg/ha) | Maize: 504.2, Cassava: 420.9, Sweet potato: 329.9, Redbean: 61.3, Soybean: 36.8, Groundnuts: 36.8, Coffee (Arabica): 228.8, Coffee (Robusta): 204.7 |
| (9) Mode of post-harvesting | Put above the fire for maize while the cassava and sweet potato kept in farm |

## Table-1(5) Fact sheet on socio-economic and agriculture situations in Suco Fadabloco

| Items (unit) | Data |
|---|---|
| (10) Volume of lost during post-harvesting (% of volume lost during post-harvesting to total production) | Maize: 8.6, Cassava: 9.7, Sweet potato: 11.4, Red bean: 9.7, Soybean: 22.8, Groundnuts: 5.6, Coffee (Arabica): 13.2, Coffee (Robusta): 36.3, Banana: 10.7, Mango: 12.7, Citrus: 5.3 |
| (11) HHs selling crops (% of HHs selling) | Maize: 5.0, Cassava: 20.3, Sweet potato: 14.0, Groundnuts: 21.4, Coffee (Arabica): 92.2, Coffee (Robusta): 88.9, Banana: 57.9, Mango: 71.4, Citrus: 77.1 |
| (12) Unit price of major crops (USD/kg) (2011) | Maize: 0.6, Cassava: 0.3, Sweet potato: 0.3, Groundnuts: 0.8, Coffee (Arabica): 1.4, Coffee (Robusta): 1.0, Banana: 0.4, Mango: 0.4, Citrus: 0.6 |
| (13) Annual sales of major crops (USD/HH) (2011) | Maize: 2.5, Cassava: 10.5, Sweet potato: 6.5, Groundnuts: 7.1, Coffee (Arabica): 133.2, Coffee (Robusta): 34.7, Banana: 16.9, Mango: 61.2, Citrus: 108.4 |
| (14) Major markets for selling crops | ・Coffee: Mostly taken to CCT collection point and/or Dili<br>・Fruits: Mostly Taken to Dili, while some sold at sub/district bazaar, and/or in the community.<br>・Others: Staple crops harvested are taken to Dili and/or sub/district bazzar. In case for maize, most of products are sold in the community. |
| 4.3. Livestock | |
| (1) Number of livestock owned (head/HH) | Cattle: 1.1, Buffalo: 0.2 Goat: 2.8, Horse: 0.6, Pig: 3.1, Chicken: 8.3 |
| (2) Grazing area (% of HHs grazing in the area) in rainy seasons | ・Cattle: Forest (30 %), Grassland (25 %), Fallow land (25%), Kept in stall (20 %)<br>・Buffalo: Grassland (50%), Fallow land (33 %), Forest (17%)<br>・Goat: Kept in stall (45 %), Grass land (32 %), Fallow land (16%), Forest (4 %)<br>・Horse: Kept in stall (45 %), Grass land (23 %), Fallow land (18%), Forest (9%) |
| (3) Grazing area (% of HHs grazing in the area) in dry seasons | ・Cattle: Forest (35 %), Grassland (25 %), Fallow land (25%), Kept in stall (15 %)<br>・Buffalo: Grassland (50%), Fallow land (33 %), Forest (17%)<br>・Goat: Kept in stall (45 %), Grass land (32 %), Fallow land (16%), Forest (7 %)<br>・Horse: Kept in stall (32 %), Grass land (27 %), Fallow land (18 %), Forest (18 %) |
| (4) HHs selling livestock (% of HHs selling) | Cattle: 20.0 %, Buffalo: 0.0 %, Goat: 11.4 %, Horse: 9.1 %, Pig: 28.1 %, Chicken: 44.4 % |
| (5) Unit price of major livestock (USD/head) (2011) | Cattle: 181.3, Goat:30.0, Horse: 147.5, Pig: 62.0, Chicken: 12.0 |
| (6) Annual sales of livestock (USD/HH) (2011) | Cattle: 18.3, Goat: 7.3, Horse: 4.9, Pig: 39.3, Chicken: 30.5 |
| (7) Major markets for selling livestock | Mostly sold in community/to the traders coming to the suco, while some taken to sub/district bazzar and/or Dili |
| 4.4. Firewood and timber | |
| (1) Major tree species for fire wood (% of HHs using trees for firewood) | Ai ru (19.8 %), Ai bubur (34.6 %), Ai samtuku (27.2 %), Casuarina (13.6%), Teak (0.6%), Others (4.3%) |
| (2) Time to collection site for firewood (minutes) | 76.1 |
| (3) Frequency of firewood collection (times/week) | 3.1 |

## Table-1(5) Fact sheet on socio-economic and agriculture situations in Suco Fadabloco

| Items (unit) | Data |
|---|---|
| (4) Major timber species (%) | Ai bubur (38%), Ai ru (29 %), Casuarina (29%), Ai samtuku (3 %), Ai kakeu (1%) |
| (5) Frequency of timber harvesting (times/month) | 6.7 |
| (6) HHs selling timber (% of HHs selling) | 0.0 |
| (7) Annual sales of timber (USD/HH) | 0 USD/HH |
| (8) Major markets for selling timber | - |
| 4.5. NTFP | |
| (1) Major NTFPs (% of HHs producing) | Bamboo (78%), Honey (13%), Mushroom (7%) |
| (2) Harvest season of NTFP | Bamboo : Feb-Mar, Honey : Apr-May, Mushroom : Jan-Feb and Apr-May |
| (3) HHs selling NTFPs (% of HHs selling to HHs producing) | Honey (63 %) |
| (4) Annual sales of NTFP (USD/HH) (2011) | 3.4 USD/HH |
| (5) Major markets for selling timber | Taken to Dili. |

Note*1: Progress Report (1), JICA Project Team, 2011

*2: The respondents are likely to consider "shifting cultivation" as slash and burn practices, not rotating farming.

# Table-1(6) Fact sheet on socio-economic and agriculture situations in Suco Hautoho

| Items (unit) | Data |
|---|---|
| 1. General | |
| (1) Administrative section | Aileu District, Remexio Sub-district |
| (2) Number of sub-villages (aldeias)*1 | 3 sub-villages (Aldeia Lebutu, Ai butihun and Ramerhei) |
| (3) Total area*1 (sq km) | 15.22 |
| (4) Total population*1 (person) | 1,066 |
| (5) Total number of household (HH) s*1 | 201 |
| (6) Major languages | Tetun and Mambae (90%), Tetun only (7%), Tetun, Indonesian and Mambae (2%), Indonesian only (2%) |
| 2. General features of HHs | |
| (1) Settlement years of HHs (% of HHs to total) | Before 1975 (62 %), 1975-1999 (26%), 1999-2002 (5%), 2002-2010 (7%) |
| (2) Number of HH members (person) | 6.9 |
| (3) Average age of HH members (years old) | 21.0 |
| (4) Number of members under working age (14-65 years old) (person/HH) | 3.8 |
| (5) Features of head of HHs | ・Occupation: farmer (90%), wage labor (5%), private business salary worker (5 %), private business (2%)<br>・Education: No graduated from primary school (77 %), Graduated from primary school (12 %), Graduated from high school (8 %), Graduated from secondary school (3 %)<br>・Organization: No members (78.3%), Village committee (8%), Group of traditional leaders (5%), Others (5%), Water user groups (2%), Religious organization (2%) |
| (6) Food shortage Period | October - February |
| (7) Frequency of meals (times/day) | ・Normal (N): 2.9<br>・Food shortage (FS): 2.3 |
| (8) Frequency of consumption of major meals (times/day) | (N→FS)<br>Rice: 2.3→2.0, Corn:1.1→0.8 Beans:0.6→0.4, Cassava: 0.8→0.8, Kontas: 0.4→0.4, Banana:0.5→0.5 |
| 3. Land use in the village | |
| (1) Area of land owned by HH (ha/HH) | ・Total holding size: 3.3<br>・Home garden: 0.01, Fixed upland without soil conservation: 0.7, Fixed upland with soil conservation: 0.2, Coffee plantation: 1.4, Fallow area for shifting cultivation: 0.01, Forest: 0.3, Grazing place: 0.7 |
| (2) HHs owing the land (% of HHs owing the land to total) | Home garden: 97 %, Fixed upland without soil conservation: 62 %, Fixed upland with soil conservation: 15 %, Shifting cultivation*2: 0 %, Coffee plantation: 83 %, Fallow area for shifting cultivation: 1.7 %, Forest: 20 %, Grazing place: 42 % |
| (3) Shifting cultivation practices*2 – Period of using area before shifting (years) | 2.0 years |
| (4) Shifting cultivation practices*2 – Fallow period (years) | 2.5 years |

# Table-1(6) Fact sheet on socio-economic and agriculture situations in Suco Hautoho

| Items (unit) | Data |
|---|---|
| (5) Shifting cultivation practices*2 – use of the same site after fallowing the area | Yes (100%) |
| 4. Livelihood and income/expenditure | |
| .1. Income and expenditure | |
| (1) Annual income (USD/HH) | ・Total income: 760.3<br>・Breakdown:<br>Selling tubers: 2.8, Selling coffee: 144.3, Selling fruits/tree crops: 147.2, Selling livestock products: 170.8, Selling NTFP: 1.1, Salary from permanent job: 74.3, Wage from temporary job: 38.6, Private business: 105.9, Remittance from family members: 60.9 and Others(e.g., subsidies): 14.3 |

3.1.3 Any land leased to others/unused → There is no land leased to others/unused

3.2 Shifting cultivation → 1HH answered

3.2.1 Perception/understanding on shifting cultivation

| Items | | Answers | |
|---|---|---|---|
| a) | Advantages of shifting cultivation | 1st: High production | 2nd: Stable production |
| b) | Disadvantages of shifting cultivation | 1st: Soil erosion | 2nd: Expansion of forest fires |
| c) | Willingness to continure shifting cultivation | Yes | reason:Increase of production |
| d) | Willingness to expand the area for shifting | No | reason: lack of labor |
| e) | Willingness to expand the area for fixed farming | No | reason: lack of labor |

3.2.2 Farming practices in shifting cultivation

| Items | | Answers |
|---|---|---|
| a) | Areas used for shifting cultivation | Bush/scrub |
| b) | Period of using the area before shifting another place | 2 years |
| c) | Use of the same site after fallowing the area | No |
| d) | Sign for reusing the fallow area | _ |
| e) | Necessary period to show the sign mentioned above | _ |
| f) | Major constraints in shifting cultivation practices | Limited labor |

3.2.3 Use of communal land → No communal area

**Section 4: Crop production**

4.1 Major crops planted

| | Major crops (Multiple answers permitted) | | | | | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 0. None | | 1. Maize (local) | | 2. Maize (improved) | | 3.Groundnut | | 5. Soy bean | | 6. Red bean | | 7. Sweet potato | | 8. Cassava | | 9. Leaf vegetables | | 12. Others | | Total | |
| Type of farming | No. | % | No. | % | No. | % | No. | % | No. | % | No. | % | No. | % | No. | % | No. | % | No. | % | No. | % |
| a. Shifting cultivation | 0 | 0.0% | 1 | 33.3% | 0 | 0.0% | 0 | 0.0% | 1 | 33.3% | 1 | 33.3% | 0 | 0.0% | 0 | 0.0% | 0 | 0.0% | 0 | 0.0% | 3 | 100.0% |
| b. Fixed upland farm | 35 | 19.4% | 41 | 22.8% | 2 | 1.1% | 15 | 8.3% | 0 | 0.0% | 0 | 0.0% | 37 | 20.6% | 45 | 25.0% | 0 | 0.0% | 5 | 2.8% | 180 | 100.0% |
| c. Home garden | 9 | 5.0% | 51 | 28.3% | 3 | 1.7% | 22 | 12.2% | 1 | 0.6% | 0 | 0.0% | 36 | 20.0% | 54 | 30.0% | 2 | 1.1% | 2 | 1.1% | 180 | 100.0% |

4.2 Annual crop production

4.2.1. Cropping type

| Crop | Cropping type | No. | % | Major crops to be planted in mix |
|---|---|---|---|---|
| a. Maize (local) | Mono | 0 | 0.0% | Maize–Cassava |
| | Mix | 60 | 100.0% | |
| | No plant | 0 | 0.0% | |
| b. Cassava | Mono | 1 | 1.7% | Cassava–Sweet potato |
| | Mix | 59 | 98.3% | |
| | No plant | 0 | 0.0% | |
| c. Sweet potato | Mono | 2 | 3.3% | |
| | Mix | 55 | 91.7% | |

## Section 8: Income and expenses

8-1. Sources of cash income of the HH

| Item | Ave.amount(unit: USD/year) |
|---|---|
| 1) Selling maize | 2.4 |
| 2) Selling vegetables | 62.6 |
| 3) Selling beans | 0.0 |
| 4) Selling tubers | 24.2 |
| 5) Selling coffee | 167.9 |
| 6) Selling fruits | 189.7 |
| 7) Selling livestock products | 100.4 |
| 8) Selling fuel wood | 0.0 |
| 9) Selling timber wood | 0.0 |
| 10) Selling NTFPs (rattan, medicinal plants, etc.) | 3.4 |
| 11) Selling handicraft / cottage industry products | 4.4 |
| 12) Salary from permanent job | 99.1 |
| 13) Wage from temporary job (s) | 48.4 |
| 14) Private business (trading, shop, etc.) | 76.7 |
| 15) Remittance from family members | 43.7 |
| 16)Others (e.g wine making / or subsidies) | 130.7 |
| Total | 953.5 |

8-2. Expenditure for consumption

| Item | Ave.amount(unit: USD/year) |
|---|---|
| 1) Expenditure for Food | 227.5 |
| 2) Expenditure for Health | 5.6 |
| 3) Expenditure for Education | 78.0 |
| 4) Expenditure for Clothes | 109.3 |
| 5) Expenditure for Firewood/Kerosine/Electorocity | 21.2 |
| 6) Expenditure for Social Activitiy | 124.0 |
| Total | 565.6 |

8-3. Investment of productive and fixed assets in the last year

| Item | Ave.amount(unit: USD/year) |
|---|---|
| 1) Livestock | 27.5 |
| 2) Farm machinery / tools | 3.6 |
| 3) Housing (improvement / repair) | 30.1 |
| 4) Household Appliance | 29.1 |
| 5) Land | 0.8 |
| 6) Transportation means | 4.0 |
| 7) Private business | 34.2 |
| 8) Others (Saving in the Bank) | 244.3 |
| Total | 373.6 |

F. Important interventions for natural resource management

| Item | | Average rating (1. Most important, 2. Important, 2. Not so much) | |
|---|---|---|---|
| | | Male | Female |
| 1 | Environment education to people | 1.0 | 1.4 |
| 2 | Tree planting/reforestation | 1.0 | 1.5 |
| 3 | Land use plan | 1.0 | 1.8 |
| 4 | Reduction of firewood consumption/alternative energy dev. | 1.9 | 2.1 |
| 5 | Infrastructures (e.g., check dam) | 1.4 | 1.7 |
| 6 | Introduce environmentally-friendly techniques (e.g., agroforestry) | 1.0 | 1.9 |
| 7 | Re-vitalization of traditional norms (e.g., Tara Bandu) | 1.0 | 1.3 |
| 8 | Government legislation and its enforcement | 1.0 | 1.2 |
| Average | | 1.2 | 1.6 |

# Appendix 1-6 Results of Baseline Survey in Suco Hautoho

**Section 1: General Information of households in the village**

1.1 Major Language Used

| Language used | No. | % to total |
|---|---|---|
| Tetun, Mambae and Indonesia | 1 | 1.7% |
| Tetun and Mambae | 54 | 90.0% |
| Tetun only | 4 | 6.7% |
| Indonesia only | 1 | 1.7% |
| Total | 60 | 100.0% |

– General Features of Household in the village

1.2 Average of Total No. of households members: 6.9 persons/HH

1.3 General Features of Household members

– Average age of members: 21.0 years old

– Gender balance in HH: Ave. No.of Male 2.5 person/HH; Ave.No. of female 3.2 person/HH

– Average No. of members under working age (15–64 years: 3.8 person/HH

1.4.Main features of HH members

1.4.1 Heads of HH

| Education level | | | | | | Primary Occupation (Unit: person) | | | | | | Organization (Unit: person) | | | | | | Total | Absence (living in other place more than 3 months a year) |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| No graduated from primary school | Graduated from primary school | Graduated from secondary school | Graduated from high school | Graduated from University | Others | Farmer | Wage labour | Salary worker | Private business | No job | Others | 3. Group of Traditional Leaders | 4. Water user groups | 5. Village committee | 7. Religious organizations | 9. Others | 10. No member | | |
| 46 | 7 | 2 | 5 | 0 | 0 | 54 | 3 | 1 | 2 | 0 | 0 | 3 | 1 | 5 | 1 | 3 | 47 | 60 | 0.0% |
| 76.7% | 11.7% | 3.3% | 8.3% | 0.0% | 0.0% | 90.0% | 5.0% | 1.7% | 3.3% | 0.0% | 0.0% | 5.0% | 1.7% | 8.3% | 1.7% | 5.0% | 78.3% | 100.0% | |

1.4.2 Other HH members

| HH members | General composision of HH (unit:person/HH) | | | | | | | | Education (Unit: person/HH) | | | | | | | | | |

3.2 Shifting cultivation

3.2.1 Perception/understanding on shifting cultivation

| Items | | Answers | |
|---|---|---|---|
| a) | Advantages of shifting cultivation | 1st: High producti | 2nd: Stable production |
| b) | Disadvantages of shifting cultivation | 1st: Expansion of forest fires | 2nd: Soil erosion |
| c) | Willingness to continure shifting cultivation | Yes (100%) | reason: Good production |
| d) | Willingness to expand the area for shifting | Yes (100%) | reason: Get more production |
| e) | Willingness to expand the area for fixed farming | No (100%) | reason: Get more production |

3.2.2 Farming practices in shifting cultivation

| Items | | Answers |
|---|---|---|
| a) | Areas used for shifting cultivation | Forest (Middle to sparse) |
| b) | Period of using the area before shifting another place | 2.0 years |
| c) | Use of the same site after fallowing the area | Yes (100%) |
| d) | Sign for reusing the fallow area | -Darkness of soil |
| e) | Necessary period to show the sign mentioned | 2.5 years |
| f) | Major constraints in shifting cultivation practices | Limited labor, tools and seeds |

3.2.3 Use of communal land → No communal area

**Section 4: Crop production**

4.1 Major crops planted

| | Major crops (Multiple answers permitted) | | | | | | | | | | | | | | | | | | | | | |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | 1. Maize (local) | | 2. Maize (improved) | | 3.Groundnut | | 5. Soy bean | | 6. Red bean | | 7. Sweet potato | | 8. Cassava | | 9. Leaf vegetables | | 10. Bitter Guard | | 11. Eggplant | | Total | |

