- D. Reconstruction of transmission 110 kV line Jabana-Birembo

V. GENERAL CONCLUSION

I. METHODOLOGY

These soil studies relate to five areas defined by the project "Improvement of substations and distribution network, phase 3, in the Republic of Rwanda.

These areas are presented, each, by the enclosed plans :

- New substation construction site at Gasogi where 6 survey points were dug : Sip1 , Sip2, Sip3, Sip4, Sip5, Sip6
- Branch point line 110 kV, on the new substation where 1 survey point were dug : Sip7
- 15 kV Distribution line Gasogi substation - Nyagasambu, where 15 survey points were dug on : Sip1 , Sip2, Sip3, Sip4, Sip5, Sip6, Sip7 , Sip9, Sip10, Sip11, Sip12, Sip13, Sip15, Sip16 & Sip17 ; corresponding to the corner points of the projected electrical line.
- 15 kV Distribution line Gasogi substation - Masaka hospital, where 15 survey points were dug on : Sip1 , Sip3, Sip4, Sip5, Sip6, Sip8, Sip9, Sip10, Sip12, Sip13, Sip15, Sip16, Sip17, Sip18 & Sip19 ; corresponding to the corner points of the projected electrical line.
- Reconstruction of transmission 110 kV line Jabana - Birembo, where 13 survey points were dug on : Sip176 , Sip177, Sip178, Sip180, Sip181, Sip182, Sip184, Sip186, Sip187, Sip189, Sip190, Sip195, Sip196 ; corresponding to the location of the existing pylons on the current electrical line.

The points considered are those which are the most solicited and the most representative, from the geotechnical point of view, for different soils.

So, all soil investigation points have been tested according to the details described below.

1) Field tests and levy of samples

This phase comprises :

- Observations and analysis of soils texture on the walls of the test pits, 4 meters for maximum depth ;
- Levy of undisturbed samples ;
- Levy of samples overhauled ;
- Backfilling of the test pits ;
- Penetration test in natural ground, performed with a static penetrometer 50 kN, up to more than 10 m deep, 3 meters around the soil investigation point.

The bearing capacity = $R_p \times 0.01$; R_p is the resistance to the tip and 0.01 is the coefficient taking into account the presence of clay ; R_t is the total resistance taking into account friction (see penetrometer tests below).

2) Laboratory tests

On the selected samples from test pits, physical, mechanical and chemical tests analysis were performed by the following tests :

- Physical tests : Natural water content, Specific gravity, Sieve analysis, Liquid limit, Plastic limit.
- Mechanical tests : Modified proctor, Shear test, unconfined compression test.
- Chemical tests : the degree of alkalinity in soil expressed as a pH, the concentration of sulphate (as SO_4^{2-}) and chlorides (as Cl^-)

3) Results and recommendations for foundation

Bringing together the results of field tests and laboratory tests, soil represented by each point is identified, in its form and in its quality.

This identification, facilitating the rational use of these soils, allows the expert to give recommendations for better land use, such as materials and support.

All the work of geotechnical studies, as described above, is presented in two volumes :

- volume 1/2 : own report of the expert ;
- volume 2/2 : test report.

For reasons of speed and ease, separate laboratories were used simultaneously :

- Rincent BTP Rwanda Ltd,
- Geotechnical laboratory and laboratory of agronomy, University of Rwanda, Huye campus .

II. STANDARDS REFERENCES

In large part, we use the French standardization (NF) and, in lesser extent, British Standards (BSCS) and American Standards (AASHTO) & ASTM.

Sampling - Standard NF P94-202

Moisture content - Standard NF P94-050

Specific gravity - Standard NF P94-053

Sieve analysis - Standard NF P94-056

Atterberg limits - Standard NF P94-051

Modified proctor - Standard NF P94-093

Direct shear box - Standard NF P94-071-2

Unconfined compression strength - Standard AASHTO T134

British Soil Classification System - BSCS

Chemical analysis (sulfate & chloride) - Standard : ASTM D 4327

Chemical analysis (pH) - Standard : ASTM D 4972

In-Situ static penetration tests performed using a GeoMIL 50 kN SPT.