## Table 3 (3) Results of Trend Analysis at Suco Madabeno

| Period | Honey | Livestock | Land availability | Water | Forest | Forest fires | Rainfall | Landslide | Tua Mutin |
|---|---|---|---|---|---|---|---|---|---|
| 1960-1975 | 7+<br>• The production was high but few people took honey due to the fear of falling from a tree. | 4+<br>• Only the persons who earned cash income were able to raise animals.<br>• It was not easy to raise animals in the village due to the cold temperature. | 9+<br>• The communities easily accessed a land for farming as the limited number of households practiced farming due to time constraints. Most of them were forced to work for the Portuguese government as servants. | 8+<br>• Households living in the hillside needed to go to the riverside to fetch water. | 10+<br>• No illegal logging was observed. | 3+<br>• The communities burned the farms in land preparation.<br>• Tara-bandu was effective.<br>• The police deployed by the Portuguese government regulated the activities of the communities. | 10+<br>• It rained regularly. | 3+<br>• Landslide had rarely taken place.<br>• Forests largely covered the areas of the village. | 4+<br>• The limited number of the households in the village collected tua mutin.<br>• There were many tua trees in the villages. |
| 1975-1999 | 5+<br>• As there were some fatal accidents caused by falling from trees while collecting honey, many households were afraid to climb a tree to get honey. | 5+<br>• The communities in the village were given animals by the Indonesian government. | 7+<br>• Due to the population increase, the available area for farming in the village was reduced. | 7+<br>• A shortage of water was observed in the dry seasons. | 8+<br>• Landslide took place in forests in the village.<br>• Resistant guerrillas against the Indonesian occupation burned forests in the village.<br>• Forests or trees in forests were illegally cut with chain saw. | 9+<br>• The Indonesian army burned forests to drive the guerrillas from forests.<br>• The communities also burned forests for hunting. | 9+<br>• The rainfall pattern or timing was slightly changed. | 5+<br>• The incidence of landslide increased due to the deforestation caused by illegal logging and forest fires. | 8+<br>• The number of the households who had knowledge on production/collection of tua mutin increased. |
| 1999-2000 | 3+<br>• Many of them were still afraid to climb up a tree to collect honey. | 3+<br>• Some animals were killed by the Indonesian army. | 6+<br>• The population and households in the village kept increasing, while the available area in the village | 7+<br>• Same as above. | 6+<br>• Illegal cutting sometimes took place due to no government regulation.<br>• It was difficult to regulate forest | 9+<br>• It was difficult to regulate and control forest fires during the crisis. | 9+<br>• Same as above. | 5+<br>• Same as above. | 7+<br>• Some villagers evacuated from the village during the crisis. |

**Results of PRA at Madabeno**

**Trend Analysis**

| Period | Honey | Livestock | Land availability | Water | Forest | Forest fires | Rainfall | Landslide | Tua Mutin |
|---|---|---|---|---|---|---|---|---|---|
| | | | decreased. | | fires during the crisis. | | | | |
| 2001-2007 | 2+<br>• There were few bee combs in the village. | 6+<br>• The number of the households who raised animals had increased.<br>• MAF/World Vision provided the financial support to the communities for the purchase of animals. | 5+<br>• Same as above. | 7+<br>• Same as above. | 5+<br>• There was still no control of illegal logging by the government.<br>• No deployment of the forest guard was made. | 5+<br>• The households set the fireline to control a fire. | 9+<br>• Same as above. | 7+<br>• The incidence of landslide increased due to the deforestation caused by forest fires. | 8+<br>• The number of the households who collected/produced tua mutin increased.<br>• There were many trees of tua in the village.<br>• Many buyers came to the village to buy tua mutin. |
| 2007-2011 | 1+<br>• The collection of honey is not popular in the village due to lacks of interest among the households and bee comb in the village. | 7+<br>• The number of animals has increased owing to the reproduction of those purchased between 2001 and 2007. | 3+<br>• Same as above. | 7+<br>• Same as above. | 7+<br>• Forest guards were deployed to control and regulate the illegal cutting. | 0<br>• There has been no forest fire since the Tara Bandu ceremony in 2010.<br>• Forest guards deployed have been effective in reducing the incidence of forest fires. | 2+<br>• The village had a long rain in 2010. | 9+<br>• A long and heavy rain in 2010/2011 caused landslides in the village. | 7+<br>• The heavy rain in 2010/2011 affected the production of tua mutin. |

## Table 4 (1) Results of Trend Analysis at Suco Talitu

| Period | Income | Maize production | Coffee | Cassava | Animal | Animal damage | Rice | Vanilla | Pepper | Clove |
|---|---|---|---|---|---|---|---|---|---|---|
| 1960-1975 | +4<br>• Only the teachers and government staff were able to get salary. | +10<br>• Maize production was high as most of the households in the village planted maize. | +2<br>• Shade trees for coffees were limited in the village. | +10<br>• Production of cassava was high. | +10<br>• Everybody used to have lots of animals to use them for the cultural ceremonies. | +5<br>• Since Tara Bandu was effective, animals entering farms were freely killed. | +5<br>• Paddy fields were limited in the village. | +0<br>• No one grew/produce vanilla. | +0<br>• No one grew/produced pepper. | +0<br>• No one grew/produced clove. |
| 1975-1999 | +6<br>• The communities were able to earn more cash income from coffee. | +7<br>• The production of maize decreased.<br>• Some maize farms were converted to coffee plantations.<br>• Newly opened areas were also used for the production of other crops, e.g., clove. | +8<br>• Many communities planted coffee as the price of coffee was high.<br>• The Indonesian government provided the seedlings of coffee and samtuku through the extension workers. | +9<br>• The production of cassava was reduced due to the labor limitation for cropping. | +8<br>• The places for animal grazing were limited in the village. | +5<br>• If animals entered into others' farms and caused feeding damage to crops, the owner of animals had to pay compensation for the crop damage to the farm owner. | +4<br>• Rice production had decreased due to the insect attack. | +2<br>• Not many households planted vanilla. | +0<br>• Same as above. | +7<br>• Many communities in Aldeias Talitu and Casmantutu had planted clove. |
| 1999-2001 | +3<br>• After the Indonesian's withdrawal, rupia's value delined. | +5<br>• The production of maize had decreased.<br>• The farms for maize were limited. It was planted in the farms adjacent to coffee plantations. | +9<br>• Coffee plantations had expanded as coffee price was kept high. | +5<br>• The households who planted cassava decreased as many of them engaged in the activities of NGOs and other donors. | +5<br>• Animals were killed by the Indonesian army. | +8<br>• Most of the people evacuated to the mountain area, and it was therefore difficult to control animals. | +3<br>• Few households managed the paddy field. | +2<br>• During the turmoil, most of the communities left their farms. | +4<br>• The communities used and managed a pepper nursery left by the Indonesian agricultural extension office. | +7<br>• Most of the communities in Aldeia Talitu and Casmantutu continued to plant clove. |

## Result of PRA at Talitu

### Trend Analysis

| Period | Income | Maize production | Coffee | Cassava | Animal | Animal damage | Rice | Vanilla | Pepper | Clove |
|---|---|---|---|---|---|---|---|---|---|---|
| 2002-2007 | +4<br>• The government started to provide pensions for the elders in 2007. | +4<br>• Some farms planted with maize were covered with trees. | +9<br>• The area of coffee plantation in the village was not changed as the communities planted other crops, such as, e.g., clove. | +3<br>• Fewer villagers were planting cassava due to time constraints as they were busy in working for the government projects. | +6<br>• After the independence, villagers started to rear animals. | +6<br>• Some community members returned to the village and started to plant trees/put fences to control free grazing. | +3<br>• Same as above. | +6<br>• Many households received seedlings of vanilla with the assistance from CCT. | +6<br>• The number of households who had interest in production of pepper increased. | +8<br>• The number of households who planted clove increased as they noticed that the price of clove was high. (US$5/kg @ CCT/Timor Grobal) |
| 2007-2010 | +8<br>• The household income in the village has increased by selling coffee, vanilla, pineapple and pepper. | +2<br>• The area used for maize production was limited. | +9<br>• Clove had replaced coffee in the coffee plantations. | +2<br>• Fewer villagers planted cassava as most of them already had income to buy the food. | +6<br>• The communities graze animals without any fear of loss. | +4<br>• Most of households lived in the top of hill and therefore it was difficult to control animals/ | +2<br>• Rice production was reduced because the communities were able to earn more cash income. | +7<br>• The number of households who planted vanilla increased as the price of the product was high. | +7<br>• Those who had already produced pepper started to share their seedlings with others. | +9<br>• Many people planted clove owing to its high selling price (5USD/kg). |
| 2010-2011 | +10<br>• Some of the communities are employed as teachers and nurses. | 0<br>• Most of the communities purchase maize at the markets. | +8<br>• Some aged coffee plantations did not generate any production. | +1<br>• A long rainy in 2010 did not allow the communities to plant cassava. | +5<br>• The place for animal grazing is limited.<br>• Animals are tied with trees/sticks. | +2<br>• The communities built fences to protect crops from animal feeding damages. | +3<br>• Few hosehololds managed the paddy field. | +5<br>• Price of the product has declined to 3 USD/kg. | +8<br>• Every household has produced white pepper and sold it at US$ 5 /kg. | +10<br>• Two aldeias has increased the production of clove. |

## Table 4 (2) Results of Trend Analysis at Suco Talitu

| Period | Landslide | Wild fire | Rainfall | Tua mutin | Forest | Plantations | Water sources | Honey | Land availability | Firewood |
|---|---|---|---|---|---|---|---|---|---|---|
| 1960-1975 | +2<br>• Few landslides took place as the area was covered with forests. | +0<br>• No wild fire took place owing to strict control by the local authority. | +6<br>• The rainfall pattern was regular and stable.<br>• The rainy season started in October and ended in April. | +8<br>• The production of Tua mutin was high. | +8<br>• There were many forests remaining in the village since the population pressure was low. | +2<br>• The areas of clove, coffee and sandalwood plantations were limited. | +0<br>• The communities needed to go to the river to fetch water. | +1<br>• The honey collection/ production was limited. | +8<br>• Many lands were available in Portuguese time. | +0<br>• The communities did not sell firewood. |
| 1975-1999 | +2<br>• Same as above. | +8<br>• The Indonesian army burnt mainly dense forests to drive the guerillas from forests. | +6<br>• Same as above. | +8<br>• Same as above. | +7<br>• People cut trees for planting coffee/clove. | +5<br>• Coffee plantation was expanded as a source of income..<br>• The Indonesian government provided technical supports for farmers. | +2<br>• Water pipes were installed to supply water to houses in the village. | +0<br>• No honey production / collection was made in the village. | +5<br>• Since the Indonesian army forced the communities to relocate their houses, their land use was limited. | +4<br>• Some households used to sell firewood. |
| 1999-2001 | +2<br>• Same as above. | +7<br>• The incidence of wild fires decreased little bit owing to the withdrawal of the Indonesian army. | +6<br>• Same as above. | +7<br>• Some households who produced/ collected Tua Mutin left the village during to the turmoil. | +6<br>• Plantations of clove, coffee and pepper increased.<br>• The communities cut trees for timber/firewood collection. | +5<br>• No expansion was made during the tumoil. | +2<br>• Same as above. | +0<br>• Same as above. | +8<br>• The communities could use their lands without any interventions by the Indonesian government. | +3<br>• Few households sold firewood. |
| 2002-2007 | +2<br>• Same as above. | +4<br>• The | +6<br>• The rainy | +8<br>• The number of | +5<br>• Forests were | +6<br>• The | +2<br>• Same as above. | +0<br>• Same as above. | +7<br>• The households | +5<br>• The number of |

**Table 9 Results of Group Discussions with Male Group on Shifting Cultivation at Suco Faturasa**

| Theme | Discussions |
|---|---|
| **Advantage and Disadvantage of Rotation Farming System** | ➢ Many people are currently practicing a rotation farming system, which uses the several plots for producing annual and biennial crops in a rotating manner, although they used to practice a shifting cultivation system before, in which forested areas used to be open for farming every year.<br>➢ There are two types of farming system in the village, i) rotation farming system and ii) fixed/permanent farming system. The former is a kind of derivation from the traditional farming system (shifting cultivation system) and therefore operated far from the residential area, while the latter is a farming system to use farms near from the houses.<br>➢ Under the current system, the communities plant annual crops (e.g., maize, cassava, sweet potato, beans, cow pea, and taro) mixed with biennial crops (e.g., banana and cassava) and occasionally with some orchard trees (e.g., orange and Jackfruit) in the same plot. After harvesting annual crops, the plot are fallowed/abandoned and use another plot for planting annual crops. The fallow plot is left untouched but used for production and harvesting of biennial crops. If any orchard trees are planted in a plot, such an area will not be used for producing annual crops under the rotation farming system, as the canopies of orchard trees planted in the plot hinder the growth of annual crops.<br><u>Advantage</u><br>➢ The area used for the rotation farming system is generally fertile enough to produce annual crops (e.g., maize and beans) in the first year when it is opened. The soil fertility declines due to surface soil erosion during the first year's cultivation, so that annual crops can not be planed but only biennial/perennial crops can be grown in the area in the second year.<br>➢ In the first year, the area for the rotation farming system can generate good production.<br>➢ Land preparation for the rotation farming system, such as cutting/slashing trees and grasses and burning them, is less laborious than that for the improved fixed farming system, such as terrace making and cultivation.<br>➢ Although USC-CTL introduced the techniques on the improved fixed farming system, it seems to take time to make the lands fertile enough.<br>➢ The area under the rotation farming system is larger than the area for fixed farming.<br>➢ Land preparation in the rotation farming system is easier than that in the fixed farming one, while the former system requires more laborers in weeding than the latter system does. (Nevertheless, male participants did not point out the difficulties in weeding until the facilitator raised such an issue.)<br><u>Disadvantage</u><br>➢ Under the rotation farming system, annual crops such as maize can not be planted in the second year, but only cassava and other biennial/perennial crops can be grown there.<br>➢ The area planted with perennial crops can not be used for annual cropping since perennial crops/trees develop their canopies. Another area need to be used for production of annual crops.<br>➢ Farming in sloping area causes the surface soil erosion and the production of annual crops gets lower from the second year.<br>➢ The participants showed their intention to introduce and expand the improved fixed/permanent farming system in stead of the rotation farming system in the future using the techniques introduced by USC-CTL. In fact, one of the participants told that they intended to disseminate the new techniques on the improved fixed/permanent farming system (such as terracing) to the neighboring villages. |

| Theme | Discussions |
|---|---|
| | ➢ Weeding in the shifting cultivation farm is quite laborious. The farm should be weeded at least twice to trice a season, while the fixed farm require only one-time weeding because of the effect of cultivation. |
| **Advantage and Disadvantage of the improved fixed / permanent farming** | Advantage<br>➢ Plowing the land and incorporating grasses covered with the surface into soils make and keep the surface soils more fertile.<br>➢ Maize, beans, and other annual crops can be continuously planted and grown in the same area under the improved fixed/permanent farming system.<br>➢ In the Portuguese era, local people had practiced the fixed farming system putting animals into a fenced area to collect cattle dung and use them for farming as manure. Under such a faming system, the people were able to have good harvest of annual crops in the same area every year.<br>➢ Such a system was abandoned in the Indonesian era, since the government forced local people to stay at one place which was far from their own farms and fenced areas for animals. Hence, they had to abandon their permanent farms and practice shifting cultivation instead.<br>➢ We are keen to introduce and disseminate the following two techniques, i) making terraces and ii) application of organic fertilizer (such as compost introduced by USC-CTL).<br>Disadvantage<br>➢ The production of maize in the newly established terraced farm is not as high as that in the first year of the rotation farming system.<br>➢ Although we understand the effectiveness of terracing in keeping soil fertility, the low production in the first year is one of the concerns.<br>➢ Compost application is essential, but there are few cattle/cows in the village. Only cow dung is suitable for manure. (Buffalo dung is not suitable for manure, although many households own buffalo in the village.) |
| **Intention to continue or expand the rotation farming or improved fixed farming** | ➢ The male participants showed the intentions to reduce the area for rotation farming and expand the area for the improved fixed/permanent farms, because of the consideration of their advantages and disadvantages as well as the rules defined by the village regulations. |
| **Practices of rotation farming** | ➢ The areas for rotation farming are clearly determined by local people.<br>➢ Each household has several places to use for rotation farming. According to the male participants, the number of plots for rotation farming ranges from 2 to 10.<br>➢ The average size of the plot is about 0.5 ~ 1.0 ha/plot.<br>➢ The average fallow period is about 3 to 5 years after abandonment.<br>➢ Used for the 1st year's cultivation under the rotation farming system, the area is fallowed with cassava for several years (3-5 years).<br>➢ All the areas used for farming are private land. There is no tenant or landless household in the village. |
| **Land use and ownership** | ➢ There is no government land in the village.<br>➢ The area where church stands and its backyard are considered as the communal property.<br>➢ After the Tara Bandu ceremony, local communities made an arrangement with land owners to provide land use rights to all the communities in the village. Under the agreement, a person who gains a land use right from the land owner can use the areas |

| Theme | Discussions |
|---|---|
| | forever without charge or production sharing. The tenant can even plant perennial crops or trees in the lands from the owner.<br>➢ However, the land ownership of the areas of which the use rights are given to communities still belongs to the land owners. Hence, the land owners own the right to harvest honey available in the areas that belong to them. |

**Table 10 Results of Group Discussions with Female Group on Shifting Cultivation at Suco Faturasa**

| Theme | Discussions |
|---|---|
| **Current Situation of Shifting Cultivation** | - Since the village regulations were implemented in 2008, the community members have not conducted shifting cultivation in their localities. |
| **Advantages / Disadvantages of Shifting Cultivation** | Advantage of shifting cultivation compared to the fixed farming<br>- The shifting cultivation is more productive, especially in maize production.<br>Disadvantage of shifting cultivation compared to the fixed farming<br>- The soil fertility in the farms seems to be low.<br>- The fertile soils were washed out easily by wind and rain.<br>- The crop could get easily damaged by animals.<br>- It is hard for the community to find the new place for shifting cultivation.<br>- The practice on shifting cultivation may cause forest fires/deforestation which affects the water resources and other natural resources as well as causes landslide in the locality.<br>- It is difficult for the community to protect the crops from damages by animals as the farms are far from their houses. |
| **Intention to Continue Shifting Cultivation and Expand Areas for Fixed Farms** | - The community members are willing (or are keen) to stop shifting cultivation and continue/introduce the fixed farming.<br>- The reasons why they prefer fixed farming are that:<br>1) fix farming can use the land more efficiently than shifting cultivation can; and<br>2) they have already acquired some skills on fixed farming, such as terrace making and compost making. |
| **Advantages / Disadvantages of Fixed Farming** | Advantage of the fixed farming<br>- The land ownership of the farm is clear as the location of the farm is close to the dwelling.<br>- It causes less damage to forests unlike shifting cultivation.<br>- The communities can maintain rather intensively their farms owing to the proximity to houses.<br>- It is not hard to get to the farm with agricultural tools and seeds.<br>Disadvantage of the fixed farming<br>- It takes time to establish a fixed farm.<br>- Land preparation for fixed farming, especially terrace making, requires a number of laborers. |
| **Farming Practices done by Harosan** | - Under the harosan system (a traditional labor exchange or work sharing system), a group of 8 to 10 persons, which are family members or neighbors in general, work together for each other.<br>- The women participants are willing to continue harosan to reduce their burden of farming.<br>- Normally each group has an agreement on the works to be done by harosan.<br>- Harosan has been often applied to the farming activities from land preparation to harvesting for maize, cassava, contas, taro and coffee.<br>- In Fakurao, a group of eight households has been producing vegetables, such as lettuce, mustard, tomato, eggplants, chili, and onion using the harosan system. |
| **Areas used for Shifting Cultivation / Specific Location for Shifting Cultivation** | - A farming practice derived from shifting cultivation (which may be called "the rotation farming system") is practiced in the remote area within their aldeia, which have been used for shifting cultivation from their ancestors.<br>- The area with sparse vegetation is more suitable for such a farming practice due to the easiness of clearing the area. |

**Results of PRA Survey at Suco Faturasa**

**Group Discussions with Female Group on Shifting Cultivation**

| Theme | Discussions |
|---|---|
| | - Once *Chromolaena* dominates in the area, another area is used for farming.<br>- Before 2008, the villagers worried that the area for farming was getting scarce as the area of *Chromolaena expanded.*<br>- Some villagers use the lands that belong to other families or neighbors for production of annual crops. |
| **Number of Areas or Size per Household** | - The average area used by one HH for shifting cultivation or rotation farming was around 0.25 ha.<br>- The number of plots that one HH own ranges from 1 to 4 plots depending on available labor in the family. |
| **Period for shifting Cultivation in the Same Area / Average Fallow Period from Abandonment to the Next Use** | - One plot can be used for maize production for one to three years. If the plot does not seem to maintain good production in the 3rd year, the farmer would move to other place.<br>- The production of maize can be usually maintained by the 2nd cropping year in the same plot.<br>- Normally, the farmers used to come back to the same plot in 4-5 years after its abandonment. |
| **Specific Sign indicating the Possibility of Reuse of the Area** | - The following are the sings that farmers are based on for site selection:<br>a) The amount of dried grass to be burned for land preparation; and<br>b) Growing condition of the crops left in the abandoned area. |
| **Difficulties in Shifting Cultivation** | - Available land for shifting cultivation or rotation farming is limited.<br>- Due to the remoteness of the farms, it is hard to carry heavy loads e.g., agricultural tools, seeds and water, to the farms as well as to maintain the crops intensively.<br>- The seeds could be damaged during the hauling to the site.<br>- The seed of sweet potato needs to be selected at the site. Therefore, the farmers need to carry whole potato to the site. Selection of seeds at the site is also time-consuming comparing to the same near the dwellings since the number of persons who could work at the site is limited. |
| **Others** | - The fire lines are usually set up around the farm to control the fire in shifting cultivation / rotation farming. |

**Table 11 Results of Group Discussions with Male and Female Groups on Present Land Use at Suco Faturasa**

<table>
<tr><th>Theme</th><th>Discussions</th></tr>
<tr><td>Discussions with Male Group on Use of land</td><td>
➢ There is no landless farmers/villagers in Suco. Every household has 4-5 sites for either shifting cultivation or permanent farm. The estimated holding size is about 5 ha/HH.<br>
➢ However, the productivity of land (quality of land) is not good in general. Therefore, many households need to use lands that belong to large land owners for shifting cultivation.<br>
(Generally, villagers use their own lands for shifting cultivation. But those who have few productive areas sometimes face difficulties in using their lands for farming since they need to take 3~5-year fallow period after shifting cultivation.<br>
➢ Accordingly, the lands owned by 75 % of households in the village are not much productive. In the case of Remehei, only 17 HHs out of 65 HHs own the productive areas. Thirteen (13) HHs of 47 HHs in Kaitas and five (5) households in Fakalau (63 HHs) have productive lands.<br>
➢ In general, the large land owners are "clans" who have owned the lands since its ancestor. The clans owns many productive lands or lands in good condition.<br>
➢ The "tenant farmers" do not need to pay the owner for the rent in cash nor even in kind. But the tenant can not be allowed to plant trees or perennial crops in the land.<br>
➢ Normally, the land in the village can not be sold even to members in the village. (OR The villagers have no practice in selling his/her land to other villagers.)<br>
➢ The land is inherited to the male line. (or inherited patrilineally.)<br>
But there is also a case where some parts of lands of the household are given to his sister/daughter, when she as no land or less land to cultivation.) In this case the couple would stay in the village where her brother or father lives.<br>
➢ There is no government land or communal land in the village.<br>
➢ All the lands in the village are clearly distributed to the households in the village.
</td></tr>
<tr><td>Discussions with Female Group on Use of land</td><td>
➢ Land for cultivation is abundant and available everywhere in Suco Faturasa.<br>
➢ The average land holding size in the village is estimated at 2 ha/HH, though some of families own the land more than 2 ha.<br>
➢ When a community member needs land for cultivation, he/she can ass the heads of "clan family" in each aldeia (The heads of clan families in each aldeia are tabulated below.). The clan families whose ancestors fought again the Portuguese government as leaders to protect their lands are traditional and large-scale landlords in the village. A tenant (a family who rants land for farming) is allowed only to grow annual crops, but not to plant perennial crops (trees and fruits) or to construct houses.

**Table 12 Results of Group Discussions with Male Group on Shifting Cultivation at Suco Fadabloco**

| Topics | Participants Views and Discussions |
|---|---|
| **Definition of Shifting Cultivation and Permanent farming** | ➢ The participants in the session thought that they did not practice "shifting cultivation" any more. They thought their farming system was "semi-permanent farming," since some crops, such as cassava and banana, were left growing in the fallow/abandoned plots although they shifted a farm for maize production periodically one farm to another.<br>➢ The fixed farms are located relatively close to the homesteads of the communities, while those for "semi-permanent farming" are far from their houses.<br>➢ The same crops, such as maize, cassava, sweet potato, taro, yam, soy bean and red bean, are planted in the fixed farm and semi-permanent farm. |
| **Advantage and Disadvantage of Shifting Cultivation** | ➢ The soils in the shifting cultivation farms are fertile enough to produce maize for one to three years. The advantage of shifting cultivation is to maintain the soil fertility even without application of fertilizer.<br>➢ On the other hand, the disadvantages of shifting cultivation are that:<br>1) the location of the plots for shifting cultivation are far from the houses. It takes more or less two hours from the houses to farms;<br>2) land preparation under shifting cultivation, which consists of tree cutting, slashing of grasses, collection of trees and grasses cut/slashed, making of fire-lines, and burning, is time-consuming as well as laborious; and<br>3) a field fire for land preparation might affect the neighboring villages, if it is not properly controlled. |
| **Farming System under the "Semi-Permanent Farming"** | ➢ On average, one household has one to seven plots for semi-permanent farming.<br>➢ For example, one of the male participants in the session has four plots for the same. He currently uses them for i) coffee plantation, ii) pineapple, iii) cassava, and iv) kontas, taro and banana.<br>➢ The average size of the plot is 0.5~1.0 ha/plot.<br>➢ The farms are located within more or less two hours walk from the houses in general. Some households put up a small temporary shed in the farms so that the family members can stay in the farms during busy times. |
| **Problems under the "Semi-Permanent Farming"** | ➢ The major problems under the "semi-permanent farming" system are that:<br>1) the farm is located far from the house;<br>2) annual crops will not grow any more when tree crops, such as coffee and fruit trees, planted in the plot establish their canopies;<br>3) production of cassava requires at least two years; and<br>4) crops, such as cassava, corn, sweet potato, pineapple, taro, and orange, get often damaged by rodent. |

**Table 13 Results of Group Discussions with Female Group on Shifting Cultivation at Suco Fadabloco**

| Theme | Discussions |
|---|---|
| **Definition of Shifting Cultivation** | ➢ The participants commented that the communities in Suco Fadabloco did not practice shifting cultivation any more.<br>➢ A household plants annual and biennial crops (maize, sweet potato, taro, cassava, banana, etc.) in a farm/plot in the first year. After harvesting of annual crops, the farm/plot is left fallow and used for production of biennial crops. The household is to produce the same crops in another plot in the following year and to reuse the first plot or fallow plot in several years (when finishing one round of rotation).<br>➢ On the other hand, the farms used for crop production every year are called the permanent farms.<br>➢ The permanent farms are located closed to the residential areas, while those for rotation farming are located rather far from houses. |
| **Features of Shifting Cultivation** | ➢ Annual and biennial crops (e.g., maize, cassava, sweet potato, taro, yam, soy bean and red bean) are planted in the farms for the short-term rotation farming.<br><u>Advantage of Shifting Cultivation</u><br>➢ The advantage of shifting cultivation is to enable the farm to recover the soil fertility in the fallow period, so that the production of annual crops in the farm is rather high in the first year, although the soil fertility usually declines in the second year.<br><u>Disadvantage of Shifting Cultivation</u><br>➢ On the other hand, the following disadvantages of shifting cultivation were pointed out by the participants.<br>1) The farms for shifting cultivation are generally far from the residential areas. It takes more than two hours.<br>2) There is not enough lands available to be used as new areas for farming.<br>3) Land preparation, such as cutting trees, cleaning wild grasses, etc., are time-consuming and laborious.<br>4) It is hard for the communities, especially women, to carry / haul farm products from the farm to house. |
| **Intention to Continue Shifting Cultivation** | ➢ The participants showed their intention to continue the short-term rotation farming and increase the number of plots for the same, so that they could maintain/improve their livelihoods and support their families. However, there seem to be no land available for expansion of their farms. |
| **Others** | ➢ All the lands in Suco Fadabloco are owned privately.<br>➢ Availability of lands for farming is one of the factors that made the communities practice the short-term rotation farming. |

**Table 14 Results of Group Discussions with Male Group on Present Land Use at Suco Fadabloco**

| Theme | Discussions |
|---|---|
| **Land holding status** | ➢ All the households in the village own enough lands for farming.<br>➢ There are some abandoned lands especially in Aldeia Rieu. The abandoned lands are privately owned by local communities but anyone, even people from the neighboring villages, can use them for animal grazing.<br>➢ One household owns one to seven farm plots on average. |
| **Existence of Communal land and Government land** | ➢ There is no government land in the village.<br>➢ Each aldeia sets a certain area apart from private lands to produce crops for offering to church. Any household who needs a farm to produce upland crops (e.g., maize and cassava) can use a part of the communal land only for planting annual crops. |
| **Existing rules on land use** | ➢ Any lands in the village can not be sold to anyone.<br>➢ As long as an owner of the land agrees on the use of his/her land, anyone, even a person from the outside, can use the land but for production of annual crops only.<br>➢ Traditionally, there is a need to consult with suco leaders when the land is rent to other households.<br>➢ There is no regulation on the use of the lands in the village. |
| **Customary / Traditional rules** | ➢ Local communities traditionally kill animals when opening a new farm.<br>➢ In the Portuguese era, all households in the village used to kill animals before cropping with praying for a good harvest. They also used to kill animals before and after harvesting annual crops to give thanks to God for a harvest.<br>➢ The land is inherited along the male line. In case a household has only daughters but one of them keeps staying in the village, she will be able to inherit the land. In case there is no one who is eligible to inherit the land, the land will be inherited by any relatives. |
| **Any disputes / conflicts among local communities** | ➢ There have been many cases of crop damages caused by animals. Such cases have been settled through a discussion between the related families.<br>➢ Crop damages caused by rodent and snake in the upland crop farms are often observed in the village.<br>➢ There has been no land dispute in the village. |

**Table 15 Results of Group Discussions with Female Group on Present Land Use at Suco Fadabloco**

| Topics | Participants Views and Discussions |
|---|---|
| **Sufficiency of land among villagers** | ✓ The participants feel that there are sufficient lands for the communities to use for farming in the village.<br>✓ Accordingly, all the households have their own land. |
| **Average land holding size** | ✓ The persons who own 5-7 ha are considered as large land owners, while those who have 0.5–1 ha can be categorized as small land owners. In general, the public servants or those engaging in some projects of NGOs can not cultivate a large-sized farm due to the time constraints. |
| **Existence of communal lands/government lands** | ✓ There is no communal/government land in the village. |
| **Any rules governing the land use in the village/possibility of renting private land which belong to other villagers for farming** | ✓ There is no written regulation in the village at present, but the following unwritten-cum-traditional rules/norms passed by word of mouth exist in the village. The communities in the village generally follow the rules.<br>- If anyone, even a person from other village, needs to use a part of the areas in the village for production of annual crops, he/she can use a land with the permission of an owner of the land but only for planting annual crops. No benefit or production sharing is required.<br>- If anyone in the village wants to build a house or permanent facility in a land owned by other household, he/she need to pay an owner of the land for the permission.<br>- Anyone who takes farm products from a farm owned by other household shall obtain the permission from an owner of the farm.<br>✓ A person who rents the land for running a kiosk along the road pays US$ 30-50/month. (The maximum amount of the rental fee is US$ 100/month). |
| **Possibility of outsiders' renting/using private lands** | ✓ At present, no one outside the village has rented/used any lands in the village. |
| **Any issues in land use** | ✓ The land is traditionally inherited by male family members in a family.<br>✓ If a family has only daughters, the land would be inherited by its nephews.<br>✓ The communities can clearly define the boundaries of lands as there are recognizable land marks, such as flowers, trees, fences, stones, and crops (e.g., cassava), on the boundaries. |

**Table 16 Results of Group Discussions with Male and Female Groups on Shifting Cultivation at Suco Madabeno**

<table>
<tr><th>Theme</th><th>Discussions</th></tr>
<tr><td>Comparison between Shifting Cultivation and Permanent Farming</td><td>➢ Characteristics of shifting cultivation and permanent farming in the villages were discussed and compared as follows:
<table>
<tr><th>Items</th><th>Shifting Cultivation</th><th>Permanent Farming</th></tr>
<tr><td>Production</td><td>Good harvest of maize can be expected from the farm under shifting cultivation.</td><td>Harvest of maize in the permanent farm is expected low, but the farm can produce other upland crops, such as cassava and beans.</td></tr>
<tr><td>Farming practices</td><td>➢ Major farming practices under shifting cultivation are: i) slashing and cutting trees and grasses, ii) burning the stuff slashed in the area, iii) planting, iv) weeding, and v) harvesting.<br>➢ The farm tools used in farming are: i) pickle, ii) hoe, and iii) katana (manual grass cutter).<br>➢ Weeding in the farm under shifting cultivation is easier than that in the permanent farm.</td><td>➢ Major farming practices in a permanent farm are: i) slashing grasses, ii) cultivation, iii) planting, iv) weeding, and v) harvesting.<br>➢ The farm tools used in farming are: i) pickle, ii) hoe, iii) katana (manual grass cutter), and iv) iron stick.<br>➢ It is difficult to control weeds in the permanent farm.</td></tr>
<tr><td>Disadvantages</td><td>Shifting cultivation may cause: i) deforestation, ii) removal of big trees, iii) shortage of water, iv) landslide, v) forest fire, and vi) increase of crop damage by rodent.</td><td>Less production</td></tr>
<tr><td>Size per plot</td><td>0.5 ~ 1.0 ha/plot</td><td>0.2~0.4 ha/plot</td></tr>
<tr><td>Number of plot per household</td><td>2~several plots (depending on the availability of areas as well as family laborers)</td><td>1 plot per family</td></tr>
<tr><td>Farming system</td><td>➢ Use the same areas with a certain fallow period in a rotating manner.<br>➢ In case a household has enough lands and laborers, the family would plant shade trees and coffee seedlings in the farm before abandoning the area and clear forest for a new farm so that they could increase coffee produce while maintaining maize production.</td><td>➢ Use the same area without any fallow period.</td></tr>
<tr><td>Volume of seeds</td><td>24 kg of maize seed</td><td>2 kg of maize seeds</td></tr>
</table></td></tr>
<tr><td>Characteristics of Shifting Cultivation</td><td>➢ The area with black soils and many litters is selected for a newly opened farm.<br>➢ When the height of the weed covering the fallow area becomes more than 2 meter, the area can be used for farming.<br>➢ Shifting cultivation is done only in the private farm.<br>➢ Households that can not produce enough food crops often work in Dili as a casual laborer.</td></tr>
<tr><td>Intention to continue or expand shifting cultivation</td><td>➢ Local communities need to continue shifting cultivation, and if anything, like to expand the farm under shifting cultivation to produce sufficient volume of maize.<br>➢ Woods cut in shifting cultivation can also be used for materials for fencing and constructing houses.</td></tr>
</table>

| Theme | Discussions |
|---|---|
| **Problems in Shifting Cultivation** | ➢ There have been disputes over land in which households who operate shifting cultivation use the part of the area that belongs to other households.<br>➢ A household can not open or expand the farm under shifting cultivation due to the shortage of laborers in a family.<br>➢ The shortage of farm inputs, such as seeds and katana (a tool for cutting grasses), also causes difficulty in the expansion of the farm.<br>➢ The lack of knowledge on upland farming hinders local communities from increasing the production of upland crops, especially maize. |