III. ILLUSTRATION OF STUDIES ON SOME PHASES

1) Excavation of test pit

2) Levy of sample

3) Penetration tests:

Setting ink needles for the base of the penetrometer

Penetrometer in action : measuring applied forces

4) Laboratory works

a. Liquid limit

b. Sieve analysis

c. Laboratory Technician at work

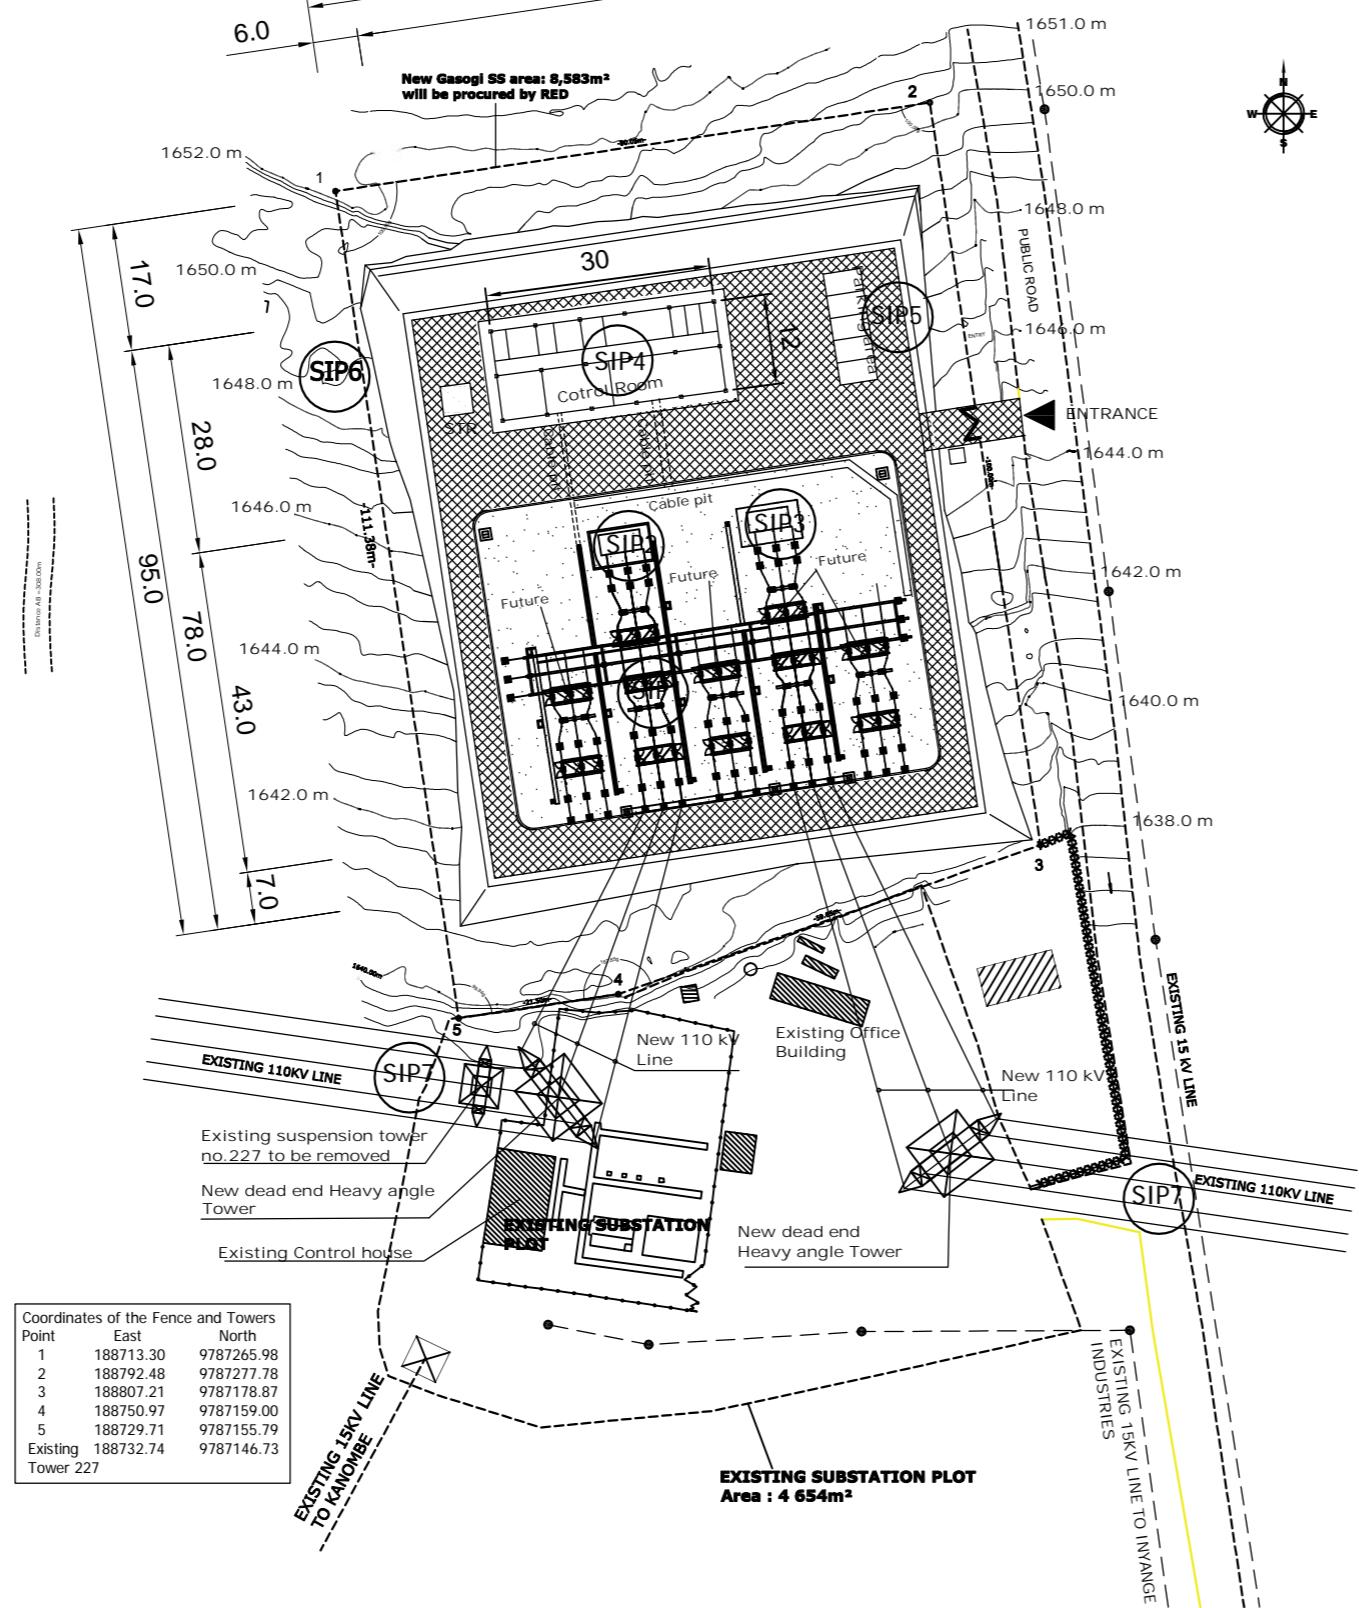

IV. EXPOSED OBSERVATIONS ON EACH TEST PIT

Legend :

- I_p : Plasticity Index - I_c : Consistency Index - $W_{optm} (\%)$: Optimum water content
- $\gamma_{d\ opm}$: Optimum dry specific gravity - γ_h : Natural specific gravity - $W(N)$: Natural Moisture content
- C_{uu} : Cohesion unconsolidated - undrained - ψ_{uu} : Angle of internal friction