**Table 17 Suco Results of Group Discussions with Male Group on Present Land Use at Suco Madabeno**

| Theme | Discussions |
|---|---|
| **Land holding status** | ➢ All the households in the village own enough farm lands for farming.<br>➢ There is no landless or tenant household in the village. |
| **Existence of Communal land and Government land** | ➢ All the lands in the village belong to either households or kinship/clan groups in the village.<br>➢ The areas used for Uma Lisan and traditional activities are regarded as common lands for the respective kinship/clan groups.<br>➢ There has been no government land since the Portuguese era. |
| **Existing rules on land use** | ➢ Tara bandu regulations of the village have been in effective since October 2010.<br>➢ The regulations were developed by the village leaders and local communities with the assistance from CALITAS Australia in March 2010. Having had 2-week discussions on the regulations, the village leaders finalized the regulations. The regulations were submitted to the Sub-district office for approval.<br>➢ The main purposes of the Tara bandu regulations are to encourage households in the village to respect another persons' property and protect plantations and farms from any damages.<br>➢ Accordingly, the Tara bandu regulations stipulates that i) no one can rent the land; ii) anyone from the outside can not use the land in the village; and iii) communities in the village can not use the land in the neighboring villages.<br>➢ The land shall be inherited through the male line. In case a family has only daughters and daughters get married with those from other villages, the land would be inherited by any male relatives. |
| **Outlines of Tara Bandu Regulations** | ➢ The following acts are prohibited by the Tara bandu regulations.<br>- Any activities causing forest fire<br>- Illegal cutting<br>- Any activities causing land dispute<br>- Tree cutting around water sources<br>- Tree cutting along the roads<br>- Tree cutting without permission from the government and suco leaders<br>- Killing animals without any reasons<br>- Sale of firewood<br>- Free animal grazing that would cause crop damage<br>- Disregard of the Tara bandu regulations<br>➢ If anyone violated the regulations, the suco council would resolve the issue according to the regulations.<br>➢ The parties interested shall make effort to solve a case between the parties at first. In case the case can not be settled by themselves, it should be dealt with at suco level in accordance with the Tara bandu regulations.<br>➢ The Tara bandu regulations in the village were made in a written form so that communities in the village could be reminded of the regulations anytime.<br>➢ Chef de suco visits each aldeia to monitor the implementation of the Tara bandu regulations periodically.<br>➢ The suco leaders in the village have organized the monitoring meeting five times so far. PNTL and the staff from the sub-district administrative office participated in the meetings.<br>➢ The leaders and people in the village were inspired by the village regulations of Suco |

| Theme | Discussions |
|---|---|
| | Tohumeta to develop their own village regulations in writing. |
| **Intention to Introduce a Future Land Use Plan and Protect Forests** | ➢ The participants showed their willingness to protect forests, especially lulic forests, in the village. In fact, many of them accepted the idea of the integration of a future land use plan which would specify forest land to be protected with the Tara bandu regulations.<br>➢ The participants even agreed with the idea to protect forests in the catchment of the Bemos river, especially the watershed from the water intake of the water supply system.<br>➢ They expressed their intention to cooperate with the JICA project. |

**Table 18 Results of Group Discussions with Female Group on Present Land Use at Suco Madabeno**

| Topics | Participants Views and Discussions |
|---|---|
| **Status of Land Ownership in the Village** | ➢ All the lands in the village are owned by the communities privately. Most of the households own large area, but some of them have only small land insufficient to produce farm products to support their families.<br>➢ There is no government or communal land in the village. |
| **Average Size of Land** | ➢ The participants determined the average size of lands for each land use as follows:<br>1) Land for house: 6m x 6m<br>2) Permanent farm: Same as the size of basket ball coat in school yard<br>3) Shifting cultivation (New farm): about 1 ha<br>4) Land for grazing animals: Same as the size of basket ball coat in school yard |
| **Basic Rules on Land Use** | ➢ Tara Bandu was revived in 2010 in the village and has been effective since the Tara Bandu ceremony in October 2010.<br>➢ The village leaders often give the communities instructions to use the lands according to the Tara Bandu regulations since the ceremony.<br>➢ The Tara Bandu regulations stipulate that any animal causes feeding damage to crops can be killed by an owner of the damaged farm. The owner of the animal shall also compensate the owner of the farm for the crop damage.<br>➢ Any disputes over the boundaries of lands shall be settled by the mediation of Chef de Suco.<br>➢ The incidence of disputes/conflicts over the lands has drastically declined since the Tara Bandu ceremony.<br>➢ Households who have a shortage of food can use the lands owned by other households with permission of the land owner, but only for cropping annual crops, as perennial crops, such as, coconut and other tree crops, planted in the field shall be considered as the property of the land users. There is no payment or production sharing between the land owner and tenant/land user for the use of land on a temporary basis.<br>➢ Accordingly, it is possible to rent the land to outsiders (people from the outside) only for producing annual crops, although there has been little cases in fact.<br>➢ No one in the village has sold the land even to those living in the village so far.<br>➢ The land is inherited along the male line. If a household has two sons or more, the land will be split equally between sons. Daughters do not inherit the land in general as they get married into husbands' families.<br>➢ In case a household has no son and only a/ daughter/s, one daughter can inherit the land as long as she lives in the village with or without her husband.<br>➢ One household has six to seven children (sons or daughters) on average. |
| **Major Issues on Land Use** | ➢ Major reasons for disputes observed in the village are related to: i) boundaries between two lands/farms; ii) use of other's land without the permission of the land owner; and iii) animal grazing in other's land without the permission of the land owner. |

**Table 19 Results of Group Discussions with Male and Female Groups on Shifting Cultivation at Suco Tlitu**

<table>
<tr><th>Theme</th><th>Discussions</th></tr>
<tr><td>Types of Crops planted under Shifting Cultivation and Permanent Farming</td><td>➢ Maize, cassava and beans are the major crops planted in the farms under shifting cultivation, and other crops, such as taro, Fehuk, bean (Fore, Fore Keli), red bean (Koto), and banana are also mixed with the major crops in the farm.<br>➢ On the other hand, maize, cassava, taro, fehuk, root crops, banana, aidili, and flowers are generally cropped in the farms under permanent farming.</td></tr>
<tr><td>Farming System under Shifting Cultivation</td><td>➢ The communities do not literally practice shifting cultivation, which is open forests for farming and move to another forested area for annual cropping.<br>➢ In general, the communities use a few or several plots for farming in a rotating manner. Under the current system, maize, cassava, beans, and other crops are simultaneously planted in the farm but only annual crops (e.g., maize and beans) are harvested in the first year. Biennial or perennial crops, such as cassava and banana are left in the farm for another one to three years.<br>➢ The following illustration shows an example of a household who has only two plots for shifting cultivation. In such a case, both areas are kept used for agricultural production even during the fallowing period, since the growing period of cassava is one to three years. (Technically, this practice shall be called “a short rotation system of maize, cassava and other upland crops.)<br> </td></tr>
<tr><td>Advantages and Disadvantages of Shifting Cultivation and Permanent Farming</td><td>➢ Advantages and disadvantages of shifting cultivation and permanent farming were assessed as tabulated below.
<table>
<tr><th>Factor</th><th>Shifting cultivation</th><th>Permanent cultivation</th></tr>
<tr><td>Labor requirement</td><td>Very High<br>(Land preparation requires a number of people, especially in cutting big trees)</td><td>Low<br>(only a few persons are needed for land preparation)</td></tr>
<tr><td>Material/tools needed</td><td>- Hoe (Baliu)<br>- Knife (Katana)<br>- Ax (Aisuak)<br>- Iron bar (Tuoik)</td><td>- Knife (Katana)<br>- Ensada<br>- Karaku oilku,<br>- Ai suak<br>- Iron bar</td></tr>
<tr><td>Types of crops planted</td><td>- Crops planted in the farm are limited as compared to those in the permanent farm since the farm is located far from their houses.</td><td>- Many crops can be planted in the farm owing to its proximity.</td></tr>
</table></td></tr>
</table>

<table>
<tr><th>Theme</th><th colspan="3">Discussions</th></tr>
<tr><td></td><td colspan="3">
<table>
<tr><td>Advantages</td><td>- Soils in the farm are fertile enough to produce a high yield of crops.<br>- Ashes after burning trees and grasses fertilize the soils.<br>- It is easy to control weeds in the farm.</td><td>- The farm is located near from houses in general.<br>- Many types of crops can be planted.</td></tr>
<tr><td>Disadvantages</td><td>- Shifting cultivation may cause water shortage, landslide, and surface soil erosion.<br>- Land preparation is very laborious and time-consuming.<br>- It is difficult to control a field fire.<br>- Crops can be damaged by pests and rodents.</td><td>- It is difficult to control weeds in the farm.<br>- Soil fertility in the farm is rather low.<br>- The farm needs to be used every year.</td></tr>
<tr><td>Distance</td><td>- It takes one to four hours from the houses to get to the farms. (Hence, the communities build a small hut in the farm to stay in the farm to protect farm products from any damages. )</td><td>- The farm is close from the house.</td></tr>
</table>
<br>➢ The average number of the plots owned by one household for shifting cultivation ranges from two to five.<br>➢ The average size of the farm is estimated based on the amount of maize seeds used in the farm as follows.<br>Large plot: 24 kg/plot (4 acre or1.6 ha), Small plot: 6 kg/plot (1 acre or 0.4 ha)</td></tr>
<tr><td>Willingness to Continue Shifting Cultivation</td><td colspan="3">➢ Most of the participants do not intend to continue shifting cultivation any more because: i) no virgin land/forest is available for shifting cultivation; ii) family laborers for shifting cultivation are limited; iii) they have coffee plantations/vegetable gardens which can generate cash income to support their livelihoods; and iv) some of them engage in salaried jobs.</td></tr>
</table>

**Table 20 Results of Group Discussions with Male and Female Groups on Present Land Use at Suco Talitu**

| Theme | Discussions |
|---|---|
| **Land Ownership and Tenancy Condition** | ➢ Most of the households in the village have their own land.<br>➢ Some of the households in the village rent farms from other households to grow staple crops, such as maize and cassava. However, they are not allowed to plant perennial crops and trees in the rented lands. In general, a tenant can use the same land from one to five years. The size of the rented land varies from a tenant to another tenant. |
| **Present Land Use in the Village** | ➢ The lands in the village are currently used as i) permanent/fixed farms, ii) farms for shifting cultivation, iii) grazing fields, iv) Eucalyptus forests, and v) communal lands managed by suco. |
| **Government Land and Communal Land** | ➢ There is no government land in the village.<br>➢ The lands in the village are currently used as i) permanent/fixed farms, ii) farms for shifting cultivation, iii) grazing fields, iv) Eucalyptus forests, and v) communal lands managed by suco.<br>➢ There is a communal land located at Fatulana in Aldeia Talitu. The area is covered with regenerating forests. The area was used to be used for a demonstration plot for the government project before, and the participants also proposed to use the area for the same in the new JICA project.<br>➢ The communal land should be used for the sake of the communities in the village. |
| **Traditional Rules** | ➢ Tara Bandu is not effective in the village at present, but the village has traditional rules on the use of natural resources. Accordingly, the communities in the village observe the traditional rules/regulations.<br>➢ Land disputes over the boundaries between two lands sometime take pace in the village. The village leaders have intervened in disputes and settled the issues.<br>➢ Dispute of boundary between the two land owners sometimes take place in the farmland, in which Suco leaders often intervene to settle the issues through dialogues. |

**Table 21 Results of Group Discussions with Male Group on Major Natural Resources for Livelihood Improvement at Suco Faturasa**

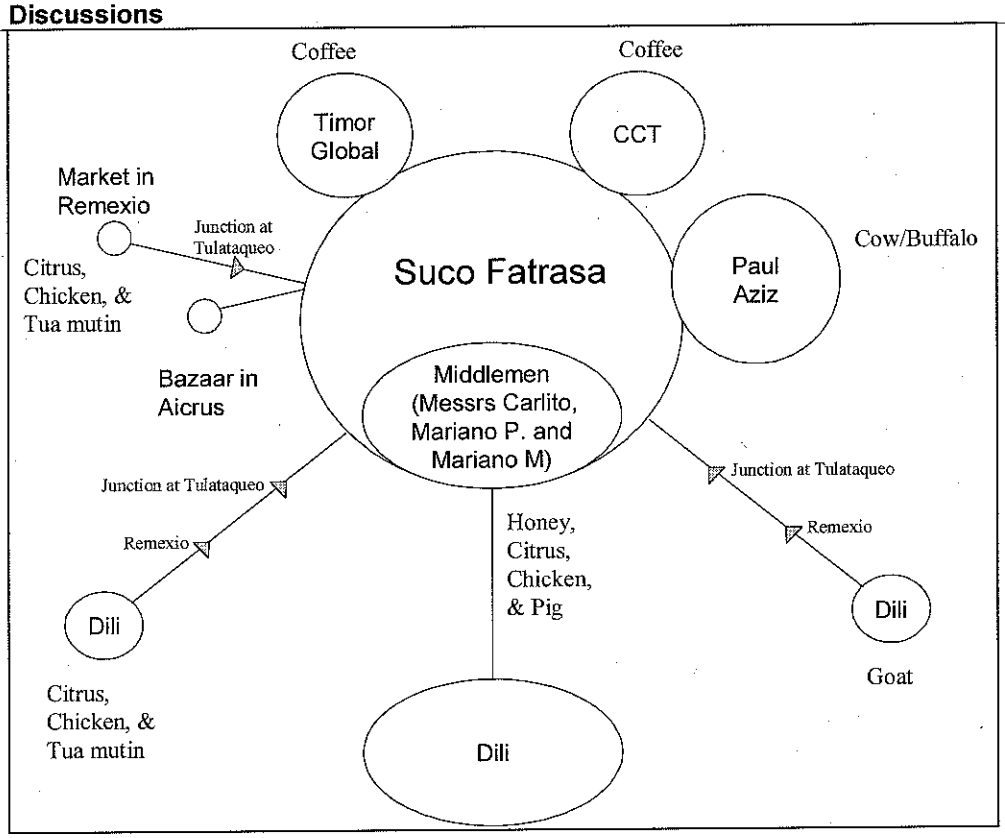
<table>
<tr><th>Theme</th><th>Discussions</th></tr>
<tr><td>Resources in locality</td><td>Please refer to the attached table.</td></tr>
<tr><td>List of major resources/ agricultural products important for livelihood development</td><td>➢ Important resources and products for their livelihoods are listed below.<br>- Maize, Cassava, Sweet potato, Peanut, Tubers (Kontas and Talas), Beans, Pigeon peas (Tunis), Soybeans, Pumpkin, Banana, Upland rice, Vegetables (eggplant, tomato, Brea), Markiza, White pumpkin, Squash, Chili, Wild tubers (Kumbili, Maek, Kuan)<br>- Fruits (jackfruit, ,mango, pineapple), Citrus (orange and lemon), Coconut<br>- Turmeric (Kinur), Ginger, Honey, Ai clila duku, Tamarindo, Ai dark, Bamboo shoot, Tua mutin, Wild pig, Dear (Rusa), Forest fruit (Uhak), Squirrel (Laku), Monkey, Meda, Snake, Coffee, River prawn, Eel (?), Wild chicken, Pigeon (Pobu), Eagle.<br>- Cattle/Cow, Buffalo, Goat, Pig, Dog, Chicken (including egg), Horse<br>(Those in bold letters were considered important.)<br>➢ The five most important resources/products are:<br>- Coffee, Chicken, Citrus, Cattle&Buffalo, Pig</td></tr>
<tr><td>Pair-wise ranking among the important resources/ agricultural products</td><td>➢ Important resources and products for their livelihoods are listed below.
<table>
<tr><th></th><th>Coffee</th><th>Chicken</th><th>Citrus</th><th>Cattle/Buff</th><th>Pig</th></tr>
<tr><td>Coffee</td><td></td><td>Coffee <1</td><td>Coffee <2</td><td>Coffee <3</td><td>Coffee <4</td></tr>
<tr><td>Chicken</td><td></td><td></td><td>Chicken <5</td><td>Cattle/Buff <6</td><td>Pig <7</td></tr>
<tr><td>Citrus</td><td></td><td></td><td></td><td>Cattle/Buff <8</td><td>Pig <9</td></tr>
<tr><td>Cattle/Buff</td><td></td><td></td><td></td><td></td><td>Cattle/Buff <10</td></tr>
<tr><td>Pig</td><td></td><td></td><td></td><td></td><td></td></tr>
</table>
➢ The reasons for selection are as follows:<br><1: The price of coffee is higher than that of chicken. Hence, coffee can improve economic conditions of households.<br>Drinking coffee inspires them.<br><2: The price of coffee is higher than that of chicken. Hence, coffee can improve economic conditions of households.<br>Coffee can be sold at the village.<br>Citrus must be brought to Dili for sale. Furthermore, citrus often get damaged during transportation to Dili.<br><3: Coffee is the primary means to earn money for buying daily necessities.<br><4: Coffee has more important value.<br><5: Chicken can be sold anytime and its price is also good.<br>Citrus can be harvested only once a year.<br><6: Chicken is in high market demand.<br>But cow/buffalo is also considered important, because:<br>- High marketing price; and<br>- Necessity of traditional ceremony.<br><7: Pig has high economic value.<br>Pig can be used for a traditional ceremony.<br><8: The price of cow/buffalo is high.<br>Cow/Buffalo is used for a cultural ceremony.<br><9: Same as above.<br><10: Same as above.</td></tr>
<tr><td>Current</td><td>➢ Major agricultural commodities are currently marketed in the following manners.</td></tr>
</table>

**Results of RRA Survey at Suco Faturasa**

**Group Discussions with Male Group on Major Natural Resources for Livelihood Improvement**

| Theme | Discussions |
|---|---|

**practices in marketing major commodities**



| Commodities | Main Buyers (Marketing Outlets) | Place of sale |
|---|---|---|
| Coffee | CCT (2006) and Timor Global (2007) <1 | 4 aldeias of suco |
| Honey | Middlemen (Messrs Carlito and Mariano) in the village. <2 | - ditto - |
| Citrus | The majority are sold to the middlemen (Messrs Carlito and Mariano) in the village.<br>The rest are sold at the bazaar/market in Aicrus and Remexio. | 4 aldeias of suco<br><br>Aicrus and/or Remexio |
| Tua Mutin | Sold at the markets in Dili and Remexio, bazaar in Aicrus, and to members of the village. | Dili, Remexio<br>Aicrus<br>4 aldeias of suco |
| Chicken | Middlemen (Messrs Carlito, Mariano P. and Mariano M) in the village. | 4 aldeias of suco |
| Goat | Sold to communities living in Dili.<3 | Dili |
| Cow/Buffalo | Butcher/Slaughterer (Mr. Paul Aziz) <4 | Suco |
| Pig | Middlemen (Messrs Carlito, Mariano P. and Mariano M) in the village. | 4 aldeias of suco |

Note:

<1: There was no buyer coming to the village before 2004.

<2: They started buying honey from 2000. Honey was sold at Dili before 2000.

<3: The current price of goat is lower than that during the Indonesian era.

<4: Mr. Aziz sends one staff here to find cow and negotiate with owners when buying cow.

**Problems/Issues in Marketing**

- Existence of competitors (There are many products in the market when they sell their produce.) in marketing cassava, citrus, mango, pineapple, jackfruit, banana, etc.
- High transportation cost (Because of high transportation cost and low selling price, they do not gain any profit or lose by selling their products.)
- Poor accessibility (because of lack of transportation facilities and poor road condition)

**Transportation cost**

| Start - End | Means <1 | Cost | Remarks |
|---|---|---|---|

| Theme | Discussions |
|---|---|

| | | | |
|---|---|---|---|
| Faturasa-Tulataqueo | on foot | None | 1 hr 20 min walking |
| Tulataqueo -Remexio | Public bus | US$ 0.5/person<br>US$ 0.5/bag<br>US$ 1.0/goat | There is no service during the rainy season. It takes 3 hrs on foot. |
| Remexio -Dili | Public bus | US$ 1.5/person<br>US$ 1.0/bag<br>US$ 2.0/goat | It takes 8 hrs on foot. |

Note: The principal transportation means in the suco is a small public bus.

<tr><td>Wood</td><td>Remanaru</td><td>Maunaru, Hautle, Oreda, Aikaslalan</td><td>Aitane, Kudaluhan</td><td>-</td></tr>
</table>
Note: <1 There was no information about Aldeia Berelisu since no one participated in the discussion.
<ul>
<li>Findings obtained through discussions made by the participants are highlighted as below.</li>
</ul>
Water: A number of sources of water (both natural spring and tapped water) are located in the food of the hills. Hence, families living around ridges of hills and mountains need to come down and climb up a steep hillside whenever they fetch water. Accordingly, women in a household fetch water for cooking and other domestic purposes trice a day. Bathing and washing clothes are done at the sources of water.<br><br>
Forests: Firewood and other forest products (such as timber) are distributed mainly in Aldeia Remehei. There is no customary rule/regulation in the village to restrict the collection of firewood and forest products or to protect forest/woodland from overexploitation by firewood collection. Community members even those living in the other aldeias can collect firewood and forest products in Remehei. On average, one family collects firewood every day or every other day. Recently, the location of forest/woodland for firewood collection is being changed due to the decrease of available eucalyptus stands.<br><br>
Grasses: Grassland is used for grazing livestock as well as collecting roofing materials. Free grazing is a common practice in raising animals. Owners of livestock check and count their animals only once a week. Like forest/woodland, grassland for grazing has declined and been insufficient for raising animals in the village, especially during the dry season.
</td></tr>
<tr><td>List of major resources/ agricultural products important for livelihood development</td><td>
<ul>
<li>Important resources and products for their livelihoods are listed below.<br>- Maize, Cassava, Potatoes, Tubers (Talas, Kontas), Pigeon pea (Tunis), Red beans, Peanut, Pumpkin, Beans, and Ai same<br>- Water, Trees, and Land</li>
<li>The five most important resources/products are:<br>- Water, Land, Trees, Maize, Cassava</li>
<li>Use of the above-listed resources are summarized below.</li>
</ul>
</td></tr>
</table>

## Results of RRA Survey at Suco Faturasa

**Group Discussions with Female Group on Major Natural Resources for Livelihood Improvement**

**Theme**

**Discussions**

| Resources | Usage of Resources |
|---|---|
| Water | Used for cooking, washing, showering, watering, drinking, and animal raising.<br>Used as construction materials mixed with cement. |
| Land | Used for farming and as bases for houses and vegetation |
| Cassava | Eaten boiled, fried and roast<br>Used for animal feed<br>Used for making cassava chips and tapioca |
| Maize | Eaten as a staple diet<br>Used for animal feed |

**Pair-wise ranking among the important resources/ agricultural products**

Important resources and products for their livelihoods are listed below. Results of Pair-wise ranking

| | Water | Land | Trees | Maize | Cassava | Total | Rank |
|---|---|---|---|---|---|---|---|
| Water | | Water <1 | Water <1 | Water <1 | Water <1 | 4 | 1 |
| Land | | | Land <2 | Land <2 | Land <2 | 3 | 2 |
| Trees | | | | Maize | Cassava <3 | 0 | 5 |
| Maize | | | | | Cassava <3 | 1 | 4 |
| Cassava | | | | | | 2 | 3 |

- The reasons behind the judgements are as follows:

<1: The villages selected "Water" as the most important resource considering that it can be used for multiple ways, such as drinking, cooking, and watering.

<2: They also judged "Land" the second important resources, since it is a base for forests and other vegetation, agricultural crops, and houses.

<3: The score of "Cassava" was higher than that of "Maize" because it can be stored for several years in the field.

<4: Although the participants gave "Trees" the lowest priority, they also mentioned that it is necessary for them to protect "Trees" because of its important functions.

**Current practices in marketing major commodities**

- Cassava and maize are used for only home consumption.
- The following products and resources were selected as those sold outside the village.

| Resources | Main Buyers (Marketing Outlets) |
|---|---|
| Coffee | A Chinese living in Dili visits the village to buy coffee beans. |
| Honey | Honey is sold in Dili mainly to people living in Dili. |
| Peanut <1 | Peanuts are packaged and sold at the school or market in Remexio. |
| Orange | Oranges are sold at the bazaar in Tulataqueo. |
| Chicken <2 | Chicken is sold in Dili to people living in Dili. |
| Egg <2 | Eggs are sold to Sunli Company (Chinese-Timor Company) at the village. |
| Vegetables | Vegetables are sold to the Halilaran market in Dili every week or every two week. |

Note: <1 Peanuts are sold after being shelled, roasted, and packaged. The processing and marketing of peanut are women's work.

<2 Raising chickens and picking eggs are women's work, while raising relatively big animals, such as cattle, goats and pigs, are under men's responsibility.

- Coffee, peanut, orange and honey can bring community members cash income just once a year, while other products such as chicken, egg and vegetables can generate cash income several times.
- The following diagram shows marketing flows of the major agricultural commodities.

**Results of RRA Survey at Suco Faturasa**

**Group Discussions with Female Group on Major Natural Resources for Livelihood Improvement**

| Theme | Discussions |
|---|---|
| |  |
| **Problems/Issues in Marketing** | ➢ Difficulty in transporting marketable commodities to the respective markets<br>- Community members must walk for 5 km with products to take public transportation from Tulataqueo.<br>- Due to poor road conditions, there is no vehicle to get to the village especially during the rainy season.<br>➢ Lack of marketing competitiveness of the products<br>- It is difficult for them to sell their farm products (such as orange and vegetables) in the peak harvesting seasons, since there are many produce coming from other areas in the market. |
| **Others** | ➢ There is no cooperative and other collective form for marketing farm products in the village. |

## Table 23 Results of Group Discussions with Male Group on Major Natural Resources for Livelihood Improvement at Suco Fadabloco

### Theme: Important agricultural products and natural resources for villagers' livelihoods by male and female

➢ The male participants selected important products/resources in the village classifying the resources into six categories such as 1) fruit, 2) horticulture, 3) plantation, 4) animal, 5) wild animal and 6) forest production.

| Categories | Resources |
|---|---|
| 1) fruit | Maize, peluk, cassava, kontas and coto |
| 2) horticulture | Modo, lis, sabraca, nunes and tomato |
| 3) plantation | Coffee, kami, orange, papaya and mango |
| 4) animal | Buffalo (karau metan), karau metan, horse, pig and goat |
| 5) wild animal | Manu huik, monkey, meda, laku and rusa |
| 6) forest production | Ai ru, Ai bubur, Kakeu, Au and Papulu |

➢ The participants further selected the five most important resources in the village among those listed above. The resources selected are 1) coffee, 2) orange, 3) pineapple, 4) vegetables and 5) mango.

### Pair-wise ranking among the important resources/ agricultural products

➢ The important resources and products for their livelihoods are evaluated by using the pair-wise ranking method as tabulated below.

| | Coffee | Orange | Pineapple | Vegetable | Mango | Total | Rank |
|---|---|---|---|---|---|---|---|
| Coffee | | Coffee<1 | Coffee<1 | Coffee<1 | Coffee<1 | 4 | 1 |
| Orange | | | Orange<3 | Vegetable <2 | Orange<3 | 2 | 3 |
| Pineapple | | | | Vegetable <2 | Mango<3 | 0 | 5 |
| Vegetable | | | | | Vegetable <2 | 3 | 2 |
| Mango | | | | | | 1 | 4 |

➢ The reasons behind the judgments are as follows:

<1: "Coffee" is the first important resources since it can be sold at the better price than others.

<2: "Vegetables" are the second important resources, since they can be sold for a long period.

<3: "Orange" is more important than "Mango," since its price is higher than that of Mango.

### Current practices in marketing major commodities

➢ The following products and resources were sold outside the village.

| Resources | Main Buyers (Marketing Outlets) | Price sold | Amount of product sold |
|---|---|---|---|
| Coffee (Arabica) | - A Chinese middleman (Mr. Akeu) visits the village to purchase the coffee. (CCT and NCBA used to buy the coffee before.)<br>- The villagers also go to Dili by public transportation to sell coffee parchment | - USD 0.25 /kg for cherry<br>- USD 1/25 /kg for parchment | - Approximately 500 kg/season (50 kg x 10 times) are sold by one household in Dili. |
| Vegetable | Vegetables are brought and sold to the middleman in Hariraran Market in Dili. | - USD 0.50 /bundle | - About 50 – 100 bundles are sold by one household in the harvest season. |
| Orange | The products are brought to and sold in Dili by themselves. | - USD 1/bundle (USD 100-150 /harvest from 1 tree) | - About 50-100 bundles are sold by one household in the harvest season. |
| Mango | Same as orange | USD 1 /bundle | Same as orange |
| Pineapple | Same as orange | USD 1 /fruit | 40 fruits/season |

| Theme | Discussions |
|---|---|
| | ➢ The villagers use two ways to carry the products/commodities to Dili, namely:<br>- One hour walking to Remexio and then taking the public transportation to Dili, which costs 1 USD/person<br>- Two hour walking to Liquidoe and then taking the public transportation to Dili, which costs 2.5 USD for person with additional charges for the products<br>➢ The following diagram shows the marketing flows of the major commodities. |
| **Others** | ➢ There is no cooperative or other collective form for marketing the products in the village. |

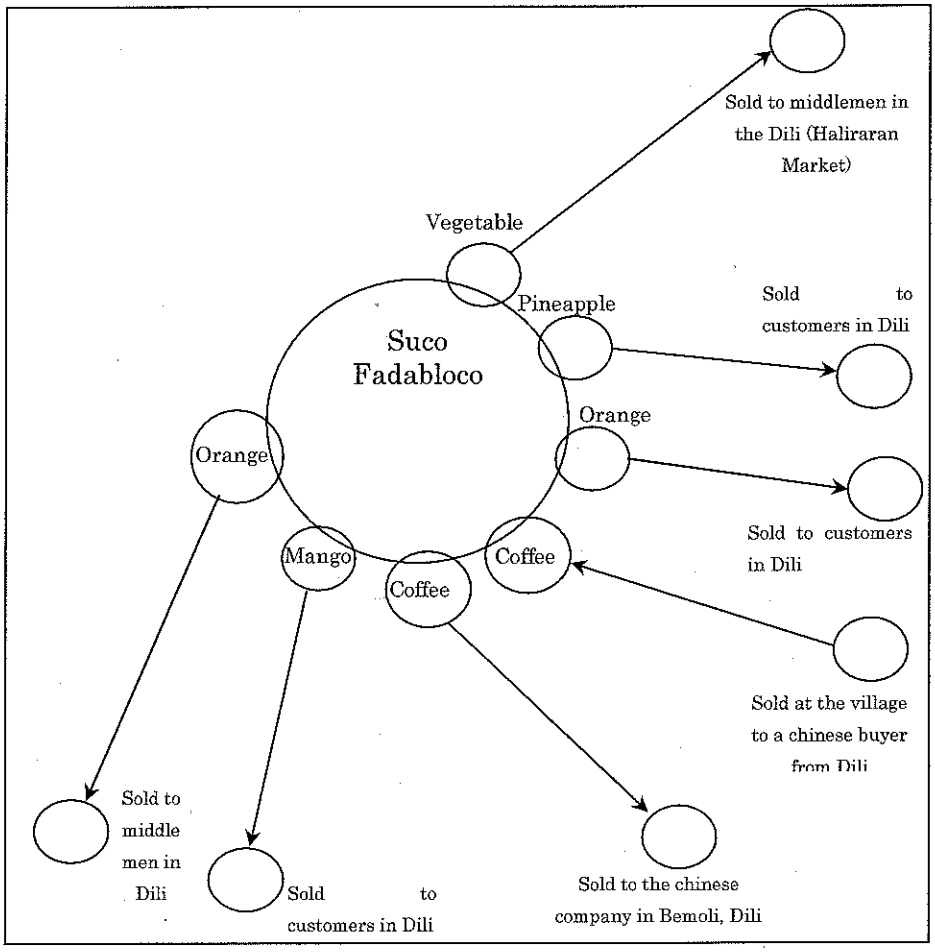

**Table 24 Results of Group Discussions with Female Group on Major Natural Resources for Livelihood Improvement at Suco Fadabloco**

| Theme | Discussions |
|---|---|
| **List of important agricultural products and natural resources for villagers' livelihoods by female** | Agricultural products<br>➢ Agricultural products important for their livelihoods are listed below.<br>- Maize, Cassava, Sweet potato, Potato, Taro(*Talas*), Edible canna (*Kontas*), Red beans, Long beans, Pumpkin (*Lakeru*), Chayote (*Lakeru mutin*), Kidney beans, Soy beans, Peanuts, Salt beans, Mustard leaf, Lettuce, Cabbage, Chinese cale, Kankun, Watercress, Slender amaranth Carrot, Tomato, Cucumber, Eggplant, Shallot, Onion, Garlic, Loofah, Chili<br>- Jackfruits (vegetable, fruits, for roast), Sour sop, Tangerine orange, Pineapple, Calamondin, Kaffir lime, Pomelo (*Jambua*), Banana, Papaya, Mango, Guava, Avocado, Java apple (*Jumbu air*), Pomegranate, Apple, Loquat, Plum, *Kaiju*, Passion fruit, Coconut,<br>- Coffee, *Tua* : Fermented sap of various palms , Betel nut<br>➢ Livestock animals important for their livelihood are listed below.<br>- Chicken, Duck, Pig, Dog, Goat, Cat, Buffalo, Cow, Horse<br><br>Natural Resources<br>➢ Forestry products important for their livelihood are listed below.<br>- White gum(*Ai bubur*), Casuarina (*Ai kakeu*), Timor mountain gum (*Ai ru*), Source tree (*Ai samtuk*), Toon (*Ai saria*), Tamarind (*Sukaer*), Sandlewood(*Kameli*), Narra(*Ai na*), Goomar teak (*Teka mutin*), *Teka metan*, Steruculia **foetida** (*Ai nitas*), Kapok tree (*Ai lele*), Banyan (*Ai hali*), *Tua metan*, Maccasar oil tree (*Ai dak*), Golden bamboo (*Au oro*), Fine bamboo (*Fafulu*), Giant bamboo (*Au betun*), Rattan (*Rotan*), Devil tree or White cheesewood (*Ai hanek*)<br>➢ Non-timber products important for their livelihood are listed below.<br>- Devil's tongue (*Maek*), Greater yam (*Kumbili*), Wild yam (*Kuan*), Long yam, Scarlet runner bean (*Koto moruk*), Yam beans, Arrow root (*Ai same*), Tua mutin, Wild papaya, Wild banana, Wild mango, Guava,<br>- Honey,<br>➢ Wild animals important for their livelihood are listed below.<br>- Wild chicken, Deer, Wild pig, Monkey, Raccoon, Opossum, Python, Fruit bat, Eel, River shrimp, *Toke* lizard, *Teki* lizard |
| **The order of five most important natural resources and the reasons for order** | ➢ The five most important products in i) staple crops, ii) vegetables, iii) fruits, iv) forestry products, and v) livestock animals were selected as follows.<br>Staple Crops<br>1. Maize, 2. Cassava, 3. Taro, 4. Sweet potato, 5. Edible canna<br>Vegetables<br>1. Mustard, 2. Onions and garlic, 3. Lettuce, 4. Papaya, 5. Tomato<br>Fruits<br>1. Oranges, 2. Coffee, 3. Pineapple, 4. Passion fruit, 5. Banana, 6. Mango<br>Forestry products<br>1. *Au betan*, 2. *Ai ru*, 3. *Tua mutin*, 4. *Fafulu*, 5. *Ai sarina*, 6. *Ai kakeu*, 7. *Ai samtuk*<br>Livestock animas<br>Chicken, 2. Pig, 3. Goat, 4. Cow, 5. Horse<br>➢ In total 28 items were selected as the most important products for their livelihoods.<br>➢ Among the 28 items, the participants selected the following seven products for further evaluation. .<br>1. Coffee, 2. Oranges, 3. Pineapple, 4. Vegetables, 5. Chicken, 6. Tua mutin, 7. Pig,<br>➢ The reasons for order<br>1. Those products actually give benefits to villagers.<br>2. They eat maize everyday but maize can not be sold at the market.<br>3. Cassava can also not be sold in the market.<br>4. The products listed above were selected from the viewpoint of marketability. |
| **Results of the pair-wise** | The results of the pair-wise ranking of the selected important products are given below. |

## Results of PRA Survey at Suco Fadabloco

**Group Discussions with Female Group on Major Natural Resources for Livelihood Improvement**

**Theme**

**Discussions**

**ranking of agricultural products**

| | Coffee | Orange | P-apple | Veggies | Chicken | Tua | Pig | Total | Rank |
|---|---|---|---|---|---|---|---|---|---|
| Coffee | | Orange<1 | Coffee<2 | Veggies<3 | Chicken<4 | Tua <5 | Pig <6 | 1 | 5 |
| Orange | | | P-apple< 7 | Veggies<3 | Chicken<4 | Tua <5 | Pig<6 | 1 | 5 |
| P-apple | | | | Veggies<3 | Chicken<4 | Tua <5 | Pig<6 | 1 | 5 |
| Veggies | | | | | Veggies<8 | Tua <9 | Veggies<8 | 5 | 2 |
| Chicken | | | | | | Tua <9 | Chicken<10 | 4 | 3 |
| Tua | | | | | | | Tua<9 | 6 | 1 |
| Pig | | | | | | | | 3 | 4 |

- The results of the ranking revealed that tua was considered as the most priority product, followed by vegetables, chicken, and pig.
- The reasons behind the judgments are as follows:

<1: The production and price of orange are good. Coffee can harvest only once a year.
<2: Every household has coffee plantation. Coffee is marketable and its price is good.
<3: Vegetables can be harvested throughout a year, coffee can harvest only once a year.
<4: Chicken can be sold throughout a year, but coffee can harvest only once a year.
<5: Tua can be harvested throughout a year and its price is good.
<6: Pig can be sold throughout a year.
<7: The price of pineapple is better than that of orange.
<8 Vegetables can be sold at a good price and many buyers buy vegetables in the markets.
<9 Tua can be harvested every day.
<10 Chicken is smaller than pig and its breeding period is shorter than that for pig.

**Major marketing outlets/buyers of the important products/resources**

The following products and resources are sold outside the village.

| Products | Main Buyers (Marketing Outlets) |
|---|---|
| Tua | Buyers come to houses to buy. |
| Vegetables | They are sold at the Fahisoi in Remexio, and the markets in Dili. |
| Chicken | ditto |
| Pig | Large pigs are sold at home and small ones are brought to the Fahisoi in Remexio and/or Dili for sale. |

- Local communities use sacks, baskets/small sacks, and yokes to carry vegetables, chicken, and pig, respectively.
- Transportation cost is high. It costs $3.5 for one way and $7 for a round trip.
- The prices of products are almost the same with those at the Fahisoi and Remexio markets.

The following diagram shows the marketing flows of the major agricultural commodities.