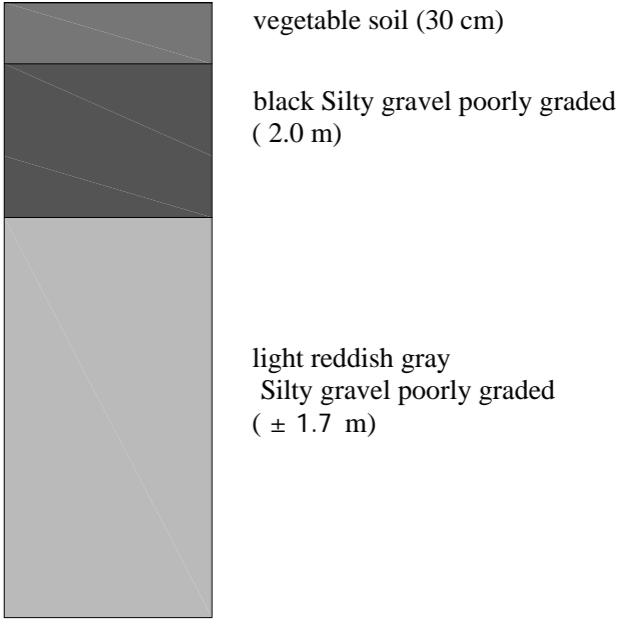

A. New substation construction site & Branch point line 110 kV

V. GENERAL CONCLUSION

1) Soil as support structure.

The presence of clay being general in all the soil structures we have studied ; caution is important in defining the bearing capacity of each lot.

Instead of the safety coefficient of 0.33 used by the laboratory ; we propose a coefficient of 0.01 which takes account of this harmful presence, in a tropical environment.

Indeed, if these studies were carried out during the dry season, the works will be carried out in all seasons and any earthwork will be confronted to a presence of water large enough in the rainy season.

It is strictly prudent to protect the works from any field sensitivity, as the index of plasticity varies from 14.8 % to 21.9 % , although the cohesion is acceptable (the internal friction angle sometimes exceeding 30°).

Apart a few cases requiring special treatment (as unconfined compressive strength), from a depth of 100 cm, a bearing capacity of 200 kN / m² can be , safety, envisaged for the entire project ; with the exception of flood areas where the bearing capacity is lower as indicated above.

This would be in the interest of the project whose foundations, for posts and for towers, are laid at more than 2.00 m depth.

(Nota / penetration test sheet :

Rt : total resistance, Rp : resistance to the tip and Qadm : bearing capacity).

2) Soil as building material.

Set up by backfill, soils must protect the works of all lifting and overturn.

The characteristics data from these studies attribute those qualities to examined soils ; indeed :

- The dry density d_{OPM} 1.67 t /m³
- The internal friction angle is greater than 20 ° for the majority of points (the shear strength is proportional to soil consolidation).
- The unconfined compressive strength gives good resistances (1.48 Mpa) to the compression pressure and good density (1.71 t / m³).
- No soil presents no aggression against cement (4.62 pH 7.3).

3) All the results of the tests imposed on soils allows to classify them into three categories :

a. Good soil, including :

- Clay of Intermediate plasticity ,
- Silty Sand ,
- Clayey Sand .

b. Soft rock, including :

- weathered rock,
- silty gravel,
- clayey gravel,
- semi rock soil.

c. Poor soils with water (or not) :

These soils are located in swamplands areas or in any other areas which can be flooded .

4) Remarque

Any anomalies observed in the performance of the results given above must be reported to an expert for advices and interpretation.