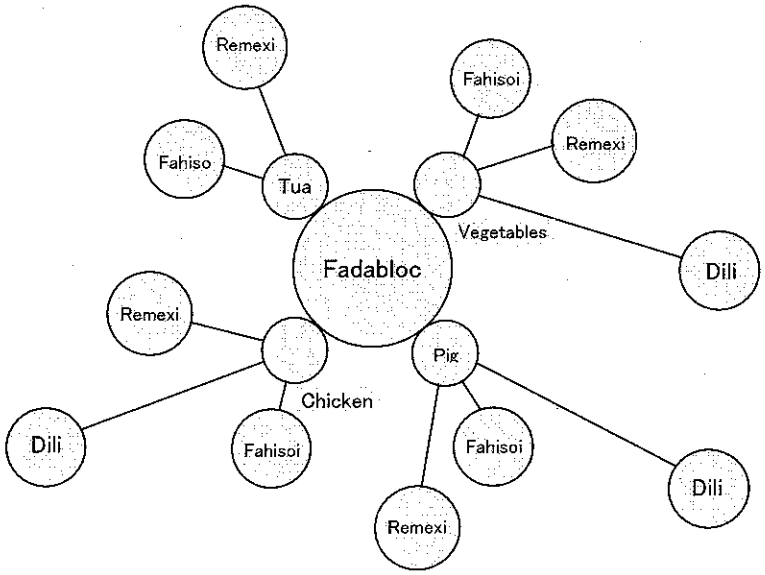

**Table 26 Results of Group Discussions with Female Group on Major Natural Resources for Livelihood Improvement at Suco Madabeno**

<table>
<tr><th>Theme</th><th>Discussions</th></tr>
<tr><td>List of Important Agricultural Products and Natural Resources for the Livelihoods of the Village</td><td>
➢ Important agricultural resources for their livelihoods are as follows.<br>
- Maize, Cassava, Sweet potato, Taro(Talas), Edible canna (Kontas), Yam beans (Singomas), Red beans, Pumpkin (Lakeru), Chayote (Lakeru mutin), Kidney beans, Mustard leaf, Letuce, Carrot, Tomato, Cucumber, Eggplant, Chili<br>
- Jackfruits (vegetable, fruits, for roast), Sour sop, Tangerine orange, Mandarin orange, Calamondin, Kaffir lime, Pomelo (Jambua), Banana, Papaya, Java apple (Jumbu air), Coconut,<br>
- Coffee, Betal leaf, Tua : Sugar palm , Candle nut<br><br>
➢ Important natural products for their livelihoods are as follows.<br>
- Devil's tongue (Maek), Greater yam (Kumbili), Wild yam (Kuan), Scarlet runner bean (Koto moruk), Red and white beans (Lehe), Arrow root (Ai same)<br><br>
➢ The participants from Aldia Desmanehata and Aldia Remadati confirmed the existence of all the resources listed.<br><br>
➢ The average yields of the major important agricultural products and resources are as fallows.
<table>
<tr><th>Resources</th><th>Yield</th><th>Resources</th><th>Yield</th></tr>
<tr><td>Maize</td><td>5-10 buckets/ year</td><td>Pomelo</td><td>4-5 buckets/ year</td></tr>
<tr><td>Cassava</td><td>2 buckets/ week</td><td>Banana</td><td>10 bunches/ year</td></tr>

<tr><td>Sour sop</td><td>0.5 bucket/ year</td><td>Scarlet runner bean</td><td>2 sacks/year</td></tr>
<tr><td>Tangerine orange</td><td>10 buckets/ year</td><td>Red and white bean</td><td>2 sacks/year</td></tr>
<tr><td>Kaffir lime</td><td>2-3 sacks/ year</td><td>Arrow root</td><td>30 buckets/year</td></tr>
</table>
</td></tr>
<tr><td>Most Important Natural Resources for their Life</td><td>
➢ The five most important resources/products are: i) Land (soil), ii) Water, iii) Forest, and iv) Grasses.<br><br>
➢ The reasons behind the order of the resources are:<br>
1. The land produces agricultural products and natural resources which they eat, use for animal feeds, and sell for cash income.<br>
2. Water can be used for drinking and domestic purposes. It is also used for watering crops and animals.<br>
3. Forests provide firewood, shade for coffee, and sources of wild products.<br>
4. Grasses are used for cattle feed.
</td></tr>
<tr><td>Most Important Agricultural Products</td><td>
➢ The participants selected the following five agricultural products as the most important agricultural products.<br>
- Maize, Cassava, Sweet potato, Coffee, Vegetables<br><br>
➢ The important agricultural products were further ranked by using the pair-wise ranking method as shown below.
<table>
<tr><th></th><th>Maize</th><th>Cassava</th><th>Sw potato</th><th>Coffee</th><th>Vegetables</th><th>Total</th><th>Rank</th></tr>
<tr><td>Maize</td><td></td><td>Maize <1</td><td>Maize <1</td><td>Maize<1</td><td>Maize <1</td><td>4</td><td>1</td></tr>
<tr><td>Cassava</td><td></td><td></td><td>Cassava<2</td><td>Cassava <2</td><td>Cassava <2</td><td>3</td><td>2</td></tr>
</table>
</td></tr>
</table>

| | | | | | | | |
|---|---|---|---|---|---|---|---|
| Sw potato | | | | Sw potato<3 | Sw potato <3 | 2 | 3 |
| Coffee | | | | | Coffee <4 | 1 | 4 |
| Vegetables | | | | | | 0 | 5 |

- The reasons behind the judgments are as follows:

<1: Maize is the most important staple crop and can not be replaced with other crops, such as cassava.

<2: Cassava is consumed every day.

<3: Sweet potato can also be used as a staple crop.

<4: Coffee is the major cash crop to earn cash income.

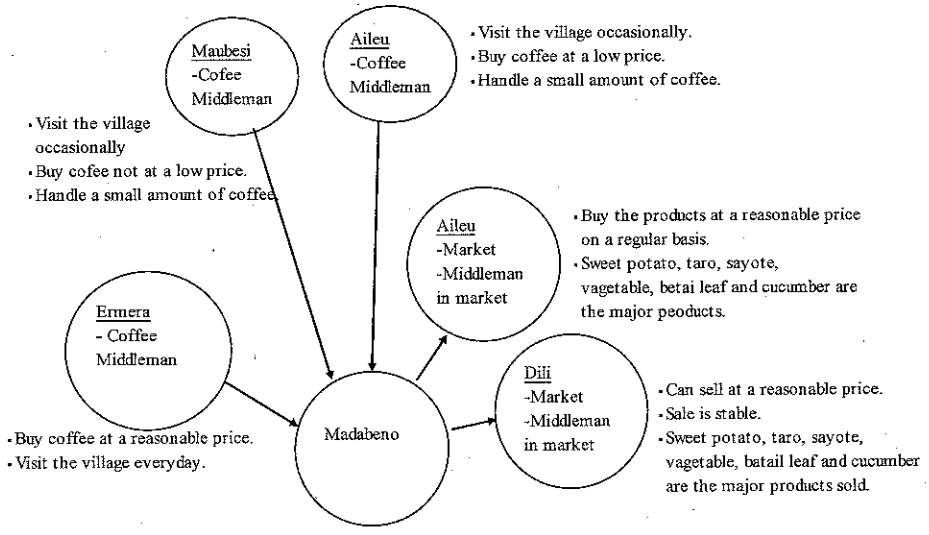
**Major Market Outlets/Buyers of the Important Products**

- Maize is used only for home consumption.
- The following products and resources are sold outside the village.

| Products | Main Buyers (Marketing Outlets) |
|---|---|
| Coffee | Coffee (cherries or beans) is sold to Timorese middlemen who visit the village. The middlemen come to the village twice or trice a month and purchase one to three sacks of coffee. The purchase prices of cherry and parchment are US$ 0.3/kg and US$ 1.5/kg, respectively. |
| Sweet potato, cassava, vegetables, taro, sayote, cucumber, | They are sold at the roadside stand or at the Halilaran and Taibesi markets in Dili. |
| Betal leaf, tua | They are sold in the Aileu market. |

- If they cannot sell the products at a high price or sell out all products, the remnants will be used for home consumption.
- Transportation cost (Mini truck) is rather expensive. (Madabeno – Dili: US$ 1.5/person/way and US$ 0.5/sack/way and Madabeno – Aileu: US$ 1.5/person/way and US$ 0.5/sack/way)
- Aldeia Ismori has one truck.

  As the communities in the village produces the same products at the same time, they can not sell the products at a high price.
- The following diagram shows the marketing flows of the major commodities.



## Table 27 Results of Group Discussions with Male and Female Groups on Major Natural Resources for Livelihood Improvement at Suco Talitu

**List of major agricultural and forest products important for livelihood development**

- The participants identified the following 12 agriculture and forest products as important resources for their livelihoods.

| Products | Area | Harvesting season | Frequency | Harvesting volume |
|---|---|---|---|---|
| Coffee | 4 Aldeias | Jun. –Jul. | 30 times/yr | 10-100 sacks/HH(Cherry)<br>4-80 sacks/HH (parchment) |
| Clove | Talitu and Quelae | Aug.-Sep. | 60 times/yr | 4-70 sacks/HH |
| Pepper | 4 Aldeias | Nov.-Jan. | 30 times/yr | 1.5-6 sacks/HH (white) |
| Vegetables | Talitu, Fatukuhun, Casa Manatutu | All the year | 12 times/yr<br>Once a month | 10-100 stick/HH<br>(100-200 bundles/stick) |
| Pineapple | Talitu, Fakutuhun, Quelae | Aug.-Feb. | Everyday during the harvesting season | 100-1,000 pcs/HH |
| Banana | 4 Aldeias | All the year | 5-10 times/yr | 5-10 bundles/HH |
| Tua mutin | 4 Aldeias | All the year | Twice a day (Everyday) | 1,000-2,500 lit/HH |
| Cassava | 4 Aldeias | All the year | Once/Twice a week | 10-20 sacks/HH |
| Sweet Potato | 4 Aldeias | Jun.-Jul. | Once a week during the season | 1-10 bascket/HH |
| Maize | 4 Aldeias | Mar.-Apr. | 1 time/yr | 5-25 bundles/HH |
| Kabura (Wild vegetables) | 4 Aldeias | All the year | Once a week | 1-2 sticks/HH |
| Aimanas Aileten (Wild chili) | 4 Aldeias | Oct. | 1 time/yr | 1-2 baskets/HH |
| Firewood <1 | 4 Aldeias | All the year | Every day | 1,000-2,000 bundles/HH |
| Timber <2 | Talitu, Fakutuhun, Quelae | All the year | 1~10 days/yr<br>(10 poles/day) | 10-100 poles/HH |

Remarks: <1 Old coffee trees, branches of Ai ru, and dead/fallen trees in Ai ru/Samutuku forests are used for firewood.
<1 Ai ru trees are used for timber.

- Vanila was not considered as an important crop since its cultural practice was complicated and laborious. The participants intended to stop the production of vanilla.

**List of major resources important for their life**

- In addition to the agriculture and non-timber forest products, the participants also assessed how the natural resources were important for their life.

| Natural resources | Use |
|---|---|
| Water | Drinking, Cooking, Washing, Watering vegetables and trees, and watering animals and fish ponds |
| Land | Farming, Housing, Cemetery, Paddy field, and Plantation |
| Forest | Animal grazing, Collection of fire wood, Construction of house, Collection of honey, Provision of water, and place of wildlife |

- The village allocates part of forests in Aldeia Fakutuhun for animal grazing. People in Talitu, Quelae and Fakutuhun have used the same for free grazing. People in Casu Manatutu do not have many animals and therefore, they tether animals to a pole or tree.
- Natural resources have affected the living conditions of the communities in the village as shown below.
  - There is no water supply or piping system in the village. Communities use bamboo to

conduce water from water sources.
- The volume of water in the water sources would be reduced in case of a long drought.
- Landslides have affected the farms and houses in the village.
- A strong wind sometimes causes damage to plantations and houses.
- A long drought makes trees shed their leaves.
- The volume of water at the water sources has been affected by tree cutting.
- The forest fires have reduced the habitats of wild life.

**Five Most Important Resources to the Livelihoods of communities**

➢ The participants evaluated the identified agricultural products and natural resources relevant to their livelihoods and selected the five most important products/resources as listed below.
- Coffee
- Clove
- Maize
- Cassava
- Vegetables

➢ Pepper was not selected as it was only available in Aldeia Talitu and it required the intensive maintenance.

➢ The participants further evaluated the five most important products using a pair-wise ranking method. The results of the assessment are shown below.

| Products | Coffee | Clove | Maize | Cassava | Vegetables |
|---|---|---|---|---|---|
| Coffee | | Coffee <1 | Maize <2 | Cassava <3 | Coffee <4 |
| Clove | | | Maize <5 | Cassava <6 | Vegetables <7 |
| Maize | | | | Cassava <8 | Maize <9 |
| Cassava | | | | | Cassava <10 |
| Vegetables | | | | | |

➢ The reasons behind the evaluations in each comparison are as follows.

<1 Coffee is planted in all the aldeias. It is the main source of income for almost all the families. Clove can be harvested only once a year.

<2 Maize is more important than Coffee, as it is one of the main staple crops for local communities.

<3 Cassava is also one of the main staple crops. Communities can harvest cassava and its leaves throughout a year. Cassava leaves can be used for animal feed.

<4 Vegetables are mainly for home consumption, but some can be sold to support the family.

<5 Maize is a main staple crop and consume the produce throughout a year. Although clove can be sold at a high price, it takes long time for them to produce clove and Aldeia Fatukhun is not suitable for clove production.

<6 The reasons are the same as those written in <3

<7 Vegetables can be grown in a short period of time (for 1.5 months). They can be consumed and sold to earn income.

<8 Same as <3

<9 Maize can grow even under the condition of less water.

<10 Same as <3

**Current practices in marketing major commodities**

➢ The current marketing practices for the important agricultural products are summarized below.

**Coffee**

| Items | Summary |
|---|---|
| Major buyers | CCT, Timor Global, Other middle men |
| Place of selling | Sold at each aldeia |
| Transportation | Communities bring coffee to the main road. |
| Volume sold | 20-50 sacks/HH/yr in the form of Cherry and 5-60 sacks/HH/yr in the form of parchment |
| Remarks | There is no mechanical pulping machine in the village and the village lacks water for pulping and places for drying. Since communities use only manual pulping machines at present, they can not produce a big amount of parchment. |

## Clove

| Items | Summary |
|---|---|
| Major buyers | CCT, Timor Global, Other middle men |
| Place of selling | At CCT or Timor Global (The products are brought to CCT or Timor Global.)<br>At Village |
| Transportation | Communities use the public transportation to bring clove to CCT and Timor Global.<br>CCT or Timor Global comes to the village to pick up the produce. |
| Volume sold | 4-50 sack/HH/yr |
| Remarks | The price of clove would be high if the produce is sold at CCT or Timor Global, but the price would be low if CCT or Timor Global picks up the produce at the village. |

## Vegetables

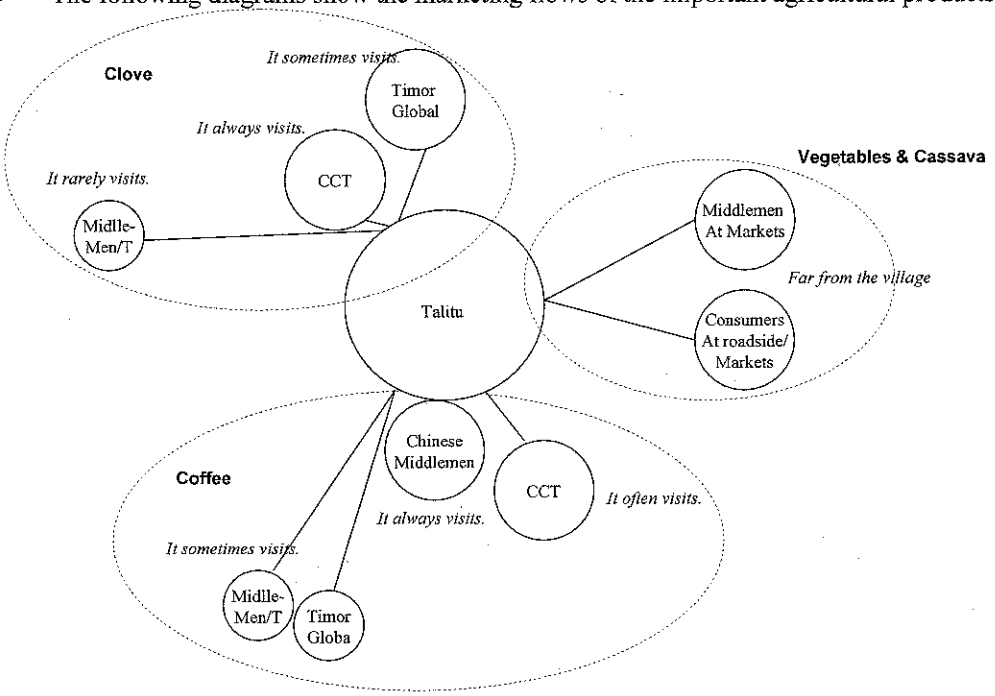
| Items | Summary |
|---|---|
| Major buyers | Middlemen (at the markets), Consumers |
| Place of selling | Sold at the main road or brought to and sold at the markets in Dili (Becora, Tainbesi, and Halilaran) |
| Transportation | Communities bring vegetables to the main road or the markets on foot. They sometimes use the public transportation. |
| Volume sold | 4 times/week (48 times/year)<br>480 sacks/yr (Max) |
| Remarks | People in Aldeia Fatukhun use the public transportation to carry the produce to Dili. |

## Cassava

| Items | Summary |
|---|---|
| Major buyers | Middlemen (at the markets), Consumers |
| Place of selling | Sold at the markets in Dili (Becora, Tainbesi, and Halilaran) |
| Transportation | Communities bring cassava to the markets on foot. They sometimes use the public transportation. |
| Volume sold | 10-20 bundles/HH/yr |
| Remarks | Cassava leaves can also be sold. |

**Marketing Flows**

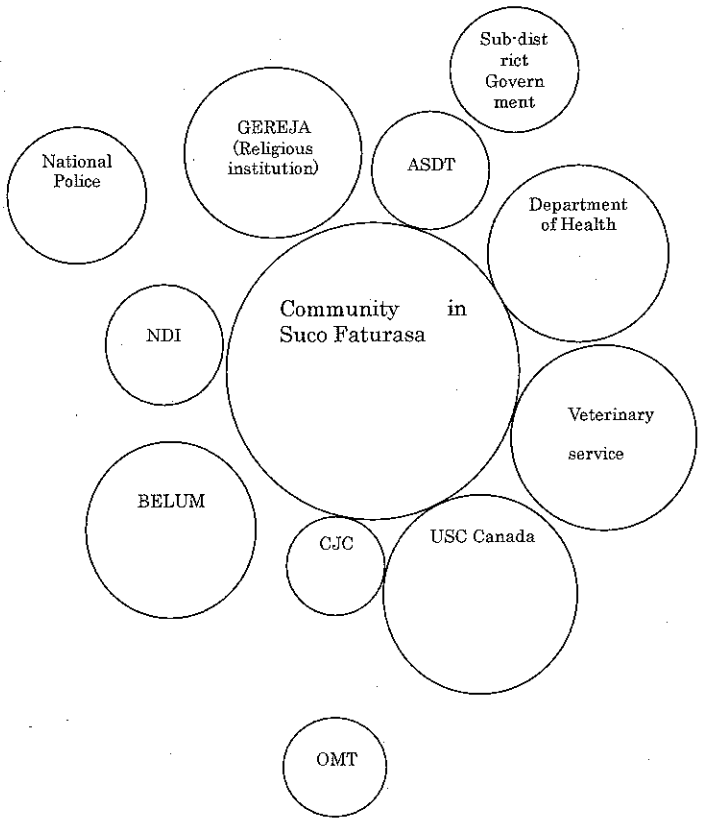
- The following diagrams show the marketing flows of the important agricultural products.



- CCT always comes to the village to buy coffee and clove and its buying prices are rather good. CCT uses its own transportation means to carry the produce.
- The prices of coffee in 2010 are US$ 0.25/kg in cherry and US$ 1.25/kg in parchment.
- The prices of clove at the farmgate in 2010 are US$ 5 /kg to CCT and US$ 4.5 /kg to Timor Global. The selling price of the same to the middlemen is lower.
- Middlemen buys vegetables/cassava in bulk (sack), while the volume of vegetables/casaba sold to consumers is small.
- In 2010, a sack of casaba is sold at US$ 5 /sack at the markets in Dili, while cassava leaves are sold to consumers in Dili/at roadside at US$ 0.25/3 bundles.

**Table 28 Results of Venn Diagram of Existing Institutions working in Suco Faturasa**

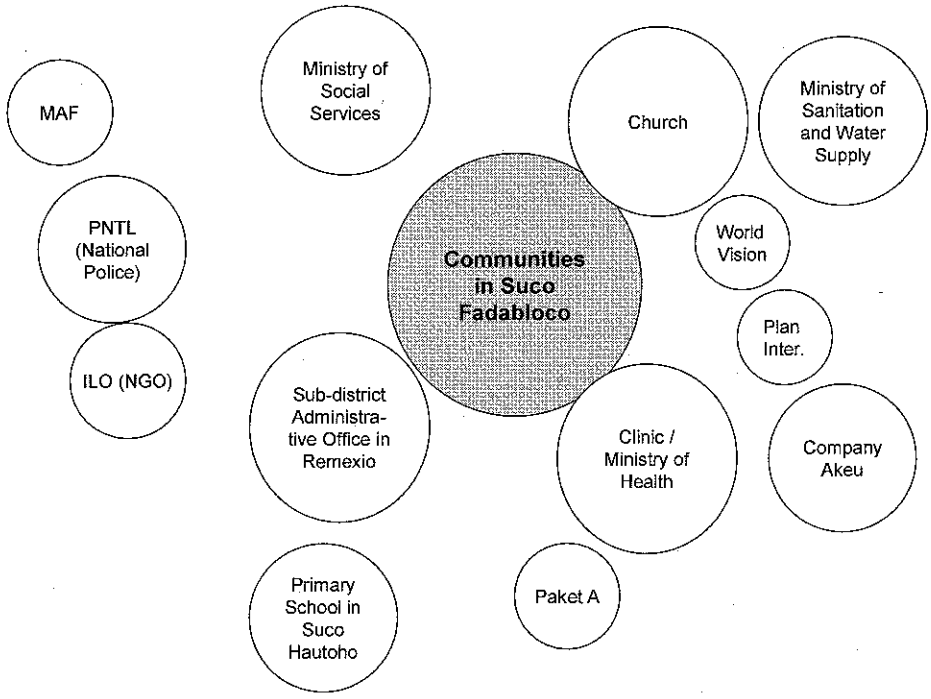
| Theme | Discussions |
|---|---|
| Venn diagram | ➢ A venn diagram showing the existing institutions/organizations in Suco Faturasa was drawn through a group discussion with the participants of RRA as shown below. |



- ➢ "ASDT" is one of the political parties in East Timor to which some villagers in Suco Faturasa belong.
- ➢ "NDI" (National Development Institute supported by USAID) is an organization that has worked mainly for capacity development of local leaders of the village, while "BELUM" is an NGO that has been working for horticulture (vegetables/fruits) development.
- ➢ "CJC" (Youth organization) and "OMT" (Women's group) are the village organizations in Suco Faturasa.
- ➢ "GEREJA" means a group of the people who gather and pray together at the church.
- ➢ "Veterinary service" indicate a person who is a member of Suco Faturasa and was trained on veterinary services. He presently functions as a community veterinarian. Community members can receive veterinary services including vaccinations of MAFF through him.
- ➢ "Department of Health" is working at a clinic constructed by UNICEF in 2003.

**Table 29 Results of Venn Diagram of Existing Institutions working in Suco Fadabloco**

| Theme | Discussions |
|---|---|
| Venn diagram | ➢ The participants identified a total of 13 organizations/institutions relevant to their life /livelihoods and developed the following venn diagram considering the importance as well as proximity of the identified organizations/institutions from the village. |

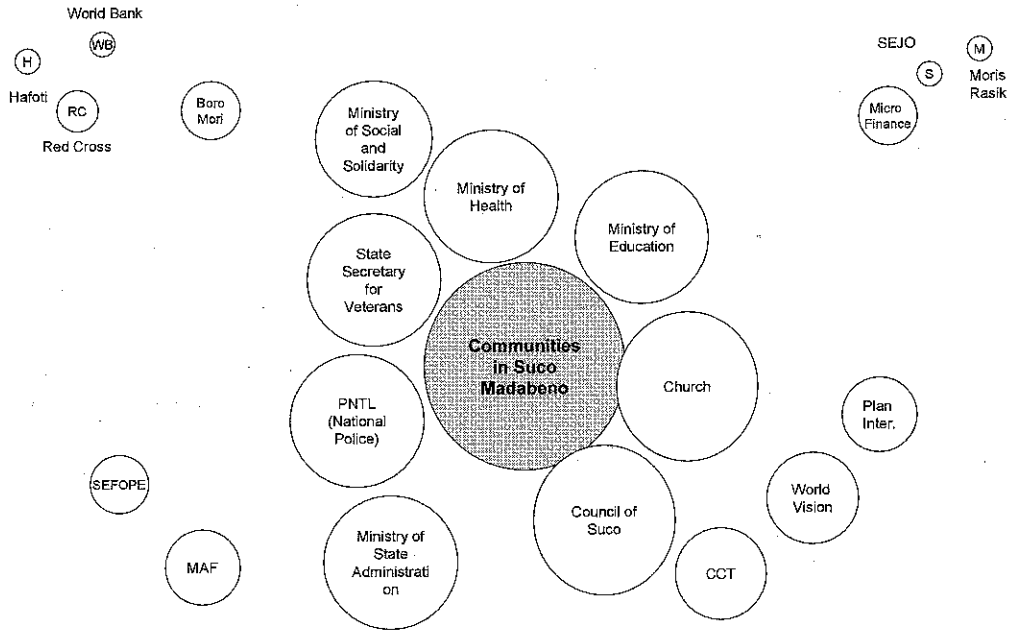


- ➢ Church often visits the village and encourages them to work for the future of the community and plant trees.
- ➢ Clinic is important for the health of the households in the village. Although there is no clinic in the village, they can request a clinic in Suco Hautoho to come to the village.
- ➢ The village leaders visit the sub-district administrative office in Remexio twice a month. If there is a problem in the village, the leaders ask the sub-district administrative office to solve such a problem.
- ➢ Ministry of Social Solidarity provides the pensions to aged persons and services to disable people in the village.
- ➢ Ministry of Sanitation and Water Supply provides water supply systems to the village, but its services and visit to the village are limited.
- ➢ "Akeu" is a Chinese trading company who has bought coffee beans from the communities in the village. Akeu has also supported the village by repairing the road to the village and providing rice to households who have a shortage of food.
- ➢ World Vision has been implementing a project and therefore visited the village twice a week. However, its project targets only the limited number of households (12 households per aldeia) in the village.
- ➢ ILO used to implement a road rehabilitation/construction project to improve a road to the village.
- ➢ PNTL is located bet far from the village, but it visits the village every week. It can also be called for in case any problems and/or criminal cases take place.
- ➢ There is no primary or secondary school in the village. Hence, children in the village go to primary school in Suco Hautoho and secondary school at the capital of Remexio Sub-district.

| Theme | Discussions |
|---|---|
| | ➢ MAF is important for improvement of agricultural production, but their visit to the village is limited.<br>➢ "Paket A" provides a literacy education to households in the village. |

**Table 30 Results of Venn Diagram of Existing Institutions working in Suco Madabeno**

| Theme | Discussions |
|---|---|
| Venn diagram | ➢ The participants identified 21 organizations/institutions relevant to their life and developed the following venn diagram considering the importance as well as proximity of the identified organizations/institutions from the village. |

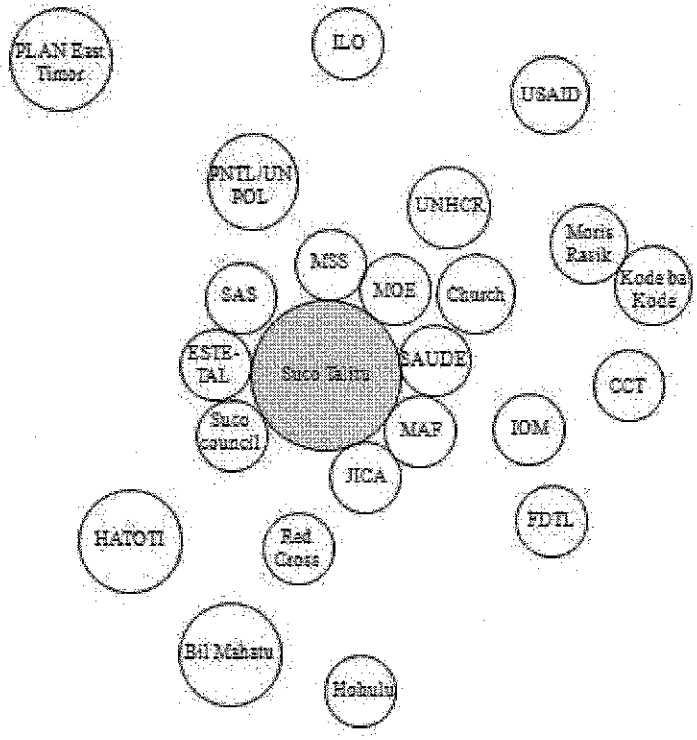


- ➢ Council of Suco is very close to the communities and the communities can get information of the council.
- ➢ Church is also very close to the communities and also important for their life, as it gives guidance to the communities. Besides, it also counts the population of the village, provides baptism certificates and other documents, and rehabilitates the school in the village.
- ➢ Ministry of Education pays salaries to teachers and provides materials and snacks to students.
- ➢ Ministry of Health constructed a health center and has implemented a program of SISCA, which is a health program for mother and children including the provision of food stuff (e.g., cooking oil and maize).
- ➢ State Secretary for Veterans provides the pension to war veterans in the village and allocate some budget to the village for organization of village ceremonies.
- ➢ PNTL looks after the security in the village. There would be internal fightings in the village without PNTL.
- ➢ Ministry of State Administration pays salaries to the members of suco council and provides budget support to the village for events and ceremonies in the village.
- ➢ Ministry of Social Solidarity gives the pensions to aged persons and scholarships to children in the village.
- ➢ CCT provides seedlings (coffee, casuarinas, and clove) to the communities and purchase coffee from them every year.
- ➢ World Vision assisted the communities in the establishment of vegetable nurseries in two (2) aldeias in 2005. It restarted the same activities with the provision of mustard seeds last year (2010).
- ➢ Plan International has worked in two (2) aldeias for establishment of nursery schools, rehabilitation of water systems, and establishment of a library from 2009.

| Theme | Discussions |
|---|---|
| | ➢ MAF provides seedlings of trees and animal vaccination services to the communities.<br>➢ State Secretary for Labor (SEFOPE) provides skill training and job opportunities by implementing a US$ 3 project in the village. However, it is not easy for the communities to attend the training courses, since the courses are organized at Dili.<br>➢ Micro Finance has worked in four (4) aldeias from 2005. It is a semi-government organization supported by ADB with the aim of providing a small scale credit to the communities. However, the main users of the scheme are the government staff who can recieve salary on a monthly basis.<br>➢ Boro Mori constructed toilets in all the aldeias in 2010, but only the limited number of households were able to receive the service.<br>➢ Red Cross disseminated the information of health and sanitation to the communities and installed water systems in one aldeia.<br>➢ Hafoti (Local NGO) have provided coffee pulping machines and corn shelling machines to the communities in two (2) aldeia between 2009 and 2010. However, there has been no follow up by Hafoti and the machines provided are presently out of order.<br>➢ State Secretary for Youth and Sports (SEJO) allocates a budget for a sport event to the youth group in the village.<br>➢ World Bank constructed water tanks in four (4) aldeias in 2000. There has been no activity by this organization since then.<br>➢ Moris Rasik is a local institution for micro credit that have been providing its services in all the aldeias since 2005. It is, however, not easy for the communities to use Moris Rasik since the application form to be filled up is complicated and collection of debts by Moris Rasik is strict. |

**Table 31 Results of Venn Diagram of Existing Institutions working in Suco Talitu**

| Topics | Participants Views and Discussions |
|---|---|
| **Plenary discussion on existing institution on 02/03/2011** | ➢ The participants identified xxx organizations/institutions relevant to their life and developed the following venn diagram considering the importance as well as proximity of the identified organizations/institutions from the villages. |



- Suco council is the village administrative organization and provide information to the communities.
- MSS (Ministry of Social Solidarity) provides the pensions for the elders, veterans, and disables.
- SAS (Department of Sanitation and Water Supply) provided water supply systems in three aldeias in the village, but the communities need more support.
- ESTATAL (Ministry of State Administration) supports the suco council as well as the communities in the village providing training courses and giving honorarium to the suco council.
- SAUDE (Ministry of Health) arranges for a mobile clinic services (SISICA) for mother and baby.
- MOE (Ministry of Education) built schools and has provided facilities to schools and salaries to teacher.
- MAF: Ministry of Agriculture and Fisheries supports the village through extensionists, but so far there has been no substantial activity.
- JICA can support the livelihood improvement and agricultural development in the village.
- Church has provides the health services and advice to the communities in the village.
- UNHCR provided foods and goods during the turmoil.
- FFDTL (Falentil Defense Force of TL) made an assessment of the village, but there has been no follow-up.
- PNTL/UNPOL can be called when any problems happen in the village.

| Topics | Participants Views and Discussions |
|---|---|
| | ➢ Red Cross installed a water tank in aldeia Casa Manatutu.<br>➢ IOM helped refuges come back to the village.<br>➢ HAHOTI is a national NGO that has introduced a micro credit scheme and provided training courses on food processing to the communities.<br>➢ Moris Rasik has run a micro credit scheme in four aldeias but the users of the scheme are limited.<br>➢ Bili Mahatu constructed schools and provided job opportunities to the communities in the construction.<br>➢ Kode ba Kode and Hohulu are the same with Bili Mahatu.<br>➢ CCT has brought coffee seedlings to the village, but up to the main road. However, CCT has not informed Chef de Suco of their activities.<br>➢ ILO has sometimes provided so-called US$3 project to the village.<br>➢ USAID gave chairs to the village and conducted skill training for the youth.<br>➢ Plan International constructed a water supply system in one aldeia. |

**Table 32 Results of Plenary Discussions on Customary Rules on Natural Resource Management in Suco Faturasa**

<table>
<tr><th>Theme</th><th>Discussions</th></tr>
<tr><td>Existing Rules</td><td>
➢ There are three types of rules governing the activities of villagers, namely, i) Adat, ii) Local regulations of Suco, and iii) Government Regulations.<br>
➢ Adat is the local tradition of Suco, such as customary practices in getting engaged/married and those in having family death. A group of Lianain, composed of Chef de Suco, Chef de Aldeias of four aldeais (sub-villages), Representative of church and Elders in suco, plays an important role in following such traditional practices.<br>
➢ The local regulations of suco are rules resolved by the village council. Chef de suco is responsible for its implementation.<br>
➢ The Decree on Community Authorities (No. 5/2004) is the government regulation that defines the roles and responsibilities of the local authorities in suco.<br>
➢ The following are given by the participants as roles and responsibilities of the local authorities of Suco.<br>
- Establish a base of the government of RDTL at suco level;<br>
- Oversea and manage public infrastructure/facilities (road, school, clinic, and environment) in suco;<br>
- Organize a general meeting among members of suco; and<br>
- Resolve any issues/conflicts within in suco.
</td></tr>
<tr><td>Any existing cases in which those rules were implemented</td><td>
<table>
<tr><th>Cases</th><th>Mediator</th><th>Means</th></tr>
<tr><td>Crop damage by animals</td><td>Chef de Suco<br>Lianain</td><td>- Killed animals that caused damage to crops<br>- Compelled an owner of animals to pay money for damage</td></tr>
<tr><td>Coffee damage by animals due to forest fire</td><td>Chef de Suco<br>Lianain</td><td>- Compelled an owner of animals to pay money for damage<br>- Compelled an owner of animals to replant coffee</td></tr>
</table>
➢ There have been no case where the above rules were implemented for deforestation caused by forest fire.
</td></tr>
<tr><td>Any rules / regulations on natural resource management</td><td>
➢ There is no government regulation relating to natural resource management at present.<br>
➢ There is a customary rule to control the harvest of honey, but there is no customary rule to control the exploitation of other resources.<br>
➢ The capacity of the local authority of suco (suco council) is not sufficient to develop a regulation governing other resources.<br>
➢ Tara Bandu was effective in protecting forests and other natural resources during the Portuguese era, but it was disregarded during the Indonesian occupation.<br>
➢ Therefore, the government of Timor-Leste tries to revive Tara Bandu.
</td></tr>
<tr><td>Reasons for increase of forest fires in the Indonesian era</td><td>
➢ There were few forest fires during the Portuguese era, mainly because:<br>
- The government enforced its law strictly;<br>
- People were treated as slaves;<br>
- There was a community police in each suco (a total of 15 policies in district) to monitor the day-to-day activities of suco; and<br>
- Burning was not a common practice for grazing.<br>
➢ Many forest fires had taken place during the Indonesian occupation, because:<br>
- There were regulations to control fires, but the law enforcement of the government was not strict;<br>
- The Indonesian army was the one who burned forests to fight against guerrollas;<br>
- There was no community police in suco;
</td></tr>
</table>