SOIL INVESTIGATION (File 2 / 2 : Field & laboratory tests)

II. CHEMICAL TESTS (for 50 points)

- New substation construction site & branch point line 110 kV at Gasogi (7 points) : Sip1 , Sip2, Sip3, Sip4, Sip5, Sip7
- 15 kV Distribution line Gasogi substation - Nyagasambu (15 points) : Sip1 , Sip2, Sip3, Sip4, Sip5, Sip6, Sip7 Sip9, Sip10, Sip11, Sip12, Sip13, Sip15, Sip16 & Sip17 .
- 15 kV Distribution line Gasogi substation - Masaka hospital (15 points) : Sip1 , Sip3, Sip4, Sip5, Sip6, Sip8, Sip9, Sip10, Sip12, Sip13, Sip15, Sip16, Sip17, Sip18 & Sip19.
- Reconstruction of transmission 110 kV line Jabana - Birembo (13 points) : Sip176 , Sip177, Sip178, Sip180, Sip181, Sip182, Sip184, Sip186, Sip187, Sip189, Sip190, Sip195, Sip196 .

Chemical Lab Results with pH - Chloride & Sulfate

PROJECT: IMPROVEMENT OF SUBSTATION & DISTRIBUTION NETWORK - PHASE III Soil Study

CLIENT: PITRAD

Operator : NZARAMBA Sylvanus

Date: July, 2017

I. NEW SUBSTATION CONSTRUCTION SITE

SN	Sample#	pH	Chloride (Cl ⁻) (mg/L)	Sulfate (SO ₄ ²⁻) (mg/L)
1	S1	7.3	85	31
2	S2	6.55	191	11.7
3	S3	7.02	177	16.5
4	S4	6.63	197	19
5	S5	6.67	193	21
6	S6	5.4	78.8	11.2

II BRANCH POINT LINE 110 KV (new substation)

SN	Sample#	pH	Chloride (Cl ⁻) (mg/L)	Sulfate (SO ₄ ²⁻) (mg/L)
7	S7	6.31	134	37

III. 15 KV DISTRIBUTION LINE GASOGI SUBSTATION - NYAGASAMBU

SN	Sample#	pH	Chloride (Cl ⁻) (mg/L)	Sulfate (SO ₄ ²⁻) (mg/L)
8	AP1	5.9	92	7.7
9	AP2	4.62	113.4	6.7
10	AP3	5.12	99.7	8.1
11	AP4	6.98	159.3	22
12	AP5	5.4	77.8	16.6
13	AP6	4.34	85	6.7
14	AP7	4.81	79.5	6.2
15	AP9	7.03	226.9	12
16	AP10	6.71	196.7	14.7
17	AP11	4.86	120.5	5.9
18	AP12	6.09	178	12.2
19	AP13	6.43	200.3	14.4
20	AP15	7.1	81	19.4
21	AP16	4.73	213	62.6

IV. 15 KV DISTRIBUTION LINE GASOGI SUBSTATION - MASAKA HOSPITAL

SN	Sample#	pH	Chloride (Cl-) (mg/L)	Sulfate (SO ₄ ²⁻) (mg/L)
23	AP1	5.11	122	13
24	AP3	6.26	99.3	59.2
25	AP4	6.15	79	18
26	AP5	5.79	78	7.6
27	AP6	7.1	201.7	9.4
28	AP8	5.22	85	5
29	AP9	6.75	226.9	9.2
30	AP10	6.83	199.4	8.8
31	AP12	6.15	209.9	10.1
32	AP13	6.64	213.1	12.2
33	AP15	6.55	218.5	9.7
34	AP16	4.91	113.3	6.9
35				
36	AP18	4.94	102.2	65.2
37	AP19	5.72	63.8	4.2

V. RECOSTRUCTION OF TRANSMISSION 110 KV JABANA - BIREMBO

SN	Sample#	pH	Chloride (Cl-) (mg/L)	Sulfate (SO ₄ ²⁻) (mg/L)
38				
39				
40	178	7.04	85	70
41	180	6.2	81	8.4
42	181	6.55	145	34
43	182	6.13	101	13.7
44	184	6.22	151	28
45	186	6.44	113.4	68.4
46	187	5.42	92.2	10.9
47	189	7.24	70.9	65.9
48	190	4.81	99.3	62.6
49	195	5.88	176.9	12.2
50	196	6.11	202.4	24