| Theme | Discussions |
|---|---|
| | - People did not make fire lines (clearing the edges of the field) when burning the fields;<br>- Burning became a common practice for grazing; and<br>- People were not fully aware of the negative impacts of forest fires.<br>➢ There are still many forest fires observed after the independence in 2002, because:<br>- People practice shifting cultivation for farming;<br>- There is no government regulation made by the government with new regulations governing natural resource management; and<br>- Burning is one of means to prevent the expansion of the special weed (Chromolaena).<br>- Chef de Suco tries to stop community members from burning the areas for shifting cultivation and grazing. But he can not change their practices. |
| **Necessary interventions to protect forests** | ➢ Revival of Tara Bandu<br>➢ Formulation of local regulations to control the harvest of forest products.<br>➢ According to the representative of the suco (one of the members of Suco Council), they plan to revive Tara-Bandu i) to protect environment as well as forests, ii) to control domestic violence, iii) to reduce free grazing, and iv) to eradicate crimes (especially robbery/steal).<br>➢ In order to control free grazing, they are also planning to define the areas for grazing and segregate the grazing areas from those to be protected. |
| **What is Tara Bandu all about?** | ➢ Outlines of Tara Bandu<br>- It orients community members to protection of properties of suco and community members and control not only the use of natural resources but also criminal activities.<br>- All community members must follow the rules defiend by Tara Bandu.<br>- A person who violates the rules (A violator) is fined one head of cow for the penalty.<br>- When the period of Tara Bandu ends, the council of suco (Lianain) calls all community members at one place and organizes a ceremony to announce the end of Tara Bandu.<br>➢ Process of Tara Bandu<br>- The council of suco organizes a general meeting with the participation of community members to announce the implementation of Tara Bandu.<br>- Participants in a general meeting discuss the subjects to be prohibited by Tara Bandu and fines to be imposed on a violator.<br>- If someone breaks the rules, a violator shall be fined one head of cow.<br>- If a violator does not submit (or kill) his/her animal, Chef de Suco will take legal stepts to punish the violator legally.<br>➢ Period of Tara Bandu<br>- Effective period of Tara Bandu is basically the same with the assignment period of Chef de Suco.<br>- However, the prohibition of harvesting/hunting is defined by hanging the subject of prohibition for a certain period.<br>➢ Monitoring<br>- All community members are responsible for monitoring the day-to-day activities in suco. |
| **Reasons for ineffectiveness of Tara Bandu** | ➢ The Indonesian Government prohibited community members from putting the symbol of prohibition, since the Government suspected it to be the sign to guerrillas to provide them foods/crops.<br>➢ The Indonesian Government also forced community members to say at once place and prohibited them from going to forests. |
| **Result of implementation of village regulations** | ➢ The villagers have followed the village regulations since the regulations were in place in 2008..<br>➢ The changes observed by the villagers are:<br>1) no forest fires has taken place;<br>2) crop damage caused by animals has declined and animals have been separated from farms; and,<br>3) no illegal cutting has been reported. |

| Theme | Discussions |
|---|---|
| **Some improvement required for village regulations** | ➢ There have been some cases of crop damage caused by animals coming from other villages. For instance, some stray animals/cattle from Suco Turataqueo damaged the crops in Aldeia Berliso. According to USC-CTL, which has also supported Suco Turataqueo in the development of the village regulations, the area allocated for animal grazing in Suco Turatagueo is adjacent to Aldeia Berliso. USC-CTL will facilitate the discussion between sucos to settle the issue.<br>➢ The current regulations should specify who must bear the cost for the arbitration. (This was a controversial topic among the villagers in the session and it was agreed that this should be discussed in the sessions of participatory land use planning in Macy 2011.)<br>➢ The regulations should also specify the right to kill animals entering farms/damaging crops. For instance, if the same animal damaged crops in the farm more than 3 times, such an animal should be killed. It is better to specify the type of animals to be controlled under such a new article. |
| **Difficulties in implementation of village regulations** | ➢ The participants requested to extend the existing fence by 1 km to fully protect their farms from animals in the grazing area. |
| **Effectiveness of the future land use map** | ➢ The community has discussed how to control shifting cultivation in accordance with the future land use map, and the land owner in the village decided to allow the villagers who had no land ownership to use parts of his lands as permanent farms without charge. Consequently, all the villagers have several plots to use for permanent farming at present. |

**Table 33 Results of Plenary Discussions on Customary Rules on Natural Resource Management in Suco Fadabloco**

| Theme | Discussions |
|---|---|
| **Existing Rules** | In the Portuguese era:<br>➢ In the Portuguese era, Tara Bandu was effective in regulating the use of natural resources by local communities in the village.<br>➢ Tara Bandu prevented local people from cutting trees illegally and entering the someone's area without permission.<br>➢ Accordingly, people were not allowed to cut trees without permission from the owner of the trees/land. If someone cut trees illegally, s/he would be fined.<br>➢ Tara Bandu was not written, but the rules in Tara Bnadu had been inherited from their grand parents.<br>➢ Lianain was the one who solved/mediated the issue and determined the penalty/fine.<br>In the Indonesian era:<br>➢ The rules implemented in the Portuguese era were not implemented in the Indonesian times. Many local people thought that they could cut trees and burn forests since the Indonesian army did the same.<br>➢ During the Indonesian times, the Indonesian government/army restricted local people's activities since there were guerrillas in the forest.<br>At present:<br>➢ At present, many people have forgotten the rules of Tara Bandu.<br>➢ One of young participants stated that "We haven't seen or discussed the regulations yet, but the story of the Portuguese era told by the old folks in the session seems better than that of the Indonesian era, as the Indonesian army/government did whatever they liked without considering the traditional regulations."<br>➢ Chef de Suco and Chef de Aldeia have agreed to follow the regulations given by the Government, but local communities have not followed/observed the regulations. |
| **Village Structure on Natural Resource Management** | ➢ In the Portuguese era, the head of lisans (kinship groups/clans) was responsible for natural resource management in the respective territories.<br>➢ In the Indonesian time, the chief of village (Kepala Desa) had the overall responsibility for natural resource management.<br>➢ At present, Chef de Suco with the support from Chefs de Aldeia takes the leading role in natural resource management. |
| **Government or Communal Land** | ➢ There is no government land in the village.<br>➢ Each aldeia has a kind of communal land to produce the offerings to church. |
| **Dispute over Natural Resources** | ➢ There is no dispute or conflict over the land as well as other natural resources in the village. |
| **Intention to Introduce the Village Regulations** | ➢ Chef de Suco said in the session, "The Village should develop its own regulations to control the natural resources in the village, and we do not have to wait until the national government gives the regulations."<br>➢ Other participants also commented that:<br>- The village regulations should be developed through a series of dialogues between/among the communities; and<br>- The village regulations should be based on the ideas that come from the communities.<br>➢ The participants further discussed whether the village regulations should be developed at |

| Theme | Discussions |
|---|---|
| | suco level or aldeia level. The highlights of the discussions is summarized below:<br>- The village regulations should be prepared by each aldeia since any problems should be first discussed at aldeia level. If the regulations were developed at aldeia level, many communities would be involved in the process of making the village regulations.<br>- It should be difficult for the village leaders to settle an issue if each aldeia has the different regulations.<br>- Many households in the village might not have interest in the discussions on the village regulations, even when the meetings are organized at aldeia level. It would be therefore more realistic and efficient to make the regulation at suco level.<br>➢ Finally, it was agreed that the village regulations should be developed at suco level. |

**Table 34 Results of Plenary Discussions on Customary Rules on Natural Resource Management in Suco Madabeno**

| Theme | Discussions |
|---|---|
| **Customary Norms** | In the Portuguese Era:<br>➢ There were two types of rules in the village, namely i) Tara Bandu regulations, which were the common rules in the village and ii) rules defied by each uma lisan (head of a kinship group/clan). The former mainly defined the rules over the use of natural resources in the village, while the latter governed the behavior of family members.<br>➢ Each uma lisan had the rules but the contents of the rules were more or less the same.<br>➢ Tara Bandu in the Portuguese era was very strong and everyone in the village observed its rules. Anyone who violated the rules must be punished/fined. It was also believed that animals owned by a person who did not follow the rules would be killed by the supernatural force.<br>In the Indonesian Era:<br>➢ The effectiveness of Tara Bandu regulations became very week since the communities were not allowed to gather for a meeting and many uma lisans were destroyed/burned by the Indonesian army.<br>➢ The Indonesian army burned and cut the forests.<br>➢ The communities considered they could cut and burn trees, even sacred trees, and hunt wild animals for selling. They seemed to be able to do whatever they liked.<br>➢ Uma lisan did not function as most of them were burned.<br>➢ Any natural resources in the village were used and exploited by anyone. There was no one or no system to control and regulate the natural resources in the village.<br>At present:<br>➢ After the independence in 2002, the communities realized that they needed to re-establish the traditional/customary rules. In 2004, they decided to ban the use of weapons/firearms.<br>➢ In 2010, the communities also re-developed Tara Bandu regulations in writing. The new regulations define not only the rules on natural resource management but also social norms in the village.<br>➢ The rules / banned activities defined the current Tara Bandu regulations include: i) do not burn forests, ii) do not cut trees, iii) do not practice slash and burning without consultation with local leaders, etc.<br>➢ At the same time, the regulations of uma lisan were also revived along with the rehabilitation (building) of uma lulic.<br>➢ The regulations of uma lisan can be considered as "house rules" of each kinship group. For instance, one of the regulations is to clarify who are the blood relatives to avoid the intermarriage. |
| **Ceremony of Tara Bandu** | ➢ In the Tara Bandu ceremony, the following activities are carried out.<br>- Kill animals;<br>- Determine and announce the activities to be banned; and<br>- Pray to God.<br>➢ The symbols of the banned activities are hanged up from a pole or tree which stands in the center of the village. |
| **Traditions on Uma Lisan** | ➢ Some sacred things, such as sacred sword, sacred stone, sacred tools are stored in uma lisan. The communities that belong to the same uma lisan gather at uma lisan and pray to the sacred things.<br>➢ The traditional rules have been inherited from the ancestors.<br>➢ The rules of uma lisan define the people's behaviors. If someone violates the rules, the |

| Theme | Discussions |
|---|---|
| | person who violated the rules would be cursed. |
| **Village Structure / Roles and Functions of Village Leaders on Natural Resource Management** | ➢ The tasks of the council of suco are to: i) prevent dispute/conflict over land and other natural resources, ii) protect natural resources from illegal exploitation, and iii) solve any issues and dispute/conflict in the village.<br>➢ When a dispute takes place in the village, the issue shall be handled by lianain in Aldeia. In case the issue can not be solved, the council of suco takes over it. (There has been no case handled by the council of suco sofar.)<br>➢ Disputes over the land, especially the boundaries of two lands, are the major issues that have taken place in the village.<br>➢ There are two types of lianain in the village, i) lianain appointed by Chef de Suco at each aldeia to solve any issues in Aldeia and ii) traditional adats (or elders) of each uma lisan, who solves family issues and pray to God for the family or kinship group. |
| **Government Intervention on Natural Resource Management** | ➢ The communities in the village need to get permission from the Sub-district Administrative Office to cut trees for housing.<br>➢ The Sub-district Administrative Office issued a letter to instruct the communities to protect forests in the village. In fact, the Sub-district Administrative Officer participated in the Tara Bandu ceremony in 2010.<br>➢ Church also encourages the communities not to cut trees in the village in the mass.<br>➢ PNTL controls the cutting of trees and issues authorization to cut trees. |
| **Government /Communal Land** | ➢ There is no government land in the village.<br>➢ All the areas in the village basically belong to households or kinship groups/clans. |
| **Dispute / Conflict over Natural Resource Management** | ➢ Issues observed in the village are: i) land disputes mainly related to the boundaries of farm; ii) use of the water source between the people in Aisirimou and those in Madabeno; and iii) crop damage caused by animals.<br>➢ In general, the issues taking place in the village are solved at aldeia level.<br>➢ The issue on the use of water source between Aisirimou and Madabeno has not been solved yet. The water source is located in Suco Aisirimou and flows into Suco Madabeno. The people in Suco Aisirimou insists that those in Suco Madabeno are not allowed to use the water source. |
| **Current Village Regulations in the Village** | ➢ The Tara Bandu regulations were developed in writing in October 2010.<br>➢ They are effective in regulating the activities of the communities, and therefore, the number of thief, illegal cutting, and crop damage by animals has declined. In addition, there has been no forest fire since the Tara Bandu ceremony.<br>➢ Accordingly, any animal that causes three-time feeding damages to crops can be killed by an owner of crops damaged.<br>➢ Crop damages by livestock animals shall be reported to the police.<br>➢ The village leaders have evaluated the effectiveness of the Tara Bandu regulations every three months. |
| **Willingness to strengthen the Village Regulations and Future Land Use Plan** | ➢ The village leaders and other participants in the PRA session showed their willingness to enforce the Tara Bandu regulations.<br>➢ They accepted the idea to strengthen the village regulations and develop a future land use plan of the village. |

**Table 35 Results of Plenary Discussions on Customary Rules on Natural Resource Management in Suco Talitu**

| Theme | Discussions |
|---|---|
| **Customary Norms** | ➢ Sacred places, such as sacred land (Rai lulic), sacred forest (Ai laran lulic), and sacred water source (Be matan lulic) have existed in the village since the Portuguese era.<br>➢ The following traditional ceremonies/practices have been held in the village since the Portuguese time.<br>- Kuru Be Lulic: Fetch water at the sacred water source and soak maize seeds in the fetched water before planting maize.<br>- Kuda batar: Kill a/ animal/s before planting maize.<br>- Sau batar: Kill a/ animal/s before harvesting maize.<br>- Hakiak animal Kill a/ animal/s when use the sacred forest for animal grazing. .<br>➢ No one has disturbed or used the sacred places without the traditional ceremonies, since communities have been taught about the stories of the lulic.<br>➢ If there is a dispute or case taking place in the village, the related families with Chef de Aldeia have a dialogue to solve the issue at the sacred place.<br>➢ Tara bandu in the Portuguese era was strong enough to regulate the activities of communities in the village.<br>➢ Tara bandu banned: i) activities causing forest fire, ii) illegal cutting, iii) steal of agricultural products from the farms, iv) harvesting prawns/shrimps in the river before the harvesting season, v) harvesting betal nut and tua before the harvesting season, and vi) harvesting maize before the ceremony of "Sau Batar."<br>➢ Although Tara bandu was effective during the Indonesian times, its effectiveness was not as strong as that of the Portuguese era.<br>➢ Accordingly, Tara bandu still exists in the village, but its effectiveness is still weak although it seems stronger than that of the Indonesian era. |
| **Village Structure** | ➢ In the Portuguese era, the village was led by Liurai (Small King), followed by i) assistant of Liurai, ii) Chef Povoacao (Chief of Aldeia), iii) Capitan Major (Lianain), and iv) Cabaronda (Suco Police). Liurai managed and solved the issues in the village following the customary rules and Tara bandu.<br>➢ The village structure was replaced with the Indonesian village structure in the Indonesian era, which consisted of i) Kepala Desa (Chief of Village), ii) Secretary of Desa (Secretary of Village), ii) Rukun Tetanga (Chief of Aldeia), iii) Rukun Keluarga (Chief of hamlet), iv) LKMD (Representatives of village organizations), and v) LMD (Lianain).<br>➢ The current suco structure are: i) Chef de Suco, ii) Chef de Aldeia, iii) Representative of women, iv) Representative of the youth, and v) Conselho de suco (Lianain). |
| **Government Intervention on Natural Resource Management** | <u>In the Portuguese Era:</u><br>➢ Any person who violated the rules of Tara Bandu was fined or forced to work for pulic/Liurai/Sub-district Administrator.<br>➢ A person who was not able to pay tax to the Government or work for Liurai/Sub-district Administrator was beaten with whip.<br>➢ No one touched the area claimed by the Sub-district Administrator.<br>➢ There were two rules in the Portuguese era, the customary rules in the village and those given by the Government.<br><u>In the Indonesian Era:</u><br>➢ The Indonesian military burned forests to fight the guerrillas and used the area for whatever |

| Theme | Discussions |
|---|---|
| | they wanted. Since the Indonesian military disregarded the rules of Tara bandu, the effectiveness of Tara bandu became weak among local communities.<br>➢ Villagers were forced to move and gathered at certain places by the Indonesian government. They were not able to access to their own lands and and water sources that they used to use during the Portuguese era.<br>➢ The Indonesian government implemented an agroforestry program providing seedlings to local communities. In a sense, the government tried to increase the vegetation cover by introduction of agroforestry systems but at the same time destroyed the forest by burning the areas.<br>At Present:<br>➢ The government set the signboard showing "do not cut/burn forest" to protect forest from deforestation.<br>➢ Although the village leaders have advised the communities to follow/observe the rules of Tara Bandu, many of them have not followed them. It seems that they still do whatever they like. |
| **Government and Communal Land** | ➢ In the Portuguese era, many lands in the village were used by Liurai and the Sub-district Administrator. Communities in the village worked in their farms as laborers. There was an area used by church.<br>➢ In the Indonesian times, there had been no new demarcation of communal land.<br>➢ There is a communal land or the land that does not belong to anyone in Aldeia Fatukhun. |
| **Dispute / Conflict over Natural Resource Management** | ➢ There is no dispute over natural resource management in the village.<br>➢ The government program used the communal land in Fatukhun and planted seedlings in there. The young people from Crist Rei as well as other young people in the village pulled out and/or damaged seedlings planted in there. Chef de Suco requested the sub-district administrator and police in Laulara to settle the issue.<br>➢ A water source located in Aldeia Fatukhun is used by communities from the neighboring villages (Suco Cotulau and Suco Aisirimau). Communities in Fatukhun gave up using such a water source and decided to use another source in Remexio.<br>➢ Crop damages caused by animals have been often observed. |
| **Village Regulations in the Village** | ➢ The village has the rules on crop damage caused by animal in writing. They are a kind of judicial precedents decided by the suco leaders to solve the issues on crop damages in the village.<br>➢ An animal causing feeding damage to crops could be killed by the owner of the farm and the meat would be shared by the owner of the animal and that of the farm.<br>➢ In Aldeia Fatukhun, the occurrence of crop damage by animals has declined since the rules were in place.<br>➢ Nevertheless, there are still many households grazing their animals freely in the village. |
| **Willingness to making the Village Regulations and Future Land Use Plan** | ➢ The village leaders and other participants in the PRA session showed their interest in making the village regulations and a future land use plan of the village.<br>➢ They accepted the idea to develop the village regulations and a future land use plan of the village simultaneously by themselves.<br>➢ They further suggested the involvement of lianain and elders in the process of making the village regulations. |
